- MARSHALL, JOHN P., in Medford, Mass., February 5; born at Kingston, N. H., August 11, 1823. Graduate of Yale in 1844. Taught in Effingham, N. H., and in Chelsea and Danvers, Mass. In 1854 became professor in Tufts College, where he remained until his death.
- MASSEY, JOHN E., in Charlottesville, Va., April; born in Spottsylvania County April 2, 1819. Studied at the Friends' School; was admitted to the bar; later was ordained Baptist minister. He served eight years (1890 to 1898) as State superintendent of public instruction.
- MEEHAN, THOMAS, in Philadelphia November 19; born in England March 21, 1826. He was chiefly self-educated, and was at one time head gardener to Vernon Harcourt, Isle of Wight. He came to the United States in 1848; was active in promoting education in botany and horticulture, and was the first to succeed in flowering the *Victoria regia* in America. He was for twenty-three years senior vice-president of the Philadelphia Academy of Natural Sciences, and at one time a member of the board of visitors to Harvard College.
- MESERVEY, ATWOOD BOND, at Hampton, N. H., February 21; born in Appleton, Me., September 30, 1831. Graduate of New Hampton Literary Institution, New Hampshire, in 1857, and of New Hampton Biblical School in 1860. Studied medicine at Bowdoin; was resident licentiate at Andover Theological Seminary, class of 1861, and studied at Brown University. Was ordained pastor in 1861. Was professor at New Hampton Literary Institution from 1862 to 1867; principal of Northwood Seminary, Northwood, N. H., from 1863 to 1868, and principal of New Hampton Literary Institution from 1888 to 1898. Received the degree of Ph. D. from Bates College in 1873, and that of D. D. in 1873. In 1867 was elected to the New Hampshire legislature.
- MICHIE, PETER S., Ph. D., LL. D., at West Point, N. Y., February 16; born in Brechin, Scotland, March 24, 1839. Graduate of West Point in 1863; reached the rank of brigadier-general of volunteers; was highly esteemed as a professor at West Point, serving there until his death. Was the author of *Elements of Wave Motion* relating to Sound and Light, and of several other works. Was a member of the board of overseers of the Thayer School of Engineering of Dartmouth College.
- MUHLBERG, F. A., D. D., in Reading, Pa., March 21; born in Lancaster, Pa., August 25, 1818. Graduate of Princeton in 1836. Professor at Franklin College, Lancaster, Pa., and subsequently president of Muhlenberg College until

he resigned to become professor of Greek in the University of Pennsylvania. In 1891 accepted the presidency of Thiel College, Greenville, Pa.

- MYERS, JOHN A., in San Francisco, April 10. Graduate of Bethany College, West Virginia. Studied at Berlin. Was instructor at Bethany and at Butler, Ind., also professor at the State University of Kentucky, which position he resigned to establish the agricultural experiment station in West Virginia.
- NELSON, EDWIN, in Amherst, Mass., June 11; born in Upton, Mass., February 22, 1828. Graduate of Amherst in 1853. Taught on Long Island; was principal of Amherst Academy and of Litchfield (Me.) Academy, and teacher in Lowell, Mass.
- NEWCOMB, GEORGE W., in Chicago, April; born in Putney, Vt., April 12, 1825. Graduate of Hamilton College in 1849. Taught in Sherburne, Ames, and Utica academies, New York. He subsequently engaged in the practice of law.
- NEWCOMB, MRS. JOSEPHINE LEMONIE, in New York City, in April; born in Baltimore of French descent. After the death of her only child she founded in her memory the H. Sophie Newcomb Memorial College for girls, an adjunct to Tulane University, New Orleans. She also built in Lexington, Va., a memorial chapel to Gen. Robert E. Lee.
- NICHOLS, W. A., D. D., at Lake Forest, Ill., June 25; born at Buckland, Mass., April 4, 1808. Graduate of Amherst in 1834. Taught a family school at Lake Forest and published numerous works.
- NICOLLET, S. EUGENE, S. J., in Mobile, Ala., December; born in Paris July 23, 1864. Came to New Orleans in 1884; studied at Woodstock, Md.; taught in Galveston and other places, and settled as chaplain of St. Mary's Orphan Asylum.
- NINDE, W. X., D. D., LL. D., in Detroit, January 3; born in Cortland, N. Y., June 21, 1832. Graduate of the Wesleyan University, at Middletown, Conn. Entered the ministry; was professor and president of Garrett Biblical Institute, Illinois.
- NORRIS, WILLIAM F., M. D., in Philadelphia; born in Pennsylvania. Graduate of the University of Pennsylvania in 1861. Served as surgeon in the civil war. Was professor of ophthalmology at the university at the time of his death.
- PADDOCK, F. K., in Pittsfield, Mass., August 1; born in Hamilton, N. Y., December 19, 1841. Graduated in medicine at the Berkshire Medical College in 1864; subsequently became dean of the college faculty.
- PAGE, JOHN R., M. D., at the University of Virginia, aged 71. Was a professor at the University of Louisiana and in the Medical College of Baltimore, Md. In 1873 became professor of agriculture, chemistry, and the science of farming. In 1887 resigned to resume the practice of the medical profession.
- PARENT, MRS. MARIE (MCCOSKEY), in New Orleans; born in Liverpool, England, 1817. Principal of girls' school and of Parent's Academy, New Orleans, and later of the College de Maria in Cuba.
- PERKINS, M. B., M. D., in Schenectady, N. Y., June 18; born in New London, Conn., March 14, 1836. Studied chemistry in Germany; taught in the Lawrence Scientific School of Harvard University and in Union College.
- PERRY, W. F., December 17, in Alabama; born in Tuskegee, Ala. Taught at Talladega; served in the Confederate army; engaged in agriculture; removed to Kentucky, where he conducted a military school.
- PILLSBURY, JOHN S., in Minneapolis, October 18; born in Sutton, N. H., July 29, 1823. Received a common school education. After several ventures in busi-

ness he engaged in flour milling with his nephew, Charles A. Pillsbury, in Minneapolis. With his brother, George A. Pillsbury, he furnished, in 1872, the capital for the flour-milling firm of Charles A. Pillsbury & Co., which became world-wide in its reputation. In 1863 he became one of the regents of the University of Minnesota; the same year he was elected to the State senate, where he served almost continuously until 1876, and then three terms as governor, until 1882. He became the watchful friend and supporter of the university, especially using in its behalf his official position as State senator and governor. The State failing to meet the necessities of the university, he aided it to the extent of \$350,000. He built a home for aged women in Minneapolis, on the East Side, and a library there, and his charities were numerous. He was especially willing to help those who strove to help themselves. He erected a library in his native town in memory of his father and mother. In addition to these benefactions his gifts were numerous and unobtrusive. His ideas of citizenship were large, and he was constantly trying to fill them.

**POLLOCK, Mrs. LOUISE**, July 26; born in Erfurt, Prussia, 1832. Was zealous in the introduction of kindergartens; for over forty years was devoted to the work in Massachusetts and in the District of Columbia, translating, editing, teaching, and lecturing. Miss Susan Plessner Pollock is her daughter, and carries on her mother's work.

**POPE, WILLIAM B., M. D.**, in Alabama, August, 1901; born in Mobile. Graduated at the Medical College of Alabama in 1884. Became eminent in medicine and was professor in the college.

**PORTER, SAMUEL**, in Farmington, Conn., September 2; born there January 12, 1810. Graduate of Yale in 1829. Was instructor of deaf mutes at Hartford and New York, and editor of *American Annals of the Deaf and Dumb*. Was for eighteen years professor in Gallaudet College, Washington, D. C., from which he retired as emeritus in 1884.

**PORTER, THOS. C., D. D., LL. D.**, in Easton, Pa., April 27; born in Alexandria, Pa., January 22, 1822. Graduate of Lafayette in 1840 and of Princeton in 1843. Was professor in Marshall College, Franklin College, and Lafayette College; was a prolific writer.

**POTTER, E. N.**, in the City of Mexico, February 6; born in Schenectady, N. Y., September 29, 1836. Graduate of Union College in 1861 and of the Berkeley Divinity School in 1862. Was rector of an Episcopal church in South Bethlehem, Pa., from 1862 to 1869; professor at Lehigh University from 1869 to 1871, and in 1871 was elected president of Union College. In 1884 accepted the presidency of Hobart College, where he remained until 1897.

**PRATT, HIRAM A.**, in Faribault, Minn., November 22; born in Shutesbury, Mass., January 21, 1819. Graduate of Amherst College in 1848. Taught at Sheldon Falls, Mass., Norwalk, Ohio, Suffield, Conn., and Hartford and Hightstown, N. J. Was superintendent of schools at Faribault from 1877 to 1881, and teacher until he retired from active life.

**RAAB, HENRY**, in Belleville, Ill. Was of German descent. Served two years as superintendent of public instruction of Illinois.

**RAY, JOHN W.**, at Eureka Springs, Ark., April 12; born in Chester, N. H., December 23, 1814. Graduate of Dartmouth in 1843; taught at Atkinson, Manchester, Pembroke, and Derry, N. H., and at Eastport, Me. Later was pastor in Goffstown, N. H., and elsewhere. Was superintendent of schools in Manchester.

**REVELS, HIRAM R. (colored)**, in Aberdeen, Miss., January 16; born in Fayetteville, N. C., September 1, 1822. Was educated in the Friends' Seminary in

Indiana. Was a leader among the people; assisted in organizing colored regiments; followed the Federal Army to Jackson, Miss. Was elected to the Mississippi senate in 1869, and to the United States Senate in 1870, being the first colored member of that body. Was for a number of years president of Alcorn Agricultural University for Negroes, at Rodney, Miss.

RIGGS, ELIAS, in Scutari, Turkey, January 17; born in New Providence, N. J., November 19, 1810. Graduate of Amherst in 1829, and of Andover Theological Seminary in 1832. Was a missionary to Greece and Turkey until his death. He prepared standard translations of the Bible in Armenian and Bulgarian, and a Bible dictionary in Bulgarian. His publications are found in the Greek, Armenian, and Turkish languages. He was a great force in the education of those peoples.

ROUNDS, CHARLES COLLINS, Ph. D., in Farmington, Me., November 9; born at South Waterford, Me., August 15, 1831. From 1849 to 1853 he was a printer in Portland, Boston, and Cambridge; graduated from Dartmouth College in 1857. Was principal of the academy at South Paris, Me., from 1857 to 1859. From 1859 to 1865 was principal of a public school in Cleveland, Ohio. From 1865 to 1868 was teacher in the Edward Little High School, Auburn, Me., and was principal there from 1869 to 1883, when he resigned to accept the same position in the State normal school at Plymouth, N. H. Was at the head of this school for thirteen years, resigning to devote his whole time to lecturing and institution work. He was twice president of the New England Normal Association and of the normal department of the National Educational Association. In 1889 was State commissioner from New Hampshire to the Paris Exposition. Was member of the National Council of Education from its organization, its president in 1895, and member of its committee of twelve on rural schools. Dr. Harris said of him: "He is one of the best known and ablest of the normal school instructors and lecturers on pedagogy; he is a deep thinker and of a singularly well-balanced mind."

ROWLAND, H. A., Ph. D., LL. D., in Baltimore, April 16; born in Honesdale, Pa., November 27, 1848. Graduate of Rensselaer Polytechnic Institute, Troy, N. Y., in 1891. After a year employed in railroad engineering became a teacher in Wooster College, Ohio, and later returned to a professorship in the Polytechnic; in 1875 he was elected to the chair of physics in Johns Hopkins University; he spent a year in Europe, and was for some months under Helmholtz in Berlin, where he demonstrated that a moving charge of statical electricity has the same magnetic effect as a current. After his return to Baltimore he retained his professorship until his death. His researches and reports cover more than a hundred topics.

SADTLER, BENJAMIN, in Atlantic City, N. J., April 28; born in Baltimore, Md., December 25, 1823. From 1862 to 1875 was principal of the Lutherville college for women, and from 1876 to 1885 was president of Muhlenberg College.

SAFFORD, T. H., in Newark, N. J., June 13; born at Royalton, Vt., January 6, 1836. In his youth displayed extraordinary mathematical abilities. Graduated from Harvard in 1854, and was then employed ten years in the observatory there. Was connected with the United States Coast Survey, and in 1876 became professor of astronomy at Williams College, where he remained until his death.

SALISBURY, EDWARD E., LL. D., in New Haven, Conn., February 5; born in Boston, Mass., April 6, 1814. Graduate of Yale in 1832; studied oriental languages abroad, and became professor of Arabic and Sanscrit in Yale; was elected member of the Asiatic Society in Paris and of other similar societies; gave his valuable collections to the Yale library.

- SCHOTT, CHARLES ANTHONY, in Washington, D. C., July 31; born in Mannheim, Germany, August 7, 1826. Graduate of the Polytechnic School in Carlsruhe in 1847 with the degree of C. E. A year later came to the United States and entered the office of the Coast Survey, in which he continued until his death. Was member of the National Academy of Sciences; represented the Government in international conferences; worked out the results of many observations for the Survey, and greatly promoted a knowledge of these facts in the United States.
- SCUDDER, HORACE E., in Cambridge, Mass., January 11; born in Boston, October 16, 1838. Graduate of Williams in 1858. Devoted himself to literature, especially for the young. For eight years was editor of the *Atlantic Monthly*. Was author of a life of Lowell.
- SEVERY, JAMES B., at Colorado Springs, March 5; born at Dixfield, Me., June 29, 1840. Received the degree of M. D. at Bellevue College in 1873. Was instructor in Bowdoin Medical College.
- SHEARER, A. B., at Germantown, Pa., October 25; born September 18, 1837, at Montgomery, Pa. Graduate of Yale in 1862. Was principal of a classical school in Philadelphia for seven years.
- SILL, JOHN M. B., in Detroit, Mich., April 6; born in Black Rock, N. Y., November 23, 1831. Graduate of Michigan Normal School in 1854; became professor in the same school, later principal, and afterwards superintendent of schools at Detroit. In 1873 was minister resident and consul-general for the United States in Korea.
- SMITH, E. KENRICK, in Poultney, Vt., January 24; born at New Hampton, N. H., February 12, 1855. Graduate of Dartmouth in 1891 and of the Dartmouth Medical School. Taught at Meredith, Whitefield, Tilton, and Penacook, N. H., and later devoted himself to medicine.
- SMITH, RICHMOND M., Ph. D., in New York City, November 11; born in Troy, Ohio, February 9, 1854. Graduate of Amherst in 1875. Studied in Germany, and in 1874 was appointed instructor in Columbia College. Devoted his attention to economics and was active in charity organizations.
- SNEED, J. L. T., in Memphis, Tenn., July 29; born in Raleigh, N. C., May 20, 1820. Served in the Confederate Army. Was a judge of the Tennessee supreme court from 1870 to 1878. Published law reports, and was president of Memphis Law School for six years (1887-1893).
- SPEAR, P. B., in Hamilton, N. Y., January 25. For over twenty years was connected with Colgate University, Hamilton, N. Y.
- STANLEY, PHILIP E., May 19, in Lynn, Mass.; born in Phillips, Me., May 11, 1865. Graduate of Dartmouth in 1893. Taught in Blairstown, N. J., and Providence, R. I., at the Friends' School. Later was devoted to editorial work until his death.
- STARKWEATHER, GEORGE P., in New Haven, March 21; born in New Haven July 12, 1872. Graduate of Yale in 1891. Was professor in Sheffield Scientific School.
- STOCHIN, ABNER C., January 11, at Watertown, Mass.; born in Limington, Me. Graduate of Bowdoin in 1857. Devoted himself to teaching; was school principal at Monmouth and South Berwick, Me., and New Hampton and Penacook, N. H.
- SUNDERLAND, BYRON, D. D., in Catskill, N. Y., June 30; born in Shoreham, Vt., November 22, 1819. Graduate of Middlebury in 1838 and of Union Theological Seminary in New York City in 1843. Taught school for a time; was installed Presbyterian pastor in 1845. In 1853 was called to the First Presbyterian Church of Washington, D. C. He was twice chaplain of the Senate.

He was devoted to charitable and educational work, and especially promoted the establishment of common schools in the District of Columbia.

- THAYER, JAMES H., D. D., Litt. D., November 26, in Cambridge, Mass.: born in Boston, November 7, 1828. Graduate of Harvard in 1850 and of Andover in 1857. Was pastor for a time and chaplain during the war and afterwards professor in Andover Theological Seminary and Harvard Divinity School. Was member of the American Academy of Arts and Sciences, the American Oriental Society, and other learned associations, and Fellow of the Corporation of Harvard College. Was one of the American revisers of the Bible and was an extensive author of valuable works.
- THOBURN, ISABELLA, in Lucknow, India, September 1; born near St. Clairsville, Ohio, March 29, 1840. Educated at Wheeling Female Seminary. Was many years president of the Lucknow College for Women and Girls.
- TITCOMB, F. L., at Melrose, Mass., January 19; born at Providence, R. I., October 28, 1862. Graduate of Brown University in 1885. Was devoted to teaching. Was State assayer in Rhode Island and school principal at Everett and at Melrose.
- TUFTS, JAMES, in Monson, Mass., April 29; born in Wardsborough, Vt., November 2, 1812. Graduate of Yale in 1833; studied at Andover. After a short pastoral term devoted himself to teaching in Vermont and Massachusetts. Was county superintendent of schools in Vermont.
- TURNER, ALFRED, at Montague, Mass., December 7; born in Boston December 6, 1869. Was school principal in Sheffield, Mass., superintendent of schools in Rutland, Vt., summer school lecturer, and superintendent of schools in Montague, Mass., until his death.
- TUTTLE, JOSEPH FARRAND, D. D., in Indiana, June; born in Bloomfield, N. J., March 12, 1818. Graduate of Marietta College, Ohio, in 1841, and of Lane Theological Seminary in 1844. Served in two Presbyterian pastorates. Was president of Wabash College from 1862 until he retired in 1892.
- VAN SCOY, THOMAS, D. D., February 11, in Helena, Mont.; born in Indiana, February, 1848. Graduated from the Northwestern University, and immediately entered the ministry; was three years in Garrett Biblical Institute; was then called to the chair of Greek in Willamette University, at Salem, Oreg., where he remained for eleven years. In 1891 was elected dean of the Portland University, at Portland, Oreg., and during the last seven years was acting president. In 1898 he became president of the Montana Wesleyan University, at Helena. Was a member of the One hundred and fifty-fourth Indiana Volunteers, and served in the civil war.
- VERY, LYDIA L. A., in Salem, Mass., September 10; born there November 2, 1823. Taught thirty-four years in Salem. Was a ready writer.
- WEBSTER, W. N., at Vineland, N. J., December 27. Was the founder and for many years at the head of the Webster Military Institute at Norfolk, Va., and a fellow in the American Association for the Advancement of Science. He donated about \$2,000 worth of books as a foundation for the public library at Vineland.
- WHIPPLE, HENRY B., D. D., at Faribault, Minn., September 16; born in Adams, Jefferson County, N. Y., February 15, 1822. Ill health hindered him from taking a college course. Was ordained deacon in the Episcopal Church in 1849, and priest in 1850. Was rector in Rome, N. Y., and in Chicago. Became the first bishop of Minnesota in 1859. Promoted the establishment of St. Mary's Hall, for girls, and the Shattuck School for Boys at Faribault. Showed how the false dealings of the whites led to the Indian massacres in 1862. Became known as the "apostle to the Indians."

- WHITE, GREENOUGH, at Sewanee, Tenn., July 3; born in Cambridge, Mass., 1863. Was educated at Harvard, and graduated at the Episcopal Theological School in Cambridge in 1892. His only pastorate was at St. James Church, West Hartford, Conn., 1893-94. Was professor of English literature in the University of the South at Sewanee, 1886-87, and of history and political economy at Trinity College, Hartford, Conn., 1893-94. He then returned to Sewanee, and was professor of ecclesiastical history there until his death. He was author of a number of valuable books.

- LION, DR. JULIUS KARL, died May 30, in Leipzig, aged 72. One of the most noted promoters of physical training; writer of numerous books.
- LOREY, DR. KARL J. T., died December 27, in Tübingen, aged 56. Professor of forestry and agriculture; editor of forestry magazine.
- MIGUEL, DR. JOHANN VON, died September 8, in Frankfurt, aged 72. Minister of finance in Prussia; parliamentarian of great influence; distinguished promoter of education.
- MÜLLER, DR. M. J. C., died January 17, at Heidelberg, aged 56. Professor of botany at the forestry academy in Münden.
- NATTERER, DR. U., died February 16, at Vienna, aged only 31. University professor at Marcy; author of *Chemistry of the Ocean*.
- NORDENSKJÖLD, BARON ADOLPH ERIC VON, died August —; born in 1832 at Helsingfors, Finland; went to Spitzbergen, as geologist, in 1858, 1861, 1864, and 1868; in 1875 discovered the Northeast Passage; prepared maps, wrote academic papers, and records of his voyages; in 1881 he wrote *The Vega's Voyage Round Asia and Europe*.

- PAPPENHEIM, Dr. EUGEN, died December 25, in Berlin, aged 70. Professor of philosophy; ardent in promoting kindergarten practice.
- PETTENKOFER, Dr. MAX, died at Munich, February 10, aged 83. Professor of medicine in Munich; president of Imperial Board of Hygiene; president of the Royal Bavarian Academy of Sciences; author of *The Cholera*.
- PFEIFFER, Dr. HERMANN, died February 18, at Darmstadt, aged 70. Member of Imperial Board of Hygiene; author of many medical books and editor of medical periodicals.
- PRINZHORN, W., died February 13, at Burgdorf, Hanover, aged 77. For many years chairman of provincial teachers' association.
- RABOLSKY, Dr. HERMANN, died December 13 in Berlin, aged 79. Head teacher of gymnasium in Neuhaidsleben, biographer of Prussian kings.
- REINHOLD, Dr. KARL TH., died November 14 in Berlin, aged 52. Professor of political economy in university. Prolific writer on economic subjects.
- RHEINBERGER, JOSEPH GABRIEL, died November 25 in Munich, aged 62. Musical director and royal inspector of music schools; successful composer.
- RIANO, JUAN F., died February 26, 1901. Eminent Spanish authority on art and letters. A reviewer of Spanish literature in the *London Athenæum* for more than twenty years.
- RICHTER, Dr. RICHARD, died May 29 in Leipzig, aged 62. Professor of pedagogy in Leipzig.
- RING, Dr. MAX, died March 28 in Berlin, aged 84. Noted novelist and historian.
- RÜDIGER, HERMANN, died November 19 in Berka, aged 58. School principal; composer of cantatas for children.
- SACHSE, Dr. FR. EMIL, died December 18 in Leipzig, aged 64. Teacher, and editor of *Practical Teacher*.
- SANDERS, NICHOLAS, died in June, 1900. Born in 1829. He became one of the veterans of Swedish literature. He was given a prize by the Swedish Academy for a *Cycle of Songs*. An expert in the literature of modern Greece; an authority on Scandinavian archæology; for several years keeper of the Swedish Museum.
- SAUER, Dr. WILHELM, died April 9 in Düsseldorf, aged 58. Historian.
- SCARTAZZINI, Dr. J. A., the great Dantean scholar, died in February. Born December 30, 1837, at Bondonio, Switzerland. He studied at the universities of Basel and Berne. From about 1872 on he prepared his great edition of the *Divina Commedia*.
- SCHÄUBLIN, Dr. J. J., died January 19 at Basel, aged 78. Director of orphan asylum in Basel. Author of numerous text-books for elementary schools.
- SCHAUENBURG, Dr. EDUARD, died September 23 in Crefeld, aged 80. Principal of classical high school; member of the royal commission for the reform of secondary education in Prussia.
- SCHEEL, Dr. HANS VON, died September 27 in Berlin, aged 62. Professor in University of Berne; later member of statistical bureau in Berlin.
- SCHLÖMILCH, OSKAR, died at Dresden February 7, aged 77. Privy councilor and professor of mathematics in Jena. Author of highly reputed works on mathematics.
- SCHMIDT, Dr. JOHANN, died July 4 in Berlin, aged 53. Professor of philology in Bonn; a criticist of great note.
- SCHNEIDER, IGNAZ, died May 14 in Bilin, Austria, aged 74. School principal and writer of text-books.

- SCHULTZ, A. M. F., died July 27, in Charlottenburg, aged 72. Principal of high school for girls in Berlin; author of text-books much used in Germany.
- SCHULZE-STRELITZ, Prof. LUDWIG, died March 20, in Stargard. Musician and teacher of vocal music of great note.
- SCHWALBE, Dr. BERNHARD, died March 31, in Berlin, aged 60. School superintendent at Quedlinburg; author of several popular text-books on scientific subjects.
- SEEMANN, Dr. OTTO, died September 19, in Hanover, aged 76. Distinguished writer on ancient mythology.
- SEPP, J. N., died August 5, in Rodenheim, aged 85. University professor in Munich; member of national Parliament; copious writer on theological subjects.
- SETTEGAST, HENRY, died December 4, in Jena, aged 53. Professor of agriculture in Jena; successful author of books on agricultural and botanical subjects.
- SEYFFARDT, B. F., died at Crefeld, January 25, aged 73. Member of German Parliament; published many essays on educational subjects from political standpoint.
- SPIESS, Dr. A., died December 23, in Brunswick. Minister of public instruction of the duchy of Brunswick.
- SPYRI, Mrs. JOHANNA, died July 7, in Zürich, aged 72. Much-read author of juvenile books.
- STARCZEWSKI, ADELBERT, in St. Petersburg, Russia, in December. Born in 1818, he studied at the universities in Kieff and St. Petersburg; wrote several historical works, among others a catalogue of Russian materials for the history of Russia. In 1856 he founded the Russian journal, *The Son of the Father*; in 1888 he wrote *Recollections of an Old Man of Letters*.
- SUSEMIHL, Fr. FRANZ KARL ERNST, died in Florence, aged 65. Historian of philosophy.
- SUTERMEISTER, OTTO, died August 17, in Aarau, aged 69. Principal of normal school at Aarau and professor of German literature at Berne, Switzerland. His writings are very numerous.
- THUM, Dr. RUDOLPH, died December 5 in Reichenbach, aged 88. Principal of high school in Reichenbach; author of popular text-books for the study of French and English.
- TOMASCHEK, Dr. WILHELM, died September 9 in Vienna, aged 60. Professor of geography in university and writer of books on historical geography.
- UHLHORN, GERHARD, died December 15 in Hanover, aged 75. Abbot and court preacher; member of consistory; prolific writer on politico-religious subjects.
- URBAN, HEINRICH, died November 24 in Berlin, aged 64. Professor in music conservatory; composer of note.
- WEBER, FRIEDRICH ALBERT, died November 30 in Berlin, aged 76. Professor of philology in university; authority in Sanscrit and other Indian languages.
- WEBER, Mrs. MATHILDE, died June 22 in Tübingen, aged 72. Founder of the first domestic science school in Germany.
- WEISBACH, Dr. ALBIN, died March 14, at Freiberg, aged 68. Professor of physics and mineralogy in mining academy at Freiberg.
- WEINHOLD, KARL, died August 15, in Nauheim, aged 78. Professor of philology and literature in several German universities. Writer of numerous books.

WIGGERS, Dr. J. OTTO AUGUST, died March 6, at Rostock, aged 90. Professor of philology at Rostock. Author of many books.

WOLLNY, EWALD, died January 9, at Munich, aged 31. Professor at technological university at Munich. Author of numerous contributions to physical science.

ZAPP, Dr. AUGUST, died May 13, in Meran, Austria, aged 86. Historian.

ZEHFUSS, JOH. GEORG, died May 5, in Darmstadt, aged 69. Professor in Heidelberg. Noted writer.

ZOLLING, Dr. THEOPHIL, died March 22, in Berlin, aged 52. Editor of *Gegenwart*, a literary journal of influence.

ZORN, BERNHARD, died June 26 in Kyritz. Teacher in normal school and best known as composer and musical director.

## CHAPTER VIII.

### EDUCATION IN CANADA.

Dominion of Canada, comprising seven Provinces, with an extent of 3,653,946 square miles and a population estimated at 5,371,051 in 1901.

#### PREVIOUS ARTICLES ON EDUCATION IN CANADA IN THE COMMISSIONER'S REPORTS.

- "Education in Ontario," Report 1892-93, Vol. 1, Chapter VI; "Notes on education at the Columbian Exposition," *ibid.*, Chapter X, pages 1213-1215; "Manitoba school question," Report 1894-95, Vol. 1, Chapter VII.
- "Current and historical survey of the systems of education in the several Provinces," Report 1897-98, Vol. 1, Chapter IV.
- "Education in Canada: Outline of the public systems of education with current statistics; Industrial and technical education; Historic foundations of the Ontario system," Report 1898-99, Vol. 2, Chapter XXIX.

#### TOPICAL OUTLINE.

Education in the Canadian Dominion: Salient characteristics of the systems of public instruction; Summarized statistics for 1900-1901; Educational systems of the separate Provinces; Conspicuous of the individual systems; Statistics, current and retrospective. Citations from current reports: Ontario, growth of high schools (p. 432), industrial and technical education (pp. 425-6), schools for special classes (pp. 436-7); Nova Scotia, development of the normal school by equipments for science teaching and manual training (pp. 449-50); New Brunswick, scarcity of trained teachers (pp. 452-3). Table of higher educational institutions.

[The following statements have been compiled chiefly from the reports of the chief officers of education, the revised school laws, and the Canadian Yearbook for 1901. Other sources of information consulted were: The School System of Ontario, Hon. George W. Ross, former Minister of Education for the Province of Ontario, International Education Series, Vol. XXXVIII; Educational System of the Province of Ontario, John Millar, B. A., Deputy Minister of Education; Proceedings of the Fourth Convention of the Dominion Educational Association, Ottawa, 1901; Documentary History of Education in Ontario, Dr. J. G. Hodgins, Librarian and Historiographer of the Education Department; Special Reports on Educational Subjects, Board of Education, England, Vol. IV; The Manitoba School Question, Ewart; The History of the Manitoba School System, and the Issues of the Recent Controversy, Mr. R. L. Morant; Special Reports, Board of Education, England, Vol. I.]

By the British North American act of 1867 the right to legislate on matters respecting education was left to the governments of the four Provinces (Ontario, Quebec, Nova Scotia, and New Brunswick), which were then united under the general name of Dominion of Canada. The same right has been assured also to the Provinces that have since entered the confederation (Prince Edward Island, Manitoba, British Columbia, Northwest Territories).

Prior, however, to the federation of the Provinces, education had become a matter of general interest. Ontario, "the core of the confederation," had at the time of its adoption a well-organized system of public schools. Quebec had brought its parochial schools under public supervision and the smaller maritime Provinces had proved their interest in the cause both by legislation and by grants for schools from public funds.

From the beginning two forces were at work directing the educational activities of the people. Both the English and French settlers had brought with them traditional respect for parochial schools and for ecclesiastical control of education; but the English settlers were also deeply imbued with those ideas that were making for the supremacy of civil authorities in all secular affairs, and the conditions of the new country favored the growth of this tendency.

The first system of public education organized in the Provinces, that of Ontario, was distinctively a system under public or government control, and as such has

been the model followed more or less closely by all the other Provinces excepting Quebec.

The Ontario school law of 1843, the basis of the system, embodied features drawn from the school systems of New England and New York, but it differed from these especially by the larger provision for centralized control.

The minister of public instruction in Ontario is more than the executive head of the system, as will be seen by the detailed statement of his powers (p. 428). As a member of the legislature he initiates and largely directs school legislation, while his judicial functions and powers of appointment give great weight to the policies he advocates. No other Province has reposed equal authority in the chief officer of education, but all have sought to secure uniformity of school provision and educational standards by means of centralized government control.

In Quebec the schools are sectarian: that is, they are distinctively either Roman Catholic or Protestant schools. The former are under ecclesiastical control, which for this purpose is organized in accordance with the provisions of the school laws; the Protestant schools are in like manner under Protestant control. In Ontario and the Northwest Territories provision is made for separate schools for Protestants and for Catholics where desired, and the supporters of these separate schools are exempt from the payment of local taxes for the support of the public schools. The separate schools are under government inspection and in general are under the same regulations as the public schools.

The public elementary schools are free schools, excepting in Quebec, where fees are charged which may not exceed 50 cents a month nor be less than 5 cents a month. In the model schools and academies of this Province, which correspond to the grammar and high schools of our own States, the fees may be higher. In the high schools of Ontario fees are charged, but may be and often are remitted at the discretion of the school authorities. With these exceptions the public schools of the several Provinces are free, their support being derived from provincial grants and local (municipal) appropriations and school taxes.

The mode of apportioning the legislative grant among the school districts differs in the different Provinces, but in all there is apparent the purpose to make the provincial appropriation a means of stimulating rather than of lessening local effort in behalf of the schools.

In Ontario the legislative grant is apportioned to the schools on the basis of average attendance in each, respectively. In Quebec the legislative grant is apportioned to the several school municipalities (areas for local school administration) in proportion to their respective populations upon proof that they have complied with the law as to the maintenance of schools and the qualifications and remuneration of teachers. Special arrangements are made in the case of very poor municipalities. In Nova Scotia the legislative grant for public schools is a fixed sum (\$100,000 annually), divided between the legally qualified teachers in conjoined proportion to the number of "authorized days taught" and to the class of license held by the teacher.

In Manitoba each municipality<sup>a</sup> is required to appropriate a specified amount (\$20 for each teacher employed for each month the school is kept open) in addition to a variable amount, depending upon the current expenditure for the schools.

The need of some regulation proportioning the provincial grant to the amount raised locally is recognized in New Brunswick, where many districts seem content to

---

<sup>a</sup>For purposes of civil administration a municipal organization is adopted in Ontario, Manitoba, and British Columbia. This organization comprises: "(a) The townships, being rural districts of an area of 8 or 10 square miles; (b) villages with a population of over 750; (c) towns with a population of over 2,000. Such of these as are comprised within a large district, called a county, constitute (d) the county municipality. (e) Cities are established from the growth of towns when their population exceeds 15,000." (Canada Statistical Yearbook.)

leave their schools to the meager provision from the legislative grant, although fully able to bear a part in their financial support.

In all the Provinces the public school systems include secondary schools corresponding to the high schools of our own country. These high schools have generally an extended curriculum, and prepare students for matriculation in the universities.

The history of higher education in the older Canadian Provinces antedates that of public provision for elementary schools. As early as 1798 an appropriation of 500,000 acres of land was made for the establishment of a university and grammar or preparatory schools in Toronto, but the charter for the university was not secured until 1827. Laval University was founded by the Seminary of Quebec (ecclesiastical organization) in 1852 and secured a royal charter the same year.

The influence of these and of kindred institutions may be traced throughout the subsequent history of education in the Dominion. They have aided materially in maintaining a high standard of secondary education. The high schools of Ontario prepare students for the matriculation examination at the university, and the precedent thus set has been followed in the other Provinces.

Everywhere the disposition is manifest to keep an open road from the public schools to the universities, and to do away entirely with class distinctions in education.

The following tables present in summaries the principal statistics of the public schools in the several Provinces. The totals are brought into comparison with the similar particulars for the New England States, whose combined population is but little above that of the Canadian Dominion. For convenience of reference the educational statistics are preceded by a table of populations in which the population is classified as Roman Catholic and Protestant, a distinction of much importance on account of its bearing upon the provision for separate schools as already explained.

This summarized view is followed by detailed particulars of the educational work in each Province, including a brief conspectus of the respective systems of public education. The constitution and scope of the central authorities in Ontario and Quebec have been presented with much fullness, as showing the most salient characteristics of these two systems and those in which they differ most from our own State systems:

*Population of Dominion of Canada, 1901.*

Provinces.	Roman Catholics.	Other denominations.	Grand total.	Ages for school attendance.	Compulsory school ages.	Age and number of registered pupils.			School population.

### *Educational systems of the several Canadian Provinces.*

#### ONTARIO.

Ontario maintains a comprehensive system of education extending from the kindergartens (introduced into the system in 1882, now numbering 120, with an enrollment of 11,234 pupils) to the provincial university, which derives a portion of its income (\$118,000 in 1900) from public lands and under a recent law (university act of 1900) must report annually to the lieutenant-governor. The characteristic features of the system are the centralized control, securing uniformity of standards and school equipment throughout the Provinces; the very equitable regulations in regard to separate schools for Roman Catholic and for Protestant pupils, where desired; the provision for assuring the professional training of all teachers, and the close correlation of the several grades of schools by means of well-considered courses of study, uniform text-books, and examinations conducted by the central authority.

*Central authority.*—The central authority, or department of education, consists of the members of the executive government, its chief being the minister of education.

The minister [to quote Mr. Millar,<sup>a</sup> deputy minister of education] directs all the educational forces of the country; first, from his place as a member of the legislative assembly, and, secondly, through the officers of his department. From the discussions of educational questions in the provincial parliament his position as a member gives him the best facilities for recognizing the working of the school law and ascertaining the trend of public opinion. As the head of his department, his constant official intercourse with trustees, inspectors, and teachers gives him the greatest opportunity for prescribing from time to time whatever amendments to the regulations may be considered wise in the interests of public high schools. From the wide sweep of the legislation which he is expected to direct, and from his position as a member of the government responsible to the people's representatives, he is able to advance such legislation as will guard the unity of the system and preserve its symmetry.

Extensive powers are given to the education department, but every regulation or order in council made under the statute giving it an existence or under the public, separate, or high schools act, must be laid before the legislative assembly. It has power, subject to the provisions of any statute in that behalf, to make regulations:

(1) For the classification, organization, government, and examination of all schools and institutions (specified in the law) and for the equipment of school-houses and the arrangement of school premises.

(2) For the authorization of text-books for the use of pupils attending such schools or institutes, and for the selection of books of reference for the use of teachers and pupils and school libraries.

(3) For determining the qualifications and duties of inspectors, examiners, and teachers of such schools and institutes, and for the appointment from time to time of such examiners as may be requisite for that purpose.

(4) For the payment of the pensions of superannuated inspectors and teachers, and the proper distribution of all moneys set apart by the legislative assembly for school purposes.

(5) For extending on the petition of a board of school trustees, and on such evidence as to efficiency as may be deemed necessary, any third-class certificate (teacher's) issued under the authority of the public-school act.

(6) For the study of agriculture and for scientific instruction as to the nature of alcoholic stimulants and narcotics with special reference to their effect upon the human system.

The education department has power also:

(1) To appoint inspectors of high schools, separate schools, and county model schools, masters of normal and modelschools, and directors of teachers' institutes.

(2) To affiliate with the schools of pedagogy such high schools or collegiate institutes as may be necessary for practical instruction in the art of teaching.

(3) To determine the fees to be paid by candidates at departmental examinations.

(4) To accept in such subjects as may be deemed expedient the examinations of any university in the British dominions in lieu of the departmental examinations.

(5) To prescribe such forms for school registers and departmental reports as may be deemed expedient.

(6) To accept, on passing the annual departmental examination, the professional or training certificate of any normal school or other training institutions in the British dominions.

The minister of education is the active agent through whom the above powers are exercised. He "makes an annual report to the lieutenant-governor upon the schools and other institutions under the control of his department, with such statements and suggestions for promoting education generally as he may deem useful and expedient. He has power to decide upon all disputes and complaints laid before him the settlement of which is not otherwise provided by law, and upon all appeals made to him from decisions of any inspector or other school officer."

*Local authorities.*—The municipal system of Ontario is admirably adapted to the maintenance of local self-government. The Province is divided into counties, which are subdivided into minor municipalities. These consist of townships, incorporated villages, towns, and cities. The municipal councils have certain powers and responsibilities in respect to education. Through their municipal councils the counties must make grants of money for high schools, and both coun-

<sup>a</sup> Millar's Educational System of the Province of Ontario, pp. 10, 11.

ties and townships grants of money for public or elementary schools. Every township is subdivided into school sections, corresponding to a school district in our States, each of which must be provided with a public school. Every incorporated village, town, and city forms a school district. In each of these districts the rate payers (that is, the persons who pay a property tax) elect a board of school trustees, men and women being equally eligible to the positions. These trustees appoint the teachers, who must have a government diploma, and determine the amounts to be expended for buildings, equipments, and salaries.

*Schools.*—Subject to the provisions of any statute relating thereto and the regulations of the department, the following schools may be established by the local boards of school trustees: (1) Kindergartens, (2) public schools, (3) night schools, (4) high schools and collegiate institutions, (5) art schools, (6) county model schools, (7) normal schools, (8) schools of pedagogy, (9) teachers' institutes, (10) mechanics' institutes, and (11) industrial schools.

*Sources of income.*—The schools are supported by provincial grant and local taxes. The provincial grant for education comprises (1) grants to elementary schools, (2) grants to secondary schools, (3) grants for the training of teachers, and (4) grants for technical education.

The legislative grant for elementary schools is apportioned by the minister of education "among the several counties, townships, cities, towns, and incorporated villages according to the population in each as compared with the whole population of the Province as shown by the last annual returns received from the municipal clerks (provided that the amount payable in every rural school in the territorial districts shall be at least \$100)."

The amount so apportioned is distributed among the school sections of each township "according to the average attendance of pupils at each public school as compared with the whole average number of pupils attending the public schools of the township." (School law 1901, section 7.)

The municipal council of every township is authorized to levy and collect by assessment upon the taxable property of the public-school supporters of the whole township, in the manner provided by the school law and by the municipal and assessment laws, the sum of \$150 at least for every public school which has been kept open the whole year exclusive of vacations. Where the school has been kept open for six months or over, a proportionate amount of the said sum of \$150 at least is levied and collected by assessment upon the taxable property of the whole township. An additional sum of \$100 at least is levied and collected in a similar manner for every assistant teacher engaged for the whole year, and a proportionate amount if such assistant teacher was engaged for six months or over.

The council of every municipality levies and collects upon the taxable property of the municipality (or of the sections in the case of rural schools) such sums as may be required by the trustees for school purposes.

The council of every municipality may, in addition to any requisition of the public-school trustees, raise by assessment such other sums as it may deem expedient for the establishment and maintenance of a school library, or for aiding new or weak schools or continuation classes within such municipality, or for the support of model schools, or for supplementing teachers' salaries or retiring allowances. (School law 1901, sections 70, 71.)

[The amount appropriated for public and for separate Roman Catholic or Protestant schools is divided on the basis of average attendance in each, respectively.]

The following tables and citations give the salient particulars respecting the operations of this comprehensive system for the period 1879 to 1900:

*Public schools, Ontario, 1879-1900.*

Year.	Schools open.	School population between 5 and 21 years of age.	Total pupils registered.	Boys.	Girls.	Average attendance.

<sup>a</sup>High schools are not included in the public school statistics, p. 420.

*The growth of high schools.*—Commenting on the statistics of high schools, the minister of education, in his official report for 1901, says:

Owing to the organization of continuation classes in public schools, there has not been much increase of late years in the establishment of additional high schools. As continuation classes are really doing high-school work, it may be seen that there is a steady progress in the support given to secondary education. In 1867 only 1,283 pupils, or 23 per cent of the whole number, studied commercial subjects, such as bookkeeping. In 1900 this subject was taken up by 9,712 pupils, or 45 per cent of the total attendance. In 1867, 5,171 pupils, or 90 per cent, studied Latin. In 1900 the number taking Latin was 18,073, or about 83 per cent. In 1867, 15 per cent studied Greek, while in 1900 only 4 per cent were engaged in studying this subject. In 1867, 38 per cent of pupils studied French, and none studied German. In 1900 the number taking French had increased to 58 per cent, while 18 per cent were engaged in studying German. The greater attention given to drawing is also a marked feature of the classification.

When high schools were first established in the Province, their primary object was to prepare pupils for the learned professions, and especially for the university. Although their original purpose has not been ignored, the course of study has been enlarged so as to meet the aims of pupils who intend to follow the ordinary pursuits of life. It is in the high schools that most students who desire to become public-school teachers receive their nonprofessional training. This is a valuable function of those institutions, and one that has done much to commend them to the general public. Many young men also, who intend to follow mechanical pursuits or prepare themselves for mercantile life, or for agriculture, take advantage of the high schools. The superior culture which is thus received proves a valuable investment. In 1872 the number of high-school pupils entering mercantile life was 486. In 1900 the number had increased to 1,331. In 1872, 300 pupils left the high schools for agricultural pursuits, and the number in 1900 had reached 757.

The following table will be of interest regarding the occupation of parents of high-school pupils, and will show the classes of our population receiving most advantages from those institutions:

Agricultural	6,221
Commercial	5,448
Mechanical	5,054
Professional	1,953
Without occupation	1,788

*Training of teachers.*—The provision for securing properly qualified teachers is one of the most important characteristics of the Ontario system.

Every position [says Mr. Millar] from the lowest in the kindergarten to the highest in a collegiate institute must be filled by a trained teacher. No teacher of a high or public school secures a permanent certificate who does not possess qualifications of a threefold nature: (1) Scholarship, (2) a knowledge of pedagogical principles, and (3) success shown by actual experience.

\* \* \* \* \*

No permanent certificate is given to any high or public school teacher who has not in the opinion of his inspector proved himself successful. The lowest grade of certificate is valid only for three years, and the holder who fails to "work up" for one of the higher grade or who in spite of his scholarship or professional training shows that he has mistaken his calling is obliged to give way and allow his position to be held by another. It is, moreover, felt that in a large graded school where important administrative ability is required the principal should have first shown his efficiency in a subordinate position. On this ground the B. A. who has received his professional certificate after attending the school of pedagogy must serve as an assistant for at least two years in a high school or collegiate institute before becoming eligible for a head master's certificate. In other words, a high-school teacher must serve an apprenticeship for two years before he can get the highest grade of certificate, and the public-school teacher has a similar period of probation before he can secure a first-class certificate. There is at the same time every incentive held out to the energetic teacher to rise in the profession. Many of the best positions as teachers and nearly all the positions as inspectors are held by those who started at the lowest step of the stairs. In the establishment of training schools it is assumed that the different grades of schools—kindergartens, public schools, and high schools—require teachers of different qualifications, whose professional attainments should be gained at institutions specially provided in each case for the purpose. With this view there have been established in Ontario the following training schools for teachers:

(1) Kindergartens, including the local schools of this kind where the training is given for assistants' certificates, and the provincial kindergartens connected with the normal schools where the training is given for directors' certificates.

(2) County model schools, where all public-school teachers receive their first professional training, and from which third-class certificates, valid for three years, are awarded.

(3) Provincial normal schools, for the further training of public-school teachers who desire to obtain second-class certificates and which are valid for life.

(4) The school of pedagogy, for the training of those who desire to obtain certificates as first-class public-school teachers, assistant high-school teachers, and specialists in one or more of the six departments of classics, mathematics, English, modern languages, natural science, and the commercial course. The school of pedagogy also gives the professional training which, with the necessary scholarship and experience, enables its graduates to obtain subsequently certificates as public-school inspectors or principals of high schools and collegiate institutes.

*Kindergartens.*—A young woman who desires to become a regular teacher in a kindergarten must take one year's training at any local school of the kind which has been established by a public-school board. If she is intelligent, fond of young children, and ready to read up such literature as bears on her work, an extensive preliminary course at a high school is not essential, but she will be all the better qualified by having first attended one for three or four years. After the year's training an examination must be passed, conducted by the education department, but the certificate gained only qualifies to teach as an assistant. The holder of such a certificate becomes, however, eligible to attend either of the normal kindergartens at Toronto or Ottawa, and a year's additional course there is required in order to obtain a certificate as director. This certificate qualifies her to take charge of any kindergarten established by a board of public-school trustees.

*County model schools.*—To begin teaching in any public school in Ontario, it is necessary to obtain what is called a third-class certificate from a county board of examiners, and only those are eligible for the examination who have attended a session at a county model school. To be admitted to a course of training at one of these institutions it is necessary to have first passed the high-school primary examination. The board of examiners consists of the public-school inspector and two other persons appointed by the county council, holding first-class certificates and actually engaged in teaching. They receive for their services \$4 per diem

and traveling expenses. This board, subject to the regulations of the education department, sets apart at least one public school in each county for the training of third-class teachers. The course of study for the pupils is the same as in any other public school.

There are 59 county model schools in Ontario, and the average number of students in training at each is about 30. A grant of \$150 by the legislature and an additional \$150 by the county council are made to each of these institutions, mainly to assist the trustees to provide an efficient staff. The course of professional training extends over about four months—from September to December.

The time of the teachers in training is taken up with (1) observation of the work done by the regular teachers, (2) practice lessons given to the classes or to sections of a class, and (3) criticisms, discussions of methods, and lectures by the principal on pedagogical principles. A third-class certificate is valid for only three years, and if the holder has by that time no higher nonprofessional attainments than a high-school primary certificate, or if he has not been successful in teaching, he is not eligible to enter a normal school, and may be obliged to retire from the profession. This regulation is based on the principle that a life certificate should be given to no teacher until he is tried by the only true test—that of experience. The object is to prevent incompetent persons from holding positions and, by offering their services at low salaries, shutting out energetic teachers and injuring the schools.

It was intended that as far as possible third-class teachers should be assistants, and the intention has been observed in cities and towns, but the supply of second-class teachers is not yet sufficient to confine third-class teachers to subordinate positions in rural districts, where there is often only one teacher in each school. It is, however, quite common for third-class teachers to have passed the junior leaving or even senior leaving examination before attending a county model school, and the good education thus gained by a three or four years' previous attendance at a high school or collegiate institute gives even to rural schools a class of young men and women earnest in their work, determined to rise in public estimation, and who, in spite of too prevalent a tendency to make teaching a stepping-stone to some other profession, have generally a fine intellectual and moral influence upon the youth committed to their care. (Millar's Educational System of Ontario, pp. 54-58.)

The following table gives particulars relating to normal schools, normal college, and county model schools, 1878-1901:

Year.	County model schools.			Normal schools.						Normal college.		
	Schools.	Teachers in training.	Passed final examinations.	Teachers, normal.	Students.	Teachers, model and kindergarten.	Pupils, model and kindergarten.	Receipts from fees of model and normal schools and kindergarten pupils.	Expenditure—model and normal schools.	Teachers.	Students.	Receipts from fees.
1878	50	1,391	1,372	14	226	8	383	\$7,752	\$34,033	—	—	—
1879	51	1,295	1,259	15	429	2	391	7,824	33,720	—	—	—

1901	55	1,189	1,145	14	613	28	921	—	—	15	113	—

In addition to the normal schools comprised in the above table—

there is organized in each county or inspectoral district a "teachers' institute" for the purpose of imparting instruction in methods of teaching and for discussing educational matters, subject to the regulations of the education department. A grant of \$25 is paid by the legislature to each institute and the county or city gives a grant of an equal amount. Many of the associations have valuable libraries of professional works. The public-school inspector takes a leading part in the work of these county associations, and he is generally aided by the more experienced public-school teachers, and the teachers of the one or more high schools or collegiate institutes situated within his district. A director of teachers' institutes, appointed by the education department, frequently attends these meetings, and very often other prominent persons are invited to give addresses on educational topics. The main object, however, is to have discussed pedagogical principles and methods of teaching, and enable teachers to compare notes regarding their daily duties. \* \* \*

In cities these associations often meet monthly under direction of the inspector. Sometimes he finds it desirable to have teachers of the same grade meet together. These institutes have also had the effect of creating greater interest in school work among the general public.

As early as 1878 the number of these institutes was 54, with 3,511 members, or 50 per cent of all the teachers in the province. In 1900 the number of teachers' institutes was 76, and the number of members 8,081, or 86 per cent of the total number of teachers. The expenditure in 1900 amounted to \$6,485.

The Educational Association of Ontario resembles in its constitution and purposes the National Educational Association of our own country. Of the Ontario society Mr. Millar says:

It has been in existence for more than thirty years, and meets during the Easter holidays for the reading and discussion of papers relating to various questions of educational interest. The meetings of the body have done much toward giving direction to the school legislation of the province. The association may be regarded, in fact, as a kind of "educational parliament." It receives a grant of \$200 a year from the legislature, and its proceedings are published for the information of its members. Besides the sessions of the general association, very many valuable papers are read and discussed in sections of that body. In this way there have been organized sections for the kindergartners, public-school teachers, high-school teachers, training-school teachers, inspectors, etc. There have also been formed associations for the advancement of classics, mathematics, modern languages, and science. The high and public school trustees have organized a provincial association which has in like manner contributed much to the discussion of educational questions. It is now a section of the general educational association.

*Industrial and technical education.*—As to recent progress in the provision for industrial and technical education, the minister says in his report for 1901:

The addition of domestic science, made to the school programme in 1899, marks another epoch in the development of education in Ontario. The organization and equipment of the Normal School of Domestic Science at Hamilton has enabled several young women to prepare themselves to teach the subject. Through the liberality of Mrs. Massey-Treble another institution for the training of teachers in this department has been established in Toronto.

This institution—the Lillian Massey Normal Training School of Household Science (formerly the Victor School of Household Science and Arts)—has been planned to some extent on the basis of the normal courses followed at Drexel Institute, Philadelphia, and Pratt Institute, Brooklyn, and embodies the advanced methods of this department as taught in those distinguished institutions. Domestic science is also taught in connection with the Young Women's Christian Guild, Toronto. In the Toronto Technical School a forward step has also been taken in providing an excellent course in domestic science. Already several of the public-school boards are taking the initiative in the matter. This subject is taught or is about to be taught in Hamilton, Stratford, Kingston, Brantford, Renfrew, Ottawa, Woodstock, etc. A kitchen has been equipped for the purpose in the London Normal School. It may be expected before long that the large towns and cities, at least, will provide instruction in domestic science.

In other departments of technical education the attention given to the subject

by the public is also encouraging. The attendance at the School of Practical Science, which has made such great progress since its establishment, has warranted an increased expenditure for its equipment and maintenance. To this institution the Province will necessarily look for efficiency in the higher departments of applied science or technical education.

The development of the new parts of Ontario, and the growth of our industries generally, make it essential that an institution which has specially in view the material welfare of the country should be liberally supported by the legislature. It is, however, between the lower and the higher institutions of learning that the break in training in what may be deemed practical in character is most apparent. The kindergarten and the school of practical science should have the missing links supplied. Unfortunately, when the child, after passing through the kindergarten, enters upon the public-school courses his attention is usually diverted from the kind of training he has been receiving and his time is mainly occupied with the acquisition of knowledge. In the public school and high school, as well as in the kindergarten and school of practical science, there should be afforded facilities for becoming practically acquainted with the ordinary agricultural, mechanical, and commercial pursuits. To supply these wants, manual training and other departments of technical education have been added to the school programmes.

In addition to what has been done through the liberality of Sir William Macdonald, and the instrumentality of Professor Robertson, of Ottawa, several school boards have taken steps to move in harmony with the general trend of educational development. In some towns and cities schools are already in operation, and in other places it may be expected classes will be established by the end of another year. Among those cities and towns where manual training is now taught may be mentioned Toronto, Kingston, Brantford, Stratford, Woodstock, Renfrew, Brookville, and Ottawa. In Brantford and Stratford commodious buildings have been provided for technical education.

As in the case of domestic science, there is no doubt that the cost of buildings, equipments, and salaries of competent teachers stands in the way of greater progress. It is nevertheless true that the reluctance to depart from the long-established programmes of study is the chief hindrance to the development of technical education.

Reforms in education, as a rule, come slowly, and doubtless conservatism often serves a good purpose in preventing the hasty introduction of subjects which sometimes turn out to be mere fads. In the matter of technical education, however, the experimental stage in this department has already passed, if we are to be guided by what has been done in Germany, France, England, and the United States. It is just as well to admit that in the matter of practical or industrial education there is great need of progress in Ontario. The resources of our Province are great, and the young men trained in our schools should be prepared to take their part in its development.

In addition to the several classes of public schools comprised in the foregoing tables, there are schools for special classes, "mechanics' institutes and art schools," which are supported wholly or in part by the government.

*Schools for special classes—Institution for the deaf and dumb.*—The legislature of Ontario has made ample provision to meet the educational requirements of the deaf mutes of the Province. The institution for the deaf and dumb, situated at the city of Belleville, is open to all deaf mutes from 7 to 21 years of age who are residents of Ontario, and who are not deficient in intellect and are free from contagious diseases.

The object in founding and maintaining this institute is to afford educational advantages to those who are on account of deafness, either partial or total, unable to receive instruction in public schools. The period of instruction is seven years, with a vacation of nearly three months during the summer of each year. Parents or guardians who are able to pay are charged the sum of \$50 a year for board. There are no charges for tuition, books, and medical attendance. Clothing must be furnished by parents or friends.

The course of instruction is both scholastic and industrial. In the former the work is analogous, so far as the capacity of the pupils will allow, to that of the elementary schools. The modes of instruction employed are the manual alphabet, signs, writing, and articulation or visible speech.

In the industrial department the trades of printing, carpentering, and shoemaking are taught to boys, and girls are instructed in general domestic work,

tailoring, dressmaking, sewing, knitting, the use of the sewing machine, and such ornamental and fancy work as may be desirable.<sup>a</sup>

The usual attendance at this institution is about 240 children. The expenditure in 1900 was \$45,252, derived entirely from the government.

*Institution for the blind.*—The institution for the education of the blind was established in the city of Brantford in 1872. Like the institution for the deaf and dumb, it is intended to be supplementary to the public-school system of the Province. Youths between the ages of 7 and 21 are admitted who are not disqualified by disease or mental capacity, but whose sight is so defective or impaired as to prevent them from receiving education by the ordinary methods. No charges are made for tuition in the case of pupils admitted from Ontario. It is not considered that children deprived of sight or hearing should be treated simply as objects of charity, but that the State owes them an education like other youths of the country.

Pupils are taught arithmetic, grammar, geography, reading, writing, and at a more advanced stage, English literature and history. Reading is taught by the use of embossed type traced by the fingers, and writing with the aid of a grooved card, which acts as a guide to the hand. The ordinary expedients in the case of blind pupils are employed to give information in geography and natural history. Where the ability of the pupil justifies, very valuable instruction is given in vocal and instrumental music. Many graduates of the institution have shown marked proficiency with the pianoforte, organ, or violin, and the lives of hundreds have been made happier by the training thus obtained. A kindergarten class is now an important department of the institution, and the work of the little blind kindergartners creates a great deal of interest.

Considerable attention is given to industrial training. Many of the boys find that the willow shop presents an excellent means of gaining a knowledge of chair and basket making. In a few sessions an intelligent youth may graduate as a competent workman and become able to earn a living for himself.

Girls are instructed in sewing and knitting, including the use of sewing and knitting machines, and have in this way been trained to provide for themselves a comfortable living.

Attention is paid to physical training by instruction in gymnastics and calisthenic exercises. The health of the pupils is carefully looked after, and satisfactory provision is made for religious instruction by devotional exercises morning and evening, and by attendance at the churches of their respective denominations every Sunday. The pupils have access to a good library of embossed books, which are increased in numbers from year to year. There is an attendance at the institute of about 150 pupils.<sup>a</sup>

The expenditure in 1900, derived, like that of the school for the deaf and dumb, from government funds was \$33,753.

*Mechanics' institutes and art schools.*—By an act of the legislature of Ontario any number of persons, not less than ten, may become incorporated as a mechanics' institute or art school. The primary object of these institutes was to form libraries and reading rooms, and to organize a system of instruction by means of lectures and evening classes. In most of the cities and towns, as well as in many of the villages, flourishing mechanics' institutes have been in existence for many years. They have done much toward providing wholesome reading matter for the public, and by systematic courses of lectures much valuable instruction has been imparted. The evening classes that have been established have proved of much advantage to many young persons who have not time to take an extensive high-school course. The subjects taught are English grammar and composition, history, arithmetic, writing, bookkeeping, and drawing. The last of these subjects has received special attention in several of the mechanics' institutes. Free-hand, geometrical, perspective, and object drawing are pursued with considerable success, and in some of the institutes many students have shown creditable proficiency in architectural and mechanical drawing and in forming various industrial designs.

As regards this extensive work which has developed under the fostering aid of the Government, no exact statistics are available. At least five organized schools

<sup>a</sup> Millar's Educational System of Ontario, p. 108.

for instruction in drawing, free and mechanical, modeling, and designing have the advantage of this provision.

In connection with and under the control of the department of education were 263 public libraries in 1900, with over 478,996 books and about 35,329 members. Their property was valued at \$381,544, with liabilities of \$20,492. Besides these there were 126 free libraries, with upward of 510,054 volumes and 111,879 readers, with assets amounting to \$642,757, and liabilities \$113,452.

*Higher education.*—The following institutions for higher education receive grants from the provincial treasury and are under the supervision of the department of education:

The school of practical science, Toronto, registering about 300 students in the first term session of 1901-2.

The University of Toronto, comprising the following faculties and departments:

	Students.
Faculty of law .....	15
Faculty of medicine .....	369
Faculty of arts .....	886
Department of agriculture .....	1
Department of pedagogy .....	2
Department of dentistry .....	79
Department of music .....	4
Department of pharmacy .....	57
Department of applied science .....	20
Department of engineering .....	3
Total .....	1,436

University College, affiliated to the university, registering 608 students in 1900-1901.

#### QUEBEC.

The public school system of Quebec had its origin in parochial schools, which were fostered from the earliest settlement of the colony and which were recognized as the basis of the public system of elementary education provided for by a law of 1846. Government inspectors of schools were appointed in 1852, and in 1859 the form of an organized system was completed by the appointment of a council of public instruction. Peculiar difficulties were experienced in the development of the work because of the religious differences of the French and English populations. The former were adherents of the Roman Catholic Church and naturally resisted all efforts that threatened their relations with the religious schools of which they were staunch supporters. After a period of tentative efforts, a policy was adopted in 1875 which has proved satisfactory to the Roman Catholics, who form the vast majority of the population (1,429,186 against 219,712, census of 1901), while at the same time it affords protection for the rights of the Protestant minority.

The system established by this law, as will be seen by the outline of its principal features given below, " provides for the separate control of Roman Catholic and Protestant schools without destroying their organic unity.

*Central authority.*—In 1859 the central control of the public schools of Quebec was vested in a council of public instruction composed of eleven Catholics and four Protestants. In this form the council continued until 1875, when the law provided for its organization in two committees, the one charged with the inter-

<sup>a</sup>The particulars are taken from the school law in force July 1, 1899, being the latest revised edition up to the present date, compiled by Mr. G. W. Parmelee, secretary of the department of public instruction.

ests of the Catholic schools, the other with those of the Protestant schools. The first-named committee consists of—

(1) The bishops, ordinaries, or administrators of the Roman Catholic dioceses and apostolic vicariates situated either in whole or in part in the Province: ex officio members. (2) An equal number of Roman Catholic laymen appointed by the lieutenant-governor in council.

The Protestant committee consists entirely of Protestant members, equal in number to the appointed members of the Roman Catholic committee, and, like them, appointed by the lieutenant-governor.

The powers of the council and its committees are as follows:

School questions, in which the interests of Roman Catholics and Protestants are collectively concerned, are under the jurisdiction of the council of public instruction, and shall be decided by it.

School questions, in which the interests of Roman Catholics or Protestants are exclusively concerned, are decided by that one of the two committees which represents the religious belief which the party concerned professes.

Each of the two committees of the council of public instruction has separate sittings. It appoints its chairman and its secretary.

It is the duty of each committee to make regulations, subject to the approval of the lieutenant-governor in council, to determine what constitutes an elementary school, a model school, and an academy.

The Roman Catholic or Protestant committee, as the case may be, and as the provisions which concern them require, may, with the approval of the lieutenant-governor in council, make regulations:

For the organization, administration, and discipline of public schools.

For the division of the Province into districts of inspection and for establishing the boundaries of such districts.

For the government of normal schools.

For the government of boards of examiners.

For the examinations of candidates for the office of school inspector.

For determining the holidays to be given in schools.

Each committee shall approve the text-books, maps, globes, models, or other articles for use in the schools of its religious belief, and, when it deems it expedient, it may withdraw the approval it has given.

Each of the two committees may revoke the diploma of any teacher of its religious belief convicted of bad conduct, immorality, drunkenness, or grave neglect of duty. [The mode of procedure in such cases is carefully specified in the law.]

The superintendent of public instruction, who is appointed by and holds office at the pleasure of the lieutenant-governor, administers the department of public instruction, which comprises, besides the superintendent, two secretaries, who act as deputy heads of the department under his direction.

The superintendent is ex officio a member of the council of public instruction and of each of its two committees, but he has a right to vote only in the committee of the religious faith to which he belongs. In the exercise of his functions he is bound to comply with the directions of the council of public instruction or with those of its committees. He compiles and publishes reports of all schools and educational institutions, and every year draws up, in accordance with the directions of the council or of its committees, a detailed statement of the sums required for public education, and submits this statement to the Government. He has power to hold inquiries, to summon before him and administer oaths to witnesses or parties in all difficulties which may arise in reference to schools or school-houses. He may also delegate this power to hold inquiries to the secretaries of the department or to school inspectors. When the investigation is held at the request of one or more ratepayers, the superintendent may require the person who applies for it to deposit an amount sufficient to cover the expenses.

The superintendent is the depository of all documents respecting matters under the control of the department of public instruction, and may deliver copies or extracts thereof, in consideration of a remuneration fixed by the lieutenant-governor in council.

The superintendent may delegate to one of the secretaries of the department all the powers conferred on him by law, if he be absent from the Province.

It is the special duty of the superintendent—

1. To receive from the provincial treasurer, in addition to the amounts appropriated for superior education, all sums of money appropriated for public school purposes, and to distribute them among the school commissioners and trustees of

the municipalities in proportion to their population as ascertained by the last census.

2. To prepare and cause to be printed recommendations and advice on the management of schools for the school commissioners and trustees and for the secretary-treasurers and teachers.

3. To keep correct books and distinct schedules of all the matters under his superintendence, so that information may be promptly obtained by the Government, the legislature, or the school visitors.

4. To examine and control the accounts of all persons, corporations, and associations accountable for any public moneys appropriated and distributed under the laws relating to schools, and to report whether they are bona fide applied for the purposes for which they were granted.

5. To lay annually before the legislature a detailed report of the actual state of education during the period to which the report relates; and

6. To state in the yearly report to the legislature what he has done with the amounts voted for education during the period covered by it.

The lieutenant-governor in council may, if he sees fit, assign to the superintendent certain other duties. He may require him "to establish or to assist art, literary, or scientific societies, libraries, museums, and picture galleries, whether these be founded by such societies or by the Government, or by institutions receiving Government aid." The superintendent may be required "to encourage competitions and examinations; to distribute diplomas, medals, or other marks of distinction for artistic, literary, or scientific work; to establish schools for adults and instruction for workmen and artisans." In fact, all which in general concerns the support and encouragement of arts, letters, and science and the distribution of the funds voted for those purposes by the legislature may be intrusted to the superintendent as one of his special duties by order of the lieutenant-governor in council.

The superintendent is required to give bonds and receives an annual salary of £3,000.

The government school inspectors are appointed by the lieutenant-governor in council, but are subject to the direction of the superintendent.

These officials must be at least 25 years of age, must have had experience in teaching, and must be furnished with the diploma of an academy or public school, or must pass the examinations for the inspector's diploma (*brevet de capacité*).

*Local authorities.*—The local unit of school administration in Quebec is a school municipality, i. e., any territory erected into a municipality for the support of schools under the control of school commissioners or of trustees elected by those who pay a property tax (ratepayers). The commissioners are empowered to divide a municipality into school districts and to maintain one or two schools in each district.

The school law provides that—

"If in any municipality the regulations and arrangements made by the school commissioners for the management of any school are not agreeable to any number whatever of the proprietors, occupants, tenants, or ratepayers professing a religious faith different from that of the majority of the inhabitants of such municipality, such proprietors, occupants, tenants, and ratepayers may signify such dissent in writing to the chairman of the commissioners.

"The notice having been duly served, the dissentients may proceed, after the lapse of two weeks, to elect three school trustees, who will have the same power with respect to dissentient or separate schools as the commissioners have with respect to the schools of the majority. The trustees alone have the right of imposing and collecting the taxes upon the dissentient inhabitants."

The commissioners or trustees elected as provided above constitute what is technically termed a school corporation. Every such corporation has the services of a secretary-treasurer, appointed by the body. This official, who is under bonds, has charge of all the books, registers, legal papers, and other documents pertaining to the corporation, and acts as its financial agent. He prepares and submits to the school commissioners or trustees in July of every year a detailed statement of all receipts and expenditures for that year. His accounts are examined by one or two auditors, appointed by the corporation. If any difficulties arise between

the school corporation and the secretary-treasurer they may be referred to the superintendent of public instruction, whose judgment in the matter is final.

The commissioners or trustees, as the case may be, have full control of the public schools in their respective areas, subject only to the general requirements of the council. They engage the teachers, determine their salaries, provide the schoolhouses and equipments, and in general discharge the same duties as the school trustees of our own country.

The separation of the schools in each district by religious differences completes the policy begun by the division of the central council into two autonomous committees.

*Classification of schools.*—In addition to the schools under control—that is, schools in charge of the elected school commissioners or trustees of each municipality—there are many Roman Catholic schools in charge of the clergy or of the religious orders, characterized as independent or partly independent schools, which receive grants either from provincial or from local funds. It is difficult to classify these different schools on the same basis as the public schools of Ontario or the similar schools of the United States. In general terms, the public schools of Quebec, whether Roman Catholic or Protestant, are distinguished as elementary schools, model schools, and academies. This classification is followed also by the independent schools. The elementary schools correspond practically to the first four or six years of the public schools in the United States.<sup>a</sup> In 1900 they enrolled 201,124 pupils, distributed as follows: Roman Catholic schools under control, 169,729; independent Roman Catholic schools, 4,884; Protestant schools under control, 26,511.

Above the elementary schools are the model schools and academies. The model schools, like the elementary schools, comprise Roman Catholic schools (under control and independent) and Protestant schools. They generally include an elementary division which covers in part the ground of the elementary school and an advanced course which laps over that of the academies. A model school can be established by agreement between the school commissioners or trustees of two or more municipalities; it is under the control of the commissioners of the municipality in which it is situated, but pupils from this municipality have no more rights in the school than those of other contributing municipalities.

An academy may be authorized by the superintendent of public instruction upon application from the commissioners of two or more municipalities. When established the academy passes under the control of trustees appointed from their own number by the commissioners or school trustees of the municipalities upon whose initiative the academy is authorized. The schools are supported mainly

<sup>a</sup> The scope of the elementary schools may be inferred from the following programme of the fourth or last year of the course:

Roman Catholic schools.—Programme, fourth year: Catechism; French—reading, grammar; English—oral spelling, dictation, translation; copy writing, exercise copy books, sacred history, continuation; history of Canada, studied in a text-book, principal passages and events; arithmetic (mental and written), review of the work of the preceding year, reduction, the compound rules, practical problems, tables of weights and measures, bookkeeping, receipts and disbursements of a family, accounts, invoices, receipts, bills, or notes; geography—Canada and the other countries of America, the continents, and oceans; map drawing—first attempts, drawing from objects, object lessons, agriculture, oral lessons. The teacher reads and explains a manual on the subject. (Condensed from report of the superintendent of public instruction, 1900-1901, pp. 190, 193.)

Protestant schools.—Programme, fourth year: Scripture reading and lessons in morals; English—reading, dictation, composition, grammar; French (optional)—reading easy translations, verbs; arithmetic, mental and written—fractions, decimals, percentages, interest, etc.; geography and history—Eastern hemisphere, map drawing, outlines of Canadian history, and relations to British history; object lessons continued. (Superintendent's report, 1900-1901, p. 221.)

by fees, which may exceed the fees charged in the elementary schools. Both model schools and academies share in the provincial grant for superior education.

As regards the course of study, the model school proper—that is, excluding the elementary division—begins with the fifth year or grade of the public school course, and covers two or four years. In the latter case the third and fourth years are called the academy course. The model school is intended for pupils who attend school up to 16 years of age: the academies may prolong the education to 18 years of age. These distinctions, however, are not rigidly maintained. Speaking generally, we may say that the model schools and academies cover the ground of our own grammar and high schools, excepting that the Roman Catholic schools of this class do not provide instruction in the classics.

In 1900 the total enrollment in model schools and academies was 113,757, distributed as follows:

Roman Catholic:	Pupils.
Under control .....	72,077
Independent or partly independent .....	32,784
Protestant:	
Under control .....	8,705
Independent .....	191

Of the total pupils in the Roman Catholic schools of this class, 87,408, or 83 per cent, were in the elementary division; 14,595, or 14 per cent, were in the model course or fifth and sixth grades, and the remainder, 2,858, or 3 per cent, were in the academy course. Of the total pupils in the Protestant model schools and academies, 8,896, there were in the elementary division 2,533, or 28.5 per cent; in the model course, 1,345, or 15 per cent, and in the academic course 5,013, or 56.5 per cent. If we regard the academic course (which comprises two or three years) as the equivalent of a high school course, this gives altogether 7,871 pupils in high schools of Quebec having a semipublic character.

*Training and qualifications of teachers.*—Besides the schools above enumerated, the law makes provision for the establishment of one or more normal schools with attached model or practice schools. The lieutenant-governor is authorized to make all needful provision for the housing and equipment of these schools. To provide for the purchase of suitable sites and the erection of buildings for the normal schools, the chief executive may order that the sum of \$3,000 shall be yearly set aside out of the grant for superior education, the same to form a fund called the normal school building fund of the province of Quebec. Besides the annual sum set apart from the superior-education fund, there is also allowed yearly, out of the common school fund for the Province, a sum not exceeding \$6,000 to defray the salaries of officers and other contingent expenses of normal schools, and a sum not exceeding \$4,000 annually to facilitate the attendance of teachers in training at normal schools. The lieutenant-governor is authorized to increase the yearly allowance for normal schools, if it be found necessary; such increase not to exceed \$10,000 in any one year.

General regulations for the normal schools are made by the council of public instruction, or by its committees, with the approval of the lieutenant-governor. The normal schools themselves are under the control of the superintendent of public instruction.

The law requires that persons desiring to teach in the public schools of Quebec must either have a normal school diploma or a government certificate. The certificate is obtained by passing an examination before an examining board formed by the appointment of the lieutenant-governor upon the recommendation of one or the other of the council committees. The following are, however, exempt from the above requirements: Every priest, minister, and ecclesiastic, and every person who

is a member either of a religious order instituted for educational purposes or of a religious community of women. In the Roman Catholic schools a large proportion of the teachers belong to the orders specified.

Although the law is thus specific as to the requirements of teachers it is very imperfectly enforced.

*Sources of income.*—The sources of income for the public schools are provincial grants, local taxes, and fees. The official reports do not enable one to indicate exactly the amount of public funds appropriated for each class of schools. In the financial year 1900-1901 there were paid for public education from local taxes, \$1,466,611; by the provincial government for public and normal schools, \$216,000; for inferior education, \$78,910; for other educational institutions and purposes, \$159,040; received from fees, \$1,533,193; total, \$3,453,754. Of this sum it will be seen the government contributed 13.14 per cent, local taxes 42.46 per cent, and fees 44.40 per cent.

The provincial grant for education comprises a grant for elementary schools and a grant for superior education. The former is paid by the superintendent of public instruction to the district school commissioners or trustees.

In order to share in this grant a school municipality must furnish proof that it has conformed to the requirements of the school law as regards length of the annual school session (eight months), number of registered pupils (not less than 15), the annual public examination, the annual report to the superintendent of public instruction, the collection of school fees, the employment of certificated teachers, the payment of teachers' salaries, the use of authorized books, and in general make it evident that the regulations and instructions of the central authorities have been carried out. It is provided, however, that if the "school commissioners or trustees, as the case may be, of a school municipality have endeavored in good faith to have the law carried out, a share of the school fund may be allowed them."

The fund for superior education is distributed to the model schools and academies and to colleges and universities. (See list, pp. 460-1.)

With this general survey of the educational system the following statistical summary becomes intelligible:

## NOVA SCOTIA.

Prior to the passage of the school law of 1864, which provided for a uniform system of public schools in Nova Scotia, private and parochial schools existed in Halifax and in the more settled portions of the Province and were fostered by grants from the public treasury. During this early period several measures were passed which showed plainly the sense of public responsibility in this important matter and the recognized necessity for legislative action looking to the educational interests of the entire Province.

Thus the system established in Nova Scotia by the law of 1864, like the Ontario system established twenty years earlier, embodied the results of a series of efforts and experiences. In Nova Scotia, as in Ontario, the need of centralized control, especially in view of the disabilities of poor and isolated districts, was clearly recognized, but the former Province did not intrust such large powers to the central authority, and in particular sought to avoid political entanglements in its constitution.

The supervisory functions of the central authority and its control of the provincial grant to the schools make it a unifying and stimulating force without prejudice to local freedom and initiative.

The principal measures leading up to the passage of the law of 1864 and the distinctive features of the system created thereby are set forth in the following citation from an account of the system by the present superintendent, Hon. A. H. Mackay.<sup>a</sup>

*Historical beginnings.*—In 1832 the Province was divided into districts averaging the size of half a county each, under a board of school commissioners appointed by the governor in council. These boards were intrusted with the power of organizing school sections approximating 4 miles in length and breadth where possible, and of otherwise stimulating and directing the formation and maintenance of schools in the district under their charge. The funds for each school were obtained mainly from local subscriptions, which were supplemented by the grant from the provincial treasury. In 1841 the legislature was opened by a speech of Lord Falkland, the governor, in which he advocated the adoption of the principle of assessment; but the house of assembly was still afraid, and contented itself with the further amendment of the act of 1832. Provision was also made at length in nearly all the schools for the education of free scholars, but they were a small minority.

In 1850 a provincial superintendent of education was appointed in the person of the late Sir John William Dawson, of McGill University. Under his short term of three years there was a rapid advance in the education of the legislature and the country with respect to the advantage of improved buildings and methods, the establishment of a provincial normal school, and the adoption of the system of local assessment. In 1855 the normal school was opened under the principalship of the second superintendent, Rev. Dr. Forrester. Under his advocacy from the platform and the press the time came in 1864 for the establishment of the free-school system.

The present Sir Charles Tupper, who was leader of the Government in 1864, was able to introduce the bill with the ultimate concurrence of the leader of the opposition, the late Sir Adams G. Archibald, and without any serious resistance it was eventually passed.

*Central authority.*—The council of public instruction consists of the members of the executive council of the provincial government, five of whom constitute a quorum. This body determines the regulations for the expenditure of the funds appropriated for educational purposes, the classification of teachers, and for the administration of all matters generally which fall within the scope of the educational statutes. It prescribes the school books and the courses of study for the schools of all grades. It directs the normal school, appoints the provincial examiners of the high-school students, inspectors, and district school commissioners, and has power to make provision for any exigency not inconsistent with the statutes.

<sup>a</sup> Cited from volume 4 of the Special Reports on Education issued by the Board of Education, England.

The superintendent of education is appointed by the governor in council, and is also the secretary of the council of public instruction. His duties are generally the same as those of a minister of education, with the exception that he has not to find a constituency for election, and is answerable directly to the government instead of to the house of assembly. The education department in Nova Scotia has hitherto had the good fortune of being considered nonpartisan, although the council is exclusively made up of the members of the provincial cabinet and its secretary, the superintendent.

The district commissioners of schools are continuations of the boards which were in 1832 invested with the power of directing and stimulating education in the days of voluntary subscriptions for the support of schools, when local efforts of specified degrees were rewarded by certain provincial grants. There were recently 33 such boards presiding over as many divisions of the Province, but their functions are now mainly confined to the rectification of the bounds of the school sections and the determination of those which, owing to their geographical and other conditions, should be placed on the list of those receiving special aid, one-third more of both the county and provincial grants than the normal ratio.

The inspector, who is appointed by the council of public instruction on the recommendation of the superintendent of education, is the secretary of each of these boards within his inspectorate, but this duty is merely an incidental part of his work. The Province is subdivided into 10 inspectorates, which gives on an average over 200 schools to each inspector. This office is one of the most important in the whole system, for the inspector directly inspects each school within his district, makes up the pay list from the return from each of the schools, pays the provincial and county grants to the teachers and trustees, when the same is authorized to be paid from the education department, to which a summary of all returns, etc., is promptly sent as the basis of the division of the funds; withholds approval from returns of schools in which the law has not been observed until there is the required reform, etc. The inspectors are the direct agents of the education office, reporting monthly on all the schools visited by them, and coming into authoritative contact with teachers and trustees in every section of the Province.

*Local authorities.*—The school section is the unit corporation for school purposes, and geographically includes a territory about 4 miles in extent with the school near the center. There is an injurious tendency in many sections to reduce the geographical limits of the section for the purpose of having all the children near the school, while neither the wealth nor the population of the section will allow a good teacher to be employed. The experience of the educational authorities proves that under ordinary circumstances it is better to be 2 miles distant from a good school than to be only 1 mile from a poor school. The section is governed by a board of three trustees, one of whom retires each year at the annual meeting of the section, when his successor is elected. In towns having a municipal government the board of trustees is known as the school commissioners, three of whom are appointed by the municipal council and two by the provincial government, one member each retiring annually. In the city of Halifax there is a board of 12 school commissioners, 6 appointed by the city council and 6 by the provincial government, the two senior of each group retiring after serving three years. Cities or towns, no matter how much their extent may exceed the normal 4 miles, form but one school section. The great mass of school sections are rural, with a simple board of three trustees; the number of sections in 1898 was 1,874.

The annual school meeting is the most important educational event in the rural school section. Except in certain specified sections it is fixed by law to be held on the last Monday of June, just before the close of the schools for the year, and seven or eight weeks or more before the opening of the schools in the new school year. It is the annual parliament of the section, where the taxpayers assemble to discuss the educational administration, elect the new trustees, and vote the amount of supply to be levied upon the section for the support of the schools for the following year. The sum of the valuations of the property within school sections having schools was in 1897 \$80,738,448, in 1898 \$81,726,341, and in 1900 \$82,641,987. The value of the school property itself was in these years \$1,484,635, \$1,502,711, and \$1,675,629, respectively. The total amount voted at the annual meeting of 1900, to be assessed on the section property, was \$519,620, \$120,351 of which was for building and repairs and \$380,681 to supplement the fund from the other two sources for the salaries of teachers. One of these sources is the county fund, which is raised under the statute by the collection, with the rates (property taxes) of each county, of an additional sum equal to 30 cents per head for each inhabitant

within the county at the last decennial census. This fund is distributed annually to the board of trustees of each section which conducts an approved public school as follows: First, a small grant of \$25 for each teacher employed for the year in the section; then the balance and greater portion is divided to each section in the municipality in proportion to the grand total days' attendance made by the pupils in each school according to the returns sent in at the end of the year. This stimulates the trustees to secure as large an attendance of pupils as possible, in order to increase their revenues from this source.

The provincial grant is the third source of revenue for the support of the school, but it is paid directly to the teacher and is dependent on the class of license held as well as on the number of days taught. Originally a Class D, or third-class, teacher received a grant of \$60 per annum; Class C, or second-class, teacher, \$90; Class B, or first-class, \$120, as well as Class A, or county academy, teachers who were not engaged in a county academy. But in 1888, in order to prevent an excessive growth of the grant from the provincial treasury, the sum total was definitely fixed at \$167,500, and in 1895 at \$182,500 (in 1900 raised to \$190,000), to be paid in joint proportion to the days taught and the scale above given. The scale was extended to allow \$180 for Class A teachers as subordinates, and \$220 as principals of schools with high-school departments of prescribed magnitude. For 1900 the total amount of county grant to the school sections was practically the \$120,000 authorized, and the total amount of the provincial grant to teachers, 2,485 in number, was practically the \$182,500 authorized by the statute.

This sum does not include the grants to the county academies which in 1900 amounted to \$16,720. The county academy is that high school within the county which receives a special grant on account of its agreement to admit free any students from the county who are able to pass the county academy entrance examination. This examination is conducted by the staff of the institution under general regulations upon question papers prepared by the education department, on the first eight years' work of the public schools, generally known as the "common" school grades. The county academies are of four orders, determined merely by the extent of their equipment, and receive annually the respective grants of \$500, \$1,500, and \$1,720 in lieu of the provincial grant to its teachers. These grants are an inducement to the shire town of each county to make its high school of superior merit as compared with the other high schools which may be within the county and which may capture the grant if the shire town fails to provide the required accommodation. As a matter of fact, there are many high schools in some of the 18 counties of the Province which are superior to the county academies in the poorer counties. The course of study for these institutions is that of the grades IX, X, XI, and, if desirable and possible, XII. The number of high-school students enrolled in the other high-school departments doing exactly the same kind of work, without participation in the academic grant, but in the enjoyment of the less liberal provincial grants to teachers according to the general system, was 4,053. Not being subject to the special testing of the county academies, these numbers include a greater proportion of pupils who are not so fully up to the standards. In many of the "common" schools a few of the pupils are doing a portion of the high-school work, as are also some special students in the high school proper. These numbered during the same year 1,652.

From 1864 to 1880 the only suggestion of a course of study for the common (elementary) schools was the list of books prescribed and for the high (secondary) schools the syllabus of the teacher's examination, of which there were four grades, known as D, C, B, and A, one advancing above the other by about an average year's work, except the latter, which meant about two years' additional work, and fitted a candidate for a county academy head master's diploma.

From 1880 to 1885 the educational department, assisted by the provincial educational association, developed a course of study for the common schools first, then for the high schools. In 1893 the high-school course was made the basis of a system of high-school examinations, which are now held at forty different stations throughout the Province in the first week of July, the closing week of the school year. Provincial certificates of grades D, C, B, and A are given to all candidates with the value of each subject or paper as marked by the provincial examiner of that subject, those not reaching the prescribed standard for a "pass" receiving a "decapitated" certificate bearing simply the full details of the examination record. Foreign languages are optional in this course. In the twelfth grade of the public schools, which is the fourth grade of the high schools, or grade A, there is a bifurcation into a classical side and a scientific side with a nucleus of subjects in common, leading respectively to the certificates of A (class-

ical) and A (scientific). The secondary schools are in this manner federated into a species of provincial university of secondary rank. The certificates of scholarship of the various grades are accepted as the scholarship qualifications of the different classes of teachers, and also in lieu of the entrance examinations into the various universities and technical colleges, thus doing away with the former necessity of having different classes in the same school if students in it were preparing for different colleges. In this manner the articulation of all private as well as public institutions of the higher education with the public-school system is perfectly accomplished. Even when the unsuccessful candidate has not "passed," his certificate, if bearing marks high enough on the various subjects required by the entrance standard of any given institution, will exempt him from examination upon those subjects. As the examination is conducted in the most impersonal manner by provincial examiners whose scholarship is universally acknowledged, and as the course of study and the examination papers themselves, as well as the results, are published in the official journal of the education department, the standards can be most easily understood by all educational officers who accept them at their value.

*Classes of schools.*—The public schools comprised in the system above outlined include the common school of eight grades (when possible, a preliminary year of kindergarten for pupils under 5 years of age is allowed) and the high school of four grades.

*Qualifications and classification of teachers.*—Teachers must have a Government license, which is granted upon proof of scholastic and professional qualifications. The former are tested by an examination which, as stated above, is either that required for graduation from a high school or its equivalent. For professional qualification the candidate must be either a graduate from the normal school or must pass an examination in the theory and art of teaching.

Teachers are classified in four grades. The school trustees of each district determine the amount of salary for the teachers of the same, but, as explained above, the provincial regulations fix the amount of the Government grant payable to the teacher of each class.

For the year ending July, 1901, the average salaries from all sources were as follows:

	Male.	Female.
Class A .....	\$763.41	\$432.87
Class B .....	384.34	293.92
Class C .....	257.61	233.62
Class D .....	192.63	165.41

The development of the normal school (which receives an annual grant from the treasury, amounting in 1901 to \$11,896) and the establishment of manual training schools in close relation with it are the most noteworthy recent events in the educational record of the province. With respect to these developments the superintendent says:

The provincial normal school, which has always been doing good work from the date of its institution, under Dr. Forrester in 1855, has now been more fully equipped than ever before.

The new science building, which also functions as the school of agriculture, has been completed with a full set of well-furnished laboratories for biological work, qualitative and quantitative chemical work, mineralogical and geological work, and a special library. The main building has been partly remodeled internally, fitted up with modern accommodations, a physical laboratory, and an enlarged general library.

The Macdonald Manual Training School, under the charge of T. B. Kidner and his staff, is installed in the original normal school building of 1855 and looks out on the campus of the new building.

The Truro Domestic Science School, under the directorship of Principal Camp-

bell, and also affiliated to the normal school, is by the side of the manual training school.

And finally, the public schools of Truro are affiliated as training schools, where student teachers have to develop power and demonstrate their skill in teaching a regular school. These schools are conducted by an able staff of teachers.

\* \* \* \* \*

The school of agriculture has its lecture headquarters and its chemical and biological laboratories and greenhouse in the science building of the normal school. The dairy, live stock, barns, piggery, poultry, agricultural, and horticultural operations are used in the practical instruction on the provincial farm. The teachers in attendance at the normal school are required to take courses here to enable them to understand the elements of agriculture, to the extent of being able to interest their pupils in the observation and study of the laws of nature on which the attachment to and success in husbandry greatly depend. Farmers' classes alternate. \* \* \*

In my previous reports I endeavored to show the importance of developing the industrial sentiment in the public schools instead of the professional notion hitherto prevailing so exclusively. I pointed out what was being done in other countries and our own few attempts in school gardening and nature study.

About two years ago, as can be seen from the Journal of Education, I had been considering the possibility of utilizing some of the best trained graduates of the school of agriculture as special teachers of the so-called "nature lessons," which is the elementary scientific basis of the art of agriculture. The plan proposed was to find, say, ten schools which could employ such a teacher half a day each week. But rural trustees who had faith in such a plan to the number of ten in one district of the country could not be found. The teachers trained to give useful nature lessons were very few. Our present normal school, in affiliation with the school of agriculture, is now giving a course of such instruction to all. But a course of even one year, in combination with the other subjects requiring attention, is hardly sufficient to develop the knowledge and power desirable. A graduate course of the school of agriculture is necessary.

Professor Robertson, who is the adviser of Sir William Macdonald's intelligent generosity, directed hitherto especially to manual training schools, and adapted rather to towns and villages than the country, saw from his experience of what was done in some European countries and from the similar work which he had already undertaken, that such a scheme might be demonstrated to be of special value to rural communities.

The idea then in his mind was further matured and expressed at the convention of the dominion educational association in Ottawa. It has later been specifically formulated and published as an experiment which Sir William Macdonald is willing to make to prove its value to rural schools.

The school includes the establishment of a "nature-study" school at Guelph, the homologue of our school of agriculture, in affiliation with the normal school at Truro, and the support of his trained teachers for a few years in a few selected localities in each province of the Dominion. Sir William's demonstration will be profoundly appreciated and eagerly observed in Nova Scotia. However, not only the general public, but teachers whose accomplishments are solely in the department of words instead of things, may find it hard to see the great use of such training. Hence it becomes the duty of all interested in the improvement of our education to think it out fairly and fully before giving expression to opinion.

The following tables show the enrollment in public schools and the expenditure for public education for the years specified:

*Nova Scotia educational statistics, public schools, 1880-1901.*

Year.	Schools.	Pupils.	Boys.	Girls.	Average attendance.	Proportion of population at school.	Cost per pupil enrolled.
1880.....	1,811	78,808	39,428	39,380	43,375	1 in 4.9	\$7.42
1885.....	2,005	86,578	43,059	43,519	50,287	1 in 5	7.54
1890.....	2,243	88,170	44,047	44,123	50,915	1 in 5.1	8.04
1895.....	2,305	100,555	51,885	48,670	54,005	1 in 4.5	8.07
1900.....	2,417	100,129	50,945	49,184	55,224	1 in 4.4	8.86
1901.....	2,387	98,410	49,768	48,642	53,643	1 in 4.6	8.58

*Total receipts by the Province of Nova Scotia for school purposes, 1880-1901.*

Year.	Government grant.	Municipal aid.	Other sources.	Total.
1880 .....	\$196,217	\$107,181	\$281,561	\$384,959

1901 .....	254,778	119,876	470,108	844,762

#### NEW BRUNSWICK.

*Central authority.*—The central control of public education in New Brunswick is vested in a board of education comprising the lieutenant-governor, the members of the executive council, the president of the University of New Brunswick, and the chief superintendent of education. The last named is the secretary and chief executive officer of the board. In his appointment regard is had solely to his professional fitness and executive ability.

The board of education has extensive powers. It is authorized to provide for the establishment of a normal school with model or practice departments; to appoint a principal for the same at a fixed salary (\$1,400), and to appoint the necessary assistants; to create inspectorial districts and appoint qualified inspectors (not exceeding eight in number); to determine the salaries of these officials and the allowances for traveling, office expenses, etc. (total not to exceed in each case \$1,200); to divide the Province into school districts; "to make regulations for the organization, government, and discipline of schools, for the arrangement and order of school premises, and for the classification of schools and teachers; to appoint examiners of teachers, and to grant and cancel licenses;" to prescribe textbooks and apparatus for the use of schools, books for school libraries, plans for the construction and furnishing of schoolhouses, and courses or standards of instruction and study for schools; to determine all cases appealed from the decisions of inspectors; to prepare and publish regulations under which public moneys may be drawn and expended for schools.

*Local authorities.*—The local school districts into which the Province is divided must contain each not less "than fifty resident children, between the ages of 6 and 16 years, unless the area of such district shall contain 4 square miles." Towns, villages, and populous localities having a community of interests form, so far as practicable, single school districts.

The school affairs of each district are managed by a board of trustees. In the villages and rural districts the board comprises three trustees elected by the resident taxpayers. In cities and incorporated towns the members of the school board are appointed for a term of three years, part by the governor in council and part by the city or town council. Two members of the board must be women.

*Classes of schools.*—The public schools are classified as common schools, superior schools, and grammar or high schools. The superior schools are common schools with advanced classes; the law authorizes one such school to every 6,000 inhabitants; the grammar schools are county high schools and, like the high schools of the cities, are essentially secondary schools.

*Sources of income.*—The funds for the support of the schools are derived from the provincial grant, the county school fund, and the district assessment.

Each teacher is paid from the provincial treasury a fixed amount per school year. This allowance depends partly on the class of license held by the teacher and partly on the grade of school in which he is employed and his position therein.

The allowances given to teachers in the ordinary schools during recent years have been approximately as follows:

Male teachers:	
First class .....	\$135
Second class .....	108
Third class .....	81
Female teachers:	
First class .....	100
Second class .....	81
Third class .....	63

The allowance to teachers in poor districts is increased one-third. The Province also makes grants to poor districts for the erection of school buildings.

\*                      \*                      \*                      \*                      \*

The county school fund is provided for by an annual assessment upon the county sufficient to yield a sum equal to 30 cents per head of the population. It is distributed among the school districts of the county, in part according to the number of teachers employed and in part in proportion to the average attendance at school. This money must be applied by the trustees in payment of the salaries of teachers. \* \* \*

The local assessment in every district is applied in support of the schools of the district, in payment of teachers' salaries, partly in defraying the cost of school buildings, furniture, apparatus, repairs, fuel, and other necessary expenses.

*Training of teachers.*—Every teacher in the public schools must obtain some professional training at a recognized training or normal school before receiving a permanent license.

The superintendent of education complains of the scarcity of competent teachers, and discusses the causes of this evil in his latest official report (1901) as follows:

By reference to the normal school report it will be seen that the average enrollment of candidates for the teaching profession during the last ten years was 273; but as a portion of those enrolled were already licensed teachers who were seeking advance of class, it may be estimated that from 240 to 250 new candidates present themselves each year. This number would provide for vacancies caused by the annual withdrawal of about one-eighth of the total number of teachers employed, and this proportion, under ordinary circumstances, ought to be sufficient to meet the requirements of the schools.

But under existing conditions a much larger proportion than 12½ per cent of trained teachers of the higher classes seek and obtain other employment. There are now many more avenues of activity than formerly opening up before educated and energetic young people of both sexes, and these new fields of usefulness give promise of much better financial rewards and their cultivation is attended with less nervous strain and self-denial than are usually associated with the charge of a country school. The inevitable results are the withdrawal annually from the teaching profession of hundreds of our best qualified teachers and the consequent closing of the schools or, what is scarcely a less evil, placing them in charge of teachers of imperfect education and utterly incompetent for the proper discharge of the functions of a teacher.

The time has come when some remedy must be found for this growing evil; otherwise every effort which has been made to raise the standards of efficiency in the schools by supplying them with a better-educated and better-trained class of teachers will be rendered abortive. A young man or woman who has spent years in acquiring the necessary education, who has undergone professional training and successfully passed the prescribed examinations, has a right to claim a reasonably remunerative salary from some source. If the public revenues are too limited to admit of increased provincial grants, and if no further assistance can be expected by the augmentation of the county fund, then I respectfully submit that by legal enactment the school districts, in proportion to their taxable valuation, should be required to contribute an amount which, when added to the provincial grant, will make up salaries sufficient to command the services of properly educated and well-qualified teachers.

In my last annual report I gave a list of twenty school districts having a taxable valuation ranging from \$409,350 to \$55,000, in which the highest sum contributed by the district toward the teacher's salary was \$185 and the lowest \$85. These were all comparatively wealthy districts. In the poor districts, so called, the

regular provincial grants to the teachers and the county fund grants to the trustees are increased from 25 to 33½ per cent. Even with this help it is not reasonable to expect that large salaries can be given in such districts, but they should be required to contribute according to their ability, for it is demoralizing to permit even the poorest of districts to become possessed of the idea that they need incur no financial responsibility for the support of a school in their midst. The minimum sum they should be required to contribute toward the teacher's salary should equal the provincial grant. Cases have come under my notice during the present year in which the teachers accepted as salary the provincial grant only, and the amount of the county fund was more than sufficient to pay all other expenses, as fuel, etc., so that in these cases the schools, instead of being a financial charge upon the districts, were actually a source of income.

It might be supposed that authority had been invested in the board of education, or in the chief superintendent, to warrant the withholding of the provincial grant and the county fund in such cases, but this is not the fact. Under section 23 of the schools act, the districts are not required to provide more than may be found necessary "in further payment of teachers' salaries, over and above the sums provided by the province and county, and any sum required for other school purposes during the year." The amount, if any, voted at the annual school meetings is absolutely within the control of the majority of ratepayers present. The employment of the teacher and the amount of salary contributed by the district is determined by the local school board, and it often happens that a majority of the school board have no other interest in the school than to protect themselves and fellow-ratepayers from taxation. The results are in many cases what might be expected when the educational interests of the community are left without limitation in the hands of ignorant and narrow-minded men, who have no proper conception of the importance of the trust committed to their charge. When obliged to open the school, they employ the person who will accept the position at the lowest figure without regard to any other consideration.

In order to protect the higher class teachers from competition as to salary with teachers holding a third-class or a local license, the board of education some years ago passed the following regulation:

"Third-class teachers shall not be employed (except as class-room assistants) in districts having an assessable valuation of \$15,000 or upward, unless by the written consent of the chief superintendent."

In the exercise of the discretion thus given him, the chief superintendent has granted permission for the employment of third-class or local licensed teachers in such districts only on the recommendation of the inspectors, and when assured that the closing of the schools indefinitely was the alternative. And yet in the majority of cases in which trustees have applied for such permission there is strong ground for the belief that teachers of the second class could have been obtained if a reasonable salary had been offered and proper efforts had been made at or before the beginning of the term.

\* \* \* \* \*

The only effectual remedy for the evils I have pointed out is to provide in some way for an adequate system of salaries, graded according to the class, experience, ability, and length of service of the teacher. In order to aid in providing adequate salaries, county school districts should be consolidated wherever possible, provision should be made for taking the children to a central school, and all school districts, large or small, should be required to contribute for educational purposes not less than 50 cents on every hundred dollars of the taxable valuation. Some of the poorer districts contribute double that amount at present.

By reference to the tabulated statistics it will be seen that the average salary of the 24 first-class male teachers employed during the term ending June 30, 1901, was \$320.10, an increase of \$56.79 on the previous year, and that the average salary of the 305 first-class female teachers employed during the same term was \$312.69, an increase of \$5.88 on the previous year. The increase in these averages results from the smaller number of these classes employed, and the fact that a larger proportion than formerly are employed in the graded schools of cities and towns.

The average salaries of teachers of the second and third classes show a small decrease, with one exception.

In an address upon the public school system of New Brunswick, before the Dominion Educational Association, the delegate<sup>a</sup> from the normal school at

<sup>a</sup> John Brittain, esq. See report of the fourth convention of the Dominion Educational Association (1901), p. 141.

Fredericton, New Brunswick, dwelt upon the progress of the high schools under the administration of the present chief superintendent of education, Dr. Inch. The high schools, he said, have made very satisfactory progress. New high school buildings, commodious and well furnished, have been erected in the cities and principal towns, the provincial grants to high-school teachers have been extended, the staff of teachers has been greatly strengthened, and the attendance has increased rapidly. The high schools are free to all candidates resident in the municipalities who pass the entrance examination.

At the apex of the system of public schools is the provincial university at Fredericton, which receives an annual grant from the legislature. The fees are quite low and are remitted altogether in the case of the winners of county scholarships. Many of the young men and some of the young women who take the normal-school course afterwards attend the university, and, after graduation, teach in the high and superior schools.

MANITOBA.

The present school system of Manitoba was preceded by a system of separate schools for Roman Catholic and for Protestant children, the general administration of the schools being intrusted (law of 1871) to a board of education composed of an equal number of Protestant and of Catholic members. These provisions were

abrogated by the educational laws of 1890. The first of these laws, the "education department act," constituted the executive council of Manitoba, or a committee of the same, an education department with extensive authority in respect to public schools; and a second law of the same year, known as the "public schools act," provided for a uniform system of nonsectarian schools and prohibited the use of public funds for denominational schools.<sup>a</sup>

The education department has authority to appoint inspectors for public schools, teachers in provincial, normal, and model schools, and directors of teachers' institutes, and to fix the salaries for the teachers and school officials; to provide for the establishment of schools, elementary, normal, intermediate, and collegiate; to arrange for the examination of teachers and the issue of teachers' certificates, and to prescribe the number of school days and the length of vacations in each school year.

The law creating the department of education provided also for an advisory board to consist of seven members, four of whom should be appointed by the department for a term of two years; two should be annually elected by the teachers of the public schools (high and elementary) actually engaged in teaching, and the seventh member appointed by the university council. The duties of this advisory body have reference mainly to the internal affairs of the schools, the authorization of text-books, the qualification of teachers, the standard of admission to high schools, etc. In particular, the board advises as to forms of religious exercises to be used in the public schools.

The inspectors appointed by the education department, besides the usual duties of school inspection, act as arbitrators in disputes between school trustees and taxpayers with regard to school sites, and between school districts with regard to the adjustment of boundaries, etc. In unorganized districts, the inspector is authorized to revise or correct the assessment roll. The inspectors are also authorized to suspend any teacher who neglects or refuses to carry out the agreement made with a board of trustees. All cases of suspension must be immediately reported to the education department.

The second law of 1890, the "public schools act," provides "for the formation, alteration, and union of school districts in rural municipalities, and in cities, towns, and villages" and for the election of trustees in each district for the maintenance and control of the schools. The law enacts that—

All public schools shall be free schools, and every person in rural municipalities between the age of 5 and 16 years and in cities, towns, and villages between the age of 6 and 16 shall have the right to attend some school.

The following sections determine the extent and character of religious exercises permissible in public schools:

SEC. 6. Religious exercises in public schools shall be conducted according to the regulations of the advisory board. The time for such religious exercises shall be just before the closing hour in the afternoon. In case the parent or guardian of any pupil notifies the teacher that he does not wish such pupil to attend such religious exercises, then such pupil shall be dismissed before such religious exercises take place.

SEC. 7. Religious exercises shall be held in a public school entirely at the option of the school trustees for the district, and upon receiving written authority from the trustees it shall be the duty of the teacher to hold such religious exercises.

SEC. 8. The public schools shall be entirely nonsectarian, and no religious exercises shall be allowed therein except as above provided.

---

<sup>a</sup> The bitter controversy to which this law gave rise, the appeal to the Dominion government, and subsequently to the English privy council, for its repeal, and the action growing out of this appeal are described in full in the Commissioner's Reports for 1894-95 (Vol. I, Chap. VII) and 1897-98 (Vol. I, Chap. IV).

*Local authorities.*—The local school authorities are elected trustees in rural districts and in villages and towns not divided into wards, and school boards in cities and in larger towns comprising two trustees elected from each ward. These trustees are responsible for the establishment and maintenance of public schools in accordance with the requirement of the school law.

*Classes of schools.*—Elementary and intermediate and high schools are maintained, and the latter may be developed into collegiate institutions preparing students for matriculation at the university. Trustees are also authorized to establish kindergartens for children between the ages of 3 and 6 years where admissible.

*School income.*—The income of the public schools is derived from provincial grants, amounting in 1901 to \$113,452, and district assessments, amounting the same year to \$653,359. The district assessment comprises a fixed rate per teacher employed and a variable rate dependent on the amount of current expenditures. The former is fixed at \$20 per teacher employed for each month the school is kept open (two hundred and four teaching days constitute a full school year).

Beyond this fixed grant the school law enacts that the council of every rural municipality<sup>a</sup> and the municipal council of every city, town, or village shall levy and collect such sums as may be required by the public-school trustees for school purposes.

*Teachers.*—All teachers employed in the public schools must be provided with a certificate granted by the advisory board of education upon the results of an examination. The teachers' certificates are of three grades. The first and second grade certificates are valid during the pleasure of the board; the third class for three years.

The advisory board may grant nonprofessional certificates to university graduates. These certificates exempt the holder from the academic portion of the examinations for teachers, but they must obtain professional certificates by proof of attainments in the theory and art of teaching before being appointed to teach in a public school of the Province.

Provision for the professional training of teachers is made by the provincial normal school, which is supported by a legislative grant, and also by teachers' institutes, which are held in each inspectorial division under the auspices of the inspector.

The public schools are affiliated to the university through the provision for raising a high school to the rank of a collegiate institute. Three high schools have already reached this standard.

The provincial university, incorporated in 1879, completes the educational system of the Province. The university was constituted as an examining body on the model of the old London University. But certain teaching institutions are affiliated to the university and have a representation in its council.

## BRITISH COLUMBIA.

The public schools of British Columbia are free, nonsectarian, and supported entirely by provincial grants, excepting the schools of incorporated cities and towns (at present four in number—Nanaimo, New Westminster, Vancouver, and Victoria). The members of the provincial executive council constitute a council of public instruction; the chief officer of education and ex-officio secretary of the council is the superintendent, appointed by the lieutenant-governor with the concurrence of the council. The council has power under the school law—

to create school districts, which must, however, in each case include not less than 20 children of school age (that is, between 6 and 16); \* \* \* to set apart in every school district such a quantity of the waste lands of the Crown as in the opinion of the council may be necessary for school purposes in the district; \* \* \* with the sanction of the lieutenant-governor, to grant, on the application of the school trustees of any school district, such moneys as may be required to pay the salary of the teacher in such school district; in rural districts to defray the cost of erecting a schoolhouse or providing a house or room within which the public school of such district may be held, the cost of all furniture and apparatus necessary for the use of any school, and the current expenses connected therewith; \* \* \* to appoint two or more examiners, who, with the superintendent, constitute a board of examiners to examine teachers and grant certificates of qualification; to appoint inspectors to visit the public schools and report to the superintendent of education as to their condition and progress, and, in general, to make all rules and regulations for the conduct of the public schools.

The council is also empowered:

To establish a normal school, with model or practice departments, and to establish a high school or collegiate institute in any school district where it may be expedient so to do, wherein the higher branches may be taught, and every such high school or collegiate institute shall be under the control of the local board of trustees for the district within which such high school or collegiate institute is situate: *Provided, however,* That no high school or collegiate institute shall be established in any district in which there are less than 20 persons duly qualified and available to be admitted as high-school or collegiate-institute pupils.

Each school is controlled locally by school trustees. In each rural district three school trustees are elected by the people. City school districts are of three classes. The first class includes "all incorporated cities and towns wherein the average actual daily attendance of pupils attending public schools equals or exceeds 1,000 for the school year;" the second class includes "all incorporated cities and towns wherein the average actual daily attendance of pupils attending public schools falls below 250, but does not exceed 999 for the school year;" the third class "includes all incorporated cities and towns wherein the average actual daily attendance of pupils attending public schools falls below 250 for the school year."

Each city school district elects a board of trustees comprising seven members for cities of the first class, five members for cities of the second class, and three members for cities of the third class.

In all incorporated cities and towns the salaries of the teachers employed in the public schools are fixed and paid at the discretion—

of the school trustees of the said cities and towns, respectively, and such salaries and all other expenses for the purchase and lease of school sites, erection, enlargement, or rent of school buildings, for furniture and repairs, and all other incidental expenses whatsoever incurred by the board of trustees in the respective cities and towns are borne and paid by the municipal corporations of the said cities and towns, respectively.

Incorporated cities and towns provide the funds for the public schools within their borders, but "a per capita grant of \$13 for cities of the first class, \$15 for cities of the second class, and \$20 for cities and towns of the third class per annum, based on the average actual daily attendance of the public school pupils," is allowed from the provincial treasury.

Cities in which a high school is in operation receive also from the provincial treasury the additional sum of \$300 for "each high-school teacher employed during the entire school year (or proportionately for the number of months such teachers have been respectively employed): *Provided*, Such high-school building and its equipment be satisfactory to the council of public instruction."

The public schools are classified as common or ungraded schools (i. e., rural schools), graded schools (in cities and towns), and high schools.

From the foregoing outline of the system of public instruction it will be seen that the law has been framed to meet the exigencies of a new country, and at the same time to impose due responsibility upon settled prosperous communities.

The execution of the school law is naturally attended with peculiar difficulties in the remote and sparsely settled districts, but there are not wanting signs of vigorous growth, especially in the cities and incorporated towns.

The following statistics show the present status of the schools in comparison with earlier conditions:

*Educational statistics of British Columbia, 1878-1901.*

COMMON SCHOOLS (RURAL DISTRICTS).

Year.	Schools.	Teachers and assistants.	Pupils.	Boys.	Girls.	Average attendance.

## PRINCE EDWARD ISLAND.

By the school law of 1877 public education in Prince Edward Island was placed under the control of a board of education composed of the members of the executive council, the chief superintendent of education, the principal of the college and normal school, and two inspectors. The interests of the public schools are thus thoroughly represented in the board. For the local control of the schools the Province is divided into school districts in charge of trustees annually elected by the taxpayers of the respective districts. The schools are supported by provincial grant, which yields about 78 per cent of the income, and district assessments, which provide the remaining 22 per cent.

## NORTHWEST TERRITORIES.

The system of public schools in the Northwest Territories is under the control of a council of public instruction comprising 4 members of the executive committee and 4 appointed members, of whom 2 must be Protestants and 2 Roman Catholics. The appointed members have no vote, their duties being purely advisory. A school district must not exceed in area 25 square miles, and must contain not less than 4 resident taxpayers (property tax) and at least 12 children of school age. Each district elects school trustees, who manage the local school affairs.

The support of the schools is derived from the provincial grant and local taxes. The former is distributed among the schools on the basis of (1) average attendance, at the rate of \$1.50 per capita; (2) number of days in session, at the rate of \$1.40 a day for a term not to exceed two hundred and ten days; (3) the graded certificate held by the teacher, 10 or 20 cents a day for an annual term of two hundred and ten days, and (4) the grade assigned to the school on the report of the government inspector, at not less than 5 cents nor more than 15 cents a day for an annual session not exceeding two hundred and ten days.

## EDUCATIONAL SYSTEM IN NEWFOUNDLAND.

The following account of the system of education in Newfoundland is cited from an article by Mr. George Milligan, M. A., LL. D., superintendent of Methodist schools.<sup>a</sup>

The present educational system of Newfoundland was fully introduced by education acts 1874 and 1876, which rendered it completely denominational, and provided for separate denominational schools, which, however, should be public schools, and restricted in their operation by a conscience clause. Both Roman Catholics and Episcopalians had declared in favor of subdivision, and Methodists somewhat reluctantly complied with their arrangement, as justice was done to all religious bodies by giving to all alike education grants per capita. By the 1874 act \$40,000 were provided for schoolhouses and school property and arrangements made for subdivision of property on an equitable basis, which was in due course accomplished without difficulty. By the 1876 act \$83,251.92 were provided for all purposes, which amount has been increased from time to time according to increase in population, etc., till it has reached a total of \$149,585.19 per year, besides \$4,000 for purposes of the council of higher education.

These grants provide \$90,251.65 for general purposes, \$4,000 to aid poor districts, \$5,297.37 to encourage on certain conditions, involving hearty cooperation, the maintenance of superior schools, \$9,565.29 to sustain colleges, \$25,297.87 for the

<sup>a</sup> Published in volume 4 of the Special Reports on Education, issued by the Board of Education, England.

encouragement of teachers and supplementing salaries, according to character and certificate of grade, and \$4,860 for the salaries, traveling and other expenses of three superintendents.

The chief and central authority is vested in His Majesty's Government. The governor in council has power to appoint in each educational district, as defined in the act, a board of five or seven members of the respective denominations, on which the senior of superior clergymen resident or officiating in the district shall be one, to manage and expend all moneys, etc. Such boards in St. Johns, and in districts in which are superior schools, may consist of nine members. Vacancies occurring by death, resignation, or absence from the colony for twelve months may be filled by the governor in council. The annual meeting of every board shall be held on the first Wednesday of July, or as soon as practicable thereafter, when a chairman and other officers shall be elected, accounts submitted and audited, and other business transacted which may be necessary, and correct returns transmitted to the superintendent, according to form of schools prescribed. For public schools there are 152 education boards, of which Methodists have 61. Similar boards are appointed in like manner for the four colleges, but nomination of members is with the respective denominations.

There were 591 schools in 1896, 33,742 pupils, or an attendance of 16.81 per cent of total population. In 1897, in Methodist public schools there were 4,695 boys and 4,118 girls; total, 8,813. In Methodist colleges there were 260 pupils, 137 males and 123 females. Attendance as yet is voluntary, but as the result of a growing interest in education it is steadily increasing.

In 1896 the cost of each pupil to government was \$3.64 on cost, an average for all denominations. In 1897 Methodist boards returned fees \$5,374.98, and voluntary contributions toward current expenses, \$614.63. Methodist College Board returned fees, \$1,700.73.

In public schools classes are conducted in six standards, in reading, writing, arithmetic, geography, grammar and composition, history, bookkeeping, mensuration, geometry, navigation, algebra, drawing, needlework, and vocal music. Singing and drawing are taught in many Methodist schools and domestic economy in a few of them.

Methodist schools are opened by singing a hymn, reading the Scriptures, and prayer daily. This constitutes usually the amount of religious instruction, which, however, in no case contradicts the conscience clause.

Teachers are appointed by education boards, must be engaged according to prescribed form, and must have three months' notice in writing in case of dismissal, but may be dismissed summarily for immorality. They must hold certificates of qualification from boards of examiners, of third, second, or first, or associate grade, and faithfully discharge duties distinctly defined in education act.

Public teachers are regularly indentured to the superintendents of education for one, two, or three years and must attend certain recognized institutions. The Methodist College, with its primary and model school, serves as training and practicing school for regular or special pupil teachers. Of total grants before mentioned, \$5,610.84 are appropriated for training teachers, of which the Methodist share is \$1,489.76 per year. The maximum amount annually paid toward the board, lodging, and training of any male-pupil teacher, per act, is \$100, and of females the maximum is \$80. By special arrangement with the college executive and the payment of \$400 annually, provided under the education act, reduced rates of cost are made applicable to Methodist pupil teachers in the college home, under the guardianship of the reverend chaplain and guardian. Selection, oversight, and gradation of pupil teachers is conducted by board of examiners for the denomination, and upon the completion of term of training such persons are required, under a penalty of \$400, to serve as teacher in a public school for three years, or if their course of training has extended over two years one and one-half times as long as the term of training.

Certificated teachers may be admitted to a second course of training for a period not exceeding twelve months provided they serve as teachers in a public school for at least eighteen months, under a penalty of \$200 in case of breach of said contract. During 1897 there were 25 regular pupil teachers and 4 special admitted for training to prepare them for teaching in Methodist public schools.

In 1897 61 teachers in Methodist schools were males and 119 females, and of pupils teachers in college, 14 were males and 15 were females.

(b) *Higher education.*—In the colleges provision is made for teaching advanced classes in ordinary commercial subjects, in Latin, Greek, French, German, algebra, geometry, mensuration and land surveying, chemistry, magnetism and electricity, free-hand and geometrical drawing, trigonometry and navigation, shorthand,

music, and school management. These colleges are all under Government inspection, and reports of their condition and progress and a detailed account of income and expenditure must be transmitted to their respective superintendents to be laid before the legislature, in accordance with prescribed forms.

The Methodist college had for its principal a B. A. F. S. S. (London), who has 5 well-qualified assistants in the upper school, besides 2 highly accomplished professors—1 of music and 1 of drawing and painting. It has also in the model school 4 other certificated teachers from kindergarten upward.

The Methodist college has a new and valuable property which has cost about \$80,000 and by the hearty contributions of its friends liabilities amounting to nearly \$50,000 are being, by voluntary efforts, regularly and steadily reduced. Current income for 1897, comprising grants and fees, was \$3,477.61; and expenditure for salaries and current expenses was \$7,697.83. Besides 260 reported as above in upper school, there were 200 pupils in model school, or a total of 460 under instruction during the past year.

This body represents the denominations and secures the combined thought and action of 23 members appointed by His Majesty's Government, including 3 superintendents of education and the 4 principals of colleges, ex officio. Its chief object is to promote education by holding examinations by a competent and independent board of examiners outside the colony and to awaken honorable competition in the schools of Newfoundland, by awarding diplomas, prizes, and scholarships to successful candidates. In my judgment, despite certain drawbacks in the way of its success, the council of higher education has a healthful influence upon public education. It gives diplomas for junior, senior, and associate grades. In June last pupils in Methodist college won 56 junior, 40 senior, and 5 associate, and in 27 Methodist public schools 92 junior, 28 senior, and 1 associate, making a total of 222 diplomas.

GEORGE MILLIGAN, M. A., LL. D.,  
Superintendent of Methodist Schools

St. JOHNS, March 22, 1898.

The following statistics from the latest official reports bring the record of the public schools under the Church of England and Methodist boards and the Roman Catholic schools to December 31, 1901:

Schools.	Schools and colleges.	Teachers.	Enrolled pupils.	Total expenditures.	Government expenditure per pupil.
Church of England boards.....	<i>a</i> 254	249	13,608	<i>b</i> \$34,240	\$3.82
Methodist boards.....	<i>c</i> 216	219	10,813	<i>d</i> 42,370	3.67
Roman Catholic schools.....	<i>e</i> 157	-----	9,244	<i>f</i> 54,541	5.90

*a* Including 2 colleges.

*b* Excluding colleges.

*c* Including 1 college.

*d* For teachers' salaries.

*e* Includes 137 public or board schools, 15 convent schools, 2 schools under the Christian Brothers, 2 academies, and 1 college.

*f* Grant for education.

## CHAPTER IX.

### EDUCATION IN THE BRITISH SOUTH AFRICAN COLONIES.

---

*Cape Colony.*—The British possessions in South Africa include the Cape Colony or Cape of Good Hope, washed by the Atlantic and Indian oceans on the west and south and southeast and bounded upon the north and northeast by the German protectorate, the British protectorate of Bechuanaland, and the Orange River and Natal colonies. It covers an area of 221,311 square miles and contained, in 1891, a population of 1,527,224 (376,987 white, 1,150,237 colored).

The colony was in possession of the British in 1806, but was not formally ceded by the Dutch Government to Great Britain until 1814. During the Dutch occupancy (1652-1806) church schools had been established in several places and attempts had been made to organize a system of schools under public control. After the transfer to Great Britain schools multiplied slowly through the efforts of the church or of private enterprise and were fostered by Government grants.

It was not until 1839 that the Government assumed distinct responsibility in respect to this matter by the appointment of a superintendent-general of education for the colony. At the same time the outline of the proposed system of schools was made public. This system had been developed in advice with the astronomer, Sir John Herschel, who was temporarily residing in the colony and had manifested deep interest in its moral and intellectual improvement.

The characteristic feature of the system thus initiated was that of Government aid and Government supervision for schools established, and in part maintained, by local efforts either of citizens or of churches. The existing system of education in the colony has been a gradual development from these early beginnings.

With the extension of the work there has come the necessity of a more definite organization of the controlling authorities, central and local, and this has been accomplished so far as circumstances have permitted after the precedent of the English system.

The central authority for education in Cape Colony is the department of public education, whose office is situated in Cape Town. The colonial secretary is the chief of the department, but for all practical purposes the superintendent-general of education administers the system. He is required to make an annual report, which has for some years followed the same arrangement. He reports on the working of the administration, the supply of schools, the enrollment and attendance, the progress of the pupils, school curricula, subjects of instruction, training of teachers, etc.

The schools that are recognized by the department of education may be schools under denominational management or undenominational public schools. The latter are in charge of managers elected by the householders of the community, who subscribe to a guaranty fee for half the expense of the school. In case the Government approves of the persons thus elected they become the local board in charge of the school. The Government on its part agrees to allow a grant sufficient for half the expenses of the school for three years. At the end of this period the grant is not renewed unless the report of the superintendent-general as to

the equipment and efficiency of the school is satisfactory. Fees are charged in the schools, but there is provision for remitting the same in case of necessity.

The superintendent-general is assisted by a corps of Government inspectors who examine the individual schools and also instruct the teachers in the requirements of the central department. The course of study and the conditions of efficiency necessary for securing the grant-in-aid are determined by the department.

There is provision for pensioning teachers and professors who have completed fifteen years' service under the education department and who have reached the age of 60 years or are incapacitated for service by reason of ill health.

According to the report of the superintendent-general for the year ending March 31, 1899, it appears that there were in operation 2,674 schools aided by the Government with an enrollment of 147,424 and an average daily attendance of 114,842 and employing 4,505 teachers.

The enrollment comprises 59,825 white children and 87,599 colored children, the latter in schools classified as mission schools and schools for the aborigines.

With respect to the attainments of the colored children, the superintendent-general says in his report for 1899:

For some years it has been impossible to report any rise in the learning standard of mission schools of the colony proper and the aborigines' schools of the frontier and the Transkei. It has been repeatedly pointed out in regard to them that more than half of their children are below Standard [grade] I, and that the number of their children who proceed beyond Standard IV is exceedingly small, in the mission schools not 3 in 1,000. The year under review, however, gives some ground for hope that improvement has at last begun. The change is indeed almost microscopic, but as it is manifest in all the standards above Standard II it deserves to be chronicled. The facts are that in the mission schools of the colony proper, the percentage of passes above Standard II has risen from 8.38 to 8.9, and in the aborigines' schools from 13.66 to 13.86. The only chance for continuing the progress thus begun lies in the improvement of the teachers, and this can only be done by a determined effort on the part of the churches which have organized training schools set apart for the purpose.

Higher education is also fostered by the Government, which apportions grants to six colleges. These maintain departments of classics, mathematics, and physical sciences. They registered 536 students in 1898 and 454 in 1899, a falling off attributed to the war.

The University of Cape Colony, incorporated in 1874, is merely an examining and degree-conferring body.

There is also a Government school of agriculture at Stellenbosh, which was originally under the control of the department of agriculture, but in 1898 was transferred to the department of education.

The Cape Town School of Art was established in 1880 and maintained for fifteen years under the auspices of the South African Fine Arts Association, with the help of an annual Government grant. In 1895 the school was passed over to the education department.

The Huguenot Seminary at Wellington, one of the most important private schools in the colony, also receives some aid from the public treasury. The seminary was founded through the efforts of Rev. Andrew Murray, pastor of a Dutch Reformed church, whose action was inspired by reading a life of Mary Lyon. Under the conviction that a seminary similar to that at Mount Holyoke, in this country, would be of incalculable benefit to the colony he entered into correspondence with graduates of that institution. Miss Anna E. Bliss, of Amherst, Mass., and Miss Abbie Ferguson, of New Haven, Conn., responded favorably to his appeal and money was sent from the colony for their passage to Cape Town. They found on their arrival that a large building with grounds had been bought for the school, the life of Mary Lyon had been translated into Dutch, and many young people were ready to enter as pupils into the Huguenot Seminary or as teachers to seek higher fitness for their calling. The seminary was formally

opened January 19, 1874, in the presence of a large assembly. Within the last decade the seminary has been provided with additional buildings and improved equipment, and is to-day in a flourishing condition. More than a thousand young ladies, descendants of the Dutch, French Huguenot, English, Scotch, etc., settlers, have received the benefits of the school and have gone forth to do excellent work. Many of them are teachers in the colonial schools and not a few are missionaries in the regions beyond.

The Government expenditure for education in 1899 amounted to £270,758 (\$1,353,790). Of this amount £225,710 15s. (\$1,128,550.75) was for the public or elementary schools.

In summing up the general conditions at the outbreak of the war, the superintendent-general in the report already cited (report for 1899, published in 1900), says:

All that can be said is that up till the outbreak new schools were being opened and school rolls were being increased at a highly satisfactory rate.

The other noteworthy features are the continued rise in the standard of attainments among the children and the continued improvement in the qualifications of the teachers; and, after all, these are the two most important points of any educational system. The steady rise in the attainments of the pupils is made at once manifest by giving the percentages of children above Standard (grade) IV for the last five consecutive years. These are 5.82, 6.68, 7.04, 7.39, 7.87. The same gradual upward movement is evidenced by the series of percentages of pupils above Standard V in the first-class schools, these percentages for the same five years being 15.0, 18.04, 19.42, 20.32, 20.98. It might reasonably be expected that with the great growth in the number of school children, many of whom entered school for the first time, the tendency would be to lower the average of attainments. The rise of standard in the face of this increase is all the more noteworthy and gratifying.

In a postscript on the effect of the war the superintendent-general continues:

The first indications of change came from the districts adjacent to the western frontier of the Transvaal, and probably the first school known to the office to be closed was one on the very border, the teacher of which having early information of invasion, locked his school door and went for safety into the land of the enemy. The railway and telegraph lines were, however, soon cut farther south, and large groups of schools were isolated in a moment. One inspector ceased suddenly to send in reports, and it was ascertained some time later that he was shut up in Kimberley. Then the northeastern frontier became affected in the same way. The December examinations were approaching, and the usual preliminary arrangements with the candidates should have been progressing. But letters and parcels of needlework failed to turn up, and one examination center after another dropped out of reach. Another inspector who had stuck doggedly to his work amid excitement and disturbance, ceased to be a correspondent, and was found to be detained in Burghersdorp. A third might have been in Colesberg, but at the time the inspectorship there was vacant.

When the school returns for the December quarter came in and began to be tabulated the loss which had been suffered grew more apparent, and the completed work showed that as many as 215 schools had dropped from the list.

*Education in the Transvaal Colony.*—Geographically the Transvaal Colony is land-locked with Portuguese East Africa and Cape Colony on the east, Orange River Colony and Bechuanaland on the south and west, and Rhodesia and Natal on the north.

The total area (including Swaziland, 5,560 square miles) amounts to about 120,000 square miles. The population in 1898 was stated by the Government to be over 1,000,000, of whom about 750,000 were natives, and 250,000 whites (males 138,000, females 112,000), and the number of fighting men at the commencement of the war was stated by the Government to be about 30,000. [Whitaker's Almanac, 1902.]

The Transvaal Colony, formerly known as the "South African Republic," or "The Transvaal," was annexed to the British Crown by Royal Proclamation of 25th of October, 1900.

The following survey of educational conditions in the Transvaal previous to the annexation was prepared by Mr. John Robinson, secretary to the director of the council of education, Witwatersrand, and was forwarded to this office by the education department of the colony,

The paper is evidently written from a purely English standpoint, but for this very reason it has a peculiar historic interest as disclosing something of those internal agitations that helped to precipitate the late war. The report is further interesting because it shows among the English settlers in the Transvaal that impulse to concerted civic action characteristic of the race wherever they are found.

Among an agricultural people like the Dutch colonists, the patriarchal order prevails, with little tendency to collective action. The Government of the South African Republic was not indifferent to education, but the system fostered was naturally better suited to a rural people of simple habits and humble ideals than to the more enterprising English of the mining region. The deficiency of educational provision which led to the formation of the Witwatersrand council, as described by Mr. Robinson, appears to have been due rather to the conditions of pioneer life in the particular district than to legislative neglect.

By the Uitlander education law, passed in 1896, the Government of the Republic authorized the establishment of schools in the mining region at the cost of the State with special provision for the children of foreigners. The regulations subsequently issued with respect to these schools appear, however, to have hindered the real purpose of the law; such, at least, is the inference from their tenor and from the report of Dr. Mansfelt, superintendent of schools. The statistics quoted from this report show that two years after the law was passed very few English children were benefiting from its provisions. Later statistics included in the very complete presentation of the educational system of the Republic made at the Paris Exposition (1900) showed that 12 of these special schools were in operation, with 1,500 pupils. Of the 49 teachers employed one-third were English. The Government expenditure per pupil in these schools was a little higher than in the ordinary schools.

It appears also from Mr. Robinson's account that while there was friction between the council formed by private initiative and the education department, the action of the council and its purposes were supported by many burghers who desired better school advantages for their children. A striking evidence of this cooperation is afforded by the memorial "relating to education on the gold fields of the Witwatersrand" presented to the Government by the combined action of the council and certain burghers of Johannesburg.

The memorial preceded the declaration of war by a few months, and naturally, as troubles were thickening, failed of practical results. It has, however, supplied to the present Government a comprehensive survey of the needs of this important region.

## SKETCH OF THE HISTORY OF EDUCATIONAL WORK IN THE LATE SOUTH AFRICAN REPUBLIC.

### EARLY LEGISLATION.

The first education law of the South African Republic was published in 1874 during the presidentship of Mr. Burgers. The law provided for three classes of schools:

1. Wijksholen. Ward schools (a ward is a field cornet's district)
2. Distriktscholen.
3. Gymnasium (at Pretoria).

The syllabus of instruction for the Wijksholen corresponded very nearly to that fixed at that time by the English code for elementary schools. The curric-

ulum of the district schools was slightly more extended (meer uitgebreid). In the wijk schools the State subsidy was £25 for 12 children, £50 for 25 children, with £2 additional for each child up to 100. In the district schools £300 was paid irrespective of numbers, with an additional £100 when the attendance reached 100. The law provided that: (a) No religious instruction was to be given during school hours; (b) Instruction was to be given in Dutch or English, according to the wishes of the parent or guardian.

The main defect of the law was the arrangement with regard to district schools. The population was small and scattered, and it was common to find a district school with ten or a dozen pupils costing the Government £300. In 1877, the first year of the British occupation, the average number of children in the schools was 306, and the cost to the State was £11 8s. 9d. per head per annum.

In view of the condition of the State exchequer at that time it is not surprising that the authorities took fright, and in 1880 we find the administrator, Sir Owen Lanyon, revoking law No. 4 of 1874 and confirming a new education law dealing mainly with the payment of subsidies. The terms "wijk" and "distrikt" are abolished, and schools are henceforth known as "town" and "country" schools. Schools, again, are divided into three classes, according to the attendance and the qualifications of the teachers. The State subsidies for first, second, and third class schools, respectively, were 7s., 6s., and 4s. per month. Country schools must have at least 12 pupils and town schools 20 before they can earn subsidies. Secular instruction only may be given in schools. This law was in operation until the middle of 1882, in which year there were nine town or village schools and 34 country schools, with an attendance of 872 children.

#### PERIOD 1882-1892.

In March, 1882, a new education law was published. In this law all local distinctions disappear. There is only one class of school recognized. Lager (lower) and middelbaar (middle) education are recognized, and the scale of subsidies range accordingly. "Lager onderwijs" corresponds roughly to standards I, II, and III in the English code and "middelbaar" corresponds to Standards IV, V, and VI. The State paid £3 for each pupil grouped under "lager" and £5 for each pupil grouped under "middelbaar" per annum. A further subsidy of £3 or £5 per annum was allowed on account of children whose parents were unable to pay fees. The law differed from previous enactments in the following important points: (a) School must be opened and closed by prayer. Bible history to be taught, but doctrinal instruction is to be left to the Kerkraad. (b) Clause 7 stipulates that instruction shall be given through the medium of the Dutch language.

So far as numbers may be taken as a criterion, education made progress under this law. In 1882 the number of children in State schools was 872, with an expenditure of £2,753. In 1891 the number was 8,170, and the cost to the State £42,823 11s. The reports during this period were carelessly compiled, but they afford sufficient data to prove that the attainments of the children were very low. A large substandard, with a few children in Standards I and II, was a common type of school. There was, moreover, no thorough system of inspection. In 1888 only 74 out of 179 schools were inspected. There is, further, evidence to show that the annual inspection when it did take place was of the most casual and superficial character. There were constant complaints in the Volksraad as to the incompetency of teachers.

In his first report to the Volksraad in 1892, Dr. Mansfelt says: "Burghers are paying in the way of fees and subscriptions less than one-half of the amount of the State subsidies. In one school there are 90 out of 100 children being educated entirely at the expense of the State.

"School buildings and furniture are for the most part in a bad state of repair.

"Teachers are holding positions owing to personal influence, without regard to their qualifications. There are teachers who are unable to sign their own names properly, who can not spell the words 'Pretoria' or 'Potchefstroom' without a mistake, and who do not know the difference between a noun and an adjective.

"Out of 538 teachers only 105 have teachers' certificates."

On the other hand Mr. Ode, secretary to the education department, 1890-1892, denounces the inspectors as incompetent and as holding qualifications vastly inferior to those held by many teachers whose schools they were appointed to inspect. "Four out of five of the inspectors," he says, "have not the qualifications that would enable them to take charge of the lowest class of school in Holland."

It is possibly owing to this laxity or leniency of administration that we have to ascribe the fact that up to the year 1892 the various nationalities living within the borders of the Republic were treated exactly alike in respect to education. The discovery of the Witwatersrand gold fields brought thousands of Europeans, mostly English speaking, and had the clause of the law of 1882 which provided that Dutch was to be the medium of instruction been rigidly enforced it would have borne hardly upon the newcomers. It is difficult to determine how far the Volksraad connived at this evasion of their enactment, but the fact remains that there were numbers of schools in Johannesburg, Pretoria, and other centers of population wherein the medium of instruction was almost wholly English, and which were in receipt of State subsidies on equal terms with the purely Dutch schools.

#### THE HOLLANDER RÉGIME.

In June, 1891, Dr. Mansfelt, a Hollander teacher from a school in Stellenbosch, was appointed to the post of superintendent of education. \* \* \*. The law 8 of 1892, drafted by Dr. Mansfelt, differs from the law of 1882 principally as follows:

(1) Subsidies for "lager onderwijs" are raised from £3 to £5, and for "middelbaar onderwijs" from £5 to £7.

(2) All teachers must be members of a Protestant church.

(3) All lesson books must be written in Dutch. Not more than three hours per week in Standards I-III. and four hours per week in Standards IV-VI may be devoted to instruction in a foreign tongue.

It will be noticed that (2) at once excludes Roman Catholics and Jews from any chance of participation in State subsidies; (3) excludes from State schools all English-speaking children, including many from the Cape Colony, who would find it more difficult to receive instruction through the medium of the Dutch of Holland than through the medium of English.

This clause was much criticised. Many Dutch people complained that for lack of a knowledge of the English language their children would be cut off from opportunities of employment for which they otherwise would be eligible. But Dr. Mansfelt stuck to his guns, and in a subsequent report we find him fulminating against the foolish claim of parents to have their children taught English as being fraught with serious consequences to our "national existence." In explaining a falling off in attendance he has to admit that certain Dutch parents, deeming the time allowed by law for instruction in English too short, have sent their children to schools where they can get "fuller scope for their short-sighted desires."

When the draft of Dr. Mansfelt's law was published there was great consternation among those interested in education in the gold fields. Deputations were sent to Pretoria to see Dr. Mansfelt and members of the Government. This agitation resulted in the passing of a Volksraad resolution in terms of which, subject to conditions, children in schools in which the medium was other than

Dutch might earn a subsidy of £4 per head per annum. The conditions are the interesting feature of this besluit.

1. The clause in law 8 of 1892 still held, which provided that teachers must be members of a Protestant Church, thus excluding Roman Catholics and Jews from any benefits to be derived under the resolution.

2. Children under 6 years of age were ineligible for grants.

3. Children of Dutch-speaking parents were excluded from earning this grant, the Government arguing that their place was in a Dutch school.

4. Children not excluded under 1, 2, and 3 had to satisfy the Dutch inspector in an examination in the Dutch language and Transvaal history. The Dutch teacher had first to be approved by the education department.

As the uitlander schools were mostly small, rarely exceeding 100 children (the attendance in the majority of cases being below 50), it was found that the percentage of children able to satisfy the conditions was so small that the amount of grant earned was insufficient to pay the salary of the Dutch teacher. Only large schools with few young children and with a minimum of the Afriander element could hope to earn anything under the besluit. Several schools in endeavoring to earn this grant sustained financial loss. During the eight years the besluit was in operation the average number of children earning grants in accordance with its terms was less than 200.

The effects of the new legislation were observable in other ways. In 1891 there were 99 town schools and 453 ward or country schools with 8,170 children drawing State subsidy. In 1893, after Mr. Mansfelt's law had been in operation for eighteen months, the town schools had been reduced to 59 and the ward schools to 353, while the total number of children was only 5,909. When it is observed that there was a falling off of something like 40 per cent in the town schools, it may easily be inferred (as was the case) that the bulk of the 2,261 children turned out of school or deprived of State subsidy were the English-speaking children living in Johannesburg and around other centers of population. One or two good voluntary schools in Johannesburg absorbed some of these children, whose parents were able to pay the high fees; the private adventure school sprung up for the benefit of others; many were left in the street. This serious condition of things was much aggravated owing to the influx of new population in 1894 and 1895. Public attention was from time to time drawn to the matter by bodies like the Transvaal National Union, but it was not till 1895 that any practical steps were taken.

#### THE COUNCIL OF EDUCATION.

In April, 1895, Mr. H. S. Caldecott, a leading Johannesburg solicitor, read a paper before a meeting of influential Johannesburgers in which he called attention to the deplorable state of things. \* \* \* Mr. Caldecott's revelations evoked profound attention, and before the meeting closed considerable funds were subscribed. A number of gentlemen, with the corporate title of "Council of Education, Witwatersrand," were elected to administer these funds in the interest of the neglected children, especially those on the mining areas. The first act of the council was to appoint a director, who entered upon his duties in September, 1895. This gentleman was forthwith instructed to make a survey of the mining area of the Witwatersrand and embody his observations in a report. It was necessary not only to approximately ascertain the number of children not attending school, but also to gauge as nearly as possible the value and extent of the voluntary educational work already being done among uitlander children. The council's report revealed the fact that in the mining area—roughly, 40 square miles—there were some 2,000 English-speaking children of school-going age, while there was not throughout the whole area a single school that might be described as efficient. A common type was a collec-

tion of children, numbering from 20 to 40 and of varied attainments, crowded into a single room of a dwelling house and presided over by a lady whose qualifications would hardly have enabled her to pass a fifth standard examination. In one case 130 children were found crammed into a room 18 by 30 feet. A large number of the mines children were not attending any school. In Johannesburg itself, including half a dozen mines in the immediate vicinity, there were 55 uitlander schools. Of these, 13 were housed in regular schools buildings, 18 in churches, and 28 in rooms of private dwellings. Out of 187 teachers, 46 held teachers' certificates. The number of children of school-going age was estimated at 6,500, of whom nearly 2,000 were not attending school.

The council's report recommended: (1) The providing of school accommodation and efficient teaching at the mines; (2) the subsidizing and controlling of deserving schools in town in the interests of the artisan population, and (3) the erection and maintaining of poor schools for the children of those unable to pay fees, irrespective of nationality.

To carry out this scheme would have involved a capital expenditure of about £60,000. It was clear that so large a sum was not likely to be forthcoming from individual donors, and efforts were made to interest the Chamber of Mines in the matter. The chamber met the council's advances in a friendly spirit, and having approved of the scheme, drew up a scale of assessment subject to which the mines were recommended to furnish the council with the necessary funds. The Jameson raid occurred at this juncture, and the political uncertainty of the subsequent months made it impossible to press the mines to give effect to the chamber's recommendations.

Meanwhile the council had been taking steps to have its status in the Republic defined. A trust deed was drawn up providing that the gentlemen elected at the public meeting of April, 1895, and who signed the deed of constitution, were to form the first council. Members were elected for life. The council was empowered to coopt members to its own body to fill vacancies caused by resignation, absence from the country, etc. Provision was made for trustees, in whom the council's moneys and property were to be vested. The council was empowered to found and support schools, to support schools not founded by the council, to support or assist technical or night schools, endow bursaries, and generally to further education within the area of its operations. The sphere of operations was restricted to the Witwatersrand, but might be extended to any other part of the Republic by resolution of council. The deed was registered at Pretoria in March, 1896.

The unrest of the first months of 1896 was followed toward the end of the year by a sense of impending reforms which rendered impossible the prosecution of the council's scheme as laid before the Chamber of Mines. Rumors regarding the appointment of an industrial commission suggested the possibility of general emendatory measures, and it was thought by some that heroic voluntary effort at this time in the cause of education would be equally impolitic and unnecessary. The state of things educationally, as revealed by its investigations, was, however, too serious to allow the council to be greatly influenced either by the unrest or the ensuing optimism, and it was resolved to get to work and make the most of the available funds, some £10,000, subscribed at the public meeting of April, 1895. Accordingly, regulations were drafted, subject to which assistance might be dispensed to deserving schools, and a code of instruction was drawn up. Before the end of the year (1896) the council had three school properties of its own and had assumed the control of and financial responsibility for three others. No effort was spared to make these schools efficient; only trained and experienced teachers were employed. Buildings were improved and furnished with the most approved equipment. In the selection of sites great care was taken not to overlap or inter-

fere with other efficient voluntary work. Good schools, not under the council's direct control, were strengthened by grants varying from £25 to £100. Working on these lines it was hoped to get the maximum of result from a minimum of expenditure. The council, moreover, undertook the inspection of and reported on schools not otherwise connected with it, and the adoption by these and other schools of the council's code of instruction gave a measure of uniformity of aim to primary education on the Witwatersrand.

While the council was engaged on the work described above, strong representations were being made as to the need for instruction in chemistry and assaying for the benefit of young men engaged in the cyanide works and assay offices at the mines. The council took the view that after a little nursing work of this kind might be rendered almost self-supporting, and the services of a thoroughly qualified man were obtained from England to inaugurate the experiment. In January, 1897, classes in physics, chemistry, and assaying were opened, a class-room and laboratory having in the meantime been thoroughly equipped. The physics and chemistry classes were largely attended by teachers and pupils of Johannesburg schools who were desirous of qualifying for the examinations of the Cape University, but most of the students in chemistry and assaying came from the mines. Many of the latter traveled long distances to the classes after doing their shift at the mines and the majority never completed their course. Consequently revenue in the shape of fees from this source was an uncertain and diminishing quantity. The strain of permanently devoting considerable subsidies to these classes, in view of the paramount importance of the other educational work, was more than the council could bear, and the classes were closed after running for a year and a half. The council, however, had the satisfaction of seeing several of their students obtaining good appointments at the mines.

During the early months of 1897 the opportunity of acquiring suitable premises at a reasonable cost enabled the council to carry out its desire to establish a high school for boys. Certain existing school premises were purchased and enlarged. The building was completely furnished with the most modern furniture and apparatus. Highly qualified teachers were appointed and the school opened with about 30 boys. Within a year the school, with an attendance of over 100, became self-supporting, thus justifying the considerable initial expenditure.

During the last quarter of 1897 the attendances at council's schools were as follows:

Science classes .....	29
Jeppestown school .....	131
Booyesen's school .....	76
Braamfontein .....	123
Brickfields .....	307
Boksburg .....	71
Springs .....	35
City and suburban .....	47
Total attendance .....	819

The amount paid in subsidies at per annum and not including administrative expenses was £1,663 15s. Seven hundred and fourteen pounds of this was absorbed by the science classes, leaving £949 15s., or a little over £1 4s. per pupil for the schools proper.

#### EDUCATIONAL LEGISLATION FOR UITLANDERS.

Meanwhile the State education department had manifested considerable alarm at the publication of the council's report in 1895. An Uitlander education law was immediately promised, and was published in August, 1896, but, as far as

related to the Uitlander, it simply transferred the control of education from the Volksraad to the Government and superintendent of education. \* \* \*

From regulations issued under the law it appeared:

1. That the qualifications of the teachers of the new schools were so limited and defined as to make it impossible for any one but a Hollander to become head master.

2. A child during his first year in school was to devote one hour per day to instruction in Dutch (the Dutch of Holland); in his second, two hours, and in his third year three hours, whilst in his fourth year he was expected to take the whole of his instruction through the medium of that language.

When these regulations were published the council, knowing how limited was the school life of the average child, again protested vigorously and called the attention of the British agent to the matter. Dr. Mansfelt was in the meantime experiencing difficulty in getting a supply of Hollander teachers qualified to become heads of schools where the children were mainly English. This difficulty was surmounted by the somewhat unique expedient of getting a law passed to enable teachers to proceed to England from Holland to learn the language at the cost of the State. Ordinary traveling expenses had been provided for by a law which had been passed *pari passu* with the Uitlander education law in 1896.

The schools under this law had very little effect upon the educational situation. According to Dr. Mansfelt's latest report there were 7 schools under the law throughout the republic. In 1 the children were mostly all Dutch. In 3 about half Dutch and half English; 3 were wholly English. The average attendance in the 7 schools was 540. Apart from administration and building expenses, these 540 children cost the state £7,240, or £13 8s. per head, during 1898.

#### THE COUNCIL AND THE EDUCATION DEPARTMENT.

Although the council took occasion to criticise abuses and anomalies in the educational laws of the State, it is not to be assumed that its attitude toward the educational department was irreconcilable. On the contrary, several attempts were made to meet the department with a view to discussing matters and arriving at a *modus vivendi*. \* \* \* Friendly relations were cultivated with moderate Dutchmen interested in education as well as with the committees of some of the State schools in the vicinity of the gold fields, many of the latter receiving from the council assistance denied to them by their own department. Direct application to the department having failed, the council, in the beginning of 1898, endeavored to approach the Government through the medium of certain Johannesburg burghers, the mining commissioner and burgomaster undertaking to carry a letter from the council to Pretoria. No reply was vouchsafed to this letter.<sup>a</sup>

#### STATE EDUCATIONAL STATISTICS.

At this point it would be interesting to note some figures from Dr. Mansfelt's report for 1898, published September, 1899. The average number of pupils in the State schools during 1898 was returned as 14,940. The total State expenditure, including about £21,000 for buildings, reached the enormous total of £226,416, or about £15 3s. a head. In Cape Colony for the year ending June, 1899, the average attendance was put at 107,783, the total cost to the Government being £270,758 6s. 9d., or about £2 10s. 2d. a head. The actual cost to the Colony of the education of white children as distinguished from colored for the same financial year was roughly about £3 5s. per head.

<sup>a</sup> See Appendix, pp. 476-8.

One item of the South African Republic educational figures is that of "logies-gelden" (lodging money). By a law passed in 1896 it is provided that poor parents living more than three miles from a school can arrange with the school committee for lodging their children, the State undertaking to pay a sum varying from £12 to £18 per annum. Taking £15 as the average payment on this account, it thus appears that in 1898 over 3,000 children were being wholly or partially maintained at the expense of the State, the total sum expended under this head being £45,355 17s. 1d. Under the heading "children of indigent burghers" comes the item of £40,675 11s. 8d. This is the year's expenditure under a law authorizing the Government to pay school fees for poor parents. The sum represents the school fees of 5,084 children at £8 per annum. Taken together, the above two items show that during 1898 the burghers of the State received gratuities from the public funds amounting to £86,031 8s. 9d. Other items which appear in this report are £7,162 6s. paid as bursaries to students in Holland, the State Mining School, with 4 students, at £261 13s. 3d. each per annum, and the gymnasium, with 88 pupils, at £88 12s. 9d. each per annum.

The increase of over 6,000 in the attendance since 1892 is not difficult to understand in view of the fact that more than 7,000 children were either being lodged or having their school fees paid at State expense. The attainments of the children, however, in view of this large expenditure, are disappointing. Of the children in standards, 56.2 per cent are in Standard I, whilst the percentage in Standard VI and over was only 0.3. In the Cape Colony for the same year the figures were for the same groups 29 and 5.6 per cent, respectively.

#### PRIVATE VOLUNTARY WORK IN JOHANNESBURG.

In Johannesburg during the years 1895-1898 excellent educational work was being done by a few private and entirely unaided schools. Some of these schools were well equipped, being furnished with gymnasia and apparatus which would compare favorably with that of the best European schools. The fees in these schools were necessarily high, ranging from 15s. to 40s. per month. The attainments of the children were good. During the four years under review the average number of pupils entering for the Cape University school examinations was 130, and the percentage passing in the upper divisions was high. The Cape examinations and examinations held under the auspices of the council of education showed that the position of the children in all the standards was much higher than in the State schools, approximating much nearer to the Cape percentage. The Johannesburg Kindergarten Association, started in 1897, was doing a good work amongst infants and younger children.

#### LATER WORK OF COUNCIL.

During 1898 the council, subject to certain guarantees, handed over the school in Jeppestown to a committee of parents of the pupils attending the school, the committee undertaking all financial responsibility. During the same year the council opened a school at Luipaards Vlei, which after a few weeks showed an attendance of 35. During this year the English school at Krugersdorp was also taken over by the council, the school having an average attendance of 90.

Toward the end of this year it was considered that the time had come to make a strong effort to augment the council's funds, with a view to extending operations. It was resolved to attempt to resuscitate the original scheme of 1895 in its entirety. A letter was forwarded through Mr. Percy Fitzpatrick to Messrs. Wernher, Beit & Co. and other financial houses in London who were interested in the Witwatersrand setting forth the then existing situation and indicating the work that had been done by the council in the past. The facts revealed by this letter evoked

considerable attention in London, and the appeal resulted in subscriptions amounting to nearly £100,000 being paid into the council's funds before April, 1899. In view of the increased educational needs consequent upon the augmentation of the mining population since 1895, the council resolved if possible to reserve this fund entirely for purposes of capital expenditure, and the mines were asked for contributions toward annual maintenance. The mines were asked for £17,000 per annum, and up to September, 1899, nearly 13,000 had been guaranteed for a period of three years. A scheme involving the erection of upward of 20 school buildings on the mines was prepared, and the council was engaged on the arrangement of plans and the selection of building sites when the imminence of war put a stop to the work; and under the new conditions which will be established in the Transvaal it is not now possible to say what, if any, arrangements in this direction may be made by the council in future.

JOHN ROBINSON,

*Secretary to Director, Council of Education, Witwatersrand.*

---

#### APPENDIX.

*Memorandum relating to education on the gold fields of the Witwatersrand, presented to the government of the Z. A. R. in March. 1898.*

In consequence of want of means, and in some cases parental apathy, there are very many children of school-going age on these gold fields who are not attending school. There are hundreds more whose education is merely nominal, there being a great number of schools which are understaffed to such a degree that their efficiency is very seriously impaired.

From lack of sufficient data we are unable to determine the exact number of children not attending school, but inquiries point to the conclusion that 1,700 or 1,800 is well within the mark so far as the 3-mile radius is concerned. Inquiries in the city and suburban and Fordsburg districts compel us to conclude that at least 1,000 children are attending private-adventure schools, carried on in sheds or rooms of dwelling houses, and presided over by teachers without any credentials whatever. In 8 well-known primary schools there are 1,600 children, and the work of these schools is suffering to a serious extent owing to their being insufficiently staffed, consequent upon lack of means.

We are convinced that these figures (4,300) far from represent the actual number of children who are either having no education or whose education is of a defective character, but if these were all we feel that there is sufficient ground to call for prompt action on the part of the Government; for this state of things, if perpetuated, is bound to grievously affect the peace and prosperity of the State in the near future.

A year and a half ago a law was passed for the benefit of the gold fields to provide for education where no provision, or only insufficient provision, existed already. Up to the present very little has been done, and the evils flowing from lack of education or inefficient education continue in all their intensity.

By placing a sum of £45,000 on the estimates for education on the gold fields under law 15 of 1896 the Government has again emphasized the principle that it should provide education where it is not provided and supplement it where it is indifferent. The acceptance and reiteration of this principle implies that the Government is anxious to give the widest possible scope to the operation of the law, and we venture to make the following suggestions as to how this result can best be achieved.

We are convinced that the Government can only secure the most effective working of the law by having careful regard to the wants of every individual school

district, and this can only be done through the instrumentality of a representative central-school committee, which should be endowed with the following powers:

1. To encourage local initiative by awarding grants in aid toward the cost of erecting school buildings, teachers' dwellings, etc.

2. Where local initiative is not available, to select sites and erect school buildings thereon.

3. To award grants to efficient existing schools whenever it is clear their efficiency would be increased by such grants. (The extent of Government surveillance in these cases to be arranged by the board in consultation with the superintendent of education.)

4. The appointment and payment of teachers.

5. The bringing into existence, wherever desirable and possible, of local committees of management and defining the outlines of these committees, with power to the general committee to delegate to the local committees any of its functions that may be thought desirable.

6. The determining as to the medium of instruction in schools controlled or aided through the board, with the proviso that there must be thorough teaching of the language of the country in all schools in which it is not the medium of instruction.

We should like to note the fact that the Government have ready to hand, in the Witwatersrand council of education, just such a board as is required. This *raison d'être* of this board is the improvement and advancement of education on the Witwatersrand, and it would gladly cooperate with the Government in this work. Should the board not be considered sufficiently representative the members would welcome such nominees as the Government might see fit to appoint.

The council of education came into existence two and a half years ago. It has now under its control 6 schools, with 813 children. The council also makes provision for technical instruction connected with mining. Starting with about £10,000, the council has still invested in 8 school properties £6,423; £1,513 17s. has been paid out in grants in aid toward cost of building and maintenance to schools not properly council schools. This leaves a margin of about £2,063 3s. as the sum with which the council has launched its schools and carried them on for two years—carried on the science classes for one and one-half years and the general administration of the work since its commencement, two and a half years ago. While the council has thus established a reputation for economy of administration which would stand it in good stead in the event of an appeal to the public for further funds, yet it would prefer, if possible, to work together with the Government in its further efforts on behalf of education on the Rand.

By making use of this organization to help to carry out its intentions with regard to education on the Witwatersrand the Government would secure a twofold advantage, unattainable by any other means. The council is in full sympathy with the main body of the people on the Rand, and it could bring into the State schools thousands of children, whereas hundreds would be the limit if the schools are to be administered from Pretoria. In the second place, the council could do much to prompt local bodies to take the initiative and bear part of the cost of education, for the members of this board fully appreciate the value of the principle that the initiative should come from the people, a principle which we know is regarded as fundamental in the education laws of this State.

Whether the Government elects to make use of this board or not, the conditions on the Witwatersrand seem to point to the conclusion that it is only by the adoption of a plan such as is above outlined that we can hope for good results in dealing with the problem of defective education on the Witwatersrand. In case the Government should not elect to make use of the council of education as its general school committee on the Witwatersrand, the executive committee of the council

would again point to its work in the past, in the hope that the Government may see its way to placing yearly a sum of £10,000 or £15,000 on the estimates to be expended by the council, acting together with such men as the Government may nominate. Statements and vouchers relating to the expenditure of such moneys would be regularly submitted as the Government might determine.

H. S. CALDECOTT, *Chairman*,

J. ROBINSON, *Secretary*,

*Witwatersrand Council of Education.*

The following article on "Education in the Transvaal and Orange River colonies" (after the annexation), cited from the *School Guardian*, January 4, 1902, appeared originally in the *London Times*:

The services of an exceedingly capable expert, Mr. E. B. Sargant, as director of education, have been secured, and the work already done in his department is a most favorable augury for the future.

In the latter half of last year a considerable number of schools had been opened in the Orange River Colony under the administration of the military governor of that colony. At that time the anticipation of a speedy termination of the war was entertained, and the southern portion of the colony seemed to have been cleared, once and for all, of the enemy. Many schools were accordingly opened in villages occupied by our forces, which afterwards had to be closed when the troops relinquished these positions. In the Transvaal, on the other hand, little provision was made for education until this year. A number of private schools in which instruction was given in Dutch to Dutch children had continued to keep open, supported partly by fees and partly by the funds of a committee in Holland. It was not until Mr. Sargant had been able to make himself personally acquainted with the sphere of his new work that full advantage began to be taken of the opportunity afforded by the concentration camps for laying the foundation of future education in the new colonies. A modest start had been made in the prisoners' camp at Green Point, Cape Town, where the Boers had formed a school for the younger inmates. A demand for English books came spontaneously from the prisoners themselves. This, it should be stated, is but one of many instances where the burghers have shown a desire to perfect themselves in the English language. English books were provided, and a member of the new education department undertook to supplement the prisoners' tuition.

The work of teaching the children collected in concentration camps, once begun, proceeded apace. It is interesting to note that while, according to the statistics of the late Transvaal government, education was being given at the outbreak of the war to 14,700 children, the number on the register last month fell very little short of that figure, and at the end of the present month is expected to be 15,000. In the Orange River Colony the number of children being taught in the various government schools is about 8,000. The concentration camps naturally offer more opportunities for reaching the children of burghers than exist in normal times, when the people are distributed over the country on farms. But there is no compulsory attendance in the camps, and the number of pupils on the register is very little over 50 per cent of the total number of children of school age; i. e., between 6 and 14.

There are 16 camp schools in the Transvaal, containing, in October, 14,081 children of school age. Of these, 7,166 were on the registers, and the average attendance was 70.4. But these by no means represent all that is being done in the cause of education. The work is inevitably restricted by the exigencies of the military situation, but schools are being opened wherever circumstances permit and there are sufficient children to form one. In Pretoria there are five free schools and two fee-paying schools under government, with 853 and 326 pupils, respectively; on the Rand, 15 free schools with 2,436 children. Free schools have also been opened at Nigel, Barberton, Vryheid, Wakkerstroom (these two villages are not on the railway), Middelburg, and Potchefstroom. At the latter place there are two free schools, while at Middelburg and at Potchefstroom there are also fee-paying schools, with 272 pupils. The total average attendance for all schools in the Transvaal is satisfactory, being over 75 per cent.

It will thus be seen that in one department, at least, of the civil administration, considerable progress has been made, in spite of the unsettled nature of the country as a whole. The demand for education, which must be regarded as a healthy and reassuring feature in the preliminary efforts at a settlement of the

new colonies, has indeed been so widespread that it has been impossible to respond to it adequately. The supply of teachers was necessarily limited.

In the camps many had to be employed who were ignorant of English, but here again the eagerness on the part of the teachers to learn was most marked. It has been necessary to call for a hundred trained teachers from England for the camp schools. The first draft of 25 is expected to arrive shortly, similar drafts following at intervals of one month. It might here be mentioned that there is no intention to oust the present Dutch teachers from their posts. Where these have an inadequate knowledge of English, it is proposed that part of their time should be devoted to learning that language. In a few months they will be themselves the best means of teaching children of their own nationality English, and their services will readily be enlisted.

Care should be exercised in the selection of the teachers sent out from England, and preference should be given to those who have had experience in country schools rather than in town-board schools only. Their work will not be limited to imparting merely knowledge to Dutch children. They should realize that they have been permitted to assist, and very materially, in the cause of the Empire, and by winning with ready sympathy and tact the hearts of the people, both young and old, they will contribute as much as can the wisdom of statesmen toward securing lasting peace for South Africa. It may be not without interest to give some idea of the general system of education that is likely to be adopted, as soon as circumstances allow, in the new colonies.

The chief difficulty that presents itself in a country where a large section of the population is rural, living on farms of wide extent and far removed from villages and towns, is to devise some scheme that will bring the children on the most distant farms within reach of educational advantages. The Boer government, as has already been pointed out, made no attempt to grapple with this difficulty. Under the new régime schools will, as a matter of course, be established in every village, and in all probability in centers where more than twenty children can be collected. Attached to these schools will be a certain number of visiting teachers (in settled districts these would be women), who will arrange a weekly system of visits to farms in the neighborhood. The system has been ingeniously worked out by Mr. Sargent as follows: Starting out in a certain direction, two teachers could travel in that convenient South African vehicle known as a Cape cart, to a farm (*a*) where one would remain to give a morning's instruction while the other would be driven on to the next farm (*b*) to teach the children there. The farmer at (*a*) might then lend his own cart to carry on the first teacher to join her comrade at (*b*), whence they could go on to farms (*c*) and (*d*), respectively, to give an afternoon's instruction. At (*d*) they would remain the night. On the next day the same arrangement would be made, the journey being homeward by a different route. The third day would be spent at the village, while a second round of the same nature would complete the working week, and each teacher would have visited eight farms. The scheme would be subject to alterations according to local requirements, but there seems to be no reason why it should not work successfully. At the farms visited by the teachers, children would be collected from the neighboring properties, with a possible minimum of five and a maximum of twenty. A good week's work for a visiting teacher would be to give instruction to fifty children in the four days. This would leave a margin for alterations in the scheme when distances or other obstacles prevented the maximum number of farms from being visited. In the intervals between the teachers' visits the children's tuition would have to be committed to a member of one of the families represented. It should not be difficult to find an elder sister willing to continue the children's lessons during the week, and where necessary she might first be given brief training at one of the larger schools.

It is proposed to divide the two colonies, for purposes of education, into provinces, in each of which one "provincial" school will be established at the most important town. In these schools provision will be made for secondary education and for the instruction of pupil-teachers. The head of the school will be responsible for the pupils receiving secondary education and for normal students. At the same time he will be intrusted with the supervision of the village or "ward" schools in his province, and as some of his time must be devoted to inspecting these, he will be provided with a skilled assistant to carry on his work in his absence.

The necessity of introducing from the beginning a sound system of State education in the interests of the future welfare of the colonies has never been lost sight of, and it is illustrative of Mr. Sargent's thorough grasp of the needs of the country that he has endeavored to secure only public-school and university men for the post of a "provincial" head master. The salary offered, £500 a year with a

house, together with £250 for an assistant (who it is suggested might be the head master's wife, a woman being desirable in view of the likelihood of the majority of the normal students being girls), should prove a sufficient inducement to secure suitable candidates.

In the Orange River Colony there will be at first eight provinces, and in the Transvaal ten; to each of the latter there will be four ward schools, and two visiting teachers to each ward school. But as the educational system expands the number of provinces, of ward schools to each province, and of visiting teachers to each ward will grow considerably. In the capitals and in Johannesburg separate schools—a high school for boys, a high school for girls, and a normal school—take the place of the upper part of a provincial school. The work of the provinces will be gathered up in the two central departments at Bloemfontein and Pretoria, each with an assistant director of education and an administrative staff. The director of education will reside at Johannesburg. The scheme thus briefly sketched is one of delegated authority from the head of the department, elasticity being given to a framework which might otherwise prove too rigid by conceding to the provincial head masters, each within his own area, considerable freedom as regards educational methods and organization.

## CHAPTER X.

### NOTICES OF SOME EARLY ENGLISH WRITERS ON EDUCATION—PART II.<sup>a</sup>

WITH DESCRIPTIONS, EXTRACTS, AND NOTES.

BY PROFESSOR FOSTER WATSON.  
*Of University College, Aberystwith, Wales.*

#### THOMAS LUPSET. 1498?–1530.

Thomas Lupset was sent by Dean Colet to S. Paul's School and Pembroke Hall, Cambridge. He read the rhetoric and humanity lecture at Corpus Christi College, Oxford, 1520, and afterwards Wolsey's Greek lecture, in the University of Oxford. He had as patrons, Colet, Pace, and Wolsey, and as friends, More, Erasmus, Linacre. "He was very serviceable to his learned contemporaries in preparing and correcting their works for the press." He prepared the second edition of More's *Utopia*.

For further account of life, see *Dictionary of National Biography*, Vol. 34; *Cooper's Athenæ Cantabrigiensis*, Vol. I, p. 40; and *Gentleman's Magazine*, 1856, Part I, p. 119.

Lupset (Thomas).

*An Exhortation to yonge men, perswadinge them to walke in the pathe way that leadeth to honeste and goodnes: writen to a frend of his, by Thomas Lupsete, Londoner.* B. L. T. Berthelet, Londini, 1534, 1535, Sm. 8vo. Also 1538, 1544. (Written 1529.)

(Consists of 99 pp.)

<sup>a</sup> The first part of these Notices formed Chapter XVII, Vol. 1, of the Report of 1901 (pp. 861–884).

I have never seen this book described by any writer on education, but it seems to be of more than ordinary interest and importance, as a witness of contemporary aims.

It is addressed "to my withipol [a term of endearment] my hearty beloved Edmund".<sup>a</sup> It is dated from More (in Herts), a "place of my lorde cardinals" (Wolsey). Lupset says: "I lie waiting on my lord Cardinal, whose hours I must observe, to be always at hand, lest I shall be called when I am not by; the which should be straight taken for a fault of great negligence. Wherefore, now that I am well satiated with the beholding of these gay hangings, that garnisheth here every wall: I will turn me and talk with you." The writer goes on to state his love for Edmund, but he has concealed it. "For long I have been taught, that the maister never hurteth his scholar more than when he uttereth and sheweth by cherishing and cockering the love that he beareth to his scholars. I think you lacked with me no cherishing, but of cockering you had very little." But Edmund is no longer a pupil; he is, however, Lupset's friend. And if the author has a friend, "I reckon straight," says he, "that all his be mine without any exception: So that in very deed I take to my care, as mine own, all things that be in my friend's care."

For the leading of a good and honest life, there are certain authors who should be assigned to all—young and old. It is not, however, "the reading of many books, that getteth increase of knowledge and judgment, for the most part of them that readeth all indifferently, confound their wits and memory without any notable fruit of their reading." Much time is lost by those who do not know how to pick and choose their reading.

There are three matters which must never be forgotten, both as to their dignity and nature, and especially as to the degrees and order of them, viz, the soul, the body, and the substance of this world. "Care for your body, for the soul's sake. Care for the world for the body's sake. Beware above all things that you go not backward, as he doth, that careth first to be a rich man: next to be an healthy man, and thirdly to be a good man: when he should do clean contrary." Merchants err in this matter, nay, for the most part all men do no otherwise. Scholars are just as bad. They have as little regard for the soul. "How far out of square, our life is!"

Again and again remember the soul is the first care, and requires the fear and love of God to sustain it. Therefore study the New Testament, and submit yourself to the expositions of holy doctors. Meddle in no point of your faith otherwise than the Church shall instruct and teach you. Seek above all things the kingdom of heaven and all other things shall be added unto you. As commentaries always have at hand Chrysostom and Jerome. At leisure, also, read Aristotle's Ethics, either under some expert philosopher or else with the comment of Futtiratius. Let Plato be "familiar with you," especially the *De Re Publica*. Read Cicero de Officiis, de Senectute, de Fato, de Finibus, de Academicis Questio, de Thust.<sup>b</sup> Especially read with diligence the works of Seneca, of whom ye shall learn as much of virtue as man's wit can teach you.

These books can lift men above the clay of this earth and set them on a hill of high contemplation: from whence they shall look down and despise the vanity which foolish men take. If another book be added, let it be the *Enchiridion* of Erasmus.

Secondly, take care of your body. Beware of corrupt air. Keep from gluttony. Fast sometimes for devotion and for health. Sleep too little rather than too much.

<sup>a</sup>It has been pointed out that one Richard Withipol was vicar of Walthamstow, Essex, at the time, and may have had a son, Edmund, but this is very problematical.

<sup>b</sup>Probably a short form for the *Tusculan Disputations*.

Exercise you continually. Let never the sun rise before you. Flee idleness. Be temperate.

Thirdly, is the care for this world's goods. Lupset admits: "I can give you small advice of myself because I have had but small experience herein." Remember, however, it is third in order. For the rest: In making your bargain keep faith and promise: deceive no man with any guile or false color. There is no little so small of virtue, that is not to be valued without comparison above the whole power of the earth and seas, through Asia, Africa and Europe. Reckon not possession of lands, substance of merchandise or abundance of money to be comparable to a good friend. On this point, read Cicero de Amicitia. As to your wife, when you marry, I am utterly of this opinion, that the man may make, shape and form the woman as he will. As to ordering your household, read the *Economia* of Xenophon. I will lend you a translation I have made into English if you care to read it. Read also Aristotle: *Politics*, Books VII and VIII.

Finally, Lupset points out that the second and third "goods" are not really permanent goods. Health may flee from the body; misfortune may despoil the rich man of his material wealth, but the goods of the mind are "sure ours." They can be taken away from us "but with our own will consenting."

One more book must be named, *The Enchiridion* of Epictetus, well translated into Latin by Angelus Politian. (Lupset intends to translate the comments of Simplicius on this book).

And one thing believe me, my good withipol, that in reading of these old substantial works, the which I have named unto you, shall beside the perfection of knowledge, gender a certain judgment in you, that you shall never take delight nor pleasure in the trifles and vain inventions that men now days write, to the inquieting of all good order: by reason that the most part of men that read these new fluttering works lack perfect judgment to describe [discriminate] a weighty sentence from a light clause, the which judgment can not be gotten, but by a long exercising of our wits with the best sort of writers.

#### GIOVANNI LUDOVICO VIVÈS. 1492-1540.

Born at Valencia. 1509 at the University of Paris. 1512 private tutor at Bruges. Afterwards, at Louvain, teacher of William de Croy, who at 19 years of age was nominated cardinal-archbishop of Toledo. Became tutor to the Princess Mary, daughter of Henry VIII. It was for her use he wrote *De Ratione Studii Puerilis*. In 1522 he wrote his *Commentary* on Augustine's *De Civitate Dei*, which he dedicated to Henry VIII. In 1523 he wrote his famous *De Institutione Feminae Christianae*, which he addressed to Queen Catherine of Aragon in 1523. In the same year he delivered two lectures in Oxford and received the degree of doctor of civil law. In 1528 Vivès presumed to speak and write against the divorce of Queen Catherine and was imprisoned for six months. He returned to the Netherlands, and taught the belles-lettres at Bruges until in 1540 he died at the age of 48.

For an account of the life (written in Latin) of Vivès see the splendid edition of his works, *Vivis Opera Omnia*, edited by Gregorius Majansius, 8 vols., published at Valentia Edetanorum in 1782; (Barnard's) *American Journal of Education*, Entire Series, Vol. XXVII, pp. 329-351 (compiled and translated from Schmid's *Pädagogische Encyclopädie*, written by Dr. Lange); Chalmers' *Biog. Dict.* Vol. 30, pp. 408-10; and Rose, *Biog. Dict.* Vol. XII, p. 378. In German, there is the excellent and full account by Dr. R. Heine in K. Richter's *Pädagogische Bibliothek*, Leipsic, Band XVI. Also *Ausgewählte Schriften*, edited by Wychgram, Wien, 1883; and F. Kuypert: *Vivès in seiner Pädagogik. Eine quellenmässige systematische Darstellung.* Dissertation, Kiel, 1897.

The complete list of the works of Vivès is very long. It is classified in the edition of 1782. I name those which have reference to the subject of education:

- I. Rogativa ad Deum—6 separate works.
- II. Grammatica—  
De ratione studii puerilis—pars prima.  
Altera pars de ratione studii puerilis.  
Exercitatio linguæ Latinæ.  
2 others.
- III. Philologica.
- IV. Rhetorica.  
De ratione dicendi, libri tres.  
De conscribendis epistolis.  
4 others.
- V. Philosophica. 10 separate works.
- VI. Moralia.  
De institutione feminae Christianæ.  
7 others.
- VII. Legalia. 2 works.
- VIII. Politica. 7 works.
- IX. Historica.  
De corruptis artibus, libri septem.  
De tradendis disciplinis, sive de doctrina Christiana, libri quinque.  
5 others.
- X. Christiana. 9 works.
- XI. Epistolica.
- XII. S. Aurelius Augustinus, de civitate Dei, cum commentariis Joannis Ludovici Vivis Valentini.

As to the general position of Vivès in the history of education, the following words of Professor Laurie may be quoted:

Like Comenius, he was one of those who were always hoping to find some basis of ecclesiastical and civil unity which might conciliate the distractions of the time. He is sometimes called a Humanist, sometimes a Realist. The truth is, that after giving promise of future distinction as a schoolman, he grew out of the scholastic philosophy, and became, in relation to the general current of thought, a Humanist, but without falling into the idolatry of style which characterised the leaders of that movement. (Teachers' Guild Addresses, pp. 177-8.)

As it only falls within the limits of this Bibliography to describe books published in England, the following translations are alone dealt with. It should, however, be named that the chief book by Vivès on education is his *De Disciplinis*, which includes *De Corruptis Artibus* and *De Tradendis Disciplinis*. Of this there is an excellent short account in the *American Journal of Education*, XXVII, pp. 343-7.

Vives (Joannes Ludovicus).

*An Introduction to Wisdom, Translated into English by Sir R. Morison.* B. L.

*In acdibus T. Bertheleti, Londini, 1540.* 8vo. Also 1544.

The translator, in his preface, describes the book. He is addressing Master Gregory Cromwell, son of Lord Cromwell, Lord Privy Seal:

It is not only an introduction to wisdom, but if ye go as it leadeth you, it introduces wisdom unto you, rooting the love and desire of virtue in your heart, extirping [extirpating] from it all manner of vice, and all uncleanness, furnishing you with general precepts for all kinds of life, for all ages, for all degrees and conditions, which precepts, if you harbor in your breast, must needs be a great stay, help and comfort unto your tender age. \* \* \* Assuredly I know no one book untranslated, that hath half so many wholesome documents as this hath.

In the edition of 1544, "For the filling of void pages there are inserted certain flowers of most notable sentences of wise men, gathered together by Erasmus of Rotterdam and translated into English." Erasmus, Vivès, and Budæus are often spoken of as the triumvirate of their age in the republic of letters. It is appropriate therefore that flowers from Erasmus should be strewn upon the work of Vivès. The friendship between the two had been warm (as is shown by their letters) up to a certain point. Vivès had undertaken to supply a Commentary for S. Augustine's *De Civitate Dei*, which Erasmus was editing. Unfortunately, Vivès through ill-health partly was behindhand. Erasmus became impatient, and their friendship cooled.

There is another edition of this book, written in Latin and published at Aberdeen:

*Joannis Ludovici Vitis Valentini, Ad Sapientiam introductio: Enchiridion repurgandis sæculi hujus vitiiis accommodatissimum. Aberdoniae, Excudebat Eduardus Rabanus, Impensis Davidis Melvil. 1623.*

Vives (Joannes Ludovicus).

*A very frutefull and pleasant boke called the Instruction of a Christian woman, made fyrst in Laten by the right famous clerke maister L. Vives, and turned out of Laten into Englyshe by R. Hyrde, etc. B. L. T. Berthelet. 1540?, 1541, 1557, 1592.*

Written in 1523, and dedicated to Queen Catherine of Aragon. The first book deals with women up to the age of marriage; the second with the married life of women, and the third is on widows. The chapters which are of special educational reference are those on the bringing up of a maid when she is a babe, of the residue of her infancy, of her exercise, of the learning of maids, and what books are to be read and what not. Vivès, like Elyot, wishes that the mother should nurse her children herself. If this is impracticable, great care should be taken in the choice of a nurse. Children should have no evil influence near them. As to the beginning of instruction Vivès leaves the determination of the age to fathers and mothers. But when the girl is ready let her both learn her book and beside that to handle wool and flax, "which are two crafts, yet left of that old innocent world." "I would in no wise that a woman should be ignorant in those feats that must be done by hand, no not though she be a princess or a queen." Queen Isabel, mother of Queen Catherine of England, taught her daughters to spin, sew, and paint. Add to these the teaching of cookery, not the "slubbering and excess in meats" which cooks meddle with, but the dressing of meat for her father and mother and brethren, while she is a maid, and for her husband and children when she is married. Moreover, cooking is of the first importance in bringing the sick to health. As to learning, Vives would have girls instructed especially in books containing precepts of virtue. "For if she can find in her heart to do naughtily, having so many precepts of virtue to keep her, what should we suppose she should do, having no knowledge of goodness at all." In reading let the girl have books that may teach good manners (morals). In writing let her examples be some "sad sentence," prudent and chaste, taken out of Scripture or the sayings of philosophers, which may by often writing fasten better in her memory. No woman should rule a school, nor live among men, nor speak abroad.

The books which girls and women should read are: The Gospels, Acts, Epistles and the Old Testament, S. Hieronymus, S. Cyprian, Augustine, Ambrose, Hilary, Gregory, Plato, Cicero, and Seneca.

The underlying thoughts of the *Instruction of a Christian Woman* are, firstly, that woman is frail, of weak discretion, and easily deceived; secondly, that the remedy is to keep herself from the ways of men and of the world. In childhood he would separate boys and girls, and not even allow them to join in games

together. As Dr. Lange says, the views of Vivès on the education of women are a direct consequence of his belief that women are "more inclined by nature to sin than men."

*Linguae Latinae exercitatio.* Joan. Lud. Vire Authore.

*Disce puer linguae quae sunt abstrusa Latinae:  
Hic liber, aut nullus, quae dabit apta tibi.*

*Edinburgi, Excudebat Gidion Lithgo, Anno Dom. 1657.* 12mo. (96 pp.).

Earliest edition in British Museum (Basilia), 1541. 8°.

This consists of dialogues on daily actions of the pupil, going to school, school-work, return. As a forerunner to Comenius, it is interesting to note that Vivès treats of common things, taking up such subjects as clothes, the kitchen, bed-chamber, dining-room, paper and books, exterior body of man, and abstract subjects such as royalty, education, precepts of education.

JOHN PALSGRAVE. ?-1554.

*Joannis Palsgravi Londoniensis, Ecphrasis Anglica in Comœdiam Acolasti.*

*The Comedye of Acolastus translated into oure englysshe tongue, after suche maner as chylderne are taught in the grammer schole, fyrst worde for worde, as the Latyne lyeth, and afterwarde accordyng to the sence and meanyng of the latin sentences: by shewing what they do value and counterrayle in our tongue, with admonitions set forth in the margyn, so often as any suche phrase, that is to say, kynd of spekyng used of the latyns, whiche we use not in our tonge, but by other wordes, expresse the sayd latyn maners of speakinge, and also Adages, metaphores, sentences, or other fygures poetically or rhetorical do require, for the more perfyte instructyng of the lerners, and to leade theym more easilye to see howe the expositiō gothe. And afore the seconde sceane of the fyrst acte, is a brefe introductory to have some general knowledge of the dyvers sortes of meters used of our auctour in this comedy. And afore Acolastus balade is shewed of what kyndes of meters his balade is made of. And afore the syxte sceane of the fourthe acte, is a monition of the Rhetorycall composytion used in that sceane, and certayne other after it ensuyng.*

*Interpreted by John Palsgrave.*

Anno MDXL. (B. L. 4to. At the end of the book: Impress. Lond. in aedibus Tho. Berthel. regii impressoris, Cum privilegio ad imprimendum solum. Immediately preceding this occurs: William Fullonius the Maker of this presente Comedy, dyd set it forthe before the bourgeses of Hagen in Holand. Anno M. D. XXIX.)

Dedication to Henry VIII, "supreme head in earth immediately under Christ, of the Church of England," by "his most humble and most obeysaunt Chapleyn, John Palsgrave, bachelor of divinity."

This dedication is of high interest in giving a contemporary picture of schools and masters of the time.

*One uniform Grammar.*

When I consider [says Palsgrave, addressing Henry VIII] how highly your grace doth tender the well bringing up of your youth in good letters, insomuch that where as it is clearly perceived, by your most prudent wisdom, how great a damage it hath heretofore been, and yet is, unto the tender wits of this your noble realm, to be hindered and confounded with so many divers and sundry sorts of precepts grammatical: you have for the address thereof, willed one self and uniform manner of teaching of all those Grammatical ensyngmentes, to be used throughout all your highness' dominions and committed the disposing of that matter unto such singular personages, both of exact judgment, & thereto of excellent literature, that I for my part do not a little heresof rejoyce, and earnestly do

I wish, that I at these present days (which in that exercise have dissipated no small time of my life) had observed but some one available document to bring to this Gazo-phylacium, some thing to help to the furtherance of this your noble grace's so goodly & thereto so godly & much fruitful a purpose.

*Palsgrave's debate with himself.*

I hereupon took occasion thus to reason and to debate with myself. Now shall the great variety used afore time in the teaching of the grammatical rules of the Latin tongue in this realm, whereby hitherto no small hindrance hath ensued, hereafter utterly cease and be put to silence \* \* \*. Now it is intended that every school of your grace's realm, should begin to wax one self school, as far as to those said principles doth belong. But as yet unto my poor judgment (seeming to be a thing very much requisite) for the more effectual and speedy furtherance of your grace's said youth, I wished, that unto this much expedient reformation of your schoolmasters' unstaid liberty, which hitherto have taught such grammars, and of the same so divers and sundry sorts, as to every of them seemed best (and was to their fantasies most approved); might thereto also follow and succeed one steady and uniform manner of interpretation of the Latin authors into our tongue, after that the Latin principles were by your grace's youth once surely conned and perceived.

*Why this is desirable? Incompetent schoolmasters.*

Upon the want and default whereof, besides the great and evident inconvenience (of which the effect is too much in every place espied) that is to say, the plainly apparent ignorance and want of a required sufficiency of many, which, in private places take upon them to teach, afore they be their craft's masters. To whom the best grammatical rules, that ever were or could be devised, cannot vailably be sufficient.

*Other causes 'whereby your grace's youth is not a little hindered.' Affectation.*

Some instructors of your highness' youth, for want of a perfect judgment in this behalf, so much desire to seem affectately [affectedly] curious, that having no due consideration to the tender wits, which they take under their charge to teach in the stead of pure english words and phrases, they declare to their children one Latin word by another, and confound the phrases of the tongues. And thus not a little do hinder their young scholars, while they would seem for their own parts to have a knowledge and erudition above the common sort.

*Another sort of master.*

Some other again there be, which having undoubtedly, learning enough, vailable and sufficient, yet while they by sundry ways and manners of speaking used in our tongue, labor to express such Latin authors' minds, as they do take upon them for the time to interpret, and for to seem therein more diligent, than the common sort, dissipend in manner whole forenoons and afternoons, in the declaring of a few lines of such Latin authors, as they for the season have in hand (as to confess the very truth, the schoolmasters' whole diligence tendeth in manner chiefly to that effect and purpose) they do by that means not only right little for the time further their young audience, but also by that ways do oppress and overlay the tender wits, the which they would so fain further, with their multitude of sundry interpretations, confusedly by them uttered. So that finally their young scholars, to help their memory with, be forced to fall a glosing, or rather a blotting of their Latin books and as their childish judgment doth for the time serve them, of divers English words in our tongue being synonyms, or of divers manners of interpretations used by their master, they choose most commonly the very worst, and therewith scribbled the books of their Latin authors.

*Some masters know less English than Latin.*

Some other furthermore there be, which though they have by their great study, at your grace's Universities, so much profited in the Latin tongue, that to shew an evident trial of their learning, they can write an Epistle right Latin like, and thereto speak Latin, as the time shall minister occasion, very well, yea and have also by their diligence attained to a comely vein in making verses: yet for all this, partly because of the rude language used in their native countries, where they were born & first learned (as it happened) their grammar rules & partly because that coming straight from thence, unto some of your grace's universities, they have not had occasions to be conversant in such places of your realm, as the purest English is spoken, they be not able to express their conceit in their vulgar tongue, nor be sufficient, perfectly to open the diversities of phrases between our tongue and the Latin (which in my poor judgment is the very chief thing that the school-

master should travail in). In so much that for want of this sufficient perfection in our own tongue, I have known divers of them which have still continued their study in some of your grace's universities. that after a substantial increase of good learning, by their great and industrious study obtained, yet when they have been called to do any service in your grace's commonwealth, either to preach in open audience, or to have other administration, requiring their assiduous conversanting with your subjects, they have then been forced to read over our English authors, by that means to provide a remedy unto their evident imperfection in that behalf.

*What no clerk has before attempted either in England or even in Europe.*

Being therefore for my part desirous, that these inconveniences might also be provided for, and thereupon taking occasion, more attentively to bethink me upon this matter, then began the great difficulty of the well achieving thereof, the more plainly to appear unto me, not only because the like thing hath not yet hitherto (that ever I could know of) been thoroughly attempted of any clerk within this your grace's noble realm, but also forasmuch, as that to be *Ecphrastes* in their mother tongue, upon any Latin authors hath never hitherto (so far as I can yet perceive) been essayed in any other region of Europe; except perchance that some such as be lettered, have for their own ease and the more brief and speedy furtherance of their scholars, used such kind of interpretation in their own tongue upon some excellent Latin author, which they would never suffer to pass the bounds of their private houses.

Palsgrave then declares "the not attempting" of interpretation in other tongues has not proceeded from any natural inferiority of our English over foreign people in knowledge. Robertus Stephanus lately wrote *De Corrupti Sermonis Emendatione*. *Nebrisensis* laments the notable corruption of Latin amongst the Spaniards. Bebelius called on the Germans to leave their own phrase and take them to the assiduous reading and observing of the good Latin authors. "I take it," he says, "that Bebelius was in manner to the Germans as was Laurence Valla unto the Italians, by whose first exhortation and setting on so many excellent writers have risen amongst the Italians, within the time of memory."

*Reasons for choosing Acolastus.*

I have chosen for my Latin author, to be *Ecphrastes* upon, the comedy entitled *Acolastus*, not only for because that I esteem that little volume to be a very curious and artificial compacted nosegay, gathered out of the much excellent and odoriferous sweet smelling gardens of the most pure Latin authors, but also because that the maker thereof (as far as I can learn) is yet living, whereby I would be glad to move into the hearts of your grace's clerks, of which your noble realm was never better stored, some little grain of honest and virtuous envy, which on my party [i. e., part] to confess the very truth unto your grace, hath continually in all the time of these my poor labors taking, accompanied me, and stirred me onwards to achieve this matter, on this wise by me attempted.

*The thought which stirred Palsgrave.*

For thus have I thought to myself. Shall Fullonius an Hollander born, thus many hundred years after the decay of the Latin tongue by the Goths, Vandals and Longobards, three most barbarous nations, utterly corrupted, through the diligent observation of the pure Latin authors, be able to make so fine and so exact a piece of work: And I shall not be able at these years of mine age, to do so much, as to declare what he meaneth, in my native tongue? seeing that he (regard had to his country) can challenge no more propriety of the Latin tongue than I can, saving that through his great and industrious labor, he hath mastered the Latinity and forced it to serve him, to set forth to all clerks his intent and purpose.

*What would reward Palsgrave.*

I shall think myself not only very well sufficed, but also much fortunate, if this mine enterprise or at the least first setting on, may give occasion unto other your grace's well learned clerks, to fall in hand with such of the Latin authors, as in the judgment of all men be most excellent, and to this purpose most necessary and expedient. So that by their diligent labors may be made such an established marriage between the two tongues, as may be unto such of your grace's subjects,

as shall succeed hereafter, not only steady, agreed upon, and permanent, but also an incredible furtherance, to attain the pure Latinity by.

After apologising for his own imperfections, he still hopes this attempt may further good learning. Beyond this there are:

"Six great and much vailable commodities" from "this thing."

1. If this kind of interpretation may take effect, and be put in execution, not only the speech of your grace's subjects should by that mean have a great advantage to wax uniform, throughout all your grace's dominions, but also the English tongue, which under your grace's prosperous reign is come to the highest perfection that ever hitherto it was, should by this occasion remain more steady and permanent in his endurance, not only by the well keeping of his perfection already obtained, but also have a great occasion to come to his most highest estate, and there, by that means long to be preserved.

2. After this, there should never be no utter ill schoolmasters within your grace's realm, for if such as would take upon them that office, were not better than their English interpretations, yet very shame would drive them, that they should not be worse, except they would stand in danger to be reproved of their own scholars, which if they were but young babes, yet might their parents easily control them, which might well enough perceive, what they did notably amiss.

3. Then should the willing scholars, which had already gotten their grammatical principles, be so evidently encouraged to go forward, that they should be great callers upon their fellows which by their negligence would drag, besides that the masters themselves should have no small provocation, to use for their own parties a good diligence, lest their scholars of their own mind should call for more of their author to be declared unto them, than perchance they had prepared to read unto them before: whereas now the scholars, be they never so well willing to be furthered, they have no manner remedy, but utterly and wholly to stay upon their master's mouth.

4. Then should all such as be already departed from the grammar schools, and afterward be taken with a repentance of their young time, negligently by them overpassed, which aforetime were forced to despair, though their wills afterwards waxed never so good, now by this means easily recover themselves again.

5. Then should young scholars, with small pains, engross the whole arguments of the Latin authors in their memory, whereas heretofore, after they have read the Latin authors in the school, they have not perceived what matter they entreated of: yea, and then their furtherance and speedy increase should be so notable, that with pleasure in manner, and with banishing of all servile rudeness out of grammar schools, they should sooner be able perfectly to go than they could aforetimes be able to creep.

6. When the schoolmasters, and also the scholars should by this means be eased in manner of three parts of their pains then should the masters have both time and better occasion, to open their farther learning, and to shew unto their scholars the great artifice used of the authors, in the composition of their works, which aforetime they had no such opportunity to do.

Palsgrave leaves the matter with the king—to advise whom is like showing "light to the shining sun."

Palsgrave also wrote *Lesclaircissement de la Langue Francoyse, compose par maistre Jehan Palsgrave Angloys, natyf de Londres et gradue de Paris*, in 1530.

Mr. Thompson Cooper, in Dict. Nat. Biog., account of Palsgrave (Vol. XLIII, p. 171), remarks that "the book was originally intended to be a kind of dictionary for the use of Englishmen seeking to acquire a knowledge of the French tongue," but that it has now a special value as one of the "best depositories of obsolete English words and phrases."

Dr. Furnivall has published (Lond., 1868) a copy of the Agreement between Palsgrave and his publisher, Richard Pynson; in the Indenture between them (second draft) it is agreed that—

the sayd Rycharde, his executors and assignes, shall Inprynt, or cause to be Inpryntyd, on boke callyd "lez les Clarcissementt de la lange Francoys," contay[n]ing iii sondrye bokes, where in ys schewyd howe the saide tong schould be pronownsyd in reding & spekyng, and all-so syche grammaticall rules as concerne

the perfection of the saide tong. with ii vocabulistes, oone begynnyng with Englishe nounnes & verbes expowndyd in frenshe. and a general vocabulist contayning all the wordes off the frenshe tong expownd in Englishe.

WILLIAM LILY. 1468?-1522.

*An Introduction of the eyght partes of speche, and the Construction of the same, compiled and sette forth by the commaundement of our most gracious soverayne lorde the king. Anno 1542.*

This is the earliest edition of Lily's Grammar which I have seen, containing the King's Proclamation.

The history of Lily's Grammar is very interesting. It has been sketched clearly and concisely by the Rev. J. H. Lupton, surmaster of S. Paul's School, in Notes and Queries, VI Series, Vol. II, pp. 441-2 and pp. 461-2, where its history is divided into three parts: (1) from its birth in 1509 until the Royal Proclamation about 1540; (2) from 1540 to the time when the Grammar was appropriated as the Eton Grammar; (3) from then to the present. The adoption of the Grammar as the authorized Latin Grammar, is paralleled only by the authorization of a particular rendering of the Scriptures. It is a cardinal point, about which centre the disputes of the progressive grammarians, as against the reactionary and conservative party which swore by Lily. The Proclamation and Address to the Reader may therefore be regarded as official documents which for good and evil bound down the recognized teaching of Latin for generations.

The following is the text of the Proclamation:

Henry the VIII, By the grace of God, King of England, France, and Ireland, defender of the faith, and of the Church of England, and also of Ireland, in earth the supreme head, to all schoolmasters and teachers of grammar within this his realm, greeting. Among the manifold business and most weighty affairs, appertaining to our regal authority and office, we forget not the tender babes, and the youth of our realm, whose good education and godly bringing up, is a great furniture to the same and cause of much goodness. And to the intent that hereafter they may the more readily and easily attain the rudiments of the Latin tongue, without the great hindrance, which heretofore hath been, through the diversity of grammars and teachings: we will and command, and straightly charge all you schoolmasters and teachers of grammar within this our realm, and other our dominions, as ye intend to avoid our displeasure, and have our favor, to teach and learn your scholars this English introduction, here ensuing, and the Latin Grammar annexed to the same, and none other, which we have caused for your ease and your scholars' speedy preferment briefly and plainly to be compiled and set forth. Fail not to apply your scholars in learning and godly education.

The Address to the Reader is as follows (in full). It is too interesting to omit it, both on account of the dignity of its English and the subject matter.

To the Reader.

Albeit this realm of England hath just cause to think itself most bounden to the goodness of God, for manifold and sundry benefits received of his inestimable bountifulness, yet if we will weigh the just value of things in an equal balance, as a certain wise philosopher did, which affirmed that realm to be most happy, whereas either a wise and a learned man had the rule, or the ruler applied himself to wisdom, and learning: we may perceive us Englishmen in nothing so fortunate, as in that we have a king and governor, both of excellent wisdom, learning and virtue, and also of great study and diligence to increase the same, whose kingly qualities, when they shall hereafter by such godly monuments, as his majesty shall leave behind him appear so plainly to his posterity, as we now presently see things, many of them already done, some in doing, and mo[re] shall see, which his majesty by the grace of God, intendeth hereafter to do: out of question all that have gone before him, may well appear but shadows. And to leave the large fields of his princely acts, wherein the wisest and best learned might walk till wit and eloquence were both weary, what constant judgment and what profound knowledge hath his majesty showed and declared to the world, in this variety of judgments and learnings, and what pains, study, and travail doth he take to bring things far out of square to a conformity, and to take good heed of Christ's

Church, to lead his flock into the fold of true doctrine the hurdles of the same so well underpight, that the wolves shall not be able to overthrow them. And as his majesty purposeth to establish his people in one consent and harmony of pure and true religion: so his tender goodness toward the youth and childhood of his realm, intendeth to have it brought up under one absolute and uniform sort of learning. For his majesty considering the great encumbrance and confusion of the young and tender wits, by reason of the diversity of grammar rules and teachings (for heretofore every master had his grammar, and every school divers teachings, and changing of masters and schools did many times utterly dull and undo good wits) hath appointed certain learned men, meet for such a purpose, to compile one brief, plain and uniform grammar, which only (all other set apart) for the more speediness, and less trouble of young wits, his highness hath commanded all schoolmasters and teachers of grammar within this his realm, and other his dominions, to teach his scholars.

Now consider you fathers in this realm, how much ye be bound to such a gracious King, whose care is not only for you, but for your posterity also, and your tender babes. And you schoolmasters of England, to whom the cure and education of tender youth is committed, with what great study and diligence ought you to follow the example of our most gracious sovereign; which among the infinite business, appertaining to his regal office, so earnestly mindeth the well bringing up of youth, in learning and virtue. How glad, how desirous ought you to be, not only to do this his grace's commandment, but also busily to apply yourselves, to trade and bring up your scholars in good manners, in knowledge of tongues and sciences. And somewhat to declare unto you the condition and quality of this grammar, ye shall understand, that the VIII parts of speech, and the construction of the same, be not here set forth in English at large, but compendiously and briefly, for the weak capacity of young and tender wits. And, therefore, if anything seemeth here to want in this English Introduction, ye shall understand, it was left out of purpose, and shall be supplied in the Latin rules made for the same intent, which children shall be apt to learn, what time they shall have competent understanding by these former rudiments. You tender babes of England, shake off slothfulness, set wantonness apart, apply your wits wholly to learning and virtue, whereby you may do your duty to God and your king, make glad your parents, profit yourselves, and much advance the commonweal of your country. Let noble prince Edward encourage your tender hearts, a prince of great towardness, a prince in whom God hath proved his graces abundantly, a prince framed of such perfectness of nature, that he is like by the grace of God, to ensue the steps of his father's wisdom, learning, and virtue, and is now almost in a readiness, to run in the same race of learning with you. For whom ye have great cause to pray that he may be the son of a long living father.

Learn diligently.

Love God entirely.

There is a further appeal to the scholar:

Ad Pubem Anglicam.

Hexasticon.

O tua parve puer non parva est gloria. Rex est

Commoda qui studii prospicit ampla tuis.

Rex magnus tibi parve puer, Rex porrigit ultro

Dulcia nectareæ pocula grammaticæ.

Accipe munifici dulcissima pocula regis,

Hæc hauri, hæc avidis faucibus ebibito.

God save the King.

The Introduction closes with Lily's *Carmen de Moribus* and Erasmus's *Christiani Hominis Institutio*.

The *Institutio Compendiaria totius Grammaticæ* follows the Introduction. This gives etymology, syntax and prosody. It is prefixed by an address in Latin to schoolmasters and teachers of grammar, in England.

Comparatively few are familiar with the Preface I have quoted. The later Preface is, however, very well known. It dates back, at any rate, to the 1577 edition.

*Charles Lamb's Description of the Later Preface.*

With what a savor doth the Preface to Colet's, or (as it is sometimes called) Paul's *Accidence*, set forth! "To exhort every man to the learning of grammar,

that intendeth to attain the understanding of the tongues. wherein is contained a great treasury of wisdom and knowledge, it would seem but vain and lost labor; for so much as it is known, that nothing can surely be ended, whose beginning is either feeble or faulty; and no building be perfect whereas the foundation and ground-work is ready to fall, and unable to uphold the burden of the frame." How well doth this stately preamble (comparable to those which Milton commendeth as "having been the usage to prefix to some solemn law, then first promulgated by Solon or Lycurgus") correspond with and illustrate that pious zeal for conformity, expressed in a succeeding clause, which would fence about grammar-rules with the severity of faith-articles!—"as for the diversity of grammars, it is well profitably taken away by the Kings Majesties wisdom. who, foreseeing the inconvenience, and favourably providing the remedie, caused one kind of grammar by sundry learned men to be diligently drawn, and so to be set out, only everywhere to be taught, for the use of learners, and for avoiding the hurt in changing of schoolmaisters." What a *gusto* in that which follows: "wherein it is profitable that he [the pupil] can orderly decline his noun, and his verb." *His* noun!

The fine dream is fading away fast [adds Charles Lamb]: and the least concern of a teacher in the present day is to inculcate grammar-rules."

ROGER ASCHAM. 1515-1568.

Roger Ascham was born at Kirby Wiske, near Northallerton. His father was steward to Lord Scrope of Bolton. He was taught by his father, and also, in the family of Sir Anthony Wingfield, by R. Bond. In 1530 Roger Ascham entered S. John's College, Cambridge. Taught there by Fitzherbert, Robert Pember, Cheke, and Redman. In 1533 took degree of B. A., and same year was elected to a fellowship at S. John's College, at the suggestion of Dr. Metcalfe, master of S. John's. In 1537 took his M. A. In 1538 he was appointed Greek reader at S. John's. Applied for a mathematical lectureship, which he did not get. Wrote official letters for the University. Took part in discussions on pronunciation of Greek. As a recognition of his *Toxophilus* (1545) Henry VIII gave him a pension of £10 a year. In 1546 succeeded Cheke as public orator of the University. In 1548 he became tutor to Elizabeth at Chestnut. He resigned his post in 1549-50 and returned to Cambridge. In 1550 was appointed secretary to Sir Richard Morysin, English ambassador to Charles V. For two years he travelled abroad in Italy and Germany. In 1553 he was appointed Latin secretary to Queen Mary, for whom he wrote 47 letters to different people, of whom cardinals were the lowest in rank, within three days. He married Margaret Howe in 1554. In 1559 he became prebend of Wetwang in York Cathedral. Between 1563 and 1568 he was writing his *Schoolmaster*, which was published in 1570. His children were Giles, Sturm (called after his friend in Germany, to whom he wrote so much but whom he never saw), and Dudley.

There is an able essay on "Roger Ascham the Humanist" in Professor Laurie's Teachers' Guild Addresses.

In German, T. Holzamer has edited *Der Schulmeister, mit einer Einleitung: Ascham's Leben und Wirken*. Pichler, Wien, 1881.

Mr. Sidney Lee, whose article on Ascham, in the Dictionary of National Biography, is very careful and inclusive, thus speaks of Ascham: His "undoubted love of sport is an interesting trait: it distinguishes him from the over-diligent students of the Renaissance, with whom he has much in common. His letters show him to have shared much of their irritability, and more than their customary freedom in demanding money of their patrons. But his treatment of his wife, of friends like Cheke and Sturm, and of his pupils, wholly relieves him of the charge of undue selfishness."

"Essays of Elia, "The Old and New Schoolmaster" (Ed. by Ainger, 1884), pp. 71-2. This essay first appeared in the London Magazine, May, 1821.

The following are the chief lives of Ascham:

1. *Oratio de Vita et Obitu Rogeri Aschami*, by Edward Grant, 1576.
2. *Dr. Johnson's Life of Ascham*, prefixed to Bennet's collected edition of Ascham's works, 1761.
3. Hartley Coleridge's *Life of Ascham*, in *Worthies of Yorkshire and Lancashire*, reprinted in Prof. Mayor's edition of the *Schoolmaster*.
4. Alfred Katterfeld. *Roger Ascham. Sein Leben und seine Werke. Mit besonderer Berücksichtigung seiner Berichte über Deutschland aus den Jahren 1550-1553.* pp. XI, 369. Strassburg, 1879.

The most important materials for the life of Ascham may be found in the Letters, of which the most complete edition is included in: *The Whole Works of Roger Ascham, Now First Collected and Revised, with a Life of the Author*; by the Rev. Dr. Giles. London. 1864. 4 vols.

In the 1863 edition of the *Schoolmaster*, Prof. J. E. B. Mayor (pp. 268-280) quotes Testimonies as to Roger Ascham—from Leland, Walter Haddon, Bale, Sir Thomas Smith, Geo. Buchanan, Queen Elizabeth, Dean Nowell, E. Grant, Walter Barker, Gabriel Harvey, Thomas Wilson, Richard Mulcaster, R. Robinson, Pilkington, J. Swan, Camden, T. Nash, Thuanus, Bacon, Gabr. Naudæus, Thomas Fuller, Teissier (*Eloges des Hommes Savans*. iii, 197), Morhof, and Charles Schmidt (*La vie et les travaux de Jean Sturm*. 1855).

Mr R. H. Quick mentions in his account of Mulcaster, in the Appendix to his reprint of the *Positions*, the interesting fact that in Prof. Arber's Transcript of the Registers of the Company of Stationers of London, 1554-1640 (vol. ii, p. 178b), is the following entry:

Thomas Chare sub manu Episcopi Londinii. Sexto die Marcii (1581) Receaved of him for his license to printe *positions* [i. e., *Positions*, the name of Mulcaster's book] whereupon the trayning up of children and so consequentlie the wholle course of learninge ys grounded \* \* \* xvi d. Provyded alwaies that yf this booke containe any thinge prejudiciall or hurtfull to the booke of maister ASKHAM that was printed by master Daie called the Scholemayster, That then this lycense shal be voyd.

The following is a list of Roger Ascham's works:

1. *Toxophilus*, 1545.
2. A report or Discourse written by Roger Ascham of the Affaires and State of Germany and the Emperour Charles his court, duryng certain years while the sayd Roger Ascham was there. 1553.
3. *The schoolmaster*. 1570.
4. Ascham also wrote three Latin treatises, but they have no bearing on the subject of education: 1. Commentary by Æcomenius on Epistles of Paul to Titus and Philemon. 2. Apology for the Lord's Supper against the Mass. 3. A letter to J. Sturm, *De Nobilitate Anglicana*. Ascham also wrote a few Latin poems.
5. *Ascham's Letters*.
  - (1) Edited by Edward Grant, 1576. 8°. Also 1578, 1581, 1590. There are three foreign editions: Hanover, 1602, 1610, and Coloniae Allobrogum, 1611. 12mo.
  - (2) Edited by Elstob, 1703. 8vo.
  - (3) Edited by J. G. Cochrane, 1815.
  - (4) Edited by Dr. Giles (*Whole Works of Roger Ascham*. 3 vols., 1865). Contains 295 of Ascham's letters, 40 of which were first published by Dr. Giles.

Ascham (Roger).

*Toxophilus. The schole of shootinge conteyned in two bookes. To all gentlemen and yomen of Englande, pleasaunte for theyr pastyme to rede, and profitable for theyr use to follow, both in war and peace. B. L. In ædibus Edouardi Whytechurch, Londini, 1545. 4to.*

The *Toxophilus*, properly, belongs rather to English literature than to educational history. Mr. Henry Craik says (*English Prose Selections*, Vol. 1, p. 238): "The *Toxophilus* is a dialogue, inculcating the necessity of cultivating the art of archery as an exercise at once pleasant and patriotic. But its real object is to show the learning of the author, and his power of managing a dialogue in the Platonic manner." Yet there are two reasons for which it deserves to be treated on the educational side. Firstly, the genuine enthusiasm Ascham shows along with Sir T. Elyot and Richard Mulcaster for the use of the English language in speaking to English people. Secondly, his advocacy of physical exercise.

If Ascham is named with Elyot and Mulcaster, it must be at once added that neither of the two had the quaint and charming simplicity of style which so characterizes Ascham. The following two passages will serve to illustrate his attitude as a scholar to the English language and his style in the use of it.

And although to have written this book either in Latin or Greek (which thing I would be very glad yet to do, if I might surely know your Grace's pleasure therein), had been more easy and fit for my trade in study; yet nevertheless, I, supposing it no point of honesty, that my commodity should stop and hinder any part either of the pleasure or profit of many, have written this English matter in the English tongue, for Englishmen; wherein this I trust that your Grace (if it shall please your Highness to read it) shall perceive it be a thing honest for me to write, pleasant for some to read, and profitable for many to follow; containing a pastime honest for the mind, wholesome for the body, fit for every man, vile for no man, using the day and open place for honesty to rule it: not lurking in corners for disorder to abuse it. Therefore I trust it shall appear to be both a sure token of my zeal to set forward shooting, and sure sign of my mind towards honesty and learning.

The second passage is an excellent specimen of Ascham's writing.

If any man would blame me, either for taking such a matter in hand, or else for writing it in the English tongue, this answer I may make him, that when the best of the realm think it honest for them to use, I, one of the meanest sort, ought not to suppose it vile for me to write; and though to have written it in another tongue, had been both more profitable for my study, and also more honest [honorable] for my name, yet I can think my labor well bestowed, if with a little hindrance of my profit and name, may come any furtherance to the pleasure or commodity of the gentlemen and yeomen of England, for whose sake I took this matter in hand. And as for the Latin or Greek tongue, everything is so excellently done in them, that none can do better: in the English tongue, contrary, everything in a manner so meanly both for the matter and handling, that no man can do worse. For therein the least learned, for the most part, have been always most ready to write. And they which had least hope in Latin, have been most bold in English: when surely every man that is most ready to talk is not most able to write. He that will write well in any tongue, must follow this counsel of Aristotle, to speak as the common people do, to think as wise men do: and so should every man understand him, and the judgment of wise men allow him. Many English writers have not done so, but using strange words, as Latin, French, and Italian, do make all things dark and hard.

The following passage advocates archery from the point of view of physical exercise for the student.

Then seeing pastimes be lawful, the most fittest for learning is to be sought for. A pastime, saith Aristotle, must be like a medicine. Medicines stand by contraries; therefore, the nature of studying considered, the fittest pastime shall soon appear. In study every part of the body is idle, which thing causeth gross and cold humors to gather together and vex scholars very much, the mind is altogether bent and set on work; a pastime then must be had where every part of the body

must be labored to separate and lessen such humors withal, the mind must be unbent, to gather and fetch again his quickness withal. \* \* \* If a scholar should use bowls or tennis, the labor is so vehement and unequal, which is condemned of Galen; the example very ill for other men, when by so many acts they be made unlawful. Running, leaping and quouting be too vile for scholars and so not fit by Aristotle's judgment; walking alone into the field hath no token of courage in it, a pastime like a simple man which is neither flesh nor fish. Therefore if a man would have a pastime wholesome and equal for every part of the body, pleasant and full of courage for the mind, not vile and dishonest to give ill example to laymen, not kept in gardens and corners, not lurking on the night and in holes, but evermore in the face of men, either to rebuke it when it doeth ill, or else to testify on it when it doeth well; let him seek chiefly of all other for shooting.

There is the following to attract the learned:

I marvel that you do not remember how that the nine Muses their self, as soon as they were born, were put to nurse to a lady called Euphemis, which had a son named Erotus, with whom the nine Muses, for his excellent shooting, kept evermore company withal. and used daily to shoot together in the Mount Parnassus; and at last it chanced this Erotus to die, whose death the Muses lamented greatly, and fell all upon their knees afore Jupiter their father, and, at their request, Erotus, for shooting with the Muses on earth, was made a sign [constellation] and called Sagittarius in heaven. Therefore you see that if Apollo and the Muses either were examples indeed, or only feigned of wise men to be examples of learning, honest shooting may well enough be companion with honest study.

Richard Mulcaster in his Positions contrasts Archery and Hunting to the advantage of the former, and it may be worth while here quoting a short passage (Quick's Reprint of the Positions, p. 102):

[Archery] hath a great deal better place in our fields for welfare [than hunting] and therefore the more, because it consisteth both of the best exercises, and the best effects of the best exercises. For he that shooteth in the free and open fields may choose, whether between his marks he will run or walk, dance or leap, hallo or sing, or do somewhat else, which belongeth to the other, either vehement or gentle exercises \* \* \* This exercise [of Archery] do I like best generally \* \* \* upon the causes before alleged, which if I did not, that worthy man our late and learned countryman master Askam would be half angry with me, though he were of a mild disposition, who both for training the Archer to his bow, and the scholar to his book, hath showed himself a cunning Archer and a skilful master.

The *Toxophilus* is in the form of a dialogue between Philologus and Toxophilus. By Philologus probably Ascham had Sir John Cheke in his mind, and, of course, Toxophilus is himself.

The following are the "Tables," or contents, of the two books into which the *Toxophilus* is divided.

#### *Book I.*

Earnest business ought to be refreshed with honest pastime. Shooting most honest pastime. The invention of shooting. Shooting fit for princes and great men. Shooting fit for scholars and students. Shooting fitter for students than any music or instruments. Youth ought to learn to sing. No manner of man doth or can use too much shooting. Against unlawful games, and namely cards and dice. Shooting in war. Obedience the best property of a soldier. Reasons and authorities against shooting in war, with the confutation of the same. God is pleased with strong weapons and valiant feats of war. The commodity of shooting in war through the histories Greek and Latin, and all nations Christian and Heathen. Use of shooting at home causeth strong shooting in war. Use of shooting at home, except men be apt by nature, and cunning by teaching, doth little good at all. Lack of learning to shoot causeth England lack many a good archer. In learning anything, a man must covet to be best, or else he shall never attain to be mean.

## Book II.

By knowing things belonging to Shooting	Proper for every sere man's use	Bracer. Shooting-glove. String. Bow. Shafts.
	General to all men	{Weather. Mark.
Hitting the mark by	Shooting straight	{Both come partly.
	Keeping a length	
By handling things belonging to shooting	Without a man	Standing. Nocking. Drawing. Holding. Loosing.
	Within a man	{Bold Courage. Avoiding all affection.

Of Archery Mulcaster said:

That it is a thing to be beloved, and liked, what argument is there that can be alleadged of comparable power to that of Cupide himselfe, which in the matter of love, doth bend with his bow, and enamour with his arrow?—Positions (Quick's Reprint), p. 101.

Other books on Archery were:

Richard Robinson.

*The Auncient Order, Society and Unitie Laudable of Prince Arthure, and his Knightly Armory of the Round Table; with a Threefold Assertion friendly in favour and furtherance of English Archery at this day. Translated and collected by R. R. Lond. 1583. 4to.*

Smith, Sir John.

*Certain Discourses concerning the Formes and Effects of divers sorts of Weapons, and other very important matters militarie, greatlye mistaken by divers of our men of warre in these daies; and chiefly of the Musquet, the Caliver, and the Long Bow; as also of the great sufficiencie, excellencie and wonderfull effects of Archer: with many notable examples and other particularities (by the author) presented to the Nobilitie of this realme, and published for the benefite of this his native cuntry of England. Lond. 1590. 4to.*

Gervase Markham.

*The Art of Archery. 1634. 8vo.*

Ascham (Roger).

*The Scholemaster Or plaine and perfite way of teachyng children, to onderstand, write, and speake, the Latin tong, but specially purposed for the private bryngyng up of youth in Ientlemen and Noble mens houses etc. B. L. J. Daye, London, 1570. 4to. 1571, 1572, 1573, 1579, 1589.*

Later Reprints:

1. by the Rev. James Upton, 1711, 1743.
2. by the Rev. J. E. B. Mayor, with notes, 1863.
3. by Professor Arber, 1870.
4. by I. Holzamer. (Introduction, translation into German, and commentary.) Wien, 1831.

Dedicated by Roger Ascham's widow, by whom it was sent to the press two years after Ascham's death, to Sir Wm. Cecil, principal secretary of state to Queen Elizabeth.

*The origin of the Scholemaster.*

In the Preface, Ascham gives an interesting account of the occasion on which the idea of writing the Scholemaster suggested itself to him. In 1563, during the time of a plague in London, a number of people met at the chamber of Sir Wm. Cecil at Windsor, to dine. The Company included Sir Wm. Cecil, Sir Wm. Peter, Sir J. Mason, D. Wotton, Sir Rd. Sackville, Sir Walter Mildmay, Mr. Haddon, Mr. John Astley, Mr. Bernard Hampton, Mr. Nicasius and Roger Ascham. The conversation turned to the news that several scholars of Eton College had run away,

for fear of beating. The several speakers gave their views as to the beating of boys, and Mr. Wotton gave utterance to an opinion very acceptable to Ascham, when he said that the schoolhouse should be in deed, as it is called by name, "the house of play and pleasure, and not of fear and bondage." After dinner Sir Rd. Sackville had a conversation with Ascham, and stated how before he was fully fourteen years old his schoolmaster drove him "with fear of beating from all love of learning." Recognising the great deprivation he had suffered, he expressed his determination that he would make his "mishap some occasion of good hap" to his grandson, Robert Sackville. Accordingly, he asks Ascham to point him out a schoolmaster who should put into practice sound and gentle principles of instruction. Ascham produces, accordingly, a literary schoolmaster.

*The chief points of the book.*

Ascham summarizes the first of the two books into which the Scholemaster is divided, in the following paragraph:

We had then further talk together of bringing up of children: of the nature of quick and hard wits: of the right choice of a good wit: of fear and love in teaching children. We passed from children and came to young men, viz., gentlemen: we talked of their too much liberty, to live as they lust: of their letting loose too soon to overmuch experience of ill, contrary to the good order of many good old commonwealths of the Persians and Greeks: of wit gathered, and good fortune gotten by some only by experience, without learning. And, lastly, he required of me very earnestly to show what I thought of the common going of Englishmen into Italy.

Ascham pleaded that he lacked ability to do all this, but Rd. Sackville would not be put off. "Seeing," said he, "God did so bless you, to make you the Scholar of the best Master (Sir John Cheke) and also the Schoolmaster of the best Scholar (Queen Elizabeth) that ever were in our time, surely you should please God, benefit your country, and honest [honor] your own name, if you would take the pains, to impart to others, what you learned of such a Master, and how ye taught such a Scholar."

As to the details of the Scholemaster it is impossible to give a full account. The book is, happily, easily accessible. It has its own quaint, spontaneous, literary flavor. It introduces the reader to educational ideas, to the literary spirit of an age, to the personal friends of the author, and to the friendly author himself.

There are certain points and passages which, even in the briefest of descriptions, it would be difficult to pass by.

*Ascham's "three books."*

In teaching Latin and Greek, Ascham requires the schoolmaster to state to the pupil, cheerfully and plainly, the cause and matter of the text. He must then construe it to the pupil, in English, so often as is necessary for the pupil to easily carry away the understanding of it. Then he must parse it all through. After an interval, the pupil is to construe and parse it back to the teacher and to be thoroughly examined.

I. There is an exercise-book to be given to the pupil, and sitting in some place, where no man shall prompt him, let him translate into English his former lesson. This is to be carefully corrected by the teacher.

II. After an hour's pause, the pupil must take another exercise and translate his own English into Latin again. The master must then go over it with the pupil and compare it with the original (Sturm's edition of Cicero for children is recommended for beginners by Ascham). "Where the child doth well, either in choosing or true placing of Tullie's words, let the master praise him and say: Here ye do well \* \* \*. If the child miss, \* \* \* the master shall have

good occasion to say unto him: N. Tullie would have used such a word, not this: Tullie would have placed this word here, not there: would have used this case, this number, this person, this degree, this gender; he would have used this mood, this tense, this simple rather than this compound: this adverb here, not there: He would have ended the sentence with this verb, not with that noun or participle."

III. Following on Sturm's practice, Ascham requires a commonplace book in which to enter the results of the pupil's observations and comparisons. He is especially to be on the look-out for:

1. *Proprium*, that which is literal, e. g.: Rex sepultus est magnifice.
2. *Translatum*, that which is metaphorical, e. g.: Cum illo principe, sepulta est et gloria et salus reipublicæ.
3. *Synonyma*, e. g.: Ensis, gladius; laudare, prædicare.
4. *Diversa*, e. g.: Diligere, amare; calere, exardescere; inimicus, hostis.
5. *Contraria*, e. g.: Dulcis et læta pax; acerbum et luctuosum bellum.
6. *Phrases*, e. g.: Dare verba; abjicere obedientiam.

The system of notebooks suggested by Ascham has been much praised, and seems to be in accord with the modern principle of requiring the self-activity of the pupil.

#### *Horsemen and schoolmasters.*

This is a famous passage showing the esteem (or rather lack of it) for schoolmasters in Ascham's time.

And it is pity, that commonly, more care is had, yea and that amongst very wise men, to find out rather a cunning man for their horse, than a cunning man for their children \* \* \*. To the one, they will gladly give a stipend of 200 crowns by year, and loth to offer to the other, 200 shillings. God, that sitteth in heaven, laugheth their choice to scorn, and rewardeth their liberality as it should; for he suffereth them, to have tame and well-ordered horse but wild and unfortunate children: and therefore in the end they find more pleasure in their horse, than comfort in their children.

#### *The Choice of wits.*

By this expression is meant the particular characteristics in children which warrant an expectation that they will become good students. There are "seven plain notes" which are that the child should be (Ascham follows Plato: Republic, Bk. vii):

1. *Εὐφρῆς*, sound in tongue, voice, face, stature.
2. *Μνήμων*, good of memory.
3. *Φιλομαθής*, given to love learning.
4. *Φιλόπονος*, having a lust to labor.
5. *Φιλήκοος*, glad to hear and learn of another.
6. *Ζητητικός*, bold to ask questions.
7. *Φιλέπαινος*, loveth to be praised for well-doing.

*As the child is used, so will he (or she) be.*

The well known passage about the teaching of Lady Jane Grey, "An example which may be heard with some pleasure, and followed with more profit," is as follows:

Before I went into Germany. I came to Brodegate [Bradgate], in Leicestershire, to take my leave of that noble Lady Jane Gray \* \* \*. I found her in her Chamber, reading Phaeton Platonis in Greek, and that with as much delight as some gentleman would read a merry tale in Bocace [Boccaccio]. \* \* \* I asked her why she would lose such pastime in the Park? smiling she answered me: I wisse, all their sport in the Park is but a shadow to that pleasure, that I find in Plato: Alas good folk, they never felt, what true pleasure meant. And how came you Madam, quoth I, to this deep knowledge of pleasure, and what did chiefly allure you unto it: seeing not many women, but very few men have attained thereunto? I will tell you, quoth she, and tell you a truth, which perchance ye will marvel at. One of the greatest benefits, that ever God gave me

is, that he sent me so sharp and severe parents, and so gentle a scholemaster. For when I am in presence either of father or mother, whether I speak, keep silence, sit, stand, or go, eat, drink, be merry or sad, be sewing, playing, dancing or doing anything else, I must do it, as it were, in such weight, measure and number, even so perfectly, as God made the world, or else I am so sharply taunted, so cruelly threatened, yea presently sometimes, with pinches, nips and bobs, and other ways \* \* \* so without measure misordered, that I think myself in hell till time come that I must go to M. Elmer [Aymer] who teacheth me so gently, so pleasantly, with such fair allurements to learning, that I think all the time nothing, whiles I am with him \* \* \* I remember this talk gladly, both because it is so worthy of memory, and because also it was the last talk that ever I had, and the last time, that ever I saw that noble and worthy lady.

*Learning contrasted with experience.*

Learning teacheth more in one year than experience in twenty: And learning teacheth safely, when experience maketh mo[re] miserable than wise. He hasardeth sore that waxeth wise by experience. An unhappy Master he is, that is made cunning by many shipwrecks: A miserable merchant, that is neither rich nor wise but after some bankrupt[cies]. It is costly wisdom that is bought by experience.

It should be added that the passages in which Ascham speaks of "Englishmen Italianated" are written *de plein cœur* with a ready hatred of Rome, all the fiercer for Ascham's self-enforced silence during Mary's reign.

*An example for the court to follow.*

It is to your shame (I speak to you all, you young gentlemen of England) that one maid should go beyond you all, in excellency of learning, and knowledge of divers tongues. Point forth six of the best given Gentlemen of this Court, and all they together, show not so much good will, spend not so much time, bestow not so many hours, daily, orderly, and constantly, for the increase of learning and knowledge, as doth the Queen's Majesty herself. Yea, I believe, that beside her perfect readiness in Latin, Italian, French and Spanish, she readeth here now at Windsor more Greek every day than some Prebendary of this Church doth read Latin in a whole week.

It is interesting to compare with this a quotation from the well-known panegyric on Queen Elizabeth in Mulcaster's Positions (Quick's Reprint, pp. 172-3):

That young maidens can learn, nature doth give them, and that they have learned, our experience doth teach us, with what care to themselves, themselves can best witness, with what comfort to us, what foreign example can more assure the world than our diamond at home? our most dear sovereign lady and princess, by nature a woman, by virtue a worthy, not one of the nine, but the tenth above the nine, to perfect in her person that absolute number, which is no fitter to comprehend all absoluteness in Arithmetic than she is known to contain all perfections in nature, all degrees in value and to become a precedent.

These examples excellently illustrate the style of Ascham and of Mulcaster. In Ascham, as Mr Craik points out, there is an "almost pedantic simplicity of style amounting often to uncouthness", whilst in Mulcaster there is a self-conscious pomposity of which he is so proud that he says in one place, speaking of the excellences of the English language, "I need no example in any of these, whereof my own penning is a general pattern." (Quoted in Mr Quick's charming Appendix to the Reprint of the Positions, p. 306.)

As to the question of Elizabeth's attainments, see Ballard's *Memoirs of British Ladies* (1775), pp. 147-170.

*Book II. "The ready way to the Latin tongue."*

Ascham repeats his Method of the Three Books. He describes it in detail, and states his satisfaction in the use of it with a pupil of his own, by name John Whitney, a young man of promise. Whitney died after Ascham had only taught him a short time, and Ascham wrote to his memory some verses in "misorderly metre", which he includes in the Scholemaster.

"*The six ways of learning tongues*" [*languages*].

These are given as—

1. Translatio linguarum.
2. Paraphrasis.
3. Metaphrasis.
4. Epitome.
5. Imitatio.
6. Declamatio.

As to translation, Ascham once more insists on double translation.

*Paraphrasis* is "to strive and contend (as Quintilian saith) to translate the best Latin authors into other Latin words, as many or thereabouts." This method, Ascham urges, is not for the scholar, but with a spice of sarcasm he suggests may be left to a perfect master. Double translation is far better.

*Metaphrasis* is to change a passage out of verse into prose or into some other kind of meter. Good method for "ripe heads." For in it, the "mind must needs be very attentive and busily occupied, in turning and tossing itself many ways. \* \* \* But this harm may soon come thereby. \* \* \* to young scholars, that in seeking other words and new form of sentences, they chance upon the worse."

*Epitome* is good for private use. But to use other men's epitomes of authors is a "silly poor kind of study." There is, however, for advanced students a use as well as misuse.

*Imitation* is "a faculty to express lively and perfectly that example, which ye go about to follow \* \* \*. To our purpose all languages, both learned and mother tongues, be gotten and gotten only by Imitation."

*The "necessary tools and instruments" of Imitation.*

"Which tools, I openly confess, be not of mine own forging, but partly left unto me by the cunningest Master and one of the worthiest gentlemen that ever England bred, Sir John Cheke." These are to be discovered as follows: by teaching—in the study of Cicero compared with Demosthenes, or Homer compared with Virgil.

1. Cicero retaineth thus much of the matter, these sentences, these words.
2. This and that he leaveth out, which he doth wittily to this end and purpose.
3. This he addeth here.
4. This he diminisheth there.
5. This he ordereth thus, with placing that here, not there.
6. This he altereth and changeth, either in property of words, in form of sentence, in substance of the matter, or in one or other, convenient circumstance of the author's present purpose.

*Is one model only to be followed in Imitation, or must all authors be imitated?*

Ascham's answer is: In every separate kind of learning and study follow a few and chiefly some one. He then discusses models according to the divisions in Genus: Poeticum, Historicum, Philosophicum, Oratorium, and their subdivisions.

Of all the Latin writers, he judges Varro, Sallust, Cæsar, and Cicero to be the authors to whom, for the purpose of Imitation, the young scholar should give heed. This section Ascham has not finished, and the promised treatment of Declamation is omitted, so that the Scholemaster as we have it is probably not completely in the form in which Ascham left it for publication.

To this account of the Scholemaster I ought to add that Ascham speaks in it of two projected books:

- i. (Mayor's ed. 1884, p. 117.)

But of all kind of pastimes fit for a Gentleman, I will, God willing, in fitter place, more at large, declare fully, in my *book of the Cockpit*.

ii. (Mayor's ed. 1884, p. 197.)

And by God's grace, if God do lend me life, with health, free leisure and liberty, with good liking and a merry heart, I will turn the best part of my study and time, to toil in one or other piece of this work of Imitation.

THOMAS BECON. 1512-1567.

Educated at Cambridge (S. John's College.) B. A. in 1530. His first living was at Brenzett, near Romney, in Kent. He had to abjure his opinions at S. Paul's Cross 1543, having gone too far in declaration of the Reformation. He retired to the Peak of Derbyshire with a view to taking pupils. He returned, in a year, to Warwickshire. He was next in Leicestershire. In all these parts he earned a living "in a lonely way by his teaching of youths." In 1547 (in Edward VI's reign) he was made rector of S. Stephen, Walbrook. On the death of Edward VI Becon was committed to the Tower. On his release, he retired to Strasburg. Wrote under name of Theodore Basil. In 1560, after the accession of Elizabeth, Becon became rector of Buchlank in Hertfordshire. He was also appointed to Christ Church, Newgate St., and later to the rectory of St. Dionis, Backchurch. He was a friend of Hugh Latimer. For further account see Ayre's Biographical Notice, prefixed to the Parker Society's reprint of Becon's Works, and the notice in the Dictionary of National Biography.

*A New Catechisme sette forth dialoge-wise in familiar talke betwene the father and the son, lately made and now fyrst of all published. n. d. John Daye.*

In the section "Offices of all Degrees" is "Of the Schoolmaster." *The importance and nature of the good Schoolmaster.*

Through the schoolmaster the youth of the Christian commonweal is brought up in the knowledge of God and of his holy word, and also in the science of good letters and virtuous manners; and so trained up in them from their very cradles, that as they grow in age, so likewise they increase in godliness, virtue, learning, knowledge, good manners, and innocence of life; and afterward become the faithful servants of God, and profitable members of the commonweal, yea, and good citizens of the country where they inhabit. Therefore those rulers and magistrates in whose power it is to choose and appoint schoolmasters, ought above all things to take heed that they elect and ordain such schoolmasters, such teachers and instructors of the Christian youth, as unfeignedly and from the very bottom of the heart fear God, love his word, embrace his religion, tender the glory of God, wish the increase of true godliness in all persons, are learned, are virtuous, in their life and conversation, desire well to the Christian public weal, and above all things think how best to profit, further, advance, promote and set forward the youth committed to their charge in all godliness, learning, knowledge and virtue.

Becon then insists on the *bringing up of children in Christian doctrine*:

A godly and diligent schoolmaster shall gather such flowers out of the holy bible for his scholars, from time to time, as occasion shall serve, with the sweet and strong savor whereof they may repel and put away the pestiferous and mortal odors of the errors and heresies, not only of the papists, but also of all other sectaries.

*And then, the schoolmaster's duty is "to teach good letters," not as mates, but as handmaids of God's Word.*

[Teach] poets, orators, historiographers, philosophers, etc., not that they should be mates with God's word, but rather handmaids unto it, and serve to set forth the honor and glory thereof. For unto this end ought all liberal sciences to be studied and learned even that they might not depress, but advance, the true religion of God. For eloquence without godliness is as a ring in a swine's snout; yea, all arts and sciences, not coupled with the love of religion, are rather instruments of wickedness than of godliness; and, as Tally saith, "To give to a lewd man eloquence without wisdom is none other thing than to give unto him armors to destroy the commonweal."

*The choice of classical authors.*

But, in reading these kinds of authors to his disciples, the schoolmaster must diligently take heed that he read those only to his scholars that be most profitable, and contain in them no matter that may either hinder the religion of God or the innocency of manners. Some writers in many places of their works are wanton and dishonest, as Martialis, Catullus, Tibullus, Propertius, Cornelius Gallus, and such-like; some wicked and ungodly, as Lucianus, etc. From the reading of these and such-like filthy writers, [it] is convenient that the youth do abstain: lest by the reading of them they make shipwreck both of their faith and manners and in their tender years drink in such corruption as shall be noisome unto them all their life after. For, as he saith: "Evil words corrupt good manners."

*Care of the heathen for innocency of life.*

The very heathen were so ware and circumspect in the virtuous and honest bringing up of their youth, that they by no means would suffer the breasts of their children to be infected with the reading of unclean and wanton writers, although never so wise, learned, and eloquent. Read we not that the Lacedæmonians commanded that the books of the poet Archilochus should be carried out of their city, because they entreated of vain, foolish, light, wanton and trifling matters: and that they by no means would suffer their children to read them, lest by the reading of them they should get more hurt to their manners than profit to their wits? They esteemed eloquence nothing in comparison of virtue and honesty. Eloquence is to be embraced, but not with the loss of virtue. All things ought to give place to virtue and innocency of life. Plato, that most divine and noble philosopher, also expelled all poets out of his commonweal, as persons occupied about vain, false, lying and wanton matters, unworthy to be read of such as tender the advancement of virtue.

*The case of Ovid.*

Was not the poet Ovidius banished of Augustus Cæsar for the books which he made *De Arte Amandi* (he might more justly have termed them *De Arte Meretricandi*, because that through the reading of them he corrupted the minds of the youth); yea, and so banished, that he could never after obtain favor to return into his country, notwithstanding the making of his books to the contrary, *De Remedio Amoris*; but after his long and miserable banishment and life among the barbarous and rude Getians, most miserably perished and died in that most savage and wild country? A punishment worthy of such fact. If the wise heathen thought it a thing unfitting to have their youth corrupted with the reading of vain and wanton books, and therefore banished both them and their authors out of their cities; how much more ought the Christians to be ware and circumspect, that nothing be read to their youth that may infect them with any lewdness, or work corruption either to their faith or to their manners!

After insisting that the godly and honest schoolmaster must not only teach "good and godly things," but must also practice them, Becon turns to the question of:

*Corporal punishment.*

[The schoolmaster] must consider the nature of his scholars. Some be so gentle and corrigible, that words may seem abundantly to suffice, and that without stripes. Some are so stubborn, stiff-necked, and almost incorrigible, that to bring them into the way, and to make them to prosper in their studies, there is need not only of words but also of stripes. The children, which either are tender, or tender witted, or fearful, or easy to be reclaimed, the schoolmaster ought gently to entreat, and to rebuke them only with words, or at the least, if they offend oft, to administer unto them easy punishment. But those children which are negligent, froward, stubborn, and rather given to play than to studies, yea, and that of set purpose, the master ought not only with words sharply to reprove them, but also with stripes largely to chastise them. Notwithstanding, in all punishments a measure is to be observed, lest through too much severity wits rather be dulled than quickened, studies rather oppressed than excited, and learning rather hated than embraced.

In the Catechism, in the discussion as to the duties of "Old Women," Becon points out that though women must not "teach in the congregation openly," yet "it is lawful for old and ancient matrons to teach." They may teach "young women to be soberminded, to love their husbands, to love their children, to be

discreet, chaste, housewifely, good, obedient to their husbands." So says the son. Wherefore the father says:

*What should women teach?*

I looked that thou shouldst have said unto me, that the ancient matrons should teach the young women trimly to dance, minionly to play upon the lute or virginals, cunningly to work with the needle, finely to apparel themselves, handsomely to play the serving-maids, pleasantly to entertain strangers, younkers and gentlemen, etc.

*Son.* These be things of vanity, rather provoking unto lewdness than unto virtue, heretofore abhorred and hated of all modest and sober women. The works and qualities, which St. Paul here setteth forth, that the ancient matrons should teach the young women, are necessary works and godly qualities. Can any thing be more necessary or godly in a Christian commonweal, than to bring up maids and young women virtuously, and to teach them "to be sober-minded, to love their husbands, to love their children, to be discreet, chaste, housewifely, good, obedient to their husbands, etc."

*Public schools for girls should be set up.*

To bring this thing to pass, it is expedient that by public authority schools for women-children be erected and set up in every Christian commonweal, and honest, sage, wise, discreet, sober, grave, and learned matrons made rulers and mistresses of the same, and that honest and liberal stipends be appointed for the said school-mistresses, which shall travail in the bringing up of young maids, that by this means they may be occasioned the more gladly and willingly to take pains.

*The need for girls' schools.*

If it be thought convenient, as it is most convenient, that schools should be erected and set up for the right education and bringing up of the youth of the male kind, why should it not be thought convenient that schools be built for the godly institution and virtuous bringing up of the youth of the female kind? Is not the woman the creature of God as well as the man, and as dear unto God as the man? Is not the woman a necessary member of the commonweal? have not we all our beginning of her? are not we born, nursed, and brought up of a woman? Do not the children for the most part prove even such as the mothers are of whom they come? Can the mothers bring up their children virtuously, when they themselves be void of all virtue? Can the nurses instill any goodness into the tender breasts of their nurse-children, when they themselves have learned none? Can that woman govern her house godly which knoweth not one point of godliness? Who seeth not now then, how necessary the virtuous education and bringing-up of the woman-kind is? Which thing cannot be conveniently brought to pass, except schools for that purpose be appointed, and certain godly matrons ordained governesses of the same, to bring up the maids and young women in the doctrine and nurture of the Lord. And verily, in my judgment, they do no less deserve well of the Christian commonweal, that found and stablish schools with honest stipends for the education and bringing up of the women-children in godliness and virtue than they which erect and set up schools for the instruction of the men-children in good letters and godly manners.

This is the strongest expression of opinion as to the necessity of girls' education in schools, which I have seen in the Tudor period, and is comparable with the passage in J. A. Comenius on the subject. See Keatinge's translation of the Great Didactic, p. 220.

SIR THOMAS MORE. 1478-1535.

Sir Thomas More (born in 1478) was sent to S. Anthony's Free School, Threadneedle St., under Holt, the author of the Latin grammar, *Lac Puerorum*. Then entered the house of Cardinal Morton, who pronounced: "This child here waiting at the table, whoever shall live to see it, will prove a marvellous man." In 1492 More was sent to Oxford, probably to Canterbury Hall, afterwards included in Christ Church foundation. Learnt Greek from Linacre. He studied also Latin, French, music, arithmetic, geometry, and history. In 1494 More entered New Inn; in 1496, Lincoln's Inn. In 1501 he was called to the bar; in 1504 entered Parliament. In 1505 married Jane Colt, who died in 1510. The same year he married Alice Middleton. In 1511 he became reader in Lincoln's Inn. Employed

on embassies, to Flanders in 1515, to Calais in 1517. In 1518 became a privy councillor, and in 1520 was present at the Field of Cloth of Gold. In 1523 he went to live at Chelsea, and same year was made Speaker of the House of Commons. In 1529 he became lord high chancellor. In 1532 he resigned. In 1534, refused the oath to Act of Succession. In 1535, put to death.

The latest life of More is that of Father Bridgett:

*Life and Writings of Sir Thomas More, Lord Chancellor of England and Martyr under Henry VIII, by the Rev. T. E. Bridgett of the Congregation of the Most Holy Redeemer. London: Burns & Oates. New York: Catholic Publication Soc. Co. 1891.*

This is an interesting and thorough work, but of course written from the Catholic stand-point. Earlier authorities, on which Mr. Bridgett's work is based, are the Letters of Erasmus, Roper's Life of More, Harpsfield's Life of More (in MS.), George Lilly's Elogia Virorum, Rastell's Life of More, Stapleton's Tres Thomæ (published at Douai in 1588), Cresacre More's Life of More.

Of recent lives of More there are:

1. Miss A. T. Drane's Three Chancellors (Wykeham, Waynfleet, and More), 1860.
2. The charming account in Seeböhm's Oxford Reformers (Colet, More, and Erasmus), 3rd edition, 1887.
3. The article on Sir Thomas More by Mr. Sidney Lee in the Dictionary of National Biography, Vol. XXXVIII, 1884.

#### *The education of Sir Thomas More's family.*

Nothing is better illustrative of the highest education of women in Tudor times than the accounts of the education of Sir Thomas More's daughters. The following is a translation of one of Erasmus's letters of 1521 (Bridgett, p. 115) to Budée:

A year ago it occurred to More to send me a specimen of their [his children's] progress in study. He bade them all write to me each one without any help, neither the subject being suggested nor the language corrected; for when they offered their papers to their father for correction, he affected to be displeased with the bad writing, and made them copy out their letters more neatly and accurately. When they had done so, he closed the letters and sent them to me without changing a syllable. Believe me, dear Budée, I never was more surprised; there was nothing whatever either silly or girlish in what was said, and the style was such that you could feel they were making daily progress. This amiable circle, with the two husbands, all live in his house. In that house you will find no one idle, no one busied in feminine trifles. Titus Livius is ever in their hands. They have advanced so far that they can read such authors and understand them without a translation, unless there occurs some such word as would perhaps perplex myself.

Mr Bridgett devotes pages 127 to 138 to More's letters regarding the education of his children. The following passage from a letter to Margaret Roper is remarkable,

*Where More expresses his opinion that the education of women should go on after marriage:*

You tell me that Nicholas [a tutor], who is so fond of you, and so learned in astronomy, has begun again with you the system of the heavenly bodies. I am grateful to him and I congratulate you in your good fortune; for in the space of one month, with only a slight labor you will thus learn thoroughly these sublime wonders of the Eternal Workman, which so many men of illustrious and almost superhuman intellect have only discovered with hot toil and study, or rather with cold shiverings and nightly vigils in the open air in the course of many ages. \* \* \* Though I earnestly hope that you will devote the rest of your life to medical science and sacred literature, so that you may be well furnished for the whole scope of human life, which is to have a healthy soul in a healthy body, and I know that you have already laid the foundations of these studies, and there will be always opportunity to continue the building; yet I am of opinion that you may, with great advantage, give some years of your yet flourishing youth to humane letters and liberal studies. \* \* \* It would be a delight, my dear Margaret, to me to converse long with you on these matters: but I have just been interrupted and called away by the servants, who have brought in supper. I must

have regard to others, else to sup is not so sweet as to talk with you. Farewell, my dearest child, and salute for me my most gentle son, your husband. I am extremely glad that he is following the same course of study as yourself. I am ever wont to persuade you to yield in everything to your husband; now, on the contrary, I give you full leave to strive to get before him in the knowledge of the celestial system. Farewell again. Salute your whole company, but especially your tutor.

*Erasmus on Sir Thomas More.*

A full account of the praises written of Sir Thomas More would take up a great deal of space, but the following summary of the merits of English scholars by Erasmus cannot be omitted:

When I listen to my friend Colet, it seems to me like listening to Plato himself. In Grocyn, who does not admire the wide range of his knowledge? What could be more searching, deep and refined than the judgment of Linacre? When did nature mold a character more gentle, endearing and happy than Thomas More's?

For the more personal and anecdotal side of Sir Thomas More, the *Life* by William Roper, More's son-in-law, should be read. Its full title is: *The Life Arraignement and Death of that Mirrour of all true Honour and Vertue, Syr Thomas More*. It was first published at Paris, 1626. It is included in the Pitt Press edition and the Camelot Classics edition of More's *Utopia*.

Sir Thomas More.

*A fruteful and pleasaunt worke of the beste state of a publyque weale, and of the new yle called Utopia: written in Latine by Syr Thomas More, knyght, and translated into Englyshe by Raphe Robynson Citizein and Goldsmythe of London, at the procurement, and earnest request of George Tadlowe Citizein and Haberdassher of the same Citie. Imprinted at London by Abraham Vele, dwelling in Pauls churchyarde at the sygne of the Lambe. Anno 1551.*

The original Latin edition was printed in 1516 at Louvain; other editions were: Antwerp, 1516; Paris, 1516-7; Basil, 1518.

The following bibliography I take from Professor Arber's reprint, a most satisfactory and valuable edition.

English translations:

Ralph Robinson's translation: London: 1551, 1556, 1597, 1624, 1639, 1808 (Dibdin), 1869 (Arber).

Bishop Gilbert Burnet: London: 1684, 1737 (Dublin), 1743 (Glasgow), 1751 (Oxford), 1753 (Oxford), 1808, 1849, 1850. With other works: 1758 (ed. Warner), 1838 (ed. St. John).

Arthur Cayley (the younger): With other works, 1808.

As Professor Arber's edition was printed 1869, the following must now be added:

1. Edited by J. R. Lumby in the Pitt Press Series, Cambridge, 1879.
2. Reprint of Dibdin's edition, by Robert Roberts, Boston, Lincolnshire, 1878.
3. Edited by Prof. Henry Morley
  - (1) In *Universal Library. Ideal Commonwealths*, 1885.
  - (2) In *National Library Series*, 1889.
4. Edited by M. Adams in *Camelot Series*, 1890.
5. With introduction and notes by T. Lattimer. *English Classics for Schools*, 1891. Also 1899.
6. Revised by F. S. Ellis (Foreword by W. Morris), *Kelmscott Press*, 1893.
7. Edited by J. H. Lupton. *Clarendon Press Series*, Oxford, 1895.
8. Edited by Robert Steele. *Temple Classics*, 1898.

All the above are Ralph Robinson's translation.

## DESCRIPTION OF THE UTOPIAN EDUCATION (INCLUDES TECHNICAL INSTRUCTION).

*No citizen is without a science (i. e., as we say, an art).*

Besides husbandry [i. e., tillage] which, as I said, is common to them all, every one of them learneth one or other several and particular science, as his own proper craft. That is most commonly either cloth working in wool or flax, or masonry, or the smith's craft, or the carpenter's science. For there is none other occupation that any number to speak of doth use there. \* \* \* Every man learneth one [craft]. And not only the men but also the women. But the women, as the weaker sort, be put to the easier crafts: as to work wool and flax. The more laborious sciences be committed to the men. For the most part every man is brought up in his father's craft. For most commonly they be naturally thereto bent and inclined. But if a man's mind stand to any other, he is by adoption put into a family of that occupation, which he doth most fantasy. \* \* \* Yea, and if any person, when he hath learned one craft, be desirous to learn also another, he is likewise suffered and permitted. When he hath learned both, he occupieth whether he will; unless the city have more need of the one than the other.

*The daily study of good literature in Utopia.*

It is a solemn custom there to have lectures daily early in the morning, where to be present they only be constrained that be namely chosen and appointed to learning. Howbeit a great multitude of every sort of people, both men and women go to hear lectures, some one and some another, as every man's nature is inclined. Yet, this notwithstanding, if any man had rather bestow his time upon his own occupation, (as it chanceth in many, whose minds rise not in the contemplation of any science liberal) he is not letted, not prohibited, but is also praised and commended, as profitable to the commonwealth.

*The nursing of infants.*

Every mother is nurse to her own child, unless either death or sickness be the let. When that chanceth, the wives of the syphograutes <sup>a</sup> [magistrates] quickly provide a nurse. And that is not hard to be done. For they that can do it, proffer themselves to no service so gladly as to that. Because that there this kind of pity is much praised: and the child that is nourished, ever after taketh his nurse for his own natural mother. Also among the nurses sit all the children that be under the age of v. years.

*The education of young children.*

All the other children of both kinds, as well boys as girls, that be under the age of marriage, do either serve at the tables, or else if they be too young thereto, yet they stand by with marvellous silence. That which is given to them from the table they eat, and other several dinner time they have none. \* \* \* Throughout all the house equal of age be set together, and yet be mixed and matched with unequal ages.

*Education for all, and in what it consists.*

All in their childhood be instructed in learning. And the better part of the people, both men and women throughout all their whole life do bestow in learning those spare hours, which we said they have vacant from bodily labors. They be taught learning in their own native tongue. For it is both copious in words, and also pleasant to the ear: and for the utterance of a man's mind very perfect and sure. \* \* \* Of all those philosophers, whose names be here famous in this part of the world to us known, before our coming thither not as much as the fame of any of them was come among them. And yet in music, logic, arithmetic, and geometry, they have found out in a manner all that our ancient philosophers have taught.

*One point of inferiority to the writer's own country.*

But as they in all things be almost equal to our old ancient clerks, so our new logicians in subtle inventions have far passed and gone beyond them. For they have not devised one of all those rules of restrictions, amplifications and suppositions, very wittily invented in the small logicals, which here our children in every place do learn. Furthermore, they were never yet able to find out the second intentions: insomuch that none of them all could ever see man himself in com-

<sup>a</sup> See Book ii, Ch. iii, and note, in Clar. Press. Ed. (J. H. Lupton).

mon, as they call him, though he be (as you know) bigger than ever was any giant, yea and pointed to of us even with our finger.

*The study of natural philosophy.*

But they be in the course of the stars, and the movings of the heavenly spheres very expert and cunning. They have also wittily excogitated and devised instruments of divers fashions: wherein is exactly comprehended and contained the movings and situations of the sun, the moon and all the other stars, which appear in their horizon. But as for the amities and dissensions of the planets, and all that deceitful divination by the stars, they never as much as dreamed thereof. Rains, winds, and other courses of tempests they know before by certain tokens, which they have learned by long use and observation. But of the causes of all these things and of the ebbing, flowing and saltness of the sea, and finally of the original beginning and nature of heaven and of the world, they hold partly the same opinions that our old philosophers hold, and partly, as our philosophers vary among themselves, so they also, whiles they bring new reasons of things, do disagree from all them, and yet among themselves in all points they do not accord.

*The learning of Greek by the Utopians.*

In the exercise and study of the mind they be never weary. When they had heard me speak of the Greek literature or learning (for in Latin there was nothing that I thought they would greatly allow, besides historians and poets) they made wonderful earnest and importunate suit unto me that I would teach and instruct them in that tongue and learning. I began therefore to read unto them, at the first truly more because I would not seem to refuse the labor, than that I hoped that they would anything profit therein. But when I had gone forward a little, I perceived incontinent by their diligence, that my labor should not be bestowed in vain. For they began so easily to fashion their letters, so plainly to pronounce the words, so quickly to learn by heart, and so surely to rehearse the same, that I marvelled at it, saying that the most part of them were fine and chosen wits and of ripe age, picked out of the company of the learned men, which not only of their own free and voluntary will, but also by the commandment of the counsel [council] undertook to learn this language. Therefore, in less than three years space, there was nothing in the Greek tongue that they lacked.

*The three years' course of Greek reading.*

They were able to read good authors without any stay, if the book were not false. This kind of learning, as I suppose, they took so much the sooner, because it is somewhat allyaunte [=allied, kindred] to them. For I think that this nation took their beginning of the Greeks, because their speech, which in all other points is not much unlike the Persian tongue, keepeth divers signs and tokens of the Greek language in the names of their cities and of their magistrates. They have of me (for when I was determined to enter into my iii. voyage, I cast into the ship in the stead of merchandize a pretty fardel [=bundle] of books, because I intended to come again rather never, than shortly) they have, I say, of me the most part of Plato's works, more of Aristotle's, also Theophrastus of plants, but in divers places (which I am sorry for) unperfect. For whiles we were a-ship-board, a marmoset chanced upon the book, as it was negligently laid by, which wantonly playing therewith plucked out certain leaves, and tore them in pieces. Of them that have written the grammar, they have only Lascaris. For Theodorus I carried not with me, nor never a dictionary but Hesichius, and Dioscorides. They set great store by Plutarch's books. And they be delighted with Lucian's merry conceits and jests. Of the poets, they have Aristophanes, Homer, Euripides, and Sophocles in Aldus' small print. Of the historians they have Thucydides, Herodotus, and Herodian. Also my companion, Tricius Apinatus, carried with him physic books, certain small works of Hippocrates and Galen's Microtechne [or Ars parva]. The which book they have in great estimation.

*The printing of books and making of paper in Utopia.*

For when we showed to them Aldus his print in books of paper, and told them of the stuff whereof paper is made, and of the feat of graving letters, speaking somewhat more, than we could plainly declare (for there was none of us, that knew perfectly either the one or the other) they forthwith very wittily [=cleverly] conjectured the thing. And whereas before they wrote only in skins, in barks of trees, and in reeds, now they have attempted to make paper, and to imprint letters. And though at the first it proved not all of the best, yet by often essaying the same, they shortly got the feat of both.

Works connected with the history of education written by Sir T. More:

1. Here is conteyned the lyfe of J. Picus, Erle of Myrandula \* \* \* With dyvers epistles and other workes of ye sayd J. Picus. (Translated by Sir Thomas More.) (1510 ?) 4to.  
Reprint in the Tudor Library. D. Nutt & Son. 1890. 4to.
2. *Lac Puerorum*. (A Latin Grammar by J. Holt, with two epigrams by Sir Thomas More.) (1510 ?) 4to.
3. *Epistolarum D. Erasmi* \* \* \* *libri xxxi.* \* \* \* *Quibus adjiciuntur T. Mori* \* \* \* *epistolae.* 1642. fol.

5. Letter written by Sir T. More, concerning the education of his family, to Mr. Gunnel, their domestic tutor, in a volume: *Hints on Education.* 1821. 12mo.
6. *The Lady's Monitor*; selected from the writings of Lady Jane Grey, \* \* \* Sir Thomas More, etc. (Six letters of More.) 1828. Svo.
7. *Epigrammatica.* Apud J. Frobenium. Basilæ, 1518. 4to.

Amongst the books on Sir Thomas More may be mentioned:

1. *Thomas Morus und sein berühmtes Werk Utopia.* (German translation and bibliography) by E. M. Oettinger. Leipzig, 1846.
2. *Thomas Morus*, by R. Baumstark. 1879. Freiburg in Breisgau.
3. Nisard (M. D.). *Études sur la Renaissance. Renaissance et Réforme.* Érasme, T. Morus, etc. 1855. Pt. 2, 1877.

## CHAPTER XI.

### MEDICAL INSPECTION OF SCHOOLS ABROAD.<sup>a</sup>

Translated from Handbuch der Schulhygiene, 2d edition, of Dr. Leo Burgerstein and Dr. August Netolitzky.

*Contents:* Arguments in favor of medical inspection—Teachers should not act as sanitary inspectors—Physicians alone competent—Financial considerations—Purpose of medical inspection—Mortality of children—Diseases among school children—Inspection of boarding establishments—Teacher's sympathy needed—Medical inspection in Europe and America—Regulations for medical inspection—Permanency of position of school physicians—Official or private physicians—Duties of school physicians—Should school physicians treat sick children?

#### ARGUMENTS IN FAVOR OF MEDICAL INSPECTION.

The organism of children is yet, during their school life, in the full course of development, and, consequently, the more sensitive their organs are the more easily they retain the mental and physical impressions received. If the influence of these impressions is not watched and regulated, permanent injuries may result. This applies not only to disturbances of bodily health, but to the origin and development of evil qualities of character and diseased states of the mind.

As far as schools are concerned, the causes of disease among school children are to be found mainly in the long deprivation of freedom, the restricted benefit of pure fresh air, the unaccustomed quiet position in sitting, the confined activity of the muscles, and premature and often protracted mental effort. Although rural school buildings are, as a rule, most deficient in hygienic arrangements, still country pupils have a great advantage over city school children, in that they enjoy in full measure exercise in the open air, which is the chief condition of harmonious physical development. For example, pupils of country schools seldom suffer from myopia, because they are seldom, if at all, engaged outside of school in any work which weakens the vision. Diseases that occur in like manner among city and country school children are mainly attributable to deficient light, badly designed seats, or unhygienic appliances for instruction, principally, however, to insufficient ventilation of crowded and closed schoolrooms.

The sanitary significance of the exacting mental work implied in a forced mastery of studies is not to be underrated. Generally the progress of education, at the present day, causes great demands to be made upon the knowledge and ability of each individual and, in consequence, public schools must afford their pupils an amount of knowledge hardly required of adults fifty years ago. Unfortunately the bounds of moderation are not always observed in this regard. A moderate, thorough knowledge is not deemed sufficient. The main stress of instruction is placed upon much knowledge rather than upon the development and training of the judgment; the memory is burdened with many unessentials, so that the youthful brain accumulates a confused mass of superficial knowledge, which is quickly forgotten after school days are over. Inappropriate methods of instruc-

tion under unfavorable conditions may be the cause of physical and mental disease.

The constantly increasing number of magnificent buildings and the introduction of hygienic arrangements for instruction, on the one hand, are manifestations of the growing care for the welfare of youth that deserve recognition; on the other, however, vigilance over other existing evils is only too lax. The knowledge that school buildings have well-constructed seats, sufficient ventilation, and plenty of light has caused inattention and carelessness toward dangers that threaten from other quarters. If we read the works of Cohn, Hertel, Von Hippel, Kafemann, Key, and others we shall see that a continuous supervision of schools and school children is most necessary out of regard for health. Myopia and scoliosis are on the increase; Bezold, Bresgen, and Schmiegelow prove that diseases of the nose, ear, and eye often go hand in hand with "poor talents." Many diseases frequently spread in the schools for a long time unrecognized and unobserved, so that the call for protective measures becomes more and more justified.

It is gratifying to note that within recent years much has been done for the promotion of school hygiene. Though the attendant sacrifice has been great the results attained have been commensurate with the effort. To quote only a few instances: According to Desguin, since adequate sanitary precautions have been taken, diseases of the eye and skin are of much less frequent occurrence in the schools of Belgium, and contagious diseases have not spread. Kuborn gives more favorable figures respecting myopia among the school children of Liege, and, as Belliard states, cases of accommodation cramp are decidedly fewer in Nantes since hygienic measures have been taken. Many sanitary improvements have been effected *without abridging or even disturbing class instruction, and without overburdening teachers.*

Most hygienic and sanitary evils may be nearly always remedied or prevented by an intelligent *supervision* of schools and pupils and by a proper employment of appropriate precautionary measures. A prompt and correct choice of these means, however, presupposes accurate knowledge and good understanding of the faults and deficiencies to be removed or supplied. Far from being perceptible at once, hurtful external influences frequently make themselves felt only after a long while; disease is not always easily and quickly perceived by the nonmedical eye, especially when it is of slow development and the first symptoms disclose themselves gradually and imperceptibly. A comprehensive technical knowledge is frequently required to establish and trace the connection between these and definite external influences. The *physician* alone possesses such knowledge, together with practical experience.

#### TEACHERS SHOULD NOT ACT AS SANITARY INSPECTORS.

Though the opinion has been advanced in various quarters that the superintendence and regulation of the measures for the maintenance of health in schools can be given in charge of teachers, this view is based upon a misapprehension of actual conditions. The carrying out of a rational system of school hygiene presupposes comprehensive methods of investigation and profound special knowledge in all branches of the care of health, which can be attained only by a thorough study of medicine and never by self-instruction or autodidactic teaching. The examination of the eyes, spine, palate, and heart of new pupils, the signification of the observations made by mothers before their children have entered school, and the suggestions and instructions for a proper individual physical treatment of children presupposes a technical knowledge which one who is not an educated physician does not possess. Courses of lectures on somatology, school hygiene, and the care of health can no more replace the study of medicine than pedagogy,

which presupposes a long term of practical experience, can be acquired during the few lessons of a course at a teachers' institute. Faulty, insufficient medical knowledge is a dangerous weapon in the hands of a nonprofessional and can only work harm. If—and not altogether unjustly—a newly graduated physician does not receive the full confidence of the people that may be given to an older, more experienced man, by so much the less can one who is not of the medical profession have, in regard to sanitary matters, a right understanding of the requirements of health and the hygienic measures to be taken to preserve it. The judging of sanitary questions is a matter for physicians, just as questions of building must, undeniably, be decided by architects, and those of instruction and training by teachers. The practical test of the value of the propositions and demands made by physicians is an affair for teachers. Unfortunately, however, it happens that, through excess of zeal, physicians, as well as teachers, overstep the bounds of their profession and touch upon matters which they do not fully understand.

An impatient pressing forward on the one hand and a jealous warding off on the other have disturbed and deferred the solution of the question of medical inspection in schools. The introduction of medical inspection has been opposed on both pedagogical and financial grounds, and, on the part of municipal authorities, out of consideration for possible annoyances in administration.

At first certain educators expressed the fear that medical specialists might go too far in their demands and attach too much importance to the sanitary factor, repressing mental development by limiting the subjects of instruction, exercising a disturbing influence upon the internal management with reference to method, programmes, and home lessons, and diminishing the prestige of teachers among pupils and in society. This prejudice has yielded to a better view, since teachers have been convinced that physicians have in no wise undermined their authority, that teaching and hygiene can go hand in hand in following out their ideal aims, and that harmonious physical and mental development is best promoted by their cooperation.

As Schubert has justly observed, the strong opposition on the part of teachers arose from the fact that it was feared an additional authority might be established which would give rise to friction, mutual distrust, and a state of uncertainty. A dictatorial attitude, without regard to pedagogical demands and aims, might occasion a confusion, in consequence of which both health and education would suffer. In education the aims of instruction alone can not determine; the physical welfare of the children must also be kept in view and promoted. The view of prominent educators is often advanced that it is a duty of the school to promote the physical well-being of the children; but for this physicians are necessary. Private study in hygiene, enthusiasm and zeal on the part of teachers, can not take their place. Some questions relating to the preservation of health, it is true, are easily understood, but many require special medical information.

#### PHYSICIANS ALONE COMPETENT.

In matters of school hygiene the cooperation of teachers is indispensable, though they can not supply the place of physicians; without the help of the teacher, however, fruitful work on the physician's part is inconceivable. To gain this, the dissatisfaction of many educators, who gave expression to their "aversion to being told what to do by a physician," had to be overcome, and teachers convinced that physicians desire neither to disturb the course of instruction nor impair the authority of teachers, but only to cooperate in the cause of general education. A primary condition for profitable cooperation is therefore, unquestionably, the judicious choice of a physician who possesses a quiet, tactful manner, wide experience, and a knowledge of human nature. Such medical men

will always act in complete accord with teachers and not assume a critical attitude. Experience so far proves that school discipline by no means suffers under medical regulations, and that school physician and school principal working in complete unison can together promote the interests of education. In recognition of these facts, the number of fervent advocates of medical inspection in schools is increasing among influential teachers. At the present day instances of jealousy of and prejudice against medical cooperation on the part of teachers are isolated and rare.

The reasons advanced by municipal authorities for opposing the installation of school physicians show all too clearly that administrative officials fear being hampered in the free exercise of their proper rights by sanitary agents.

As late as 1893, for instance, the city council of Berlin rejected the motion to inaugurate measures for the examination and supervision of the health of school children for the reason that examination by physicians entailed loss of time and great expense, disturbed instruction, and implied a certain distrust of the school board, and that, moreover, the condition of health among school children was satisfactory, and that teachers themselves could exercise supervision. This view has since then changed essentially in Berlin.

It is instructive to follow the long struggle in Breslau, in which Dr. Cohn has been the chief figure. It may be generally accepted that the opposition to medical inspection on the part of local authorities is based chiefly on the fact that physicians may make known damage of various kinds to school buildings, disclose procrastination for years in the treatment of sanitary affairs, and occasion great expenditure of money, thus disturbing the quiet and ease of many a town council.

Since then, however, a large number of cities, recognizing the fact that compulsory education has laid upon them not only the right but the obligation to care for the health of school children, have appointed school physicians: cautiously at first, but in more rapid succession as their fears proved unfounded. The distrust of the medical profession lest private practice might be injured through the measures taken by school physicians, and the anxiety of parents regarding meddling interference with home education, have likewise proved to be exaggerated and without cause.

Furthermore, the fear was entertained that medical inspection in schools would awaken and develop a certain distrust and prejudice among the people, concerning chiefly the authority of parents and teachers, thus injuring the cause of education.

In *Norway*, accordingly, medical examination of school children was characterized as a direct encroachment upon family rights. Not only have these objections been estimated at their proper value by physicians, as well as by teachers, in different medical congresses (Paris, Vienna, London, Brescia), and the necessity of introducing medical inspection in schools asserted, but it has been also recommended by the chief health authorities in many States, as, for instance, by the Scientific Council of *Prussia* (October 21, 1888) and the State Board of Health of *Saxony* (October 30, 1891).

#### FINANCIAL CONSIDERATIONS OF REGULAR MEDICAL INSPECTION.

Financial reasons have also been advanced against the institution of school physicians, still the conviction is constantly gaining ground that with appropriate organization attendant costs for medical inspection are insignificant compared with the advantages which accrue to children, the family, and the State, from a regulated medical supervision of school children, school buildings, and instruction.

It is only just that a physician, like any other brain worker, should receive pay

according to his services, and so, in justice, it can not be expected that the responsible position of school physician should be considered solely an honorary office, and that the duties should be left to the judgment and caprice of a "nonofficial" physician. Definite work can be required only of a salaried physician. The costs of medical supervision of schools would be moderate if in smaller communities this were combined with the municipal health service, and if in larger cities the duties of school physician were divided among city physicians of the poor already appointed.

#### PURPOSE OF MEDICAL INSPECTION.

The purpose of medical inspection in schools is to take care that no injuries result from school attendance. The importance of this is best shown by the results of the medical examinations of pupils during recent years. Besides nearsightedness and curvature of the spine, headache, anæmia, nosebleeding, nervousness, mental fatigue, etc., are increasing to an appalling degree among school children in both city and country. Moreover it can not be denied that the close contact of children causes the rapid spread of infectious diseases; and not only the so-called children's diseases—measles and scarlet fever—but those the spread of which has in recent years been proved beyond a doubt to be owing to attendance at school.

From the examination of 5,100 boys and 3,200 girls Schmid-Monnard has proved that children during their first years at school gain little in weight and height. Acute diseases occur particularly during the first school year and under unfavorable sanitary conditions at home.

Chronic diseases are more frequent by 5 to 10 per cent among girls than among boys; the number of the former suffering from anæmia is twice as large at the close as at the beginning of the scholastic year. Nervousness and headache are of more frequent occurrence in schools with afternoon sessions, and increase in the higher classes. The cause lies in the greater amount of work, long sitting, and the bent posture in writing, piano playing, and manual work.

#### MORTALITY OF SCHOOL CHILDREN.

According to Pressl, the mortality of school children between 7 and 14 years of age ranges between 1.2 per cent and 0.4 per cent, being greater among girls because of their more delicate physical constitution and their early employment in domestic work. Geissler has calculated the mortality among 31,696 school children between 7 and 14 years of age (1886-91). The results are here tabulated:

Causes of death.	Per cent of deaths due to each disease.			Number of deaths from each disease in every 10,000 school children.		
	6 to 10 years of age.	10 to 14 years of age.	6 to 14 years of age.	6 to 10 years of age.	10 to 14 years of age.	6 to 14 years of age.
Diphtheria .....	35.86	15.11	29.75	22.77	4.29	13.84
Scarlet fever .....	13.17	7.44	11.48	8.96	2.11	5.34
Measles .....	2.25	.67	1.79	1.43	.19	.83
Whooping cough .....	.70	.12	.53	.44	.03	.25
Typhoid fever .....	1.92	5.35	2.93	1.22	1.52	1.35
Contagious diseases, collectively .....	53.90	28.69	46.48	34.23	8.14	21.62
Consumption alone .....	5.55	14.15	8.08	3.53	4.01	3.76
All other diseases .....	40.55	57.16	45.44	25.76	16.21	21.14

According to Würzburg, 11.8 persons in 10,000 between the ages of 10 and 20 years, the time of life during which a large number of minors attend school, died

of tuberculosis in Prussia. These figures are made more impressive by the results of the investigations of Hertel and Key, as may be seen from the following table prepared by Key:

*Percentage of sick among school children, according to age and grade, in Sweden.*

Schools.	General schools.				Latin schools.					Modern high schools.						
Classes.	I.	II.	III.	IV.	V.	VI.	VII.	VIII.	IX.	X.	VI.	VI.	VII.	VII.	VII.	VII.
Average age.....	11.3	12.3	13.4	14.3	15.4	16.5	17.4	18.3	19.4	14.6	15.7	16.6	17.6	18.7	19.5	
Per cent of sick pupils:																
(a) Myopia excluded	34.4	37.6	38.3	37.4	33.6	34.7	33.6	40.5	33.9	32.9	23.7	25.8	31.7	33.6	38.9	
(b) Myopia included	37.6	41.4	43.2	43.9	45.5	49.7	52.7	58.1	53.5	38.1	35	38	39.8	48.4	50	

Among 50,027 children in 106 London schools, Warner found 9,176 with mental or physical defects. The Danish commission, appointed at the instance of Hertell found 29 per cent unhealthy boys among 16,789 examined. The examination of the pupils in the public schools of Prague showed that 4.43 per cent were nearsighted, 1.54 per cent were hard of hearing, and 5.5 per cent were otherwise afflicted. The oculist's examination of 2,476 school children between the ages of 7 and 14, in Berlin, during the years 1897 to 1899, showed that of 300 between 13 and 14 years of age, 24 per cent possessed normal sight, 35.3 per cent were farsighted, 25.7 per cent nearsighted, and 15 per cent weaksighted; of the remaining 2,176, 48.9 per cent possessed normal vision, 29.7 per cent were farsighted, 16.8 per cent nearsighted, and 9.6 per cent weaksighted. In Zurich, of 2,667 new members of the first-year class, 757 were examined by eye and 423 by ear specialists: 508 were found to suffer from abnormal vision, 364 from diseases of the ear, 222 from astigmatism, 83 from the effects of a running ear, and 148 from a diseased tympanum.

Krapelin draws attention to the fact that in school, children are required to do a certain amount of mental work and that no heed is given as to whether the youthful brain is able to meet the requirements. To be able to judge the capacity of pupils regarding the amount and character of their work other factors must be taken into consideration; as, for instance, liability to fatigue, capacity for work increased by exercise, duration of working time, kind of work, intermissions for rest, time given to sleep, all factors which in their combined physiological action exhibit a very close relation and interdependence on each other, the establishing of which is one of the most important problems of school supervision. In his statistical inquiries Key has kept in view, among other things, the relations between length of sleep and state of health, and has compared the actual customary with the needful time for sleep.

According to Key, children from 10 to 11 years of age should have 10 to 11 hours of sleep; from 12 to 13 years, 10 hours; those 14 years old, 9.3 hours; from 15 to 16 years, 9 hours; from 17 to 18 years, 8.3 hours if the capacity for work and endurance is not to weaken and diseases increase in number.

These remarks substantiate the claim that physicians alone can properly judge and appreciate sanitary conditions of schools, and that reliable statistical material for judging the influence of school and instruction upon the health of the young can be collected and interpreted only by school physicians.

A supervision of school children outside of school, of their home conditions and manner of life, is likewise necessary. The statistical inquiries of Key concerning the home relations of 11,192 school children in Sweden show that 58.5 per cent live with their parents; the others are brought up in other families as boarders, and most of those in the higher classes are deprived of parental care. How little

attention is given to ventilation and light in boarding houses! How overcrowded narrow quarters are! How often is it necessary to seek redress, and call those foster parents to account who look upon child boarders solely as a source of revenue and never think of the duties they have assumed in taking charge of such children!

#### INSPECTION NECESSARY IN BOARDING ESTABLISHMENTS.

In *Austria* a ministerial decree of January 22, 1897, ordered an investigation of the conditions in the student quarters of pupils of Realschulen (high schools), classical schools, and normal schools, which disclosed a multitude of sanitary and moral evils. By ministerial decree of December 17, 1897, the directors of these schools, and by the decree of May 10, 1899, those of industrial and commercial schools, were directed to draw up information for boarding and lodging house keepers relating to sanitary and moral requirements respecting the rooming of children with other persons, the supervision of them, and the distribution of their work. At the same time teachers were invested with the right to require parents to withdraw their children from unsuitable boarding houses, and directors were instructed to recommend suitable quarters. The supervision of the sanitation of students' quarters is included in the jurisdiction of the municipal officials, with whom the directors are to consult. In union with physicians and teachers, local authorities are to conduct regular inspections of students' quarters. In places where there is a lack of accommodation the erection of dormitories under the direction of teachers is to be promoted as much as possible. Special attention must be given to such pupils as are obliged to remain in school during the mid-day intermission, and all possible effort must be made to provide poor children with warm food. Teachers are to cultivate and maintain conciliatory relations with parents and their representatives, for the sake of the children's education.

Sanitary inspection must be unremitting in boarding institutions, in which particularly those dangers must not be underrated which are a result of living and sleeping together and supplying food to large numbers. For such matters, teachers alone will not answer; decisions must be left to professionally educated men.

Following the example of *France*, where for more than half a century rural orphan asylums have existed, as well as the model of the English "Scattered home," the attempt has been made in northern *Austria* to buy or rent country houses and give poor, honest, married couples a moderate stipend for bringing up 8 or 10 orphans till their fourteenth year of age. The advantage of this educational method is that children enjoy, at moderate cost, family life and a home education suitable to their station in life, and a fondness for agricultural pursuits is awakened in them.

Teachers and physicians are unanimously agreed that sanitary inspection of schools is required for the interests of education itself, and that its control can not be laid upon the shoulders of teachers alone. For secondary schools and like institutions, the circumstances must be considered that teachers are fully occupied with their own individual work, have not the time to prescribe and carry out sanitary measures for schools and pupils, and are not sufficiently acquainted with the work of the medical profession.

#### THE TEACHER'S SYMPATHY NEEDED.

In public schools teachers and pupils obtain varied information on sanitary affairs from extracts in readers, enabling them to examine with critical eyes the sanitary conditions and hygienic appointments of their surroundings. If, however, this knowledge is to broaden and a correct practical application is to result from suggestions, teachers must, above all things else, possess a deeper knowledge

of the fundamental principles of hygiene, and must have their attention directed to the dangers which threaten the salutary education of the young from various quarters.

By a thorough study of hygiene, which in accordance with the views repeatedly expressed at teachers' meetings in *Germany* should hold a fitting place in any curriculum and be a subject for examination, candidates for teachers, it is true, learn to know the necessity and usefulness of hygienic measures, but do not acquire the ability to undertake complicated investigations independently, or even to institute proper sanitary measures. The opinion of Altschul must be indorsed that "an understanding of hygienic regulations is not synonymous with the power to make such regulations."

On the other hand, it must also be readily conceded that sanitary inspection in schools can prove beneficial only when physicians are in sympathy with teachers, remain in constant communication with them, and act in concert with them. That the care of health lays a great duty upon teachers, without the fulfillment of which the ideal end can never be attained, is self-evident. Who better than teachers can draw physicians' attention at the proper time to abnormal indications among pupils, to hardness of hearing, slow understanding, etc.? Who is more reliable than the teacher for the daily regulation of the temperature, ventilation, heating, and cleaning of schoolrooms? To whom can the young be better intrusted on excursions for study, during recreation at school, etc., than to teachers?

To keep the uniform direction of schools undisturbed the physician can not be intrusted—except in case of protective measures against threatened danger from infectious diseases—with the right of independently directing sanitary measures. On the other hand, school authorities can not dispense with his cooperation in matters of health, and will therefore be obliged to consult him in all affairs pertaining to hygiene, and for this reason make him a member of the board.

#### MEDICAL INSPECTION IN EUROPE AND AMERICA.

To satisfy the needs of regulated sanitary inspection of schools, the different states of *Europe* and *America* have adopted different measures according to local conditions.

As early as the beginning of the nineteenth century Peter Frank, of *Austria*, considered the fittings for schools and the instruction in his *System of a Complete Medical Police*; in *Sweden* in 1832 the number of lessons was diminished for reasons of health. In the year 1869 medical inspection in schools was discussed at the scientific congress at *Innsbruck*, and was repeatedly brought up at later meetings. One of the most fervent advocates for medical inspection in schools is Dr. Cohn, of *Breslau*. In *Wurtemberg* the medical examination of pupils was in 1875 given in charge of the superior district physicians. School physicians were subsequently appointed in different cities of *Sweden*, *Austria-Hungary*, *France*, *Egypt*, *Belgium*, and *Holland*. The present status of sanitary and hygienic supervision of schools in various countries may be gathered from the following notes:

Since 1882 in *Cairo, Egypt*, a school physician has been employed at a salary of 12,000 francs, besides two assistants with each a salary of 3,600 francs, having the supervision of 5,000 pupils.

In the *United States* the significance of school hygiene for the common welfare has been more and more recognized since the foundation of the Hemenway Gymnasium, 1879, under Director Sargent.

Medical inspection has been introduced into the schools of *Boston* (1890), *Philadelphia* (1892), *Chicago* (1886), and *New York* (1897). As a rule, one physician is appointed for 1,000 children, so that *New York*, for instance, has about 300 such physicians. Schools are daily inspected by these, the children indicated by the teachers examined, the sick and suspected sent home, the

absent looked up at home to ascertain the facts about their sickness, without the physicians encroaching upon the rights of home or the family physician.

*Boston* is divided into 55 school districts, each with 4 school buildings and about 1,400 pupils. A physician with a salary of \$1,000 is appointed for each district. Besides the functions mentioned, his duty is to assure himself that the prescribed isolation of cases of diphtheria and scarlet fever has been effected, and to see that the regulations for disinfection are observed. In one year among 14,686 children examined 9,188 were found to be sick and 413 suspected of infection.

In *Chile* in 1888 the supervision of schools was intrusted to a provincial council including a physician as member, and the supreme direction of sanitary affairs was given in charge of a superior board of public health composed of seven members.

School physicians in *Chile* are required to visit each school at least once a month, inspect the sanitary condition of the building and surroundings, inform themselves of the condition of health among the children, make note of their observations, and hand in a monthly report. The teachers are advised to give physicians all possible support.

A special interest in the introduction of medical inspection in schools has been manifested in *Argentina*, where Coni with two colleagues gave his services gratis until the educational law of 1884 was passed, whereby the supervision of schools was legally placed in the hands of a medical superintendent, who publishes his observations regularly and delivers lectures on the principles of hygiene. *Buenos Ayres* has three school physicians with three assistants and one secretary. In the province *Entre-Rios*, consequent upon the legal introduction of medical inspection in schools since 1890, the one holding the office in each prefecture is required to visit the schools at least once a month, to enter results in a book, to examine pupils under suspicion of illness, and to give the certificate for return after recovery.

In *Japan* in 1898 the minister of education directed the nomination of salaried school physicians in all public schools, and such were at once appointed in *Fu*, *Hokkaido*, and *Ken*; only places with fewer than 5,000 inhabitants are exempted from the appointment of a school physician. The nomination is made by the governor and the duties are defined by law. A monthly visitation of schools is required.

In *Europe*, marked progress has been made in medical inspection in schools within the last decade.

In *Belgium* the city of *Brussels* first appointed special school physicians in 1874, who are required to visit schools three times a month. The duties of the 52 school physicians appointed in 1896 are identical with those prescribed in *Neuchâtel* (Switzerland), only that, in addition, they are required to see that cases of infectious disease are isolated in the respective families of pupils, and that the regulations for disinfection are carried out. In view of the favorable results, dentists and oculists were likewise appointed to examine pupils regularly. Similar arrangements exist in *Antwerp*, *Louvain*, *Liege*, and other cities. According to Delvaile, instruction in hygiene is given in 65 per cent of the public schools.

In *Germany* medical inspection is differently organized in the different States. In *Bavaria* and *Wurtemberg* since 1892 physicians in office are required to visit schools unannounced and to report sanitary defects. In *Heilbronn* each pupil undergoes a medical examination and receives a certificate of health (*Grundbuchsblatt*) for the whole school period, in which are specified general physical constitution, height, weight, chest measure, condition of skin, spine, sight, hearing, mouth, nose, speech; suggestions for treatment in school; information for parents, and observations of teachers. In *Prussia* the supervision of schools is confined to medical officials, who visit them on their regular circuits and report their observations in prescribed forms, for which blanks are furnished. This measure, however, is limited only to the sanitary condition of the school buildings. Many cities (*Leipzig*, *Dresden*, *Königsberg*, *Sigmaringen*, *Wiesbaden*, *Nuremberg*, *Darmstadt*, *Karlsruhe*, *Offenbach*, etc.) have introduced their own measures for medical inspection of schools. The city of *Berlin* March 3, 1900, by way of experiment, appointed 10 physicians, each having the oversight of 2 schools, with a salary of 500 marks (\$125) for each school. Their main duties are to examine new pupils and those proposed for extra lessons as to physical defects; at the request of the school committee to examine children said to be unable to attend school because of sickness; to give opinions on contagious disease, and arrangements of buildings prejudicial to health. Similar laws obtain in *Charlottenburg* and other cities.

In *Breslau* school physicians are appointed for three years and must show a certificate of hygienic study. They take part in the deliberations of school committees, and have an average of 2,000 children each under them. In *Frankfort-on-the-Main* 11 school physicians are appointed, each with 1,000 marks (\$250) salary, and averaging 1,700 children each in charge. The duties of these, however, are only advisory, since they are limited to examination of the feeble-minded and stuttering, and to the expression of opinion on the buildings, seats, and baths, gymnastic games, new buildings, and renovations. *Wiesbaden* possesses a statute in the law of 1897 which has been used by many other cities as a model. Six physicians are appointed, each having a salary of 600 marks (\$150), and 1,000 to 1,300 children in charge. They make a two hours' visit every two weeks, seat all the newly admitted pupils with defective sight and hearing, pass judgment

upon admission to subordinate branches of study (gymnastics, singing), keep the *Grundbuchsblätter*, and make annual reports.<sup>a</sup>

In the duchy of *Meiningen* school physicians are appointed at the public expense as medical advisors to district and city school officials; their duty is to thoroughly examine the health of newly admitted children. In *Baden*, district physicians must inspect schools once a year; in *Hesse*, district physicians make an annual report upon the condition of health in schools; in *Alsace-Lorraine*, the schools are officially inspected by physicians in office; in *Mecklenburg*, since 1891, district physicians are required to inspect institutions on their regular circuit of visits during hours of instruction. In *Saxony*, district physicians must examine plans of construction and supervise sanitary conditions of educational institutions. *Leipzig* introduced its own system of inspection in 1892, dividing the city into 15 districts, each with 3,000 to 4,000 children and one physician, with a salary of 500 marks, intrusted with the supervision of schools and pupils. Generally, in all German states, school authorities regularly consult medical officials when considering plans for new school buildings or renovations, examining sites and surroundings, drinking water, ventilation, light, heating, and when judging the condition of buildings and the arrangement of schoolrooms and studies.

In *Great Britain*, where superintendence of schools is a local affair, individual cities have appointed school physicians. Since 1889, the *London* school board employs one medical school officer,<sup>b</sup> who passes upon the sanitary features of plans for school buildings, the hygienic conditions of public schools, and the physical qualifications of candidates for the teaching profession. In *Edinburgh*, since 1892, schools are inspected by two physicians (one male and one female).

#### REGULATIONS FOR MEDICAL INSPECTION.

The first regulations concerning medical inspection in schools in *France* date back to the year 1833; but it was not until 1884 that the city council divided *Paris* into school districts, each with 15 to 20 classes, and a health inspector with a term of office for three years, appointed by the prefect on the nomination of the mayor; the salaries of the 123 physicians foot up to 100,800 francs. By decree of April 2, 1896, medical inspection of schools was completely organized and a general school inspector appointed who is to assist the superintendent of studies in all measures that affect the hygiene of pupils and schools. At the close of the year he is required to make to the city council, through the superintendent of studies and prefect of the Department of the Seine, a comprehensive report on the conditions affecting health in the schools of Paris, based upon the communications of the medical school inspectors. Each school physician in Paris has about 1,200 to 1,800 elementary pupils in charge. At the bimonthly inspections the sanitary condition of the school building and its appointments must be investigated, sick children examined, and the report presented to the administrative authorities within twenty-four hours. Every year all children 10 years of age are vaccinated, and those are selected who are to be sent to vacation schools. Unfortunately, secondary schools, lycées, and gymnasia, as well as private schools, are not subject to medical inspection. By the laws of October 30, 1889, and January 18, 1887, school inspection was decreed for the departments; still it was at first introduced only in 10. By the law of July 15, 1892, the communal physicians of the poor are required to inspect the schools and pupils in the provinces, so that now medical inspection has been introduced into all the public educational institutions of France.

<sup>a</sup>The former Prussian minister of education, Dr. Bosse, in 1900, addressed an order to the various provincial governments regarding the introduction of regular medical examinations and the inspection of all educational institutions. It reads in part as follows:

Medical inspection in the schools of Wiesbaden has proved that many infirmities, diseases, and predisposition to disease are found in children of large cities before their entrance into school, which after subsequent recognition are erroneously attributed to attendance at school, and which, moreover, imperil the health of other pupils. It is of interest to learn the state of health of children in rural districts by means of the medical examination of a large number of children who either have been just admitted to school or have attended some time, so that it may be judged from the facts deduced whether permanent medical inspection be necessary in rural schools, and to what extent. The provincial school authorities are therefore ordered to select about six schools in each county (*Regierungs-Bezirk*) where children about to be admitted, chosen from various grades of the population as far as practicable, shall be examined by the health officer, assisted by the local school inspector and teacher, to ascertain whether they may be admitted without danger to other pupils, and whether they can attend all or some of the classes [this refers to dispensation from gymnastic exercises, etc.] without prejudice to their physical development. In regard to the first point, the investigation should cover infectious and contagious diseases, especially scarlet fever, measles, whooping cough, and diphtheria. With regard to the second point, the general build, mental development, constitutional diseases, and physical infirmities should be considered.

The inspection of class rooms from a hygienic standpoint is likewise required, and the following points are to be considered: Number of children, capacity of rooms, cleanliness, natural and artificial light, window shades, temperature, ventilation and heating, condition of the air, seats and desks and other furniture. The inspection of schoolhouses includes that of grounds, in regard to drinking water, drainage, and vicinity of factories.—ED.

<sup>b</sup>In 1898 two assistants to the medical officer were appointed, and in 1902 three are reported, two men and one woman. In 1900 a standing subcommittee was constituted to supervise the work of the medical officer's department.—ED.

Since 1889 instructions have been in force in *Norway* to the effect that with the consent of the local administration a physician may inspect the health of school children; but by decree of September 24, 1891, this regulation was extended, so that the health of pupils must be medically examined three times a year, in May, August, and December, and a report drawn up in prescribed form by the board of teachers and physician, who are to give special attention to the causes of absence from school, headache, and fatigue. No special school physicians are appointed; medical inspection is in charge of city physicians, who receive for this service an increase of salary. The first school physician was appointed in 1885 in Hamar, for a public school with 700 pupils. A law for school physicians was passed May 24, 1898, in pursuance of which they are to advise teachers in all matters of health, inspect the hygienic conditions of schools, examine pupils, inspect during instruction in drawing, writing, gymnastics, and manual work, examine all communications from private physicians certifying illness and physical defects which would justify absence from school, and hand in a report at the close of the school year.

Whereas in most states medical inspection of schools is a local affair, and in great measure dependent upon municipal authorities, in *Austria-Hungary* it is a State institution, which is, however, differently organized and developed in the two parts of the realm.

In *Austria*, the supervision of schools is an affair of the State; in the different Crown lands it is under the provincial councillor of education, in the school districts under the district school boards, and in the different communities under the local school boards. Though special school physicians are not appointed, medical inspection is assured through special regulations.

In addition to detailed regulations concerning the sanitary arrangements of schools, the ministerial decree of June 9, 1873, directed that each district school board should have a permanent committee on health, with a physician as regular member. No general law for medical inspection in schools exists, but numerous minor orders assure the influence of official physicians in school affairs. In deciding upon plans for new constructions and alterations local school boards are required to consult physicians, and district boards and the councillor of education must obtain the opinion of State health officials before consenting to any building project. State physicians, 359 in number, exclusive of physicians appointed by independent municipal authority, are required by numerous regulations to inspect schools, to remedy at once existing evils and report subsequently to school boards, to present suggestions, and to make yearly a detailed report on sanitary conditions. In most all Crown lands, continuing the development of sanitary organization, provision for medical school service is completely made by the appointment of district physicians, since it is made the special duty of these to inspect schools. Moreover, in all larger communities the forming of boards of health under the chairmanship of the mayor is prescribed, at whose ordinary sessions physicians and teachers must be conjoined as regular voting members.

The duties of public physicians, in so far as they concern educational affairs, consist in the application of preventives against contagious diseases in school and at the home of teachers; in the examination of children to be excused from studies and those suspected of contagious diseases; in the execution of regulations concerning the cleanliness and disinfection of school buildings; in the supervision of heating, ventilation, seats, etc. By decree of the minister of the interior, February 23, 1900, the participation of public physicians in the proceedings of boards relating to construction of school buildings was prescribed anew and made more positive.

Several cities lead in giving good example in the regulation of medical inspection in schools. In *Troppau*, *Friedek*, and *Freiwaldau* (Silesia), physicians have undertaken the service gratis; they inspect schools, consult with teachers on sanitary affairs in quarterly meetings, examine new pupils, watch over their health, etc. In *Brünn*, the city council has increased the number of sanitary districts to 10, the number of physicians to 13, and has confided to these the duties of medical inspection of schools, selecting one for special examination of diseases of the eye and ear. In *Salzburg*, since 1894, public physicians examine the physical and mental condition of school children. In *Vienna*, the inspection of schools and the periodic examination of pupils are in charge of city physicians under the direction of the head physician appointed by the city; their duties are defined by the law of May 9, 1895.

Moreover, individual educational institutions appoint their own physicians; in this respect, the Theresian Academy in Vienna (a boarding school combined with a classical high school) serves as a model. A head physician and two resident physicians conduct the medical inspection of this institution; games are supervised and adapted to physical conditions, and the pupils are examined at regular intervals by an oculist and a dentist. At the beginning and close of the school year pupils undergo a medical examination. Besides a winter bathhouse with 20 tubs, and a large summer swimming pool, which is used for skating in the winter, each dormitory is provided with a shower-bath apparatus. The infirmary has 74 beds, each having 36 cubic meters of air space. For older pupils seven, for younger eight and a half to nine hours sleep are allowed.

In *Hungary*, the office of school physician was created by Minister Trefort in 1885, and in 1887 the first physicians were appointed; they are obliged to superintend the health of school children, inspect the sanitary conditions of school buildings and their appointments, as well as the dwellings where pupils board, and, finally, give instruction in hygiene in secondary schools. School physicians are members of the teaching corps, have a vote on all questions of hygiene, and are consulted on all matters concerning health. As certain preparatory studies and exami-

nations are required of them, such physicians have as yet been appointed only in secondary schools; the lower schools are still without them. Some private institutions, as, for instance, the Jewish elementary schools in *Budapest*, with about 1,300 pupils, have appointed their own physicians, who are required to hand in semiannual reports.

In *Roumania*, by decree of April 5, 1893, head state physicians are required, either themselves or in the persons of district physicians, to examine all school children at least once a year, to inspect buildings with reference to construction and appointments (heating, light, cleanliness, drinking water, privies, etc.), to supervise all that touches in any way on the subject of health, and to submit propositions to the proper authorities for supplying existing wants and remedying evils.

In *Russia*, the minister of the interior is assisted by a "medical board" composed of prominent physicians, and the minister of education by a "medical department." The supervision of health in schools is in charge of school directors and school physicians. A strong movement is in progress in favor of the introduction of medical inspection in schools. Since 1871 a physician has been appointed for each secondary school, who not only treats pupils and has a voice in their admission, but who is also required to supervise schools, pupils, and methods, and see particularly that gymnastic exercises are adapted to the pupils' physical powers. Since 1887 the right of vote on sanitary questions has been granted to these physicians in the sessions of district school boards. Special physicians have been appointed for the schools of various large cities. Since 1835, in *Moscow*, 6 physicians have been in charge of health matters in the 72 elementary schools, and since 1888 two female physicians have been employed at the girls' high school. Besides their other functions, these physicians are required to vaccinate and revaccinate, to treat poor sick pupils free of charge, and to manage affairs in cases of epidemics.

The expression "school physicians," in the proper sense of the term, was first employed in *Sweden*, though at first their duties did not comprehend the work done by them at the present day; for in 1863 they were only obliged to examine pupils with reference to exemption from gymnastic exercise. In 1874 committees on health were given charge of the schools, especially their ventilation, and in 1878 school physicians were required to examine the health of children at the beginning of the term and report the results.

In *Switzerland*, *Lausanne* was the first to establish an excellent school medical service. Physicians with definitely outlined duties have been appointed in *Lausanne*, *Zurich*, *Basel*, *Chaux-de-fonds*, *Montreux*, *Yverdon*, *Neuchâtel*, *Chur*, and *Nyon*. In the Canton of *Zug*, by decree of July 25, 1894, physicians are required to examine all the pupils of the lower classes within fourteen days after their admission, and to supervise the enforcement of the police regulations in cases of infectious disease; also the school hygiene and ventilation, domestic work, closing of school during hot weather, etc. In 1893 the canton of *Vaud* promulgated a law concerning the care of health in public and private schools, including directions for procedure during the prevalence of contagious diseases, disinfection, etc. In 1900 *Freiburg* issued an ordinance relative to the superintendence of health in schools by physicians. In *Geneva*, by an ordinance of December 24, 1888, sanitary inspection is in charge of 12 physicians, who are obliged to examine school localities and pupils twice a year. In *Basel* and *Zug* the instructions for school physicians have reference to the seating of pupils with respect to size, position of the body, and nearsightedness; also to the hygiene of the eye, ear, and voice; to intermissions, course of study, vacations during hot weather, home lessons, private lessons, physical exercises, sickness, dismissal of children from school, and to the inspection of the sanitary condition of appointments and the appliances of instruction. In *Neuchâtel* school physicians are required to keep constant watch over the sanitary condition of schools, examine the plans for buildings, supervise the carrying out of the rules relating to light, ventilation, and heat, examine the mental and physical condition of pupils, determine when there is complete recovery from contagious diseases, acquaint teachers with the first symptoms of such diseases, and teach them first helps in cases of accident. Poor sick children are treated only upon request of parents. One hour a week is set aside for the examination of school localities, and one hour for consultation on matters pertaining to the service. Every third semester a lecture is held on some subject of school hygiene, and once a month a report is made to the school board.

In *Servia* the erection of schools is regulated by law; in *Belgrade* special physicians are appointed for the city schools; those for high schools are appointed by the minister of education. Instruction in hygiene is given in all institutions of learning (*Lehranstalten*); at the normal school special teachers are assigned for this study.

#### PERMANENCY OF TENURE OF SCHOOL PHYSICIANS.

A prime condition for the successful and beneficial development of medical inspection in schools is that the position of school physician be permanent and independent. It is only when a physician is sure of his position that he can successfully oppose countermovements in the execution of well-founded sanitary

schemes. If he proceeds in a tactful manner, and affirms the principles of hygiene without setting them above those of pedagogy, all prejudice which may yet exist against school physicians will vanish. With the necessity for medical inspection once established, it is only a question of time when physicians will be voting members of all school boards, and sanitary affairs relating to schools and instruction uniformly managed with the cooperation of physicians or boards of health.

Great difference of opinion prevails as to who shall be appointed as school physician. In deciding this fundamental question, regard must be had as to whether medical inspection is to be a permanent institution or whether there is only to be a sanitary supervision.

If, as Dr. Cohn desires, school physicians are to give their entire energies to school service, their official duties, in case medical inspection is extended to infant asylums, private schools, and kindergartens, will leave them no opportunity for private practice, for work in legal cases, or for any other subordinate occupation in the line of their profession. To forbid private practice to school physicians, in so far as it does not conflict with their school duties, would not advance the interests of the cause, for a physician can only have a full knowledge of his science if he has the opportunity to test and utilize his knowledge by attendance on the sick. It would be contrary to humanity for physicians to be only statisticians, professors, and investigators, and not at the same time medical advisers in cases of sickness.

If physicians are to act solely as school physicians, and extensive special knowledge for a thorough examination of eyes, nose, ears, and teeth are required of them, besides lectures on school hygiene, their appointment is apt to fail on the question of salary. Only a few communities would be in a position to offer a large enough salary for the position to be desirable. With the requirements mentioned but few children could be assigned to the charge of one person, and the large cities would be compelled to appoint a number of physicians at considerable cost, whereas smaller communities would be forced to do without them altogether. Trials in the different cities have determined how many children may be assigned to one physician. In no case is it advisable for one to have more than 1,000 to 1,200 children intrusted to him. The fewer children a physician has to supervise, the more conscientiously and the more reliably he can fulfill his duties; a greater number would cause superficial work. It is the same as with instruction—the fewer pupils a teacher has, the better are the results obtained.

The case is different if the question becomes one only of sanitary inspection. If (as the case is in *Austria*, where there is a thorough organization of the municipal health offices) the sanitary inspection of public schools is made directly by public physicians, as a rule, in view of the small average size of health districts, only a moderate number of classes and children fall to one man; and even in cities, where several such physicians are employed, the number of pupils assigned to each seldom exceeds 500 to 1,000, so that overburdening of physicians can not result and medical inspection can be carried out to its fullest extent. The State supervision of the school work of these municipal physicians can easily be effected by the sanitary specialists associated with the district (*Bezirk*) and federal authorities. A few communities have solved the difficulties of the situation, in that they have appointed private physicians for the minor duties of examinations, keeping the health registers, testing sight and hearing, passing judgment on gymnastic exercises and games, yet have confided the chief direction in all questions of hygiene to special official physicians. This method of procedure is to be recommended only for larger communities with a great number of school children, and then only when regular meetings of the physicians are held under the chairmanship of the head school physician, with the school superintendent present.

## OFFICIAL OR PRIVATE PHYSICIANS AS MEDICAL INSPECTORS.

There is no doubt but that communal physicians intrusted with the charge of medical inspection in schools will make a speedy effort to acquire sufficient practical experience in school hygiene and the necessary training in methods of examination through their own studies and under the direction of official physicians. The opposition advanced in many quarters, that not every certificated physician is able to meet the necessary requirements, is therefore hardly well founded in the majority of cases, and should by no means prove an insurmountable obstacle in the way of introducing school physicians. The fear of a lack of adequately educated physicians is the less justified at the present day, since according to the course of study required in most countries each member of the medical profession without exception can, and in part must, acquire sufficient knowledge in the subsidiary branches which qualify him for undertaking special examinations of school children.

The appointment of female physicians, as has been made in high schools for girls in Paris, Edinburgh, Moscow, and other places, can meet with no objection, if they are admitted to the practice of medicine only after passing the same strict examinations as their male colleagues.

The wisdom of calling official physicians to the duties of public supervision of medical inspection in schools can hardly be doubted; the only objection that can be advanced is the lack of time for the fulfillment of their many obligations. Such an objection is valid only in those countries where public physicians are in charge of extensive districts, or where their whole time is claimed by forensic duties. The claim advanced by the government of *Reuss* for state medical supervision must be agreed to in the interests of a uniform administration, and for the reason that in most countries the appointment of official physicians is dependent upon the proof of a special knowledge of hygiene.

The minister of education in *Bavaria* has instructed the trustees of secondary schools to consult official physicians on all sanitary questions. In *Austria*, according to the provisions of the imperial sanitary law of April 30, 1870, state physicians are required to superintend the sanitary condition of schools; moreover, according to most local laws, each district school board must have a physician as a regular member, who is to give advice on all sanitary matters, to remedy on the spot abuses which come under his notice, to inspect schools, and submit propositions for improvement. Some state school boards have passed explicit resolutions to that effect. The enforcement of these plain legal provisions, however, has as yet been effected only in exceptional cases.

## DUTIES OF SCHOOL PHYSICIAN.

Of what nature are the duties of school physicians? It would be altogether wrong to designate the medical treatment of school children in cases of sickness as the business of school physicians. On the contrary, if their position is not to be undermined, and if they are not to come in conflict with various authorities, their labors must, first and foremost, be directed toward prevention of disease. Their duties must be, not to treat sick children, but to preserve healthy children from disease and injuries to body and mind by keeping the agencies which caused them at a distance. The diseases of school children merely give physicians the hint how and where injurious influences are to be sought. If the source of the evil effects has been traced, it will not be difficult for him to make the proper suggestions for moderating or removing the disturbing influence.

The work of physicians should not run in a fixed groove; they must individualize, and above all take local conditions into consideration. School hygiene in cities requires different action on the part of physicians from that in the country.

Though general sanitary conditions are usually better in the country, because of purer air and the fewer restrictions upon the liberty of children, it would be unjust to confine medical inspection to city schools and neglect rural schools. In the same way medical cooperation in the care of health must extend to all public and private schools, as well as to boarding schools, high schools, normal schools, lycées, commercial and industrial schools, and schools for girls (attended exclusively by girls), for it may not be presupposed that the sanitary conditions of these higher institutions are any better than those of elementary schools. On the contrary, thorough and intelligent work from a physician is often especially necessary in such institutions, because, with few exceptions, they lack altogether or have insufficient medical cooperation in their management, though the health of teachers and pupils frequently affords enough occasion for it. It would be superfluous to enumerate instances, as every teacher who does not close his eyes to the simplest requirements of health finds instances enough in his own building. Is it just, for example, that pupils should be kept in schoolrooms with doors and windows closed, while teachers and their companions seek recreation in the halls? Or is it right that a prematurely debilitated teacher should anxiously keep windows and doors closed, preventing the children from receiving a sufficient amount of pure air? How often is it forgotten that fresh air, together with a proper interchange of rest and motion, is the best remedy for headache, anæmia, and mental overfatigue.

Palatial school buildings and hygienic contrivances of all kinds are not sufficient to replace lost freedom and the deprivation of unrestrained exercise in wood and field; certain injurious influences connected with school attendance must be kept at a distance if the health of school children is to be preserved. Disease is not always a result of faulty arrangement of buildings, but is often due to other external agencies.

Kollmann states that the pupils of the old classical school of *Frankfort*, of which the hygienic appointments were faulty, were examined by a physician before they occupied the new building; after nine years of occupancy of the new building a recent medical examination showed the sad result that, in the meantime, despite the "best sanitary appointments" of the new building, near-sightedness had increased from 26 to 33 per cent. The reason for this is to be found in the increasing strain on the sight in mastering the greater number of studies.

At the 24th meeting of the German Public Sanitation Association, in *Nuremberg*, Schiller and Schubert formulated the demands of medical school inspection. The duties of school physicians should comprise:

"I. The supervision of the sanitary condition of school buildings and their appointments.

"II. The supervision of the carrying out of regulations concerning the hygiene of instruction and appliances of instruction.

"III. The care of the health of school children and aiding the public physicians in preventing and combating contagious diseases, determining the physical defects of children for the purpose of continuous observation or special consideration during school hours, and the supervision of physical training in so far as it is directed in school."

In the development of school hygiene these requirements might form the skeleton to serve as a foundation for the laws governing the duties of school physicians.

From this state of the case it is readily seen that the professional duties of school physicians group themselves into three classes, to-wit: (1) Supervision of the sanitary conditions of school buildings; (2) influencing as far as permissible the in-

struction, and (3) the supervision of the health of pupils. Key has outlined a system of medical inspection and supervision of school hygiene based upon his investigations in hygiene.

Comprehensive and exhaustive regulations for medical inspection were issued in 1885 and republished June 4, 1890, by the council of education in Görz, Gradisca, and Istria, in Austria. Dr. Altschul has drawn up a list of questions, adapted to conditions in the city of *Prague*, to be used in the sanitary investigation of school buildings and their appointments, as well as in the special physical examinations of pupils, following the form of which a register for schools and pupils might easily be arranged and kept constantly filled out.

The "Russian Society for the Preservation of Public Health" has recently arranged a programme for the investigation of the hygienic condition of schools, instruction, and pupils, in which all important points are considered that may come into question in framing instructions for school physicians. Nevertheless, the principle will always hold good that the school physician must "feel" the extent (or scope) of his duties, and that the manner of their fulfillment must be left to the tact of this specialist.

The office of the school physician should be mainly to advise and prevent; least of all to cure.

The advisory sphere of action will include the site and neighborhood of school buildings, materials, plans of construction, division into rooms, and interior arrangement, appliances of instruction, lighting, heating, ventilation, water supply, play grounds, baths, gardens, places for gymnastic exercises, and residences of teachers and pupils. Schools will derive an advantage only when buildings are thoroughly examined once a year by a physician, in company with an architect and the superintendent, and the ways and means for remedying existing evils are discussed.

According to the 31st annual report of the State Board of Medicine in *Saxony*, all the schools in *Dresden* have for several years been visited by a commission consisting of an architect, the physician in charge, and the principal of the school, and notes made of the deficiencies noticed. The requirements for school buildings in the canton of *Geneva, Switzerland*, were defined by the decree of January 28, 1898. In lower *Austria* the board of health has defined the principles of sanitation to be observed in the construction and maintenance of orphan asylums, educational institutions, and dormitories.

As a preventive measure, school physicians should inspect each class room frequently during the year, examine the eyes, ears, mouths, and spines of the children, and advise the proper authorities of faults noticed; devote their most unremitting energy and attention to locating and fighting contagious diseases and disinfecting schoolrooms and dwelling apartments in the schoolhouse; note down their observations in a book kept in the school, propose measures, adopt their own measures in pressing cases, in anticipation of official approval, and recommend a suspension of school when any danger is threatened. Special attention should be given to faulty speech, bad positions of the body, nervous states, defects of hearing, infectious eye diseases, nearsightedness, and skin diseases; also, when the programme of instruction is under consideration, to call attention to unwholesome features in it or to its hygienic requirements. The examination of pupils at their first entrance into school is of the utmost importance; height, weight, nutrition, constitution, the condition of spine, eyes, and ears, all imperfections, and mental conditions should be accurately determined. It would be most desirable if mothers could be present at the first medical examination, since they could give the best information as to previous illness and could receive suggestions for the treatment and bringing up of children at home. In the mother's presence

children would submit more readily to examination, and more reliable data could be obtained.

Dr. Mangelot maintains that examinations should be exclusively for the benefit of pupils, and that all purely scientific or statistical inquiries, for instance, anthropological, should be forborne for want of time, even though their scientific value was not to be gainsaid. The examinations should be simple, not complicated. When practicable, height and weight should be ascertained. A report should be made twice a year and copies sent to parents. Professional confidence would not be violated, since eye, ear, and nose diseases are inoffensive and would not lead to any faultfinding on the part of parents. Remarks upon syphilis—of rare occurrence among children—could be made apart or entirely omitted; scrofula and rachitis could be indicated by terms intelligible only to the medical profession. Acquainting parents with the results has the advantage of drawing their attention to any evil for which they could seek further medical advice.

Should these preventive measures prove unsuccessful, medical inspection, as has been already said, must extend to the homes of pupils and their manner of life outside of school. In this regard those physicians in the country have the advantage who as family physicians gain an insight into the family relations of pupils. Consequently, they can judge better of the influence of home, food, manner of life, social intercourse with other children, and habits, and can better estimate the consequences of hereditary disease in families, etc., than the school physicians of cities, who as a rule see the children only during a short examination. Disease can only be rightly interpreted and explained when the defective lighting of the homes of pupils, the bad air in sleeping apartments, the damp rooms, the wage-earning occupations, and the lack of care of the skin are known to physicians and are considered by them.

#### SHOULD SCHOOL PHYSICIANS TREAT DISEASED CHILDREN?

It is only in exceptional cases, when children are taken suddenly ill in school, that school physicians should undertake to cure; wherefore the proposition of the medical inspectors of the schools of Paris to provide district schools with an emergency medicine chest containing a small selection of medicines and liniments, and explaining their use to teachers, is not altogether to be ignored. In Austria, in 1895, the supreme board of health indorsed the introduction of medicine chests, with rules for use framed and hung on the wall. Repeated instances of their usefulness are recorded in the country in cases of poisoning by eating poisonous mushrooms, berries, and plants (belladonna, Jamestown weed), as well as in cases of accident during gymnastic exercise.

No one will dispute that physicians alone should have the right to determine when a child shall resume his studies after recovering from illness, or from what studies he should be excused. Children should be examined at once upon entering school, so that defects may be disclosed and further injury to health prevented. It is also of advantage that physicians be sometimes present as silent observers during instruction, so as to watch the children without attracting their attention. It is a well-known fact, in the case of general examinations formally announced, that the subjects often assume forced attitudes of body, give wrong replies in testing their sight or hearing, and so make the results of examinations unreliable.

It is a further duty of school physicians to consult teachers on important matters, to explain sanitary measures, in order to remove detrimental influences and supply deficiencies. In this respect it is necessary that physicians hold an equal rank with teachers in their assemblies, that their propositions may not lack a certain authority. On the other hand, physicians should not forget that their posi-

tion is a coordinate one, that they must exercise moderation in their claims and not aim beyond their mark.

The sanitary service of school physicians must be permanent, extending over the whole domain of school and throughout the whole year. Great difference of opinion prevails with regard to the frequency of inspection. One inspection a year is not enough, because sanitary conditions change according to the time of day or year, climate, temperature, and the occupation of pupils. On the other hand, one to three detailed examinations of pupils a month must be acknowledged too many.

## CHAPTER XII.

### ADMISSION TO COLLEGE ON CERTIFICATE OF SECONDARY SCHOOLS.

CONTENTS: General statement—New England College Entrance Certificate Board—Accrediting systems of different State universities—List of institutions admitting students on certificate—Address by Prof. A. S. Whitney on methods of accrediting schools.

---

#### GENERAL STATEMENT.

The acceptance of certificates from principals of certain high schools and other secondary schools in lieu of examinations for admission to the freshman classes of universities, colleges, and schools of technology is becoming very general throughout the country. The most complete system of accredited schools is found in the Western States, where the State universities are in very close relations with the numerous public high schools.

The methods adopted for the accrediting of schools vary in the several States. The initiative is made by the secondary schools, and upon the receipt by a university or college of an application from such a school to be accredited, the work of such school is examined and passed upon by a committee of the faculty or by a special high-school examiner or visitor after a personal inspection of such school. In other cases blank forms of application are furnished to the principals of schools, which applications are then examined and passed upon by the faculty of the institution to which they wish to be accredited.

#### NEW ENGLAND COLLEGE ENTRANCE CERTIFICATE BOARD.

The New England College Entrance Certificate Board was organized at Boston on May 16, 1902. The institutions holding membership in the board are Amherst College, Boston University, Brown University, Dartmouth College, Mount Holyoke College, Smith College, Tufts College, Wellesley College, and Wesleyan University. After January 1, 1904, no certificate will be accepted by the above-mentioned institutions from any school in New England which has not been approved by the above-mentioned board. The by-laws and rules governing the board are as follows:

#### BY-LAWS.

I. The name of this board shall be the New England College Entrance Certificate Board. This board is established for the purpose of receiving, examining, and acting upon all applications of schools that ask for the privilege of certification.

II. Each college belonging to the board shall be entitled to one delegate, whose term of service shall be three years.

III. The officers of the board shall be a president and a secretary, who shall also be treasurer. They shall be elected annually at the regular meeting in May, and shall enter upon the duties of their respective offices at the close of that meeting. Their duties shall be those usually attaching to such positions.

IV. These officers, together with another member annually elected by the board, shall constitute an executive committee, whose duties shall be:

1. To consider such measures as may be suggested for furthering the objects for which the board is established, and to obtain for the use of the board all necessary information relating to such of these measures as the committee may deem important.

2. To apportion the expenses of the board among the several colleges in accordance with Section IX of the general provisions under which the board was organized, and to direct the collections and disbursements of the board.

3. To make an annual report to the board at the regular meeting in May.

The time and place of the annual meeting in May shall be fixed by the executive committee.

Special meetings of the board may be called by the executive committee.

Not less than one week's notice shall be given of all meetings of the board, regular and special.

V. In the absence of the regular delegate from any college a substitute authorized by that college shall be understood to have the full powers of delegate.

VI. The amount due from each college as its share of the expenses of the board shall be payable on the first day of January in each year.

VII. The board shall make an annual report to the several colleges represented in it. This report shall include the annual report of the treasurer.

VIII. A majority of the members of the board shall constitute a quorum for the transaction of business, but no school shall be approved except by the affirmative vote of two-thirds, and no school shall be dropped except by the affirmative vote of a majority of the board.

IX. Any college in New England that admits students by certificate shall be eligible to membership in the board on accepting in full the rules of the board, and may be admitted by a majority vote of the faculties therein represented.

X. These by-laws may be altered or amended by a vote of two-thirds of the members present at any meeting of the board, regular or special.

#### RULES.

I. The executive committee shall receive and examine all applications of schools to be put on the approved list, and shall present them to the board for action.

II. Applications for approval must be made to the secretary upon blanks furnished by the board and covering full statements concerning courses of study, teachers, and equipment.

III. Applications for approval shall be acted upon as soon as practicable after they are received, but they must be received before May 1 in order to be approved for the next college year.

IV. No school shall be placed upon the approved list unless it can prepare for college according to some one of the recognized plans of entering the colleges represented on this board.

V. No school will be approved unless it has shown by the record of its students already admitted to college its ability to give thorough preparation for college, or unless it can satisfactorily meet such tests as the board may establish to determine its efficiency.

VI. The board shall have the power of withdrawing approval from a school, and from such a school certificates shall not afterwards be accepted until it shall have again been approved by the board.

VII. Certificates coming from any school approved by the board, and covering all the requirements for admission made by any college represented in the board, shall be valid at such college, and certificates that do not so cover the entire requirements shall be treated by each college according to the rules which that college establishes for such certificates. No certificate from a school not approved by this board shall be valid for admission at any cooperating college unless the school lies outside of the jurisdiction of the board.

VIII. A general report of the work of pupils from approved schools for at least one-third of their first year in college shall be made to the board and such other reports as the board may require, and all complaints of insufficient preparations shall be made to the board with specifications as to subjects and individuals, but such complaints shall not interfere with reports to the schools about students entering from them.

IX. The list of approved schools shall be revised every three years, and approval shall be withdrawn from schools that within that time have sent no student to any of the colleges represented in the board.

X. The list of schools approved by the board shall be published in the catalogues of the colleges, or in such other way as the colleges shall deem best.

The secretary of the board is Nathaniel F. Davis, LL. D., 159 Brown street, Providence, R. I.

## ACCREDITING SYSTEMS OF DIFFERENT STATE UNIVERSITIES.

The University of Alabama accredits any school of a certain standard in the State of Alabama upon the written application of the principal, submitting its curriculum. There are 23 accredited or auxiliary schools. The form of certificate required is as follows:

M ———, of ——— county, a young ——— years of age and of good moral character, having been a student of ——— for ———, and in a satisfactory manner having pursued the following studies: ———, which are substantially in accordance with the requirements for admission into the freshman class of the ——— course of the University of Alabama, is recommended for admission into that class.

The University of Arkansas, on the application from the principal of any high school, academy, or other institution, sends an officer of the university to visit and examine the organization and work of such school. Upon a favorable report, submitted in writing by the visiting officer, the school is declared by vote of the faculty duly accredited to the freshman class. There are 26 accredited schools.

Schools desiring to be accredited to the University of California are visited and examined by a committee of the academic senate, upon whose report the faculty acts. In 1901 there were 116 California schools on the accredited list. Certificates from a high school or other secondary school in another State or country may be accepted in favor of a recommended graduate thereof, provided said school has been examined and accredited by some college or university at which the entrance requirements are equivalent to those of the University of California.

The University of Colorado furnishes blank forms of application to those high schools desiring to be placed on the accredited list. The applications are considered in full meeting of the faculty. There are 31 accredited schools.

The University of Idaho sends a representative to visit and examine secondary schools.

The University of Illinois employs a high-school visitor, whose duty is to inspect the high schools of the State. The visitor is not sent to any school not already accredited unless a request is made for such visit. After inspecting a school the visitor reports upon it to the council of administration of the university, and upon approval the school is added to the list of accredited schools. There are 206 schools on the accredited list.

The high schools of the State of Indiana are examined from time to time by the State board of education, and to those that reach the required standard a commission is granted which recognizes them as preparatory schools to Indiana University. There are 176 commissioned high schools.

The schools accredited to the University of Iowa are subject to inspection by the university, which employs permanently an inspector of high schools. The accredited list contains 124 high schools and 19 other secondary schools. There are also 63 other high schools and 4 additional secondary schools whose certificates are accepted in so far as their work covers the requirements of the university.<sup>a</sup>

The University of Kansas has on its accredited list 113 high schools and 5 academies. In addition there are 30 high schools in the State which fall short of preparing for the freshman class by not more than the amount of two terms' work.

The University of Michigan, on request of the proper authorities, designates a committee<sup>b</sup> to visit a school and report on its condition. If the report of the committee is satisfactory the school is placed on the list of approved schools for a period not exceeding three years, reserving, however, the right to require another inspection, if circumstances seem to make an examination necessary. Graduates

<sup>a</sup> Calendar of the University of Iowa for 1901-1902, p. 175

<sup>b</sup> Calendar of the University of Michigan for 1901-1902, p. 55.

of approved schools are admitted on the recommendation of the principal, made on a blank form furnished by the university.

Graduates of any Minnesota State high school that has been approved by the State high-school board after examination by the State high-school inspector appointed by the board will be admitted to the University of Minnesota without examination, provided (1) that the school maintain a full four-year course of high-school work; (2) that the applicant present the principal's certificate, showing the satisfactory completion of all the studies required for admission to the desired university course. Graduates who are deficient in not more than three half-year subjects may be excused from examinations in such subjects as the enrollment committee may decide. Any Minnesota high school or academy not under supervision of the State high-school board, but requiring for graduation a four-year course, exclusive of the common school branches, conforming essentially in distribution of time to the entrance requirements of at least one of the university courses, will, upon application, be inspected by a committee, and after favorable recommendation may be accredited, provided (1) that the school be open to inspection at any time by the university, and (2) that it take such supplementary examinations as may be prescribed from time to time. Graduates from schools in other States, whose diplomas admit to reputable colleges in the State in which the school is located, will be received subject to the regulations that apply to graduates of Minnesota State high schools.

On application to the University of Mississippi a committee of the faculty visits schools desiring to be affiliated. If the work of the school is approved by the faculty, after a favorable report by the committee, the name of the school is placed on the list of affiliated schools and its graduates admitted on the certificate of the principal. There are 68 schools on the approved list.

The University of Missouri employs an "Examiner of Schools" to facilitate the work of bringing the secondary schools into close connection with the university. The list of approved schools contains 107 names.

The inspection of high schools for the University of Nebraska is performed by an inspector of accredited schools appointed by the board of regents. The report of the inspector, together with the official reports of the schools, forms the data on which the university bases its action.

The Ohio State University inspects high schools through a committee of the faculty appointed by the president. Approved high schools must be reexamined at intervals not exceeding three years.

All approved State secondary schools in Tennessee are accredited schools of the University of Tennessee. The branches required to be taught in such schools are orthography, reading, writing, arithmetic, grammar, geography, history of Tennessee, history of the United States, Constitution of the United States, elementary geology in Tennessee, elementary principles of agriculture, elements of algebra, elements of plane geometry, elements of natural philosophy, bookkeeping, elementary physiology and hygiene, elements of civil government and rhetoric, or higher English. Practice shall be given in elocution or the art of speaking. Any other high school, academy, or institution whose course of study covers the branches required for admission to the university, may be put on the accredited list after application, examination by some officer of the university, and approval by the faculty. Such schools may offer Latin, Greek, or other good equivalents in lieu of the sciences provided in the secondary school course. The list of schools accredited to the University of Tennessee includes 39 schools in Tennessee and 18 schools in other States.

No school will be affiliated by the University of Texas before the president or some person designated by him shall have visited it and shall have rendered a

report concerning its equipment and its work. Graduates of approved schools are admitted on presentation of diplomas. There are 93 affiliated schools.

The University of Washington inspects the work of high schools through a committee of the faculty which visits schools desiring to be accredited. Graduates of accredited schools are admitted on certificate. The list of accredited schools includes 18 high schools and 5 academies.

The University of Wisconsin requires an inspection of accredited schools by a committee of the faculty.<sup>a</sup> The accredited list contains the names of 226 schools.

When a school approved by the academic council of Johns Hopkins University shall certify that a candidate has satisfactorily completed all the studies requisite for matriculation such candidate will be exempted from examination except in the following subjects: Trigonometry, analytic geometry, Cicero or Virgil (as the candidate may prefer), Latin prose composition, Homer or Herodotus (as the candidate may prefer), Greek prose composition, the minor courses in French and German, English, and science.

In nearly all cases where students are admitted from accredited, affiliated, or approved schools, the diplomas of such schools are not accepted as evidence of a candidate's fitness, but must be accompanied by the certificate of the principal, showing that the candidate has satisfactorily completed the studies required for admission.

#### LIST OF INSTITUTIONS ADMITTING STUDENTS ON CERTIFICATE.

The catalogues of the following-named institutions show that students are admitted to the freshman class on certificate. In some of the institutions included in this list an examination is required in some particular subject or subjects, as, for instance, in Cornell University an examination is required in English.

*Alabama.*—Alabama Polytechnic Institute, Howard College, Southern University, Lafayette College, University of Alabama.

*Arizona.*—University of Arizona.

*Arkansas.*—Ouachita College, Arkansas Cumberland College, Hendrix College, University of Arkansas.

*California.*—University of California, Pomona College, Occidental College, University of Southern California, Mills College, California College, Throop Polytechnic Institute, University of the Pacific, Pacific Methodist College, Leland Stanford Junior University.

*Colorado.*—University of Colorado, Colorado College, Colorado Agricultural College, State School of Mines, University of Denver.

*Connecticut.*—Trinity College, Wesleyan University, Connecticut Agricultural College.

*Delaware.*—Delaware College.

*District of Columbia.*—Columbian University, Georgetown University, Howard University.

*Florida.*—John B. Stetson University, Florida Agricultural College, Florida State College, Rollins College.

*Georgia.*—University of Georgia, Atlanta University, Emory College, Clark University.

*Idaho.*—University of Idaho.

*Illinois.*—Hedding College, Illinois Wesleyan University, Blackburn University, Carthage College, Armour Institute of Technology, University of Chicago, Eureka College, Northwestern University, Ewing College, Knox College, Lombard College, Greenville College, Illinois College, Lake Forest University, McKendree

<sup>a</sup> Catalogue of the University of Wisconsin for 1901-1902, p. 75.

College, Lincoln College, Monmouth College, Northwestern College, Rockford College, Augustana College, Shurtleff College, University of Illinois, Westfield College, Wheaton College.

*Indiana.*—Indiana University, Wabash College, Franklin College, De Pauw University, Hanover College, Butler College, Purdue University, Union Christian College, University of Notre Dame, Earlham College, Rose Polytechnic Institute, Taylor University.

*Indian Territory.*—Henry Kendall College.

*Iowa.*—Iowa College of Agriculture and Mechanic Arts, Coe College, Amity College, Luther College, Des Moines College, Drake University, St. Joseph's College, Parsons College, Upper Iowa University, Iowa College, Lenox College, Simpson College, State University of Iowa, Graceland College, German College, Iowa Wesleyan University, Cornell College, Penn College, Central College, Morningside College, Buena Vista College, Tabor College, Western College.

*Kansas.*—Midland College, Baker University, College of Emporia, Highland University, Kansas City University, University of Kansas, Lane University, Bethany College, Kansas State Agricultural College, Ottawa University, Kansas Wesleyan University, Cooper College, Washburn College, Fairmount College, Friends University, Southwest Kansas College.

*Kentucky.*—Central University of Kentucky, Georgetown College, Agricultural and Mechanical College of Kentucky, Kentucky University, Bethel College, Kentucky Wesleyan College.

*Louisiana.*—Louisiana State University, Tulane University.

*Maine.*—Bates College, University of Maine, Colby College.

*Maryland.*—Johns Hopkins University, Woman's College of Baltimore, Maryland Agricultural College, New Windsor College, Western Maryland College.

*Massachusetts.*—Amherst College, Boston College, Boston University, Smith College, Mount Holyoke College, Tufts College, Wellesley College, Williams College, College of the Holy Cross, Worcester Polytechnic Institute.

*Michigan.*—Adrian College, Michigan Agricultural College, Albion College, Alma College, University of Michigan, Hillsdale College, Hope College, Michigan College of Mines, Kalamazoo College, Olivet College.

*Minnesota.*—Augsburg Seminary, University of Minnesota, Carleton College, St. Olaf College, Hamline University, Macalester College, Gustavus Adolphus College.

*Mississippi.*—Rust University, Millsaps College, University of Mississippi.

*Missouri.*—Southwest Baptist College, Pike College, Christian University, University of Missouri, Central College, Westminster College, William Jewell College, Missouri Valley College, Park College, Washington University, Drury College, Central Wesleyan College.

*Montana.*—Montana College of Agriculture and Mechanic Arts, University of Montana, Montana State School of Mines.

*Nebraska.*—Bellevue College, Cotner University, Union College, Doane College, Grand Island College, Hastings College, University of Nebraska, Nebraska Wesleyan University, York College.

*Nevada.*—Nevada State University.

*New Hampshire.*—New Hampshire College of Agriculture and Mechanic Arts, Dartmouth College.

*New Jersey.*—Rutgers College, Seton Hall College.

*New Mexico.*—University of New Mexico, New Mexico College of Agriculture and Mechanic Arts.

*New York.*—Alfred University, Wells College, Adelphi College, Polytechnic Institute of Brooklyn, St. Lawrence University, Hamilton College, Elmira Col-

lege, Hobart College, Colgate University, Cornell University, College of the City of New York, Manhattan College, New York University, St. John's College, Niagara University, Clarkson School of Technology, Vassar College, University of Rochester, Union College, Syracuse University, United States Military Academy.

*North Carolina.*—University of North Carolina, Davidson College, Trinity College, Elon College, North Carolina College, North Carolina College of Agriculture and Mechanic Arts, Livingstone College.

*North Dakota.*—North Dakota Agricultural College, Fargo College, University of North Dakota, Red River Valley University.

*Ohio.*—Buchtel College, Mount Union College, Ohio University, Baldwin University, German Wallace College, Cedarville College, University of Cincinnati, Case School of Applied Science, Western Reserve University, Ohio State University, Defiance College, Ohio Wesleyan University, Kenyon College, Hiram College, Lima College, Marietta College, Muskingum College, Oberlin College, Miami University, Scio College, Wittenberg College, Heidelberg University, Otterbein University, Wilmington College, University of Wooster, Antioch College.

*Oklahoma.*—University of Oklahoma, Oklahoma Agricultural and Mechanical College.

*Oregon.*—Albany College, State Agricultural College, University of Oregon, Pacific University, McMinnville College, Pacific College, Willamette University.

*Pennsylvania.*—Western University of Pennsylvania, Lebanon Valley College, Beaver College, Moravian College, Dickinson College, Ursinus College, Lafayette College, Pennsylvania College, Thiel College, Juniata College, Franklin and Marshall College, Bucknell University, Allegheny College, University of Pennsylvania, Susquehanna University, Lehigh University, Pennsylvania State College, Swarthmore College, Villanova College, Washington and Jefferson College, Waynesburg College.

*Rhode Island.*—Rhode Island College of Agriculture and Mechanic Arts, Brown University.

*South Carolina.*—College of Charleston, South Carolina College, Furman University, Wofford College.

*South Dakota.*—South Dakota Agricultural College, Huron College, Dakota University, Redfield College, University of South Dakota.

*Tennessee.*—Grant University, Southwestern Presbyterian University, Greenville and Tusculum College, American University of Harriman, University of Tennessee, Cumberland University, Washington College, Maryville College, Carson and Newman College, Roger Williams University, University of Nashville, University of the South, Sweetwater College.

*Texas.*—University of Texas, Agricultural and Mechanical College of Texas, Fort Worth University, Polytechnic College, Southwestern University, Texas Christian University, Austin College, Baylor University.

*Utah.*—University of Utah.

*Vermont.*—University of Vermont, Middlebury College, Norwich University.

*Virginia.*—Bridgewater College, University of Virginia, Emory and Henry College, Washington and Lee University, Richmond College.

*Washington.*—Vashon College, Washington Agricultural College, University of Washington, Puget Sound University, Whitworth College, Whitman College.

*West Virginia.*—Morris Harvey College, West Virginia University.

*Wisconsin.*—Lawrence University, Beloit College, University of Wisconsin, Milton College, Concordia College, Marquette College, Ripon College.

*Wyoming.*—University of Wyoming.

METHODS IN USE OF ACCREDITING SCHOOLS.<sup>a</sup>

By Prof. A. S. WHITNEY.

*University of Michigan.*

The time allotted for consideration of this subject necessarily limits me to a brief presentation of its main essentials. It has been deemed best, therefore, to confine the scope of this paper to a concise exposition of the origin and progress of the accrediting system, the present methods of accrediting schools, the methods of certificating students, and the general evaluation of the system as conceived and executed primarily by the University of Michigan, supplementing it with reports of methods in use in other institutions whenever sufficient differentiation obtains to cause any material modifications of the plans evolved. I shall make no attempt to set the merits or the demerits of the accrediting system over against those of the examination system as operating within the territory covered by this association. To do so would be to transcend the bounds circumscribed by the topic assigned me.

The accrediting system had its origin at the University of Michigan in a resolution adopted by the faculty in 1871 and confirmed by the board of regents in 1872—thirty years ago. It sprang from two apparently antagonistic causes: First, from an earnest desire on the part of the president and members of the faculty to cooperate with superintendents and principals of high schools, with a view to consolidating, strengthening, and elevating the entire system of the State; and secondly, from urgent solicitations of superintendents and principals of the leading high schools of the State for closer articulation with the university as an organic part of the educational system, to the end that each institution might react upon and stimulate the other for the benefit of each and the good of the whole.

In the early beginnings of the accrediting system a committee of the faculty, upon special invitation of superintendents and boards of education, annually visited the high schools and examined their courses of study, methods of instruction, scholarship of teachers and pupils, library and laboratory facilities, and prevailing intellectual and moral conditions. In addition, schedules of test questions, previously prepared for use of visiting committees, were assigned the various classes and their written answers submitted as confirmatory evidence of the character of the work accomplished. These findings were reported to the faculty, and upon their character was determined the future relationship between each individual high school and the university.

As time advanced and the number of schools seeking accredited relationship multiplied, this system was found burdensome and impracticable. The professors were too engrossed with their legitimate university duties to give sufficient time properly to conduct this work. In consequence the formal test examination fell into disuse, and the term of affiliated relationship was gradually extended to two or three years, according to the excellence of the school, the university always reserving the right to reexamine whenever, in its judgment, changed conditions might seem to warrant.

This system prevailed until three years ago, when stress of numbers, inadaptability of certain members of the faculty to do the work of inspection, and a desire for greater uniformity of standards and methods necessitated a change. Following the example of several of her sister institutions, the University of Michigan appointed a special official to take sole charge of inspection and to report his findings to a so-called diploma school committee, composed of heads of departments, with the president of the university as chairman. This plan of inspection now

<sup>a</sup> Address delivered at the annual meeting of the Association of Colleges and Preparatory Schools of the Middle States and Maryland at Baltimore, Md., and printed in the *School Review* for February, 1903.

obtains, in some form or other, in connection with all the great universities of the Northwest, except the universities of Minnesota and Indiana. The smaller institutions generally accept the standards set by the great universities of their respective States.

The University of Minnesota, as stated, has no special high-school inspector as such, but it attains practically the same ends through the State high-school board, an organization created by the legislature and endowed with certain specific powers and duties. This board appoints the State high-school inspector, determines the methods of examination and standards of scholarship, and approves or disapproves of the work of each individual high school according to the findings reported. If these findings are satisfactory, the high school is given a bonus of \$400 from the State treasury as an aid and stimulus to further endeavor and is placed on the accredited list. Students graduated from such approved schools are, if properly recommended, admitted without examination into all the higher institutions of the State, including the State university. That the standards set for the high schools are of a high order is attested by the fact that the president of the State university is *ex officio* chairman of the State high-school board.

In Indiana the methods of procedure are widely divergent from those already described. In that State the inspecting and accrediting function is performed solely by the State board of education, the different members of the board apportioning the work among themselves. Graduates from the high schools thus accredited or "commissioned" are admitted without examination, when properly recommended, into the State university and all other high institutions of the State.

As stated above, therefore, the field work in connection with the great universities of the North Central States, with the exceptions named, is conducted at the present time by special inspectors. And, although representing different institutions, so systematic has the work become that the inspectors follow the same general methods of procedure, apply the same general principles of analysis, and seek the same general ends. Their methods differ somewhat in minor details, but not in essentials. The routine is practically as follows:

The inspector visits the schools without previous notification. He learns the population of the city, the total enrollment of the schools, the enrollment in the high school, and the number of teachers employed, both in the grades and in the high school. He acquaints himself with the teachers of the high school, inquires concerning their academic and professional preparation, the subjects they teach, and the number and average length of their daily class periods. He visits the class rooms, analyzes the work of the teachers, and endeavors to determine the efficiency of each by noting his aim and plan of lesson, his mastery of the subject, his skill in adapting the lesson to the needs and capacities of his pupils, his ability to analyze and classify difficulties, his power to attract and hold attention, his skill in the art of questioning, his assignment of the lesson; he also notes the manner in which the pupils have attacked the lesson, their habits of thought and study, and the general spirit and progress of the class. He examines the course of study, the text-books used, the library and laboratory facilities; he takes note of the plan of organization, the character and methods of discipline, and the intellectual and moral tone of the school; and he ascertains the average size of the graduating classes, the number of graduates attending higher institutions of learning, the number now preparing for such institutions, and the general attitude of the board of education, the patrons, and the community toward the school and toward educational affairs generally. Finally, he examines the structure, capacity, heating, lighting, and ventilating of school buildings.

All these facts and more are recorded by the inspector and reported back to the proper committee, or to the faculty, as a basis for determining what relationship

should exist between the high school and the university. In case, however, it is a high school seeking a renewal of accredited relationship, this report is supplemented by official records showing the ability or inability of the students representing this high school to pursue university work with profit. If all the conditions essential to a school of high grade, as indicated by the inspector's report and by the scholarship of the students of this school attending the university, are present, the high school is formally approved and placed on the accredited list; if these conditions are wanting, the school is rejected, and the reasons therefor are specifically given to the proper authorities. It should be remarked in this connection, however, that some universities, notably Chicago and Illinois, follow the plan of accrediting by subjects, approving some and disapproving others, while the universities of Michigan, Wisconsin, and Iowa regard the high school as a unit and accept it or reject it as such.

As to methods of certificating students to university authorities, there is much confusion and misunderstanding, especially among those unacquainted with the workings of the accrediting system. It is generally assumed that the possession of a diploma from an approved high school opens wide the doors of the university to all who may choose to enter. Such is far from the exact truth. At least four conditions must be fulfilled before an applicant can receive recognition at the hands of the university:

1. The applicant must have received his preparatory training in an accredited high school.

2. The applicant must be a graduate of an accredited high school. The university sets the stamp of its disapproval upon nonhigh-school graduates and will give them no recognition whatever. Only the finished high-school product receives consideration.

3. The applicant must present a regulation certificate, furnished by the university and properly filled and signed by the superintendent or principal of high school; this certificate states that he has completed all the work required for entrance to the university and specifies the branches pursued, number of weeks and of recitations per week devoted to each, text-books used, and the teacher's estimates of his scholarship in the several branches.

4. The applicant must furnish a recommendation from the superintendent, high-school principal, or faculty attesting their belief in his ability to pursue university work with pleasure and profit to himself and credit to the university. The aim of this provision is manifestly to throw the responsibility for his success back upon the high school where it properly belongs. The school knows, on the one hand, all about the student, his powers, capabilities, and impulses, and, on the other, all about the requirements of the university, and should, therefore, be able to judge accurately whether he is of university material.

It should be observed that after the first semiannual examination of the freshman year the records of scholarship attained by the students thus recommended are reported back to their respective high schools, and the credit or discredit, after making due allowances for changed conditions, is charged accordingly. So deeply is the responsibility felt by high-school authorities that they are wont to exaggerate on the side of conservatism. This is not only the testimony of superintendents and principals themselves, but it is demonstrated by the fact that every year numbers of students who have been refused recommendations by the accredited schools present themselves and enter the university by way of the examination door. This requirement has led not a few high-school authorities to grade the diplomas granted to the graduating classes as "A" and "B," the former entitling the holder to certificates of admission to the university and the latter withholding such privilege.

Having now briefly indicated the origin and early development of the accredi-

ing system, the methods of accrediting schools, and the methods of certifying students to university authorities, there remains to ask what is the effect of this system upon the university, upon the high schools, and upon the educational system of the State as a whole. From the standpoint of the University of Michigan, two features are worthy of consideration: First, the effect of the system upon scholarship, and, secondly, its effect upon attendance.

As to scholarship, little better can be done than to summarize a report made by a committee of the faculty appointed to investigate the standings of students admitted on certificate as compared with those admitted on examination for the first nine years of the existence of the accrediting system. This committee made a careful study of the examination records of all the members of the freshmen classes for the period named, and tabulated the results in such manner as to show separately the standings of those admitted on certificate and those admitted on examination—a study involving more than 1,000 students and more than 10,000 examinations. The committee refrained from examining the records subsequent to the freshman year, in the belief that one year in the university ought to obliterate the main distinctions arising from differences in preparatory schools. From the tables thus framed and classified the committee computed the percentages of scholarships from each class by dividing the number of examinations successfully passed by the number that, by order of the faculty, ought to have been passed. The following are the results obtained:

Total number of students admitted on certificate .....	470
The percentage of scholarship .....	88.91
The total number of students admitted on examination .....	574
The percentage of scholarship .....	87.22

It will be observed that the committee found a slight balance in favor of admission by certificate, showing that the university was the gainer, rather than the loser, by the change. Unfortunately no systematic investigations have been made since that time. It is our firm belief, however, that a like investigation to-day would not result to the disadvantage of the certificated student.

As to the effect of the certificate system on the attendance at the university, there is not the slightest doubt in the minds of any conversant with its workings but that it greatly increases it. This is the unanimous verdict of high-school and university authorities, of the students themselves, and of high-school inspectors. It follows as a natural consequence from shortening and smoothing the pathway leading from the high school to the university and from bringing them into closer union and sympathy with each other. Two illustrations from many: A little more than a year ago the inspector responded to an invitation to examine the high school in the town of A. He was informed by the superintendent that there was no one preparing to enter higher institutions and no sentiment for such preparation, but that he desired affiliated relationship with the university for the purpose of creating and arousing such an interest. The school was examined and accredited in the usual way. This very act seemed to arouse such ambitions, and to open the door to such undreamed possibilities that three students entered the university in the fall and others went elsewhere.

Somewhat less than a year ago the high school in the town of B. was reexamined and rejected after having been on our accredited list for many years. Six students who were preparing to enter the university on certificate were thus deprived of the privilege and could now enter only on examinations. Of these six, one came and was successful; the other five sought institutions of lower grade. The school has now been reorganized and has made application for reexamination.

But it is from the standpoint of the high schools that the crowning virtue of the accrediting system is most marked, a fact wholly unrecognized and unappre-

ciated by the great majority of those unacquainted with the practical workings of the system. It has been deemed best, therefore, to point out definitely and specifically wherein the accrediting system reflects upon and exalts the high schools, even at the cost of overlapping and repetition.

1. *Its influence upon standards.*—Before a school can be accredited it must offer all the branches required at the university for admission; it must pursue them for certain periods of time, the minimum of which is specified; it must give suitable opportunities for library and laboratory work, and it must attain a certain fixed degree of thoroughness, vitality, and spirit of scholarship. The inspector comes, backed by all the authority and influence of a great university, examines these standards according to his definitely fixed ideals, and reports back to the proper authorities. Upon this report hang in a large measure the reputation, the influence, and the prestige of the school, and therefore a favorable outcome is highly prized. Inspectors are frequently requested by superintendents to examine their schools unofficially for the sole purpose of aiding them in marking and bettering their standards.

2. *Its influence upon the teaching force.*—After the inspector has examined a high school, as heretofore outlined, comes the conference. Here he explains to the superintendent or principal the conditions as he sees them, commending the good and pointing out the bad. He explains the theories of the university, changes in requirements for admission, and plans in operation in the best high schools, and he suggests ways and means for correcting deficiencies and laying solid foundations for scholarship. He advises also concerning the organization, the methods of discipline, the courses of study, library and laboratory facilities, text-books, and supplies. The inspector listens in turn to a statement of their difficulties, fears, hopes, and ambitions, and aids to the best of his ability in their proper solution. He meets the teachers if need be and gives them opportunity to ask for his criticisms, suggestions, and help, an opportunity of which they freely avail themselves. If the standards of the school are only moderately satisfactory or are too low to warrant establishment of accredited relationship, it is placed on the "nursing list" and reexamined the following year. If conducted frankly and sympathetically the conference hour can be made productive of immeasurable benefit.

3. *Its influence upon pupils.*—The influence of the accrediting system upon pupils has already been indicated. There needs to be added, however, that the opening of the university door to all properly accredited students is not the only potent influence at work among them. The repeated visits of the university inspector are of scarcely less importance. They arouse among the pupils of the average high school a spirit of inquiry concerning colleges and universities; they set them to thinking and to talking about going to college; they intensify their desires and stimulate their ambitions to make the trial. The very fact that a great educational institution will send an official to them adds dignity, importance, and seriousness of purpose to the work of the school and to the work of life. The pupils often ask questions concerning the university, the expenses of living, the opportunities for self-help, the methods of securing rooms, and of registering. These the inspector answers individually, in groups, or in a short address before the school, offering suggestions, encouragement, help.

4. *Its influence upon the board of education and the communities.*—The boards of education and the communities always desire the highest possible efficiency of their schools, and they have come to measure this efficiency by the recognition the schools receive at the hands of the university. They therefore cordially invite the university inspector, earnestly seek his opinions and advice, and give serious consideration to all his recommendations. Indeed, so thoroughly have they come to rely upon the university to mark the efficiency of their schools that I do not exaggerate when I say that there are few places in Michigan where a superintend-

ent or high-school principal can long maintain his position if accredited relationship, once established with the university, should be repudiated on reexamination.

As to the effects of the accrediting system upon the educational system of the State as a whole, I quote from the annual report of President Angell to the board of regents after an experiment of ten years. He says:

This innovation on old customs, like all innovations, and chiefly because it was an innovation, was met at once with severe criticisms, and especially by some distinguished educators in the older colleges, fearing, as was alleged, that such a system would bring down the standards of colleges. Experience, however, has proved that there was no ground for fear, except that the thing was new and not practiced in the mother colleges. Two facts are to be noted among the results: (1) The standard of preparation in the high schools, if affected at all, has been elevated rather than lowered; (2) the State system of education has become a reality. It is obvious that there can be no system, properly so called, without an actual and living connection and communication among its members. By calling for the visiting or examining committee of the faculty the high schools have been brought into that vital connection with the university which makes them parts of a natural organism and, so far as concerns our schools, our State system no longer exists merely on paper.

No one can look into the condition of these schools without feeling satisfied that this connection has had the effect both to animate their students to more earnest effort and to encourage and strengthen the teachers, while it has brought about a more perfect unity of plan and method in the schools of the State in general. In short, it gives to our schools, otherwise isolated, a bond of union and a center of life. We are convinced, as the result of an experiment of ten years, that this cooperative plan, especially if entered into by the few remaining schools, and thus perfected, will give a character of consistency, solidity, strength, and efficiency to the educational work of the State, which will leave nothing further to be desired but the uninterrupted operation and movement of the system.

At that time there were 16 schools upon the accredited list; to-day the number has swelled to 250. In a recent interview President Angell, in the light of the twenty years that have passed since that report was written, emphatically confirms the position there taken. He realizes that the accrediting system has its limitations the same as the examination or any other system; but that, taken as a whole, it is freest from objections, is the most productive, and the most logical of all systems yet devised.

One criticism presents itself. The admission of properly accredited students to the university without examination tends to belittle examinations as an educational factor. This, however, is incidental rather than essential, and the university is gradually awakening to the necessity of setting the stamp of its disapproval upon it.

In conclusion permit me to say that the colleges and universities of the territory covered by the North Central Association of Colleges and Secondary Schools are perfecting a plan looking toward a general recognition of the best high schools in the several States. When this plan is completed and put in execution, it will not be unlike this association in the breadth and uniformity of the work attempted.

#### THE FIRST AMERICAN PUBLIC SCHOOL.<sup>a</sup>

By WILLIAM A. MOWRY, Ph. D.,

*Hyde Park, Mass.*

We have now fairly entered upon the twentieth century. The United States of America as a nation is rapidly making important history. The events of the last year, of the last decade, of the last half century will hereafter play a conspicuous part in the annals of the world. To-day our territory extends from the Atlantic to the Pacific, covering the largest and most desirable portions of the north temperate zone in North America, to which we have added Alaska and our recently acquired islands between the Tropics in both the Atlantic and Pacific oceans. In less than three centuries from the first permanent English settlement in North America we have grown from English colonies to independence, and have established a government—a compound republic—which for a century and a quarter has steadily grown, increasing in territory, in population, in the intelligence of its people, in industry, and in wealth, until to-day the Stars and Stripes float over nearly 4,000,000 square miles of territory, and under our flag are protected the interests of nearly, if not quite, 85,000,000 people.

The broadening of our industries, the accumulation of wealth, and the ever-increasing growth of general intelligence are believed by many to be without parallel in the history of any of the nations of the world. Without doubt this Republic is to-day at least one of the strongest, most powerful, most successful of the nations.

Doubtless many causes have conspired to produce these great results. To understand present conditions we must go back to remote causes. To comprehend the growth, development, uplift of human society in these modern times we must go back to the great Reformation and to the Renaissance in Europe in the fifteenth and sixteenth centuries. We must give attention to the wresting of arbitrary power from sovereign rulers. We must read the history of the Anglo-Saxon race. We must have respect for those who secured Magna Charta from King John. We must study the establishment of the Protestant Church in England and the history of the English Bible. But perhaps more than all these, we must read carefully and attentively the story of the English Puritans. To under-

<sup>a</sup> Reprinted from *Education*, May, 1901. See in this connection an article by Dr. George Gary Bush entitled "The first common schools of New England," in the Annual Report for 1896-97, vol. 2, pp. 1165-1186.

stand the growth of modern ideas we must visit Bedford jail, look out upon the fires of Smithfield, read the annals of Scrooby, hear the sermons of John Robinson to his exiles in Leyden, cross the Atlantic with the *Mayflower*, the *Abigail*, the *Arbella*, and the *Mary and John*.

The settlement of Massachusetts by English Puritans has unquestionably exerted a great influence upon both the development of our own country and the history of the world.

The United States of America to-day has a civilization of its own. While in the main this is the same civilization that Great Britain shows at home and in her colonies, yet there are peculiarities, customs, interests, with particular modes of progress, which stamp the civilization and state of society in the United States as different from British or European conditions. We have many American institutions peculiar to our country and our Government. Perhaps, however, no one of them is so marked, so distinctively American, as that which is termed the American system of public schools. The topic that concerns us at the present time is the origin of this institution. Where did it originate? Which was the first public school in America? This is the question to which we must now devote our attention.

The term American system of public schools has acquired a fixed and definite meaning. It is a public or a free school. Free, not necessarily in the sense that the recipient of its benefits has nothing whatever to pay, for sometimes rate bills have been charged or the parents of the pupils have furnished board for the teacher, or they have provided wood for the schoolhouse stove. Free in this sense means open to all—that is, public. The school is for the entire public.

But this term means more than public. An endowed academy is a public school in one sense; it is free or open to the entire public of the place where it is established. But it is made so by an endowment. Such a school would not be a representative of the American public-school system. In addition to being open to the whole public, a representative school of this system must be supported at public expense. This support may come largely from the State, or the county, or the city or township, or the funds may be appropriated by all three. The essential features of this system are that the schools are for the children of all the people, and that they are supported either wholly or principally by taxation. A private school established by individuals or a collection of individuals—by a church, society, or guild, or endowed by individuals, churches, or guilds, whether with or without tuition—is not a representative of our public-school system. The principle of taxation lies at the bottom of the American public school.

The Puritans of Massachusetts Bay from the beginning of their colony felt that the church and the school were essential to the welfare of the State. The church they supported by a tax from the first. For this they had abundant precedent in the mother country. To support a school by taxation they had no precedent. They, however, very soon established one. Learning and virtue must go side by side in the New World.

As money in the new colony was not plenty, and the calls for taxation were numerous and frequent, they found it necessary to avoid direct tax whenever possible. Public schools, so called, they were familiar with in England. But those schools were so named because they were open to the public, churchmen and dissenters alike. Such were the schools at Rugby, Eton, and Harrow. In imitation of what the Puritans were familiar with in England, within six years of the settlement of Boston, Harvard College was founded at Cambridge, and the first steps were taken to establish a Latin preparatory school in Boston. Private schools sprang up at an early date in various places—in Virginia, Manhattan (or New York), and at different points in New England. Some of these will be considered later. We are looking for the first school which was established by the

public for the education of the youth of the locality and was supported by taxation. Let us, then, examine the claims of the school established by the voters of Dorchester, Mass., to which the Hon. Joseph White, secretary of the Massachusetts board of education, refers as the "first school in the world supported by direct taxation or assessment on the inhabitants of the town." In order to understand clearly the meaning of the particular taxation resorted to in this case, a bit of explanatory history will be necessary. Near the coast of the town of Dorchester was an island called Thompsons Island. It had been taken possession of by David Thompson in 1626, but he had retired from it before the permanent settlement of Boston and Dorchester. This island, on the 4th of March, 1635, was given by the act of the general court of Massachusetts Bay to the inhabitants of the town of Dorchester, "to enjoy, to them, their heirs and successors, which shall inhabit there forever," on condition that they pay to the treasury twelve pence yearly as rent. This island was apportioned by the town and set off in parts to the freemen of the plantation. The records of the town are too meager to tell us clearly whether every freeholder had a portion of the island set off to him, or whether it was divided between the principal citizens, freeholders or freemen. It is possible that every taxpayer had his share. It is, at least, clear that every one of the principal freeholders had a portion of the island allotted to him. At any rate this allotment was made by the town to more than seventy persons, and other evidence goes to show that this was probably about the number of freeholders in the plantation. These men receiving their portions of the island, larger or smaller, as the case might be, were termed "proprieters" of the island. It is to be observed that this word "proprietor" was everywhere understood at that time as meaning "freeholder" or "freeman;" that is, a voter.

With this explanation we now come to the establishment of the school. A town meeting was held in May, 1639, and provision was made for maintaining a school in the plantation. In order to avoid any misunderstanding the order that was passed at this town meeting will here be given in full:

It is ordered, the 20th of May, 1639, that there shall be a rent of twenty pounds a year forever imposed on Thompson's Island, to be paid by every person that hath propriety in the said island, according to the proportion that any such person shall from time to time enjoy and possess there, and this toward the maintenance of a school in Dorchester. This rent of twenty pounds yearly to be paid to such a schoolmaster as shall undertake to teach English, Latin, and other tongues, and also writing. The said schoolmaster to be chosen from time to time by the freemen, and it is left to the discretion of the elders and the seven men for the time being whether maids shall be taught with the boys or not. For the levying this twenty pounds yearly from the particular persons who ought to pay it according to this order, it is further ordered that some man shall be appointed by the seven men for the time being to receive this, and on refusal to levy it by distress, and not finding distress, such person as so refuseth payment shall forfeit the land he hath in propriety in said island.

Twenty pounds a year was the amount of this tax upon the people of Dorchester for the support of the public school. Four years and more later the same amount, £20, was voted to the schoolmaster by the town of Dedham, and the salary of the schoolmaster in that town remained £20 per annum until the close of that century, when it was made £25. In 1635 the town of Newbury voted to pay "£24 by the year to maintain a free school at the meetinghouse." It would seem, therefore, that £20 a year was a fair salary at that time for the Dorchester plantation to pay its schoolmaster.

The next step taken by the town was to secure a teacher. Rev. Thomas Waterhouse was the first teacher of this school. In what month or upon what day of the month the school was first opened we can not now tell. The records are too meager to give us the necessary information, but it is clear that the school was opened at some time during the summer or early autumn of that year, 1639. In

the town records is this entry, made of a vote in town meeting on the 31st of October, 1639: "It is ordered that Mr. Waterhouse shall be dispensed with concerning the order in the charge of twenty pounds yearly rent to be paid for Thompson's Island toward the school, where he is bound to teach to write, it shall be left to his liberty in that point of teaching to write, only to do what he can conveniently therein." This vote would seem to show that the school was at that time in operation, and that the people of the town trusted to the judgment of Mr. Waterhouse, the master, in reference to the question how much time should be used in teaching the pupils to write.

The school was now established. The tradition has been handed down that a log schoolhouse was built, located near the corner of Pleasant and Cottage streets, just at the western foot of Meetinghouse Hill. There Dominie Waterhouse kept the school and taught the boys "English, Latin, and other tongues," and, so far as he deemed it advisable, "writing." A succession of eminent teachers followed him. A succession of eminent men here received the rudiments of their education. Here Rev. James Blake Howe taught young Edward Everett to read, to write, and to spell. Mr. Howe was the first teacher in the new brick schoolhouse built on Meetinghouse Hill in 1798. Here Edward Everett, when a small boy, practiced declamation.

The plan of taxing this island, instead of the entire property of the town, was a device which, doubtless, when it was adopted, seemed to the voters a better plan than to tax the entire property of the town for this special purpose. After a few years, however, it was found in practice that the collection of these rents or taxes on the small bits of land which had been apportioned among the taxpayers or freemen of the town was attended with much difficulty. It was found also that the tax which could be collected was not sufficient in amount to carry forward the school successfully. Moreover, the people found that the income from their several portions on the island was not sufficient to make it profitable. For these and other reasons, on the "Seaventh day of the Twelfth moneth in the yeare 1641" (N. S., Feb., 1642), the proprietors of the island made a direct conveyance of the island to the town for the special support of the school. By this conveyance they expected that the school would be more effectually and better maintained. This conveyance was made in the following terms:

The said island and all the benefits and profits thereof, and all their right and interest in the same shall be wholly bequeathed and given away from themselves and their heirs unto the town of Dorchester aforesaid, for and toward the maintenance of a free school in Dorchester aforesaid for the instructing and teaching of children and youth in good literature and learning.

This document further says:

It is hereby ordered and the present donors do hereby declare that it is their mind that the said island shall be let, assigned, and set over only to such tenant or tenants as shall by land or otherwise sufficiently secure the payment of the rent thereof for the use and behoof of the school as aforesaid in such manner and form and at such time and times of payment as shall be agreed upon by and between the inhabitants of Dorchester or their agents, one the one party and the said tenant or tenants one the other party.

And for avoiding the trouble that might arise in collecting and gathering the same rent by so multitude of tenants that ought to pay the same, and to the intent that the rents which shall become due for the said island may be the better and more readily collected and paid, it is hereby ordered and declared that the said island shall never be let out to so many tenants as shall be above ten in number at once.

To this deed of conveyance seventy-one persons, "present inhabitants," subscribed their names, and the following memorandum was appended to the document:

That before the subscribing of these presents the donors aforesaid did further agree and declare that it was and is their mind and true intention that if at any

time there shall happen and fall out a vacancy of a schoolmaster by means of death or otherwise, yet the rents and profits issuing and arising of the said island shall be converted and applied only to and for the maintenance and use of the school either by augmenting the stipend for a schoolmaster or otherwise, but not for any other use.

The author of the History of Dorchester says: "So far as the writer is informed this was the first public provision made for a free school in the world by a direct tax or assessment on the inhabitants of a town." Hon. Joseph White, in the fortieth annual report of the secretary of the board of education for Massachusetts, already mentioned, in referring to the establishment of this school by the town of Dorchester uses the following language:

This action of Dorchester, which was two years earlier than that of Boston for a similar object, is claimed by the historian of the town and by other distinguished writers to be the "first public provision made for a free school in the world supported by a direct taxation or assessment on the inhabitants of a town."

The school was now established, and it has continued in successful operation from that time to this day. A new question now presents itself to the inhabitants of the town: Who shall be charged with the management of this school? At first it was directly in the hands of the town meeting. Then the details would naturally be directed by the "seven men;" that is, the selectmen.

At the March meeting in the year 1645, just two months after the town of Dedham had passed their initial vote looking toward the establishment of a school in that town, the freemen in Dorchester voted to adopt "rules and orders concerning the school," and these rules were confirmed by a majority vote of the inhabitants of the town present at the meeting.

This first public school after the American idea was now well established and had been in successful operation for several years. It was placed in charge of a managing board such as we to-day call a school committee or a board of education, or as in Pennsylvania, school directors. In order that there may be no misunderstanding or misapprehension we will pause here to examine various claims made for other places.

Our system of public schools to-day is so important and so popular, so thoroughly intrenched in the affections of the people of our whole country, that a widespread and deep interest exists in this question of when and where the first of these public schools started. About seven years ago Judge Draper, then of New York State, published some articles in the Educational Review, in which, with great boldness, he claimed that this American school system originated among the Dutch at Manhattan, now New York City.

At Manhattan in 1638, among the officials of the Dutch West India Company, was Adam Roelandsen, "the schoolmaster," and Mr. Barnard, in his American Journal of Education, 1862, says: "And the school which he taught, it is claimed, is still in existence in connection with the Dutch Reformed Church." But this was a private school and was not supported by taxation. Indeed, all the schools established in these English colonies in America prior to 1639 were private schools. Taxation is essential to the generic idea of the American system of public schools.

Prior to this Manhattan school was one established at Charles City, Va., as early as 1621 by Rev. Patrick Copeland, who raised by subscription a large sum of money to found "a free school." The school was entirely a private school, not managed by the plantation nor supported by public money.

The Boston Latin School appears to have been begun in 1635, but there seems to be a lack of evidence that it received the support of the town till 1641. The first step, however, was taken in behalf of this school by the town, in that it elected the teacher in a legally warned town meeting. But, like many other cases, it is

clear that the effort at first was to support the school on "a foundation" like the schools of old England at Eton, Westminster, Rugby, etc.

The records of Charlestown have the following: "1636, June 3, Mr. Witherell was agreed with to keep a school for a twelve month, to begin the eighth of August and to have forty pounds this year." The record fails to give us the needed evidence that the school was supported by taxation till after the Dorchester people had set the example. This one vote is all the record we find in the case. If this vote in 1636 by which "Mr. William Witherell was agreed with to keep a school for a twelve month, to begin the eighth of August and to have forty pounds this year," was passed in town meeting and not in a meeting of the proprietors simply—if the same can be considered as conclusive evidence that the school was kept at that time and that the forty pounds to be paid to Master Witherell was raised by taxation, then Charlestown has the priority. But is this one vote conclusive? Would the courts render a verdict on such meager evidence? Indeed, if the school were so kept and the money had been raised by taxation, would there not be, inevitably, various other records concerning it? But there is, so far as I know, no evidence that the town supported the school by taxation till long after 1640.

Mr. Saltonstall, the first mayor of Salem, has claimed that that town had the honor of leading in the establishment of public schools. He claimed that a grammar school was founded in 1636. Mr. Small, superintendent of the schools in Salem, in his report for 1875 says: "The date of its foundation was 1637, according to the facts given by Felt in his *Annals of Salem*." There is, however, no vote of the town on record relating to a public school till January, 1640, when at "a general town meeting young Mr. Norris was chosen by this assembly to teach school."

The town of Newbury in 1639 granted ten acres of land to Anthony Somerby "for his encouragement to keep school one year." But the first notice of the town's intention to build a schoolhouse or to support a teacher at their expense was in 1652, and the next year (1653) it was ordered "that the town pay twenty-four pounds by the year to maintain a free school," against which vote seventeen persons "desired to have their dissents recorded."

Newport, R. I., established a school in August, 1640, at which time Rev. Robert Lenthall was "called by a vote of the freemen to keep a public school for the learning of youth, and for his encouragement there was granted him and his heirs one hundred acres of land and four more for a house lot." It was also voted that "one hundred acres should be laid forth and appropriated for a school for encouragement of the person sent to train up their youth in learning, and Mr. Robert Lenthall, while he continues to keep school, is to have the benefit thereof." This was evidently, from subsequent entries in the town records, a "Latin school" or "grammar school" in the old English sense of the term, and this rent was applied to reduce the expense to poor scholars. Barnard says: "The children of the rich were provided for in private schools or family teaching, and not a few were sent to England for their education."

It has been claimed that the first public school in America was at Dedham. The proof is clear that "the founders of Dedham at a town meeting held on January 1, 1644, old style (1645 N. S.), forty-two persons being present, whose names are given in the record, passed the following vote, viz:

The said inhabitants, taking into consideration the great necessity of providing some means for the education of the youth in our said town, do with a unanimous consent declare by vote their willingness to promote that work, promising to put to their hands to provide maintenance for a free school in our said town. And further do resolve and consent, testifying it by vote, to raise the sum of twenty pounds per annum towards the maintenance of a schoolmaster to keep a free school in our said town.

The school was without doubt established and some years later a schoolhouse was built. Schoolmasters were from time to time employed, and thus Dedham takes her place with these other sister towns in the establishment of the American public school. It is clear that this school thus early established in Dedham was a free school, a public school in the proper sense of these terms, being supported by a distinct tax.

These first schools were inaugurated by the several towns, each acting for itself. In 1647 the system was legalized and made obligatory by a school law passed by the general court. This law made it compulsory upon the town to support public school and to make education universal and free. Of this school the late Hon. John W. Dickinson says: "As this was the first law of the kind ever passed by any community of persons or by any State, Massachusetts may claim the honor of having originated the free public school." This law, however, only made compulsory upon all the towns that which had been voluntarily undertaken by a number of them.

In this law we find the following:

It is therefore ordered that every township in this jurisdiction after the Lord hath increased them to the number of fifty householders shall forthwith appoint one within their town to teach all such children as shall resort to him to write and read, whose wages shall be paid either by the parents or masters of such children or by the inhabitants in general, by way of supply, as the major part of those that order the prudentials of the town shall appoint; provided those that send their children be not oppressed by paying much more than they can have them taught for in other towns; and it is further ordered that where any town shall increase to the number of one hundred families or householders they shall set up a grammar school, the master thereof being able to instruct youth so far as they may be fitted for the university; provided that if any town neglect the performance thereof above one year that every such town shall pay five shillings to the next school till they shall perform this order.

The Massachusetts system of education was now in full operation, with enactments for elementary English schools, secondary classical schools, and the college at Cambridge already established.

We have seen that a number of the towns had previously established their own schools. The system was now made universal and compulsory.

It would not be germane to our purpose to follow the history of this Dorchester school further. Let it suffice to say that the school became permanent and was never abandoned. This identical school has had a continuous existence to the present day. As the town grew other schools were established. Thompsons Island, whose original proprietor was David Thompson, then dead, was claimed a few years later by his son and heir, John Thompson. The general court, after due trial, decided in favor of the claim of John Thompson and nullified its grant to Dorchester, turning the property over to John Thompson as its legal owner. Subsequently Dorchester appealed to the general court with a request that the court would grant other lands in place of Thompsons Island thus taken from them. October 18, 1659, the general court granted the petition in the following vote:

The deputies think meet to grant this petition, viz: A thousand acres of land for the end mentioned in this petition, where they can find it according to law, with reference to the consent of our honored magistrates hereto.

WILLIAM TORRY, Clerk.  
EDWD RAWSON, Secy.

Consented to by the magistrates.

On the 14th of November the selectmen of Dorchester "Impowered Mr. Clarke and Henry Woodward to search and stake out a farm of one thousand acres of land granted unto the town of Dorchester for the use of a school by the order of the general court at Boston the 18th of October, 1659."

Nearly sixty years, however, elapsed before the tract thus granted was located

(1717) and taken possession of by the town. It was then located in what was afterward called Lunenburg, in Worcester County. A committee chosen to examine the quality of the land reported in the year 1727 that they found "upon a careful review thereof the north side to be good land, but the south side to be uneven and mean land." This land the town sold at public auction on the 4th of March, 1733-34, to Benjamin Bird, of Dorchester, for the sum of four hundred pounds.

In addition to the above-mentioned grant by the general court of 1,000 acres of land for the public school in Dorchester, the inhabitants of that town in 1657 voted to appropriate 1,000 acres of her own soil for the same high and laudable purpose. Five years later four men were chosen "to look out some convenient place or places for the laying out" of the said land. It is said that in the latter part of the summer they rode out into the country, "and coming to a place above Dedham," did agree "to take up three hundred acres at one place, namely, beginning at that place where the Dedham and Dorchester line meets with the Neponset River, and so to come down as far as three hundred acres will expend, both in length and in breadth, as the conveniency of the land will afford when it is laid out by measure."

Forty years afterward the remainder of this grant was laid out near the Plymouth Colony line, by the Bridgewater road, halfway between Boston and Taunton, and bounded by Halfway Brook, near Woodcock's well, the Rehoboth road, etc. It was composed of several different lots, which were, however, in the same neighborhood. This "school farm," as it was called, was rented to different persons and afterwards sold for the benefit of the town.

One little incident in connection with the sale of this land deserves notice. Eight hundred acres of it were sold in 1772 to Timothy Stevens for £284 13s. 4d. Within a short time this Stevens sold out his eight hundred acres to different persons for more than three times what he paid for it. The historian naively adds, "This was not the first nor the last time public property has been thus disposed of."

Such were the beginnings of our New England public-school system. From time to time appropriate legislation was enacted, for the general court of this Commonwealth has always jealously guarded the interests of education. The institution which was thus early planted here upon the west coast of the Atlantic has from time to time extended westward. The English settlers here were pioneers. The pioneers pushed westward until they had occupied the territory of New Hampshire, subdued the land beyond the Green Mountains in Vermont, made settlements upon the hills and in the valleys of the Berkshire region, dotted everywhere with farmhouses western Connecticut, leaped over the Dutch settlements in New York, planted freedom and education in the territory northwest of the Ohio, covered the plains of the two great valleys of the Mississippi and the Missouri with cornfields and wheatfields, and finally, passing over the summit of the continent, they spread New England people and New England principles "where rolls the Oregon," and even to the Pacific coast. And everywhere that these pioneers from New England went they planted the church and the school-house. The American public-school system was thus extended over the whole Northwest on this side of the mountains, and beyond them in Oregon and Washington.

But there were two civilizations from the very start in the English colonies of North America. Plymouth and the Bay Colony represent the Roundheads; Virginia the Cavaliers. In an educational address at St. Albans, Vt., in 1881, Dr. J. L. M. Curry, in speaking upon the topic "Education in the South before the civil war," said:

In proportion to the population, taking man for man, negroes excluded from the population, the South sustained a larger number of colleges, with more professors

and more students and at a greater annual cost, than was done in any other section of the Union. The same was true of the academies and private schools.  
\* \* \*

In the matter of public schools, sustained by taxation and free to all who chose to attend, the South was far behind the North in the provision made for universal education. No plans adequate for universal education existed.

It is a great pleasure to quote further from Dr. Curry's address as follows:

When the Confederate soldier furled his flag at Appomattox there was not a Southern State that had a system of public schools; but now, in organic law and in statutes, universal education is recognized as a paramount duty. The newspaper press gives intelligent and effective support; party platforms incorporate public schools in the political creeds; State revenues are appropriated; local communities levy taxes, and scarcely a murmur of dissent is heard in opposition to the doctrine that "free government must stand or fall with free schools."

This was said in 1881, eighteen years ago. To-day it is true that every State in this Union and every organized Territory has established by law and in good working condition a system of universal education, based upon the American plan of public schools supported by taxation.

Let us pause for a moment and contemplate this gigantic result. A small plantation, situated on the eastern shore of North America, for the first time in the history of mankind, taxes itself to support a school where all the children, rich and poor, high and low, plebeian and patrician, shall receive at public expense the rudiments of an education. That was the beginning. As a result to-day we have a nation holding sway from the Atlantic to the Pacific, with its southern borders upon the torrid zone and its northern extremity in the Arctic Ocean, embracing 75,000,000 people with one single system of education, supported not by a central government, but by the people themselves, through taxation upon their own property, in every State, in every county, in every municipality. This is something never before witnessed in the history of the world; an achievement in a quarter of a single millennium greater than any the sun hitherto ever shone upon. To quote once more from the address already alluded to from Dr. Curry. He said:

Let me affirm with emphasis, as an educator, as a patriot, as an American, that on universal education, on free schools, depend the prosperity of the country and the safety and perpetuity of the Republic.

The exigencies of the present time seem to be favorable for the cultivation by some persons of pessimistic views concerning the future prospects of our Government and our people. Of course, governments, like individuals, find here and there disappointments and disasters. In ancient times empires arose, flourished, decayed, and were swept away. Revolutions have taken place. Dynasties have been overthrown. In our own country one political party succeeds the other in the management of our Government, both State and national. Yet it is safe to say that no careful student of history ever ought to be a pessimist. The progress of the race is steadily and constantly upward and onward. No one need to lie awake at night for fear that our national bark is to founder in the deep sea, or break to pieces upon the rocks of some inhospitable coast. Doubtless there are dangers ahead. We are to-day confronted with many serious problems, but there have been pessimists always, and serious problems are always confronting a brave and prosperous people. Our fathers had them and overcame them, and their fathers overcame them. Like the poor, we shall have them with us always.

From the beginning, however, the Anglo-Saxon race has been equal to any emergency. It has again and again overcome obstacles, dangers, and difficulties, which to many minds have seemed to threaten prosperity, and even existence itself. From the beginning of these English settlements, nearly three centuries ago, dangers, difficulties, adverse circumstances have always threatened. It is equally true that the dangers have always been averted and the problems success-

fully solved. The same will be found true now. This hardy race shall triumph. American civilization is the hope of the world. The public school is the corner stone of our national superstructure. We shall find means adequate to the ends. Let us not forget, however, that the means must be used to accomplish the ends desired. It is highly necessary that all the people recognize the value and the importance not only of education in general, but especially of the institution known as "The American system of public schools."

## SUPERVISION IN MASSACHUSETTS.

### PROVISIONS OF THE LAW RELATING TO SUPERINTENDENTS.

[From "The revised laws of Massachusetts relating to public instruction. Enacted by the legislature November 21, 1901."]

#### SUPERINTENDENTS OF PUBLIC SCHOOLS.

SEC. 40. The school committee of a city or town which is not within an existing union for the employment of a superintendent may, and after the first day of July in the year nineteen hundred and two, shall, at the expense of the city or town, employ a superintendent of schools, who, under the direction and control of the committee, shall have the care and supervision of the public schools. The compensation of the superintendent shall not be less than one dollar and fifty cents for each day of actual service, and shall be determined by the school committee.

SEC. 41. Two or more towns may, by a vote of each, form a district for the purpose of employing a superintendent of public schools therein.

SEC. 42. Such superintendent shall be annually appointed by a joint committee, composed of the chairman and secretary of the school committee of each of the towns in said district, who shall determine the relative amount of service to be performed by him in each town, fix his salary, apportion the amount thereof to be paid by the several towns and certify the same to each town treasurer.

#### SUPERINTENDENTS OF SCHOOLS FOR SMALL TOWNS.

SEC. 43. The school committees of two or more towns the valuation of each of which is less than two million five hundred thousand dollars, and the aggregate number of schools in all of which is not more than fifty nor less than twenty-five, and the school committee of four or more towns the valuation of each of which does not exceed two million five hundred thousand dollars, without reference to the minimum limit in the aggregate number of schools aforesaid, may, and after the first day of July, in the year nineteen hundred and two, shall, form a union for the purpose of employing a superintendent of schools. Such union shall not be dissolved for three years after the date of its formation except by a vote of a majority of the towns constituting the union, nor shall it be dissolved for the reason that the valuation of any one of the towns shall have so increased as to exceed two million five hundred thousand dollars, nor for the reason that the number of schools shall have increased beyond fifty or, in a union of less than four towns, shall have decreased below twenty-five.

SEC. 44. The school committees of such towns shall be a joint committee, which, for the purposes of such union, shall be the agents of each town therein. The joint committee shall annually, in April, meet at a day and place agreed upon by the chairman of the committees of the several towns comprising the union, and shall organize by the choice of a chairman and secretary. They shall choose, by ballot, a superintendent of schools, determine the relative amount of service to be performed by him in each town, fix his salary, apportion the amount thereof to be paid by the several towns, and certify it to each town treasurer.

SEC. 45. When the chairman and secretary of such joint committee certify to the auditor of accounts under oath, that a union has been effected, that the towns, in addition to an amount equal to the average of the total amount paid, or to the amount paid for each child, by the several towns for schools during the three years then last preceding, unitedly have appropriated and raised by taxation not less than seven hundred and fifty dollars for the support of a superintendent of schools, and that a superintendent of schools has been employed for one year, a warrant shall, upon the approval of the certificate by the board of education, be drawn upon the treasurer and receiver-general for the payment of twelve hundred and fifty dollars, three-fifths of which shall be paid for the salary of such superintendent, and two-fifths thereof shall be apportioned and distributed to the towns forming such union on the basis of the amount appropriated and expended for a superintendent in such towns for the preceding year and shall be paid for the salaries of teachers employed in the public schools therein.

SEC. 46. There shall be annually appropriated by the Commonwealth such amount as may be necessary to carry out the provisions of the three preceding sections.

SEC. 47. Towns whose valuation exceeds the limit fixed by section forty-three may participate in a union formed under the provisions of said section, in the same manner and subject to the same terms, conditions, and benefits as towns having such limited valuation, except that the allowance by the Commonwealth in aid of said union, as provided in the preceding section, shall not be made to the entire union, but shall first be apportioned to the several towns upon the basis of the amount appropriated by them, respectively, for the support of a superintendent of schools for the preceding year, and the warrant upon the treasurer and receiver-general shall then be drawn in favor of and only for the portions so assigned to those towns of the union whose valuation at the time of said union did not exceed the limit provided in section forty-three.

SEC. 48. If the valuation of a town in a union formed under the provisions of section forty-three or of the preceding section shall so increase as to exceed three million five hundred thousand dollars, such increase shall have the same effect as if the valuation of said town had exceeded two million five hundred thousand dollars at the date of the formation of such union.

## DISTRICT SUPERVISION.

[Reprinted, with some changes in arrangement, from the 64th and 65th reports of the Massachusetts Board of Education (1899-1900 and 1900-1901), Hon. Frank A. Hill, secretary.]

*Development of district supervision.*—The system of district supervision in Massachusetts—that is, of the supervision of the public schools in a group of towns by a single superintendent—was established by an act of 1888. Previous to that date there were several instances of two towns employing the same person as superintendent, but, as there was no aid from the State, only towns of considerable means could resort to the plan. It was therefore beyond the reach of most of the towns of the State. Under the legislation of 1888 the smaller towns were encouraged to establish superintendency districts. To guard against the employment of inferior persons, the minimum salary of the district superintendent was fixed at \$1,250. Of this the State paid \$500; it also gave in addition \$500 toward the salaries of teachers in the district. Amendments of the legislation of 1888 were made by acts of 1890 and 1891, the principal change being an increase of the superintendent's salary to \$1,500, the State contributing \$750 thereof. An act of 1898 codified the previous laws and extended their scope somewhat. In 1900 an act was adopted by the legislature making the employment of superintendents of schools the universal and permanent policy of the State after July 1, 1902.

*The method of educational progress.*—The history of supervision in Massachusetts illustrates the way in which many of the State's great educational steps have been taken. At first the towns feel their way to a new method of supervising the schools by employing a paid expert for the service. They do this without any special sanction from the legislature, but out of that reserve of authority which they assume to have in the general authority granted them by the State to manage their schools. The method proves successful, whereupon the legislature formally authorizes the towns to adopt it if they choose to do so. Under this formal authority other towns take similar action. Meanwhile there is an undercurrent of conviction that the State ought not to force the plan upon towns—certainly not so long as there is any widespread failure on their part to utilize it. In time, however, a large proportion of the State is won over to the plan. Then the people conclude that it has been sufficiently tested and that the good of the schools requires it to be made mandatory and universal. It is a slow process; it has its disadvantages. But there is one superlative merit—a good principle worked out and fixed in this way rests on that solidest of foundations, the experience and intelligence of the people. The Massachusetts system of district supervision is the most successful yet devised in the United States for reaching the small towns; and the act of the legislature of 1900, that, in addition to its mandate that every town shall employ a superintendent of schools, makes it the duty of every eligible town to provide for this kind of supervision, is the most promising school legislation of recent years. Energies may now be more fully directed to improving the quality of the supervision.

It will be noted from the statute that it is no longer necessary for the towns to consider in town meeting questions relative to the formation or the dissolution of superintendency unions. Whatever authority they exercised in this way under earlier legislation has been transferred to the school committee; and very properly, now that the State has decided to require all towns, through unions or otherwise, to employ superintendents of schools. The question of expediency having thus been settled by the State itself, only details of procedure are left to be acted upon. Obviously these can be better handled in school committee than in town meeting. In this substitution of State authority for that of the town, as well as in the very arguments used for and against the State policy, history has repeated itself. It was, for instance, once optional with the town whether it should have a school

committee or not. In many towns the selectmen managed the schools, as they did everything else. After numerous towns had voluntarily appointed school committees, and shown the worth of such supervision, the State in 1826 decided that what was good for these towns was good for all, and so directed that thereafter every town should choose a school committee. There were towns that chafed under this mandatory policy, and the next legislature was beset with petitions to repeal it, but to its credit it stood firm. To-day a petition for such repeal would be looked upon as preposterous. Nay, in colonial and provincial times there were towns in which such things as appointing teachers, fixing their salaries, and making rules for the schools were not delegated to selectmen or special committees at all, but were settled in open town meeting—the most democratic and primitive way of all, the town being a committee of the whole, as it were, for the purpose. It clears the situation for the school committee to understand that henceforth it has the same sort of authority in employing a superintendent of schools as in employing a teacher. It is for the school committee to select the one as the other, to determine what grade of qualifications it shall demand in each, and to fix upon the compensation that, in its judgment, will command the qualifications desired. In the case of the district superintendent, however, this authority of the school committee has to be exercised jointly with other school committees, and within the limitations of the district superintendency law. It is now as much the duty of the town to appropriate money enough to cover the superintendent's salary as the salaries of teachers.

Inasmuch as nearly all the towns whose valuation exceeds \$2,500,000 already have superintendents, the new law is practically of chief concern to towns under that valuation that have not yet effected the necessary unions. Such unions can be better brought about by school committees than by towns acting in town meeting.

*Status of towns whose valuation comes between \$2,500,000 and \$3,500,000.*—The law provides that when the valuation of towns in superintendency districts rises above \$2,500,000 they may nevertheless remain in such districts and receive State assistance until their valuation reaches \$3,500,000. There were 30 towns whose valuation May 1, 1900, came between these limits.

The superintendency arrangements of these 30 towns are as follows:

1. Four employ superintendents on full time.
2. Two employ superintendents in conjunction with other towns, none of them receiving aid from the State.
3. Ten are in superintendency districts and are aided by the State.
4. Three that do not receive aid from the State are in districts with towns that do receive aid.
5. Six employ the high school principal as superintendent also.
6. One employs a superintendent on part time.
7. Four are without superintendents.

All of the foregoing towns, could they have entered superintendency districts when their valuation was under \$3,500,000 each, might have been in them at the present time, with aid from the State. As it is, however, 13 are now in districts, 10 with aid and 3 without, the latter having entered districts after passing the limit of \$2,500,000, while 17 are outside. There is no question but that some of the unaided towns stand more in need of help than some of the aided.

Some towns employ the high school principal as superintendent also, reasoning that if they unite the two offices in one person they can afford to pay a higher salary, and so command higher qualifications. The reasoning is correct so far as it goes. But if these towns were in superintendency districts, they probably could afford to utilize the principal's superior qualifications in the exclusive service of the high school. The work of the high school, and particularly of the high

school that must get along with only two or three teachers, is so exacting that it is not good policy to add to the principal's duties those of a superintendency. The danger is that one side of his work or the other, more likely both, will suffer, let him be never so able.

As to superintendencies that command but a portion of the time of persons engaged in other pursuits, at a compensation but little more than nominal, it may be said, without the slightest reflection upon the holders thereof, who doubtless render a full equivalent or more for their humble pay, that they do not conform to the unwritten standards already set for them in the general practice of the State.

*Duties of the superintendent.*—The statutes do not define the duties of the superintendent; they simply provide that he shall have, under the control and direction of the school committee, the care and supervision of the public schools. Inquiries were recently made to find out the extent, in practice, of the authority granted to superintendents in Massachusetts by the school committees. The following table embodies the results of these inquiries:

*Table showing the duties performed by superintendents of schools in 233 towns and cities of Massachusetts, and the degree of authority exercised.*

Duties.	Number of towns in which certain degrees of authority are exercised by superintendents.				
	None.	Advisory.	Joint.	Full.	Unanswered or uncertain.
1. Selection of text-books.....	8	85	44	92	4
2. Selection of reference books.....	9	88	38	93	5
3. Selection of apparatus.....	6	81	35	103	8
4. Making of course of studies.....	3	41	21	164	4
5. Nomination or certification of teachers.....	10	67	40	95	12
6. Appointment of teachers.....	45	89	60	21	18
7. Suspension of teachers.....	41	104	53	16	16
8. Dismissal of teachers.....	48	102	61	15	7
9. Inspection and direction of teachers' work.....	-----	3	8	218	4
10. Calling and conducting teachers' meetings.....	-----	2	2	224	5
11. Promotion of pupils.....	4	16	19	187	7

*The popular character of the superintendency movement.*—It should be noted that supervision by superintendents of schools has been on trial in Massachusetts for sixty years; that it has developed steadily through these years, until now it applies to all the schools of the State except 4 per cent, and to all the school children except 3 per cent; that this growth has been wholly a voluntary one, the State authorizing but not requiring it; that it was the value of the movement to the larger towns and cities that led the State to encourage it in the small towns by paying half the superintendent's salary; and that the action of the State in making such supervision an integral part of the school system everywhere after July 1, 1902, is simply the incorporation into law of a conviction previously reached almost universally by the people that the number, variety, and magnitude of the public school interests demand a closer, more constant, and more intelligent supervision than school committees, however ably constituted, can be expected to give. Indeed, the more highly people are qualified to serve on school committees, the greater their sense of the importance of such service, but the less the time they can usually give to it; hence the greater their need of the superintendent, and the quicker their recognition of this need. And so they readily accept the principle that the school committee should limit itself to what may be called legislative functions, but assign executive functions to the superintendent.

*Qualifications of the superintendent.*—The mere fact of employing a superintendent does not in itself insure a wise administration of the schools. It is of the utmost consequence that there should be employed a competent superintendent. With inadequate qualifications he can not hope to gain the confidence of the teachers, the committee, and the public, and at the same time serve the schools courageously and well. It comes clearly within the jurisdiction of the State to set a minimum standard of qualifications for superintendents, should it deem it expedient to do so. In the case of district superintendents, half of whose salary is paid by the State, the State is especially concerned that its money should be judiciously expended. It may become its duty in the not distant future to provide, without otherwise impairing a district's freedom of choice, that the candidates from whom the superintendent is to be chosen shall be approved as properly qualified in scholarship, character, experience, and wisdom to discharge the high and diversified duties of the office. As a first step, let certificates of qualification be issued by the State to such persons as are able to show their fitness to serve as district superintendents. Let the plan begin on a voluntary basis, leaving candidates and districts free to use it or not. Let it stand or fall on its merits, after the customary Massachusetts way. If it stands there will be time enough for the consideration of such requirements as developing conditions suggest. It should not be overlooked that the voluntary basis favors the setting of higher standards of superintendency qualifications than the compulsory—an important compensation for certain disadvantages that pertain to any plan that invites rather than demands.

*Supervision by superintendents as related to supervision by school committees.*—Notwithstanding the occasional failures of superintendents to meet the reasonable expectations of school committees and the public it continues to be an impressive fact—nearly the entire State has voluntarily borne witness to it—that a capable superintendent is a power for good with the schools. The secretary in this connection deems it important to say again what he said a year ago, that “stronger committees, as a rule, are found; they more willingly render unpaid service; better teachers are nominated and employed; better methods prevail; better equipment is secured; a stronger uplifting force is felt throughout the system—where the good superintendent is found and trusted. In all this there is not the slightest reflection upon those men and women who, in places without superintendents, have nevertheless better served the schools than an inferior superintendent could possibly have done. Indeed, it is better, in the argument for expert supervision, to dismiss at once all comparisons of able committees with poor superintendents or of poor committees with able superintendents. Each of these conjunctions of superiority with inferiority is abnormal and undesirable. The right comparison to make is that between good men and women, of general intelligence and ability, who can not be expected as members of school committees to give a large part of their strength and thought and time to the schools, and good men and women, of general intelligence and ability, who have specially trained themselves by study and experience to deal with school questions, particularly with those of an educational character, and who give all their time to this difficult and important work. Ideal supervision in Massachusetts now requires that each of the foregoing kinds shall be supplemented by the other, and that the people everywhere shall press for the highest attainable service on both sides, and press all the harder for it wherever incompetency has brought either kind into disrepute. Shall a school cease to exist because a teacher has failed therein, or a school committee because its members are a discredit to the town, or a superintendency because its incumbent does not adequately fill it? If good teachers, good committee members, and good superintendents are worth having—and that is the verdict of 95 per cent of our people—by all means stand by the permanency and universality of the offices and fight for better holders thereof.”

*Extent of supervision by superintendents.*—After July 1, 1902, all towns and cities are required by law to have superintendents of schools, towns whose valuation is less than \$2,500,000 each to form unions for the purpose. The status of the towns relative to such supervision December 31, 1901, was as follows:

Number of towns and cities employing superintendents independently.....	103
Number of towns in a union superintendency.....	2
Number of unaided towns in district superintendencies.....	7
Number of aided towns in district superintendencies.....	197
Number of towns eligible to aid, but without superintendents.....	36
Number of towns ineligible to aid and without superintendents.....	6
Number of towns with superintendents, 311; without, 42; total.....	353
Percentage of all the schools under superintendents.....	93
Percentage of all the pupils under superintendents.....	97

*Ineligible towns without superintendents.*—The number of towns without superintendents and ineligible to State assistance in employing them is 6. These towns are Amesbury, Danvers, Ipswich, Leicester, Lancaster, and Nantucket. The movement of towns of this class for the past seven years toward the superintendency plan is shown in the following statement:

Year.	Number of ineligible towns without superintendents.	Population.	Valuation.	Number of schools.	Number of different pupils.
1895.....	15	73,193	\$57,144,046	277	12,110
1896.....	12	69,467	48,890,798	244	10,408
1897.....	11	61,805	48,072,086	281	11,049
1898.....	7	55,798	25,256,314	142	6,149
1899.....	5	28,088	19,621,421	103	4,789
1900.....	6	31,322	22,425,783	119	5,115
1901.....	6	31,573	22,854,577	121	5,088

*Eligible towns without superintendents.*—Towns whose valuation is less than \$2,500,000 each are eligible to State assistance in paying their superintendents. The movement of these towns toward the superintendency plan during the past seven years is brought out in the following statement:

Year.	Number of eligible towns without superintendents.	Population.	Valuation.	Number of schools.	Number of different pupils.
1895.....	85	81,861	\$48,404,852	591	16,635
1896.....	82	85,918	46,099,998	582	16,096
1897.....	79	85,270	45,813,981	598	16,159
1898.....	80	88,522	47,082,335	572	16,542
1899.....	78	81,524	45,325,754	544	15,645
1900.....	62	64,521	33,496,370	431	12,108
1901.....	36	33,249	19,892,288	260	7,120

*Classification of superintendents.*—The superintendents of Massachusetts may be classified as follows:

1. Superintendents who give full time to single cities or towns.
2. Superintendents who give full time to groups of two or more towns not aided by the State.
3. Superintendents who give full time to groups of towns aided by the State.
4. Superintendents who give part time to single towns
5. High-school principals who serve also as superintendents.
6. Members of school committees returned as superintendents.

The following statement summarizes the towns, superintendents, and salaries of each of these classes or groups:

Groups.	Number of towns.	Number of superintendents.	Salaries.	Average salary.
Group 1 -----	69	77	\$173,110	\$2,326
Group 2 -----	13	6	12,300	2,050
Group 3 -----	204	67	103,940	1,551
Group 4 -----	2	2	1,100	550
Group 5 -----	20	20	34,000	1,700
Group 6 -----	3	3	300	100
Total -----	311	173	\$30,750	1,890

The salaries of superintendents, arranged by magnitudes, appear as follows:

Number with a salary of \$3,000 -----	1
Number with a salary of \$4,000 -----	3
Number with salaries from \$3,000 to \$4,000 -----	13
Number with salaries from \$2,000 to \$3,000 -----	42
Number with salaries from \$1,500 to \$2,000 -----	97
Number with salaries from \$1,000 to \$1,500 -----	12
Number with salaries below \$1,000 -----	7
Average salary for the State -----	\$1,890

If we exclude from consideration the superintendents of groups 4, 5, and 6 on the ground that they are also principals of schools, or for other reasons do not give full time to their superintendencies, the average salary of the Massachusetts superintendent stands at \$1,969.

## SCHOOL SUPERVISION.

[From report (for 1900) of Clarence A. Brodeur, superintendent of Chicopee (Mass.) schools.]

*History of supervision.*—Our present educational system has been a growth. When at the outset education was seen to be vital to the life of the colony, the direction and management of schools was vested in the towns as corporations. In town meeting assembled citizens chose the schoolmaster, fixed his compensation, determined the conditions of admission to the schools, or chose officers to attend to these matters for them; frequently the selectmen were chosen to attend to these duties. Then, as now, there were people who set no adequate value on their privileges. Foreseeing future peril to the State if the education of the children was neglected, the general court of Massachusetts Bay in 1642 passed an act charging the selectmen of the various towns "to have a vigilant eye over their \* \* \* neighbors, to see \* \* \* that none of them suffer so much barbarism \* \* \* as not to \* \* \* teach \* \* \* their children \* \* \* to read English tongue \* \* \*."

In 1701 we find the first legislation concerning the qualifications of teachers, when it was enacted that every grammar-school master should be approved by the minister of the town and by those of the two next adjoining towns or any two of them. In 1789 a statute was passed recognizing the duty of school visitation. It declared that "It shall be the duty of the minister or ministers of the gospel and the selectmen \* \* \* to use their influence \* \* \* that the youth \* \* \* do regularly attend schools \* \* \*, and once in every six months at least \* \* \* visit and inspect the several schools \* \* \* and \* \* \* inquire into the regulations and discipline thereof and \* \* \* proficiency of the scholars therein \* \* \*."

By 1827 the duties of the selectmen had become so varied and exacting and the importance of the school had so increased that an act was passed creating a board of officials for every municipality, consisting of three, five, or seven persons, whose especial duty should be the care of the schools. In 1857 it was enacted that the number constituting this board should be three or some multiple thereof, one-third to be elected annually, to continue in office for three years. This is the law to-day in all municipalities where city organizations have not made necessary special charter legislation.

Meanwhile the duties of the school committee have increased apace. They are now required to attend to the following matters: To apply the interest of the State school fund; to make reports to the town and to the State; to determine the number and location of schools; to appoint janitors and truant officers; to see that the school laws are obeyed; to select and assign teachers; to prepare courses of study; to determine methods of teaching; to organize and classify the schools; to select text-books, apparatus, and supplies; to have the care of the school-houses; to inquire into the regulation and discipline of the schools and into the habits and proficiency of the scholars; to visit the schools "on some day during the first week after the opening of such schools and on some day during the two weeks preceding the close of the same, and also, without giving previous notice thereof to the instructors, once in each month;" under certain circumstances to grant labor certificates.

This increase of duties, the growth in population of the towns of the Commonwealth, and the rapid increase in the size and importance of cities have made it apparent that no school committee can do efficiently the work assigned it. To attend to the number and variety of duties required by our statutes presupposes (1) more of time than any man sufficiently intelligent to attend to such duties can be expected to give; (2) a degree of intelligence far greater than was necessary formerly; and (3) a certain technical skill, demanding natural aptitude, extensive education, and special professional training such as few public officials can be expected to possess. Furthermore, as public intelligence in school matters has increased, it has seemed anomalous that communities should tolerate a method of management entirely at variance with the systematic practices of business life. To have no settled educational policy, to have as many heads and lines of work as there are members of the school committee—these considerations have suggested the employment of a new school official, the superintendent of schools, a name borrowed from business life, an official employed originally to manage the business interests of the schools. Providence, R. I., was the first city to employ such a superintendent, and Springfield, Mass., tried the experiment a few years later. \* \* \*

Recent educational progress has brought out clearly the thought that in assigning duties to the superintendent too much attention has been paid to the business side of school affairs, and that his far more important duty should be to educate and inspire teachers, pupils, and communities. Superintendents are now selected not so much because of great business sagacity, important though this qualification be, as because they possess the power of mastering educational problems, of conceiving practical educational measures, of leading teachers to constant self-improvement, and of setting forth fitly educational aims and methods for the enlightenment of the public.

The number of school superintendents has increased greatly in recent years owing to our "district superintendency" law, an enactment whereby small towns may unite in employing a superintendent of schools, the State repaying them theoretically one-half but practically five-sixths the expense. This law, passed in 1898, was made optional, but was so widely adopted that in ten years 95 per cent of the school children of the State were in schools supervised by superintendents.

At the present time only 63 of the 353 towns and cities of Massachusetts are without superintendents, and these towns contain less than 5 per cent of the children.

By custom and legislative enactment, school committees have been given extraordinary powers; but in passing over a part of their duties to the superintendent they have not relinquished any of their rights. The superintendent sometimes forgets this, and because those he represents are all powerful he imagines himself to be so. Such situations are fraught with danger to the schools and call for a mutual understanding of the duties, rights, and privileges of the superintendent.

The superintendent of schools should be a well-educated gentleman, a college graduate, a man quick and sound of judgment, courteous, upright, a member of some religious denomination, and a person actively interested in the best civic and social life. He should be large enough in spirit to be above petty quarrels and jealousies, fair enough to work with others even when no personal gain is to result, sympathetic enough to see matters from the point of view of teachers, pupils, and parents, and democratic enough to recognize the just claims of all with whom he has to do. He should be able to judge fairly of the educational needs of a community, he should know what he wishes to accomplish and how to bring about desired results, inclined to solve educational problems for himself, determined to grow constantly in his profession, and willing to bring to the accomplishment of his duties untiring industry and perseverance. Few superintendents will fully meet these requirements, for perfection is as rare in school officials as in other men; nevertheless the ideal must not fall far short of this description.

*The superintendent's relation to the school committee.*—The superintendent is the executive agent of the school committee chosen to see that their decisions are carried out and that the school machine runs smoothly and effectively; but if he is worthy of confidence, he will find his greatest opportunity in guiding by his advice the counsels of the school committee. This influence upon the school policy of a community is what makes him an important official and differentiates him from a mere clerk. He should not be officious, neither should he be afraid to give his opinion; he should not attempt to overawe his employers, but he should realize that they expect him to advocate strongly the best things. He should be given the privilege of discussion and, on all matters within the scope of his duty, his opinion should be given more than ordinary consideration. He should be given a place on most special committees, and some matters should be left to his sole control. He should keep the committee informed on all matters, realizing that the more complete this information the greater will be the power lodged in him. The school committee will usually allow a worthy superintendent to do almost anything he wishes, provided he first asks their permission.

The duties of school management may be divided into three classes. (1) Some belong naturally to the school committee—the appointment of janitors and truant officers, the establishment of school boundaries, the decision as to the number and location of schools, and the transportation of pupils. (2) Some belong of right to the superintendent—the organization and classification of schools, the promotion of pupils, the preparation of courses of study, the adoption of methods of teaching, etc. (3) Some duties belong to both superintendent and committee—

(a) Who shall appoint teachers? To answer this question fairly we must realize the responsibility of each party. The superintendent is responsible for results of schoolroom work; if children are taught but little, if time is wasted, if pernicious influences surround pupils, he will justly feel public displeasure; under such circumstances he ought to have no small share in the choice of his assistants. This is doubly so since in almost every community the service of nearly a quarter of the entire teaching force is either mediocre or entirely unsatisfactory, while in some cases egregiously poor teaching is tolerated because of public opinion or through pity for those concerned. On the other hand, the school committee must

elect all teachers; the public realizes this fact and for years has received its appointment favors at their hands. A failure to respond to the requests of influential patronage seekers is sure to bring down vials of wrath upon undeserving heads. Every community has its two classes of citizens—those who are anxious for the best teachers, wherever appointments may be given; and the more numerous and more strenuous people, who believe places on the teaching force, like positions on the roads, should go to local applicants. A few foundation principles may be suggested. (1) To secure a good teacher should be the first consideration; (2) if such a person can be found in the city, she should be employed; (3) in determining fitness, "influence" should play no part; (4) attendance at a normal school or graduation from college does not make one a teacher; (5) the school committeeman should realize that a faithful discharge of his duties forbids that he shall consider himself primarily a ward representative; he is a State official, charged with the duty of caring for her future citizens.

I have spoken thus at length because here is the great cause of dissatisfaction in every progressive community; we all seek to be fair and to discharge faithfully our duties, but the situation is difficult. I believe all teachers should be elected by the school committee from candidates nominated by the superintendent, and that without such nomination no candidate should be considered. The committee should prescribe rules of procedure in accordance with which the superintendent shall nominate, but once determined, the procedure should be invariable. It is our practice that whenever a vacancy occurs the superintendent shall nominate a candidate; if satisfactory, he is elected; if not, another name is submitted. The only rule for the guidance of the superintendent specifies that he shall not recommend any candidate who is not a graduate of a normal or an approved city training school, or who, lacking this, shall not have had successful experience as a teacher elsewhere.

We have not yet reached the position where applications may not be made through a member of the committee; I hope we may soon make this needed improvement, not because it will add to my own power, but because our present practice is frequently an embarrassment to a member and because some time disastrous results may follow.

(b) Who shall select books and supplies? I think our practice is right and conducive to good results. The committee decides how much money shall be spent for such materials; it wisely leaves the decision as to what paper, pencils, pens, etc., shall be bought to the superintendent, who buys what the teachers need. When a change of text-books is contemplated, the superintendent, after careful investigation by himself and by some of those teachers who are to use the books, asks the subcommittee on text-books to propose the change. Copies are sent to the members of the school committee for their examination; if the proposed book is satisfactory it is adopted.

*The superintendent and his teachers.*—The most delightful and valuable part of the duty of the superintendent lies in his relations to his teaching force. Here he deals directly with the vital forces of the school. In the schoolroom he may commend or correct the teacher, and may strengthen her hands against new and unforeseen emergencies by leading her to right views of education; in the teachers' meeting he may lead his helpers to broader views of education, to more correct methods of instruction, and to a keener interest in study; by personal conferences he may help to settle those schoolroom difficulties, so many and so real, which cause constant vexation of spirit; in the community he may smooth away many points of friction between parents and teachers which otherwise would cause constant annoyance.

The teacher should have complete confidence in the superintendent; she should be sure that, whatever may be his opinion of her work, he will ever prove him-

self fair, honest, honorable, and in the best sense her friend. If her work is unsatisfactory, she has the right to know wherein she fails. The superintendent should be willing to labor for the upbuilding of a poor teacher with all charity, but no teacher should so have lost her self-respect as to wish to continue permanently in a work which she knows is in every way unsatisfactory.

The teacher should have a voice in the settlement of all matters in which she is directly concerned. Courses of study must be made by the superintendent, but he should not forget the value of the teacher's experience; proposed changes in the requirements for any grade should be discussed with the most successful teachers of that grade. The choice of text-books must ultimately depend upon the decision of one person, but the relative merit of books should be determined by practical schoolroom tests, and no teacher's protest should fail to be duly considered. Such cooperation increases good feeling, is especially valuable in keeping teachers alert for the best methods, and stirs their minds to new intellectual activity; it also aids in prolonging the schoolroom life of a teacher. Few professions tend so inevitably to rigidity of thought, to monotony of expression, and to narrowness of view. Unless some force within or without the teacher shall continually urge her to improvement, there can be but one result. Herein lies the value of the teachers' meeting to her who will make the most of it: it gives an opportunity to investigate broadly certain aspects of school activity and to discuss results with others equally anxious to know the truth.

It is the superintendent's privilege to aid in bringing teachers and the public into more appreciative relations. There are but few difficulties between teacher and pupil which can not be settled by a thorough understanding. Teachers are apt to be autocratic, parents to be overindulgent. Frank conferences between teachers and parents will correct many false perspectives; they will convince fathers and mothers that if it is hard to keep a single child in the straight and narrow path, it is no less so to keep 40 children in such condition that effective teaching becomes possible; they will lead the teacher to become acquainted with those who are interested in children with an interest deeper and holier than their own because begotten by God himself.

*The superintendent and the community.*—The superintendent has another duty to perform not now fully appreciated. It is natural for us to expect people to see things as we see them and to be indignant at the conservatism and ignorance of the public; but conservatism is not wholly bad. The public realizes that as "the child repeats the history of the race," so most people learn by experience. It wisely distrusts many clever schemes and bids us prove their worth. We should respect this conservatism and seek no higher privilege than that of convincing the public. To this end, the superintendent will do well to be much with the people, to meet them socially, and to address them on every possible occasion; thus will he prove the seriousness of his thought and the faithfulness of his presentation.

---

### GEORGE CHARLES HOLLS.

[Extracts from a memoir by Hon. Henry Barnard, first United States Commissioner of Education.]

In the history of education in the United States under the Constitution the secular element largely preponderates, and the pioneers in organization or administration have generally been connected either with the public-school system or with the higher educational and charitable institutions maintained by municipalities or States, and, in consequence, entirely independent of any church or denomination. But, on the other hand, in the ranks of religion, closely identified with particular denominations, there have been not a few to whom doctrines and dog-

mas were subordinate to the active work of education, and especially of charity, and whose influence, while to a certain extent circumscribed by the bounds of their own church, has yet extended far beyond these limits, and who are entitled to by no means the least honorable positions in the roll of honor of American educators.

Among Protestant denominations in this country the Lutheran Church has risen most rapidly to prominence, at least in the number of its adherents. It has done and is doing a great work in educating millions of our naturalized citizens and their descendants, and it has been the means of acquainting this country with much that is best in German educational thought and the organization of charity. No one man has contributed more to this end than the distinguished philanthropist who, by his powerful thought and active and untiring labor in his chosen field, has won for himself a prominent place in the history of American education and charities.

George Charles Holls was born in Darmstadt, Germany, on February 26, 1824, and belonged to an old and highly respected family. His father served with distinction in the German war of liberation against Napoleon, but the moderate fortune of the family was lost in the financial distress attendant upon the war. The father was afterwards appointed superintendent of governmental charities for the city of Darmstadt and province of Starkenburg, and thus the earliest impressions of the son were associated with the dispensation of charity. The father died in 1830, and the task of educating his three children devolved upon his widow, a most remarkable woman, to whose loving influence and energy alone Dr. Holls was wont to ascribe his further success. He was educated in the excellent schools of his native city. The practical bent of his mind led him to seek a scientific rather than a classical education, with a view ultimately of teaching in the *Realschule*, or scientific school, at Darmstadt.

To this end, and with the further object of perfecting himself in French, he entered the *École Polytechnique*, at Strasburg, in 1841; but it was here that he felt what we should call a religious awakening, and a strong desire to contribute his mite to the alleviation of human suffering. He left the school, against the counsel of friends, and volunteered as an assistant to Inspector Becker, the head of the "Neuhof" Institution, a well-known house of refuge about 6 miles south of Strasburg. Here he remained more than three years, and was so successful that at the age of 20 he became first assistant to the inspector, and often, for long periods of time, had entire charge of the institution. Charles Henry Zeller, the celebrated educator and pupil of Pestalozzi, heard of the young man, and at his invitation Holls spent several months at Zeller's great institution at Beuggen, studying the history and theory of education under that great teacher. Meanwhile the experiment of the "Rauhe Haus," near Hamburg, had been going on for ten years and was watched with intense interest by young Holls. He was powerfully attracted by the plan of a brotherhood of Christian workers, and after considerable correspondence, in 1846 he decided to join, and was thus brought into contact with one of the most remarkable men of the age, and one who was to exert a determining influence upon his whole future life, Johann Heinrich Wichern,<sup>a</sup> who has often been called the Howard of Germany, but who was even more. In 1833 he had established that most celebrated of German houses of refuge, the Rauhe Haus, near Hamburg, and a few years later he introduced into it what has since become famous as the "family system." This consisted in dividing the inmates into so-called "families" of from twelve to twenty in num-

<sup>a</sup> For memoir and portrait of Dr. Wichern and description of the Rough House, with ground plan of the institution, see *Barnard's Journal of Education*, Vol. III, pp. 5-20, 603-648.

ber, each in a separate building, and under the care of one or more "brothers," and the latter constituted the "Brotherhood of the Rauhe Haus." In this way the influence of the teacher or educator was brought as closely to the child as possible, and the latter was taught to consider the institution, not as barracks or a house of detention, but as a congregation of families of unfortunate children bound together by natural affection and under one common head. The "brothers" were young men of approved habits and ability, who, without taking any vow or making any pledge to that effect, had freely devoted themselves to the relief of the unfortunate, and who, in their position as "brothers," served an apprenticeship, as it were, fitting themselves to take charge later on of independent institutions. Thus the Rauhe Haus was not only a house of refuge for destitute children, but also a training school for charity workers.

Holls entered into the spirit of the Rauhe Haus with the enthusiasm of youth and religious conviction, and when, during the great famine of 1849, the Prussian Government applied to Wichern for "brothers" to take charge of the temporary governmental charities established to relieve the terrible distress in the province of Upper Silesia, Holls, though only 24 years of age, was selected as the chief of those sent. He established 4 orphanages, which contained, before the winter was over, upward of 4,000 children, and he was indefatigable in his efforts to relieve what was probably the most disastrous famine of this century upon the Continent. At the same time he was actively preaching, and he learned the Polish language in order to be able to communicate more readily with the objects of charity, most of whom understood no German. His services called forth the highest encomiums from the ministry of public worship and the governor-general of Silesia, but on account of failing health he was obliged to resign in 1850. He returned to Darmstadt and took up the scientific course in the highest classes of the Realschule at the point where he had abandoned it in Strasburg.

A sudden impulse came to him in 1851 to emigrate to America, whither a younger brother had preceded him, and being convinced that he would find in the New World a larger field for his energies, he came to this country in June of that year. He traveled via Liverpool, where he closely inspected the harbor mission, then in successful operation there, and this gave him the first ideas of the emigrant mission, of which he afterwards became so active a promoter in New York. He settled in Pomeroy, Ohio, and engaged at once both in learning the English language and in teaching German and French at the academy established there. In the following year he returned to Germany and was married to Miss Louisa Burx at Darmstadt. The newly married couple settled at Pomeroy and remained there until 1855, when that eminent Lutheran philanthropist, Rev. William A. Passavant, having heard of Mr. Holls, extended to him a call to organize a large orphan asylum which was to be established at Zelenople, Butler County, Pa. It was the first Lutheran orphan asylum in this country, and the intention of the founders was to introduce, if possible, the family system and the idea of home into such an institution in this country. Holls accepted the call and remained at the head of the institution for eleven years.

At this time the question of juvenile reform and the methods best adapted for the successful administration of reformatories and houses of refuge occupied the public mind in this country to a considerable extent. The success of the family system and of the Brotherhood of the Rauhe Haus led many to hope that the same results would follow from their introduction here, but the circumstances were different, and Holls saw from the start that unless certain fundamental difficulties could be overcome any attempt to reproduce the German experiment on American soil would be a failure. In a letter which was published in the *American Journal of Education* for March, 1858, Volume IV, page 824, he discussed the

question at some length. Theoretically he expressed a strong preference for the family over the congregated system, saying:

I am, in theory, decidedly in favor of the family system, being convinced that it is the system by which houses of refuge and all smaller institutions of a preventive, correctional, and reformatory character ought, if possible, to be managed. The natural ground for the development of youthful life is in the family. If we were able to trace back each case of degradation and crime to its original cause, we would find it to be, in almost all cases, the want of that kind, genial, winning influence and discipline which parental government alone affords. All the children that fill our reformatory institutions have been more or less destitute of a family life, family relations, and family discipline as it ought to be according to the divine law. Our institutions, therefore, ought to restore to these poor children, as far as it can be done, that of which they have been deprived, or at least that which they never enjoyed—a home, a family, with all its endearments.

But he well understood the peculiar difficulties here. He observed:

There are elements of character in the vicious and unfortunate youth of this country which are different from those found in Germany. That spirit of independence which is growing up with the one, which exerts such a powerful influence over his character, and which, when wrongfully applied, leads him not only to defy the laws and regulations of society, but also to repel all efforts made by others to correct him, is at least to a considerable degree unknown to the other, who is sooner taught to submit. It would, therefore, require greater efforts to exercise that influence over the youth in this country which should lead him to a truly religious reformation; but, believing in the almighty power of the Word of God, the happy effects produced by a kind, just, and firm treatment, by continual personal intercourse with these children on the part of the house father, the elder brother or sister, I believe that these efforts might be crowned with equal success here as elsewhere. But the most important difficulty that presents itself to my mind in introducing the family, as existing in the Rauhe Haus, into this country is the great want of competent persons to take charge of these families. \* \* \* Without these the system must necessarily prove a failure. Classes of 50 or more children are no families. If we intend to produce the greatest amount of good to our children individually by the family system, these families must be small—say from 12 to 15 each. Are suitable persons obtainable here, and if so, how? Can it be done without paying high salaries? \* \* \* We must waive the idea of enlisting persons into this service who would do it for the sake of a temporary employment or in order to make a living.

The difficulty of finding proper men as brothers or helpers proved insurmountable at Zelenople. Holls even made the experiment of sending for six young men from the Rauhe Haus to form the nucleus of a new brotherhood, but not one of them proved competent or willing to continue the work here under the same conditions as in Germany.

The idea of a true home for the unfortunate, on the other hand, was established by Dr. Holls in this institution and in one of which he subsequently was the head, near New York, perhaps more successfully than has ever been done before. At his suggestion a rule was adopted permitting discharged inmates of the institution to return at any time in after life, if unfortunate, ill, or out of work. This gave to every child the idea of a permanent home, and it was reinforced by the home-like character of the discipline and house government.

In 1863 Dr. Passavant, in connection with the late Peter Moller, of New York City, established the Wartburg Orphan Farm School near Mount Vernon, N. Y., and Dr. Holls, who had meanwhile entered the Lutheran ministry and risen to a position of high honor and commanding influence in the church, was called to organize the new institution. This he did, having succeeded in finding assistants whom he imbued with his own spirit and principles, and thus the Wartburg became the best example of his practical work of charity. It was in the true sense of the word a home for the friendless and destitute, on the idea that small institutions of not more than from 75 to 85 inmates, and imbued with the family spirit, are far more important and "successful" in the true sense of the word in the general

work of charity than large institutions with perhaps hundreds of children under one general drill. Great stress was laid upon the cultivation of a taste for music and for innocent games and amusements on the part of the children. Dr. Holls was himself a thorough master of vocal and choral music, and never neglected an opportunity of impressing its importance as an educational agency upon his assistants. In the judgment of the best authorities upon the subject, both the farm school at Zellenople and the Wartburg near Mount Vernon were model institutions.

Thoughtful men came from afar to study the working of these charities, and the writer does not hesitate to say that in the days of Dr. Holls's administration the Wartburg was the most admirable and perfect institution of its kind of which he has ever known.

Dr. Holls came to this country in advance of the great tide of German immigration which for the last quarter of a century has had such a determining influence upon our national characteristics. He foresaw the result of so great an influx of foreigners into this country, and as early as 1858 raised his voice in favor of the speedy Americanization of immigrants by education as the best and only possible remedy for the manifold evils which would otherwise ensue. No adopted citizen has loved this country more, and few have become so thoroughly imbued with the spirit of its institutions and its peculiar civilization. In impressing his views upon his countrymen he was, however, far in advance of German-American popular sentiment, and he often suffered under the insinuation of having too little pride in the land of his birth and no regard for the interests and language of his own people. This charge was, of course, absurd. For a person of his very strong American sentiment, Dr. Holls was most active in seeking to impress the good characteristics of German thought and German civilization upon the social, and especially upon the religious, life of this country. In an address before German-American teachers, speaking of parochial schools in Columbus in 1858, he said:

We hear much of the so-called mission of the Germans in America. In my opinion the first mission of the Germans in this country is to become Americans, and by that I mean that it is their duty, as well as their privilege, to enter deeply, heartily, and with all the fervor and steadfastness of Teutonic manhood into the current of American religious, political, and social life. There is no room in this country for a German nation besides the American nation, and, if there were, neither this country nor the Germans would be the gainers by the establishment of one. It is the greatest possible mistake, and one which I regret to say is often made in the fatherland, to think that by the emigration of so many of her sons Germany is weakened and vast numbers are lost to German thought and feeling. That which is best in German thought and feeling is, on the contrary, rejuvenated and strengthened and receives a new lease of life in a wider and grander sphere by being absorbed in and becoming part of the thought and feeling of this nation, which is the people of the future as certainly as European nations may be called the people of the past. I would even go further and maintain that the only ground upon which the establishment and spread of German churches, German schools, and German periodicals in this country can be justified is that they accelerate, instead of retarding, the process of absorption, which is as useful as it is inevitable, whatever may be said to the contrary.

He then proceeded to prove the necessity of this absorption and the hopelessness of all ideas of a separate permanent German community in this country by showing how every nation, in order to retain its national characteristics, requires the exclusive possession of a country. He claimed that only by constant reinforcement from abroad, by further immigration, could the German language be maintained even for daily intercourse among Germans themselves, because all experience showed that the second generation knew little or nothing of their fathers' language, while the third was thoroughly American. We regret exceedingly that no complete report of this able address has been published, in which

the soundness of the arguments advanced is no less remarkable than the foresight displayed for the problems which then were only in the future, but which are now present and of vital importance.

Dr. Holls strongly opposed the custom, which even now exists in many German parochial schools in this country, of teaching European and especially German history more thoroughly than the history of the United States and of using schoolbooks published in Germany and imbued with the monarchical spirit of that country. Of the American public-school system he was a warm friend and unflinching advocate, in spite of much narrow-minded opposition within the boundaries of his own church. At a meeting of the Lutheran Synod, to which he belonged, held in Brooklyn in 1877, a committee representing the fanatical sectarian view presented a report denouncing public schools as "pagan" and speaking of them in terms no less harsh than those employed by Jesuits. This called forth determined denunciation and opposition from Dr. Holls, who took the bold ground that however beneficial parochial schools might be in many localities, and especially in view of the necessity of hastening the transformation of Germans into Americans, the public-school system, as such, was more important for the welfare of this country and for the welfare of all the churches themselves than all parochial schools could ever be. The narrow and extreme views at the time prevailed, but the agitation against the public schools has greatly waned since that time and may almost be said to be extinct.

Dr. Holls was equally in advance of his time, so far as German-Americans are concerned, in his opposition to the teaching of the German language in the public schools. His reasoning was the same as that advanced in favor of the rapid absorption of the immigrants into the body politic. But at the same time he urged all Germans to continue the use of their native tongue at home, so as to give the second generation the enormous advantage of the perfect command of two languages. His own son was thus taught German before he learned English; but the German language was used to convey the lessons of United States history and of the principles of this Government into the child's mind, thus carefully distinguishing between useless foreign prejudices and the acquirement of a foreign language of incalculable practical value.

In all his endeavors in this direction Dr. Holls was prompted and greatly assisted by his wife. Herself a woman of unusual intellectual power, Mrs. Holls clearly saw the duties of educated German-Americans, especially of such as occupied conspicuous positions in the church, and the charm of her conversation was such that her influence was felt by a very wide circle of acquaintance, and her example was of the highest value.

Upon his removal to New York, Dr. Holls's field of labor was of course greatly enlarged. He was a constant contributor to the religious journals of his church at home and abroad, and for some years occupied the position of secretary for foreign correspondence of the American Christian Commission. As such he was in constant communication with the leaders of charity work in England, France, Germany, and Scandinavia, and his influence was largely instrumental in assisting the late Dr. E. C. Wines in organizing the international prison congresses. Together with Dr. Wines, Horatio Seymour, Francis Lieber, and Louis D. Pillsbury, he was active in the work of prison reform in the State of New York, and the only political work of his later years consisted in his efforts to secure the passage of the constitutional amendment which, by abolishing elective superintendents of State prisons, wrought such a beneficial change in prison management. He was a regular contributor to Barnard's American Journal of Education, and, together with the late Dr. Linus P. Brockett, translated several German educational classics, notably Raumer's *Geschichte der Pädagogik*, for that periodical.

He steadily emphasized the sociological features of religious activity, and the

results of his labors in this direction may be seen throughout the country in numerous hospitals, orphanages, homes for the aged, and asylums for various classes of unfortunates, established largely through his influence and the force of his example. In his church he occupied various positions of dignity and influence, and his activity was largely instrumental in establishing the emigrant mission in New York, which, in its various branches, is now one of the glories of Lutheranism in America. In 1883 he had a stroke of apoplexy, and after that time his health failed rapidly. The trustees of the institution urged him to postpone his resignation as long as the physician held out any hopes of convalescence, but in August, 1885, the case was seen to be hopeless, and, as it was aggravated by an equally serious and painful illness of his wife, he resigned and moved to Mount Vernon, to the house of his only son, Frederick William Holls, esq., of the New York bar, where everything that filial piety could do for his comfort and medical skill and nursing for his relief was done. He lingered for more than a year, but the end came on August 12, 1886.

---

### THE BROTHERS OF THE CHRISTIAN SCHOOLS IN THE UNITED STATES.<sup>a</sup>

It is to \* \* \* Baltimore, the Monumental City, that the credit belongs of having been the first to secure the establishment of the Christian Brothers in the United States.

Among the steps taken by Archbishop Eccleston to promote Catholic education was that of inviting the Brothers of the Christian Schools to open an institution in his archiepiscopal city; it had already been decided to build an academy for young men on the site of Baltimore's first church, Archbishop Carroll's pro-cathedral. The corner stone was laid in 1842, and the academy was named Calvert Hall, after Leonard Calvert, the first governor of Maryland and son of Sir George Calvert, Lord Baltimore.

The arrival of the Brothers is thus recorded in Shea's History:

On the 13th of November, 1846, Archbishop Eccleston announced to his flock that the Brothers of the Christian Schools had opened a school in Calvert Hall, Brother Leopold being director. A novitiate was also established for any pious persons who wished to devote their lives to Christian education under the rule of the Blessed de La Salle.

Calvert Hall College of to-day is a magnificent granite structure opposite the Baltimore Cathedral; it was erected in 1890 to meet the constantly growing demands of higher education. \* \* \*

New York was the second city in the United States to secure schools of the Brothers. Previous to his death, in 1842, Right Rev. John Dubois, Bishop of New York, had taken means to obtain Brothers from France, and his successor, the Most Reverend Archbishop Hughes, spared no efforts in the same direction; but the difficulties of communicating with Europe at that time and other unlooked-for obstacles delayed their coming for some years. Finally the Brothers arrived, and the following from Shea's History tells of the beginning of their work in New York:

In 1848 Providence, by indirect means, endowed the diocese of New York with the sons of the Blessed de La Salle, the Brothers of the Christian Schools. During the spring of 1848 a colony of the Brothers took up their residence on East Canal street (No. 16, near Broadway), and they soon had English-speaking novices. It was a feeble beginning, but with the blessing of God it prospered. The school of St. Vincent de Paul proved their ability as teachers and their judgment in adapting their course to the exigencies of the country.

---

<sup>a</sup>Extracts from an article in the Catholic World, September, 1901.

In addition to St. Vincent's School, the Brothers conducted an academy for boarding students; both institutions progressed very satisfactorily under the management of Brother Stylian, the director. In 1853 the increased number of boarding students necessitated removal to more spacious quarters at Manhattanville, where, under the title of "Academy of the Holy Infancy," the work continued to flourish under the direction of Brother John Chrysostom. In 1855 Brother Stylian was appointed to preside over the new academy, which he did with remarkable success until 1861, when Brother Patrick assumed charge as director.

On the 2d of April, 1863, the name of the institution was changed to "Manhattan College," as it had been incorporated by the regents of the University of the State of New York. The large increase in the number of students and the higher standard of scholarship required by the faculty to meet the wishes of patrons made this important step advisable. \* \* \*

How well Manhattan College has fulfilled its destiny is eloquently attested by the hundreds of priests, professional men, and hosts of skilled workers in all the callings of life who claim Manhattan as their alma mater.

The annual courses of lectures to the undergraduates by members of the Manhattan College Alumni Society; the late series of scientific lectures at Carnegie Lyceum, under the auspices of the alumni, by five of the most prominent inventors and scientists of the day; and lastly, the financial aid spontaneously provided by members of the alumni—all this is convincing proof of a loyalty and a generosity above all praise. \* \* \*

The West was not to be without Brothers' schools. Hardly had the Brothers obtained a footing in New York when they were invited by Archbishop Kenrick, of St. Louis, to establish themselves in his extensive archdiocese. His request was complied with, and it is worthy of note that the Brothers arrived in St. Louis on August 25, 1849, the feast of the patron saint of the city and its cathedral.

The Brothers began their work by opening the cathedral school in the early part of September, only a few days after their arrival. Brother Gelisaire was the director in charge. In the following year the Brothers opened a boarding school, and they were invited to take charge of schools in other parishes of St. Louis.

The progress which the Brothers had made in three years after their arrival in the city of St. Louis is told in the following extract from Shea's history:

The Brothers of the Christian Schools were the next accession to the diocese of St. Louis. By 1852 they had a boarding school on Sixteenth street near Market and directed the parish schools for boys at the cathedral, St. Francis Xavier's, St. Vincent de Paul's, and St. Patrick's churches. They had even been encouraged to open a novitiate on Eighth street to receive applicants for admission to the order. \* \* \*

Among the interesting phases of the spread of their work from St. Louis to distant points is the account given by Brothers still alive of their experience during long weeks of travel in caravans from Kansas City to Santa Fe, N. Mex., for the purpose of opening an institution. The excitement caused by pursuing and attacking Indians has not been forgotten by the Brothers. \* \* \*

The Pacific coast had no Brothers until August, 1868, when eight of them arrived as a result of the persevering efforts of the Most Rev. Joseph S. Alemany, Archbishop of San Francisco, [and] \* \* \* took charge of St. Mary's College in San Francisco. Owing to the injurious winds and fogs beyond Bernal Heights during the summer, the college was transferred to Oakland in 1870. The success of the Brothers in the college, as well as in their other institutions on the Pacific coast, has been all that the Most Rev. Joseph Sadoc Alemany and his distinguished successor, the Most Rev. Patrick William Riordan, could have hoped for. \* \* \*

Brother Philippe was superior-general of the order at the time the Brothers first arrived in the United States. Since his time Brothers Jean-Olympe, Irlide,

Joseph, and Gabriel-Marie have governed the society. the last-mentioned general having been elected at the general chapter, 1897. Brother Anselme, assistant general, was in charge of the Brothers' schools in Canada and the United States for some years after 1846, and Brothers Aidan and Facile were successively provincials (visitors), with residence in Montreal, Canada.

In the course of years each one of the cities Baltimore, New York, St. Louis, and San Francisco became a head center of one of the four provinces or districts into which the United States are divided.

About the year 1861, Brother Facile having been elected assistant general, the New York province was organized, and was successively governed by Brothers Ambrose, Patrick, Paulian, Justin, Quintinian, and lastly by Brother D. Joseph, who was appointed to this responsible position in 1898. The New York province includes all the institutions of the Brothers in the archdioceses of Boston and New York and in the dioceses of Albany, Brooklyn, Buffalo, Cleveland, Detroit, Manchester, Portland, Providence, Springfield, and Syracuse. The Brothers' schools in the archdiocese of Halifax, Nova Scotia, are likewise affiliated with those of the New York province.

The province of San Francisco was begun in 1868, and has been successively governed by Brothers Justin, Bettelin, and the present visitor, Brother Theodorus, with headquarters at St. Mary's College, Oakland, Cal. The establishments belonging to this district are in the archdioceses of San Francisco and Oregon City, and in the dioceses of Los Angeles, Nesqually, and Sacramento.

St. Louis was formed into a province in 1870, and was successively under the direction of Brothers Edward, Romuald, Lothaire, Paulian, and its present visitor, Brother Gerardus. It includes the schools of the Brothers in the archdioceses of Chicago, St. Louis, St. Paul, and Santa Fe, and in the dioceses of Kansas City, Mo., Nashville, and St. Joseph.

The province of Baltimore was formed in 1878, and has been successively governed by Brothers Christian, Reticus, Quintinian, Romuald, and the present acting visitor, Brother Austin.

The Brothers have schools in the archdioceses of Baltimore and Philadelphia, and in the dioceses of Newark, Richmond, and Scranton.

In each province there is special provision for the religious formation, literary and scientific instruction, and pedagogic training of new members. Each of these establishments includes a scholasticate, a novitiate, a preparatory institute for young candidates, and a department for aged and infirm Brothers. There is a director, with the requisite number of instructors, for each of these distinct communities. For these houses of formation and training there is a provincial visitor to whom these institutions are responsible. Brothers Armin-Victor, Reticus, and Edward of Mary successively held this position until 1898, when Brother Imier was delegated by the general to attend to the important interests of these institutions. These normal colleges and institutes are at Amawalk, N. Y.; Ammendale, Md.; Glencoe, Mo., and Martinez, Cal. There are more than 250 young men in these establishments who are receiving instruction and training for the duties of the religious and Christian educator.

In 1873 Brother Patrick was elected assistant general, and after his death, in 1891, Brother Clementian succeeded to this important position, which he holds at the present time.

A summing of statistics shows that the normal institutes, colleges, high schools, academies, parish schools, protectories, industrial schools, and orphanages of the Brothers are distributed through 30 archdioceses and dioceses in the United States, where they have about 35,000 students under their care and instruction.

It would require volumes to record the details connected with the foundation, growth, and development of the Brothers' institutions; of the obstacles that had

to be removed and of the difficulties that had to be overcome; of the hardships of various kinds endured by the Brothers; of the results obtained and successes achieved; of the many and heroic sacrifices made by prelates, priests, and benefactors to found and maintain schools, and finally of the great good that has resulted to religion and to society during all these years.

With the exception of but three of their institutions, the Christian Brothers have not received any large benefactions to aid them in the erection or extension of buildings or for the supplying of apparatus, libraries, etc. From this it will be easy to understand that the greatest of sacrifices and efforts were required on the part of the Brothers to build up and to maintain so many institutions.

\* \* \* Referring to the literary and scientific instruction given by the Christian Brothers, the Right Rev. Bishop Bradley, of Manchester, said:

The Brothers neglect no department of secular knowledge, for everything has been made by God, and everything, therefore, can be studied with a view to His glory. Their success as educators is evidenced by the numerous and high-grade honors and encomiums bestowed on them by the officials of the present Paris Exposition, by the officials of the Chicago World's Fair, as well as of the London Exposition of many years past, and of educational experts in all parts of the world. Their number and their rapid spread in every part of the known earth attest their ability as masters in the training and teaching of the young.

The fact that the students of the Christian Brothers' colleges have nearly always taken rank among the highest when immediately after graduation they entered ecclesiastical seminaries, schools of law, medicine, civil engineering, pedagogy, etc., is very strong evidence of the intellectual and practical element in the education given by the Christian Brothers. It may not be out of place to note that, with the probable exception of a purely ecclesiastical college for the training of candidates for the priesthood, Manhattan College enjoys the proud distinction of having given a larger number of priests to the church than any other Catholic college in the United States.

Every college of the Brothers holds a charter under the laws of the State in which it is situated, and the courses of studies lead to the bachelor's degree in arts, in science, in architecture, and in civil engineering; courses in pedagogy prepare students for teachers' State certificates; commercial diplomas are granted to those who, on examination, are found worthy of this distinction.

The following extract from a review of educational work is a strong tribute to the methods of the Christian Brothers:

The Brothers are, above all things, systematic, clear, and plain. They desire not to cram, but to expand the mind, make it thoroughly receptive, and put the pupil in possession of the fundamentals, so that in after years he can "hoe his own row" without fear or anxiety as to opposition or competition. If the boy is to become a civil engineer he is taken step by step along the difficult road and is held firmly under direction and control until he feels and knows himself to be equal to any task within the limits of his line. And so it is with a boy who desires to be an architect, a lawyer, a physician, a bookkeeper, or a business man. The groundwork for all of these professions is laid broad and deep and according to methods of instruction that are being more and more simplified every year. To the Brothers, whose sole occupation and care is the education of the young, every day's lesson brings its special experience. These experiences they note and out of them develop new and simpler plans of impressing and strengthening the youthful mind.

The most abstruse studies and problems are by their easier methods made so plain that learning is no longer a task, but a pleasure. It is this adaptation, this readiness to overcome difficulties, this ability to make smooth roads to educational progress, that have enabled the Christian Brothers to make such wonderful progress themselves, not only in Europe but in this country, where they entered upon their work in 1846.

The brothers are enthusiastic in their work and are heartily identified with their pupils in all their studies. Education is the business of their lives and monopolizes all their waking hours. They are always on kindly and intimate

terms with the pupils, and are constantly devising measures and means for advancement. Object lessons they make a specialty of, and they carry the principle as much as possible up through all their grades of instruction. They have no puzzles and they seek to simplify every problem, their special aim being to give technical strength without destroying the spirit of the pupil or impairing his powers of observation or application.

After viewing the educational exhibits of the Christian Brothers at the Cotton Centennial Exposition, New Orleans, 1884-85, Col. J. T. Murfree, president of Howard College, said that "he had never in his life spent so little money, learned so much, and was so highly entertained in so short a time as that he spent in viewing the exhibits, which it would take a volume—and a large one—to contain anything like a full review of."

The request made by the archbishops in 1891, through his eminence Cardinal Gibbons, for a Christian Brother to undertake the management of the Catholic educational exhibit at the World's Fair, Chicago, 1893, under the direction of Bishop Spalding, was an expression of their supreme confidence in the order of the Christian Brothers as educators; and all the world knows that the archbishops were not disappointed.

The Brothers of the United States had exhibits from about one hundred of their institutions at the Columbian Exposition, Chicago, 1893. The Hon. John Eaton, Ph.D., LL.D., ex-Commissioner of the United States Bureau of Education, among other things, wrote:

The Catholic exhibit of education was a surprise for those who believe that the Catholic Church seeks its ends by concealed means. Here, for the examination of everyone who came, was the work of the students in every subject taught, from those in the kindergarten to the most abstruse in the professions. \* \* \* The whole was an appeal to American boasted fairness. It was saying to all the world, "Here is what we do; judge ye!" \* \* \* The exhibit is phenomenal. \* \* \* No statement, no statistics, no discussion ever conveyed such an idea of Catholic education as was here disclosed.

The foregoing excerpts are but a fraction of the strong testimony as to the completeness and the high character of the Christian education given by the Brothers to their 35,000 pupils in all kinds and grades of their institutions.

As for the physical element in education the Brothers are obliged by their rule to take every care and precaution for the health of their pupils; they must exercise supervision on the playground, encourage students in proper exercise and unobjectionable sports. Wherever possible, athletic and gymnastic apparatus are provided as far as means can be found. The Brothers' students all over the country have a splendid record wherever they have cadets at competitive drill, baseball games, field sports, etc. The healthy appearance of their well-developed students is a sure indication that the physical welfare of those under their charge receives due attention.

## EDUCATIONAL TENDENCIES, DESIRABLE AND OTHERWISE.<sup>a</sup>

By ANDREW S. DRAPER, *President of the University of Illinois.*

The writer turns his face toward this paper with the sad conviction that he can not hope to say anything new, but with a stern purpose to take up the school-man's cross and resist temptation to say things because they are novel.

He is not an expert. Of course he indorses President Eliot's declaration that one of the proofs of advancing intelligence is the readiness to accept expert opinion. He accepts expert opinion when convinced that it is expert opinion. He believes in experts. Indeed, it has fallen to his lot to have something to do with

<sup>a</sup> Reprinted from the *Educational Review* for May, 1902.

keeping experts on the earth. But he knows there is a limit to the strength of intellectual material: that the very basis of expertness is concentrated study of an occult and controverted subject: and that the mastery of such a subject must be at the expense of deep knowledge of other subjects. He knows also that it is a fact, possibly with a psychologic explanation, that men who have well-nigh mastered one hard subject are prone to think they have mastered others—indeed, that men are very likely to have the conceit that they know the things best which they really know least: that they can do the things best which they can hardly do at all. He finds some consolation for the fact that he is not an expert in the possible immunity from this illusion. Is it too much to hope that the Almighty in His wisdom provides compensations for not knowing unfathomable things to the very depths by enlarging the possibility of better understanding more commonplace things through a crust of a foot or two? He does not dare say it is so; he hopes it is so.

In any event his view-point can not be that of the classical teacher disciplining minds by the hard-and-fast processes which gave intellectual form to the learned men of the ages gone: nor that of the scientist searching patiently for the hidden truth; nor yet that of the philosopher who worships the past and stakes the future on the faith of his ideas. He regards them all, but he has not their outlook. He must look through the eyes of one who has had to struggle, who was never prepared for any one thing as deeply as he might well have been, who has simply taken each succeeding step with the best judgment and the most courage he could gather, and whose later years, all unexpectedly, have been weighted with the administration of very considerable educational trusts. He may not see as deeply into some crevasses as some, but he has certainly had opportunities for bumping against men, and for appreciating the relations of men and things on a somewhat extended field. He idealizes self-effort, for he has seen that it alone makes for culture and for power. He sympathizes with all that augments learning and uplifts men, and has an idea that more forces serve to enlarge learning and inspire men than have heretofore been sufficiently recognized or much emphasized in the schools.

It is the business of our democracy to do more than protect the citizen from hurt, more than assure legal equality of right and opportunity to all. Such a political organization as ours is bound by its very constituent elements to use the common power to provide the instrumentalities which will enable everyone to make the most of himself; to pursue the courses which will encourage everyone to do it; to fill all with a sense of gratitude which will impel them to do what they can to help the whole mass forward. Democracy surely has the inherent right to determine the policies it will pursue, and the resulting power to constitute agents and delegate authority to do all for the education of its people quite as much as and even more than the consolidated forms of government assume the right to do.

These are ideas which are more or less developed, which have developed as far as any educational ideas have been developed, throughout the country. They are certainly crystallizing into the settled purpose of the Republic.

They have resulted in an educational system. This system rests very generally on public, but somewhat on private foundations. It has in legal contemplation unity of aim. It is a very comprehensive and, on the whole, a very harmonious system. Because it is so flexible and adjustable to all conditions some are wont to think it is no system at all. But it is typically American, and it is the very best school system in the world. It may not do some things as well as the system of some other people does those things, but it does many things for all the people very much better than any other system does them. It not only trains the young of the nation in practically every direction of intellectual activity, but, what is of no less importance, the development of it, the support of it, and the care and

direction of it, have brought and will continue to bring untold advantage to the nation itself.

These popular ideas and this democratic system, although of comparatively recent origin, have given rise to distinguishing educational tendencies which have become well ingrained in the nation. Some are desirable, and some seem otherwise. Those which are desirable far outnumber and outweigh those which are not. In the main, the undesirable ones result from overdoing things, from pinching good things until they can contain themselves no longer without crying aloud.

Some of these are so thoroughly grounded and accepted that they need no more than be named. Others of more recent development may well have a few words of comment.

It is the plan of the nation to provide the opportunities of free education for every person living under its flag.

It is the purpose, now well under headway, to provide facilities for the higher learning, college courses, and university research, free of cost to every person who is qualified for them and who will pursue them. The people have already built a road from every town and every farm up to a free university, or they will do so. There are great and influential sections of the country where this tendency is not yet recognized and hardly suspected, but it is the spirit of our democracy, and it is "going through."

It is very generally believed that down to the present generation there has been an unfair and unwise discrimination in favor of men and against women in educational policies. At first this extended to all the schools. In time it was removed from the elementary schools; it is now disappearing from the advanced schools. Where it is not disappearing it is being minimized by devices. It is being established that what we have called the culture studies are not all that are desirable for women, and that the best results are attained from admitting men and women on equal terms and together to all that the schools have to give.

The demand that the teacher shall be free from bias and protected from influence has had new popular support in recent years. Skepticism runs among the people as to the judicial freedom of the teaching upon controverted questions in institutions sustained by great fortunes accumulated by men who are likely to have acquired a very natural bias and are known to be possessed of very forceful qualities. Generally this skepticism is without occasion, but I do not regret it. Men who are liberal with their purses are generous in their feelings. The institutions are quite able to take care of themselves. It is a wholesome feeling, inborn in our democracy; the discussion of it is educating the masses, establishing freedom on a firmer basis in the universities, and helping to extend it to the secondary and even to the elementary schools. And the freedom of the teacher is exacting better preparation for teaching and bringing added strength to teaching.

There has been in recent years a steadily enlarging demand for better preparation for teaching. It has been both without and within the teaching body. Speaking very generally, the teachers of the land are struggling and sacrificing for their own upbuilding. They leave off teaching for a year or two, they attend summer sessions, they go to conventions, and they read and study with a conscientiousness which is inspiring. The public feeling runs strongly in favor of more complete preparation for beginners. We are moving up to the time when at least the training of a college or of a good normal school will be exacted of practically all teachers. If we advance in the next two decades as far as we have in the last two we shall reach it in that time. The schools are becoming professionalized.

We can scarcely have failed to feel a closer unity of purpose and organization in the educational systems in recent years. The college is less isolated. The secondary school is less isolated. So it is with all the others. The accrediting

system which recognizes the work of the lower schools brings all more closely together. It has its disadvantages, but not so many as an exclusive examination system. It does not break down; it builds up. The denominational or other institutions on private foundations are not so far separated from the public institutions as they used to be. There is room enough for all. The great and voluntary assemblages of teachers make for the solidarity of the whole system. Relations are more cordial. Impulses are more generous. There is a wider understanding of the fact that educational meanness defeats itself, that one who gives to another does not take from his own store, but enriches himself through the giving. It is making for a healthier tone, and it is inspiring a more virile intellectual and moral activity, a more rational advance throughout the whole educational system.

The best type of the well-educated man is changing, because the better judgment of the world concerning him is changing. He is no longer a recluse. He is hearty, enjoys life in the open. He bumps against other people and finds out how much he knows that is not so. He reads and reasons and investigates, but he struggles with things and is rounded out in the struggling. He enters into life; if need be he faces opposition. He accomplishes things, and finds that the things of most account spring from the triumphs over opposition.

Educational ideals are changing. We are coming into a clearer understanding of Theodore Parker's declaration that "Work is education." We know better than our fathers did, for we have proved it, that there can be no seasoned and hardened education without work of hand as well as brain. We are seeing that all kinds of work make for learning, for steadiness, and for power. Even more, we are realizing the influence of real accomplishments upon the making of the man, no matter in what field it may be achieved.

This has changed the standards and widened the work of the schools. They are compelled to equip themselves for instruction in every conceivable direction, and they are obliged to accept students on the basis of an equivalence of work, without so much regard to the class or kind of work which has been done. Our democracy is breaking out its own educational thoroughfares. Substance, not starch; earnestness, not fortune; resourcefulness, not the number of books read in another tongue; power and endurance, not culture; performance, not the particular thing done; the ability to do things which bear upon life and the world advance, not mere acquisition, have in this last generation begun to have the weight which they deserve to have in shaping the plans and settling the policies of the schools. Some institutions which do not like it, or can not meet it, are swearing about it in classical phrase and correct form as they struggle against the inevitable end. But the greater number are happily falling in with the movement of the crowd and helping life to harden and invigorate culture, while they bring culture to the uplifting and ennobling of life.

It can not be said truly that this expansion of the scope of our educational activities to meet the increase in numbers and the advance in ideas of our cosmopolitan millions has led to superficiality. If we have been over-ambitious in places, and if some have undertaken things which they could not do, or which it was not well for them to attempt, the best educational work has gone forward with a steadily broadening reach and a constantly increasing accuracy. Profundity has lost some of its solemnity and become more common, but it is no less real and it is no less respected. Language and letters, history and philosophy, mathematics and the material and life sciences are being carried farther than the most profound ever dreamed of a century ago, and, what is better, by the million instead of the one.

The carrying of literature to the masses and the applications of science to the constructive arts have been the great educational undertaking of the last two decades. And the marked advance of this movement, supplemented by a better

realization of the fact that learning is weak indeed unless it can breast the world's life, and that it is impotent except as it makes fellowship with labor, has brought about a great change in the educational outlook of the world. For reasons obvious enough, this change was first apparent and has had its fullest expansion in this country.

Perhaps no more space can be afforded for this side of our subject, but one can hardly part with it without noting the decided and most desirable tendencies toward closer and more systematic organization and sounder administration in the educational system. Certainly there are discouragements enough, and they will never disappear altogether. Happily we are learning that the structural organization can not be strengthened and improved without vigilance, nay, even without courage and aggressiveness, and that administration of public trusts is not a pastime in which any fool may engage. The learning of this lesson is working very great advantage to the machinery of the schools. Executive functions are being centered in individual officials, and the intelligence of the country is coming to see that democratic principles are not contravened, but made potent, by the centralization of the common authority in the agent who is to execute, and that the very life of a democracy, like that of any other form of political organization, depends not only upon purposes which are sound, but quite as much upon having them carried out. While we have come to see that boards can not execute, we know very well that individuals ought not to legislate. We are differentiating legislative and executive functions in the educational system, and very decided results are already apparent.

The influences which ignore the purposes of the schools and would make plunder out of the most sacred interests of the people are surely being repelled. It may not seem so in places, but one can not have observed and reflected upon the matter long without very clearly seeing that the sentiment of the country has, in recent years, gained in appreciation of the necessities of the case, and in determination that the schools shall be free and shall be operated upon educational principles; that the teaching force shall be secure on the basis of merit, and that the unworthy influences which would degrade it shall be fought back to their lair. Surely nothing could give larger encouragement to the future of education.

Turning now to the tendencies which seem undesirable, one feels bound to say that they result from what is perhaps the American tendency to overdo things, and that they have been encouraged by the large measure of freedom accorded to the professional superintendents and teachers in the schools. They spring from zeal and conscientiousness and ambition, and are helped on by unceasing intercommunication.

Our educational system is adjustable. The State is bound to insure schools, but the perfection or the elaboration of the schools is left to the city, the township, or the district. Every American community worth considering wants the best and the most up-to-date in its schools. The educational system has become so complex that the average man of affairs, the man whose experiences have best qualified him to judge of the most imperative ends of popular education, has come to feel that he has little judgment and practically no influence in the matter. For very comfort's sake, he is too prone to leave the educational trend and the details of the schools to the professional zeal of the schoolmen, the manipulation of men of the baser sort who have little else to do, and the enthusiasm and more or less discriminating conclusions of the women's clubs.

The land is covered with educational literature of one kind or another, and conventions of teachers are of weekly, almost daily, occurrence. The written or spoken word is commonly given by men and women whose names are known and respected by the teachers of the country, who have become expert and enthusiastic in a given field, but who fail to see that what they present so entertainingly

has little practical application to the work of their hearers or readers. Frequently there is discussion for the mere intellectual exhilaration of the thing, and the effect upon the outlook of the crowd is questionable. When committees of the foremost schoolmen of the nation are constituted by the highest educational authority, their work is pointed to yet more intense discussion rather than to the solution of complexities and the giving of real aid and direction to the multitude below them. Out of all this come the endless suggestions for reenforcing the curriculum and multiplying the devices of the schools.

Let it not be said that this is a dissent from the work of the advanced schools or a criticism upon liberal thinking. It is simply a suggestion that things have their places and that even very desirable things may do quite as much harm as good when out of their place.

On my journey hither I was struck by a passage from Professor Münsterberg in which he laments the unpreparedness of the American teaching force, and says: "To produce anything equivalent to the teaching staff from whose guidance I benefited in my boyhood, no one ought to be allowed to teach in a grammar school who has not passed through a college or a good normal school; no one ought to teach in a high school who has not worked after his college course at least two years in the graduate school of a good university; no one ought to teach in a college who has not taken his doctor's degree in one of the best universities; and no one ought to teach in a graduate school who has not shown his mastery of methods by powerful scientific publications."

We all accept this as an ideal. Possibly we can not escape the surmise that there is something in the American teaching force, however, something in the way of versatility and resourcefulness, something in the way of adaptation of the teacher to the taught, which the German blood and the boyhood environment of this very distinguished and very welcome Harvard professor have stood in the way of his realizing at its full worth, but that is of little moment in this connection. I feel sure he would agree with me in this, that the teachers prepared as he would have them are not bound to transfer the methods, the discussions, and the operations of the schools in which they have been taught to the schools which they are to teach. And this is an attempt upon which a very large body of college and university teachers are, as it seems to me, fatuously bent.

Let me state the outcome of all these things, and perhaps of some other things which I have not the space to mention, in as condensed form as I can.

The educational system is undertaking too much, at least in the grades below the college.

"Research" is attempted where drill is what is needed.

"Culture" has been the slogan of recent years. It is important, but strength is still more important. It is very desirable, but it is yet more desirable that boys shall be trained to bear the part of a real man and girls the part of a real woman. If they are, the culture will come with it. The leadership of a distinguished son of Harvard, now the President of the United States, has already started a healthful reaction.

Children are being told that they should elect their studies. They can not elect. They are put to studying things they have never been prepared for and can not grasp, things which are laborious and unhealthful now, but which they would get easily and naturally enough in time if there should ever be occasion for it. It makes them artificial and conceited.

We have many of us forced our particular schemes into the work of the elementary school until we have constructed an incoherent and unsymmetrical whole. We have overlooked the fact that it makes not so much matter how much work a child does as that he shall do something exactly and completely, have the

satisfaction of accomplishing difficult tasks, and gain the enthusiasm for yet more difficult ones.

We have shaped the work of the lower schools with too much reference to the demands of the advanced schools, and we have exacted so many things for entrance to the colleges and universities that we have too often taken away the probability of such completeness of preparation, such acquisition of power, as is necessary to carry college work naturally and satisfactorily.

We have changed and multiplied the branches taught in the schools until they confuse and confound the homes upon which the great public educational system rests. Parents are unable to enter into the work of their children. It is not because the parents are so ignorant, but because the work is so changed and so complex. There is something sad about this, and there is something more than sad, even dangerous, about it. It lessens the interest of the people in the schools. If they support the schools because it is ingrained in them to do so, they can not by word and act sustain a knowledge in their children that the home and the school, the father and the mother and the teacher, are in intelligent concord, in active alliance, in a not to be questioned league, as of yore.

The management of the early schools was too harsh; it is too condescending now. The child once sat at the feet of the teacher, but now the teacher is at the feet of the child. It would be well in moderation; it is bad in excess. It would be well if it helped the child, but it gives untrue standards and false ideals. There is talk about applying the spirit of the kindergarten to boys and girls of the high-school age, or men and women grown. They do not want it. If they accept it, they are weaklings or become such.

There are some healthful signs that the child-study diversion which has been carried to such extremes has well-nigh run its length. It commenced with the infant in embryo and has come down to adolescence. It has gone into some things from which miscellaneous assemblages should be secure. It has assumed to make some investigations in mixed gatherings of youth and has talked and has printed details in public which should be resented by parents and, if necessary, prohibited by law. It has delved in the abnormal and attracted the morbid. It has made much of things arranged by nature, things about which one can think much and be very wise and very miserable, or which he can let alone and get on comfortably enough.

There has been too much adjusting to the individual peculiarities. Physicians whom you admire because they help humanity on its way do not pamper their stomachs by always wondering what may be put into them. They eat what they want and when they want it, and let their stomachs do the adjusting, and their stomachs ordinarily do it. It is better to lay out educational highways which ordinary people ought to follow, and can follow, and help the others to follow them, if they can do it by help, even though some fall by the way, than it is to lay plans for weaklings and force the larger and stronger part to square their lives by lines laid down for the weaker sort.

There is too much agitation, unceasing change, and consequent uncertainty in the operations of our American schools. There is too much individualism in laying plans and arranging courses and in methods of teaching, too burning a desire to say something new or do something novel for the sake of prominence in the teaching body. Of course it will be said that this has brought us to where we are. But we might be quite as well off if we were not exactly where we are. And, moreover, a thing that is good for a time is not good forever. Plans and processes ought to settle down in the lower schools at least. It may very well be assumed that there are not going to be many more new continents or systems of wireless telegraphy discovered to the profit of the curriculum and the teaching of the schools of elementary, secondary, and college grade. The doctrinaires ought

to seek places of meeting by themselves, where they can discuss things to their satisfaction and not keep the whole educational system stirred up all the time. We may rest assured that if they ever came to any sort of an agreement upon anything of moment, we would hear of it very soon. The experts ought to work in their laboratories until they get hold of something the world ought to know and get it in such shape that the next expert will not knock it over. It is hard upon a teacher or a child to be manipulated by so many "experts" who do not agree. There are some things about this modern school system of ours which, as it seems to me, might be very profitably cooled off with a good stream of cold water.

As much as is practicable, and perhaps more than is desirable, in view of the fact that so very much has been accomplished and that there is really so much to gratify and so little to condemn in our educational system, has been said upon this phase of our subject. Happily I can not have my way, and happily the other man can not either. The true way will come out of the compounding. That is reason enough why we should each have a way and, within reasonable limits, should stand by it.

In concluding words, my say concerning the educational system is as follows:

I would not forget that the educational system rests upon three foundations, viz: (a) The policy of the States as determined by their legislatures and accomplished through the taxing power; (b) local communities, which, through the exercise of power delegated by the State, supplement the system provided by the State to such extent as will be sustained by the intelligence, pride, and resource of the vicinage, and (c) private beneficence, which enriches and embellishes the legally established system and founds great institutions to give the largest inspiration to the comprehensive whole.

I would aim at an elementary school in reach of every home, a secondary school in every city, township, or incorporated village, and a university in every State, all free and without discrimination as to sex or other conditions appertaining to the individual. I would even go further than some and pursue courses which would not drive out the cultivated and the rich.

I would adopt Professor Münsterberg's platform as to the teaching force, and try to secure college or normal graduates for the elementary schools, college graduates with a year or two of graduate work for the secondary schools, university doctors for the colleges, and the real experts who have had their feet on the ground and shown sanity, productivity, and power for the universities. I would fight political, social, religious, and all other influences which are disposed to meddle with the teaching force, and I would adopt a resolution in favor of preference on the basis of merit in every place and at every time where there was half an opportunity.

I would manage children without so much reference to their weaknesses or peculiarities, recognizing these where so marked as to make it necessary, but not accentuating them in the mind of the child or in the thought of the school. I would not allow a teacher to put a hand on a child in punishment. I would not coddle; I would direct, encouraging comradeship as children grow up to it and prove worthy of it. I would make plans for normal children and, assuming that the crowd is normal, expect them to adjust themselves to the plans. I would give special help to the exceptional cases, if a little unusual help would suffice, and go on without saying much about it.

I would not attempt to put into the heads of children the accumulated history, science, philosophy, art, and patriotism of the ages. I would give a school an architectural schoolhouse and artistic grounds, and put some standard pictures on the walls and call attention to the need of caring for them, and see that they

are cared for, and let that do for art for some years of child life. I would not teach patriotism, but I would lay the foundations of citizenship in mathematics, and language, and in history, with less of the imaginative and fictitious living in it which we hear so much about. I would stir their feeling and draw out the better expression of themselves, not by laying so much stress on original work, but by having them rehearse masterpieces in literature on Friday afternoons. I am sure the patriotism of the school and of the community would be the gainer by it. I would lay foundations upon which the State might rely by training pupils in the elementary schools and students in college to respect authority and by inbreeding in them the habit of performing their duty. I would mix with them freely in the gymnasium and on the ball ground. I would yell with them in victory and carry one end of the shutter in disaster, but I would give them tasks which they could do and see that they did them exactly and completely. I would work not for quantity but for interest and for power. I would reason that if I started the child aright at first, whether he liked it or not, he would in time gain enthusiasm that would steadily increase and that he would ever after bless me for it. I would have no electing, at least below the college, but I would have plenty of drill. I would try to do the electing and endeavor to provide the resolution necessary in the premises. I would strive to train the youth so that when he got to the age when he ought to have judgment he would have it, and so that when he made his election he would have zest and power to accomplish what he undertook. I would not try to make nice characters so much as square and strong ones. Beauty in form follows, it does not precede, effectiveness in life. I would put in the way of the youth the things which would lead him to think that the constructive industries, the industrial arts, are quite as respectable and quite as promising and profitable as the professions, and I would preach and exemplify the gospel of work by brain and hand from morning to night, year in and year out.

I would lose no opportunity to assert the fact that any power to uplift and vitalize the work in any school must come from a school above; but I would insist that the schools above shall know the real conditions and come into intelligent and genuine sympathy with the schools below before presuming to direct and inspire them. I would have the way open and continuous from the primary to the university. I would trust the work of the schools below, at least until it was proved that they were unworthy, and I would not distrust all because some proved unworthy. I would lay more stress upon one's knowledge and resources when coming up for his degree than upon his acquisitions when he wants to commence to earn one. I would not allow the incapable or the indolent to clog the machinery and interfere with the rights of others, but I would soften hard-and-fast entrance requirements so as to give his rightful opportunity to one giving reasonable promise of power to do the work. I would do all I could to interlace all the schools of all grades and people of all kinds together by generosity and helpfulness, because the stability of the nation hangs upon it and because educational exclusiveness and meanness defeat themselves.

I would never forget that the educational system of America is not merely for the people. It is the people's system. They have created it. They are to administer it. Great men have founded the great privately endowed universities, and men of their kind are to administer those universities. The religious denominations have set up schools of their own and for their own ends, and they are to carry them on. The people have established the great public educational system, and the people are to direct it. All must work in accord with the common sentiment or pay the penalty of decay, for we are a cosmopolitan, but a united people. Civilizations make schools, not schools civilizations. Schools are the instruments and helps of civilizations, but civilizations come out of the Great Unknown. Our

democratic society has developed our educational forces and ideals on democratic but virile lines. There are more elements of strength than of weakness in democracy. We suffer much from mismanagement by incompetents and self-seekers, but we want no better management than the creators of institutions can give them and will sustain. Mismanagement is in defiance of the better sentiment of the people, and it is this better sentiment which will have its way. Let us help it on its way. There is a spirit in this democracy of ours which is only manifest on occasions and which we too often overlook and ignore. It has come out of a great past. It has resulted from the compounding of the greatest peoples in world history. Let us distinguish that spirit and follow its lead. Let the educational advance be in touch and in harmony with it. Let the schools bear in mind the religious and political and industrial history of the country and be content to employ simple plans and settled measures in promoting the noble and lofty mission of our democracy.

---

### RURAL SCHOOL LIBRARIES.

[Read before the Iowa State Teachers' Association, December 23, 1899, by Henry Sabin, formerly State superintendent of public instruction.]

Emerson says that books are only to inspire. Knowledge is of secondary importance. That alone ministers to the growth of the race which, coming from the heart of one, finds lodgment and life in the heart of another. Not only would schools, colleges, and universities disintegrate and disappear without books, but everything which we call culture would vanish, and society would lapse at once into barbarism. Emerson is right. The inspiration which makes life worth living is drawn from the printed page. To place a book in the hands of a child after he has been taught to read it is an act of the greatest moment. We give him the key; we teach him to unlock the door which opens into all the activities of life. We recognize that in the fullness of his creation he ranks but little lower than the angels of God. The child who in his youth is led to open his heart to the inspiration of books anchors his life to the teachings of the great and good of all ages. It is not necessary, then, to discuss the advisability of establishing libraries in connection with rural schools. That is settled in all thinking minds.

There are certain forces at work in society which will ultimately rescue the rural school from its present isolated condition. The increased demand for better roads, for rural postal delivery, for cheaper telephone and telegraph rates, will eventuate in bringing the country school out into the full light of a brighter day. The regeneration of the rural school must keep equal pace with the regeneration of the public which sustains it. It is a mistake to attempt to study the rural school problem by itself, apart from its surroundings and environments.

The school in the country is a part of community life, more than it is in the city. We must rely upon its instructions to make farm life more attractive as well as more profitable; to add to the usefulness of the child as an aid in carrying on the affairs of the home; to make the farmer's house more attractive, and to prevent, as far as possible, the exodus of young people from the country to the city.

The rural school is in danger from the short-sighted policy of its friends. To raise the intellectual standard is only a small part of the work in hand. Better teachers, better buildings, better methods, better text-books, there is still left something even more desirable than these. The rural school must be brought into close touch with the life about it. It must be made potent as a social factor. It must have a place in every plan which looks to the betterment of country life.

The early part of the twentieth century will see the beginning of a new era in our system of farming. The present wasteful system of extensive farming has

seen its best days. In its place will come an intensive system, in which the main study will be how to get the most from every acre under cultivation. The increase of population, a large foreign demand for our farm products—in fact, a world-wide market, in which we shall have to compete with the cheap labor and the fertile soil of South America, India, and Russia—will compel us to make the most of what we now consider the waste products of the farm, the mine, and the factory.

With the advent of the small farmer will come to him and his family a sense of independence of others and of dependence upon self. With less hired labor there will be more time for study and reading and a disposition to think and act for himself.

The library must be an adjunct to all this. Books which inform and instruct must be placed where the rural population can reach them. The best methods of treating and cultivating the soil, the most effective fertilizers, the breeding and care of stock, the foods best calculated to produce fat or increase the flow of milk, forestry, horticulture, mining, landscape gardening, and other kindred subjects can not long be excluded from the curriculum of the common school.

The rural school library must be selected with certain ends in view. It must contain on its shelves not alone history, poetry, fiction, but also books which bear upon the industries in the midst of which the school is located. A library suitable for farmers' boys and girls is not the best for children whose parents work in the mines.

If nature study is to be permanently installed in its appropriate place, it must not be allowed to degenerate into meaningless talk, lest the same fate overtake it which has fallen upon the object teaching of twenty years ago. There is scarcely a trace of object teaching left to-day, and, unless we are careful, in twenty years nature study will be classified with the lost fads.

Do not misunderstand me as opposing nature study. But nature study must call for the exercise of research and study on the part of the pupils as well as the teacher. The library must furnish books to be read by the teacher and pupils in connection with these subjects which I have mentioned as of importance to the school and to the community about it. Teachers can no more instruct intelligently in nature study without preparation and instruction in methods than they can in language or numbers. The object of the lesson is not to inform, but to stimulate, and to create a desire to know more. This desire awakened by an enthusiastic teacher dies out unless the library furnishes something to nourish and strengthen it. I greatly fear that the books usually selected for the library are not of the character here indicated. They do not furnish the sustenance needed for a healthy growth of mind.

I desire not to criticise too severely. The suggestion that much greater care should be taken in selecting books, that many should be thrown out because the only claim they have is their ability to amuse and their places supplied with those of a higher grade, is all perhaps that there is time to offer in this paper. The library should be selected with a definite purpose in view. The old order of things must soon pass away, and in the new curriculum there will be use for books bearing upon every subject connected with social life in the country.

The strength of the country school should be in the library. Not in the heterogeneous mass of books bearing upon everything in general and nothing in particular, but in a collection carefully made up and chosen, having in view the greatest possible usefulness to pupils and people. Let me briefly recapitulate. The library, in order to be of the greatest use to the rural school and the community tributary to it, should contain—

First. Books which treat of agriculture or which pertain especially to the industry most prominent in that region and which furnishes the means of living

to the inhabitants. They should pertain especially to whatever is the center of interest to that people.

Second. Those which treat of animal life: the birds most pleasing as songsters and those most useful in destroying injurious insects and worms; the care of bees; the habits of ants and wasps; of domesticated animals, the care of them, and the profit in raising them. Above all things children should read books which have a humane side as regards the life which is about them.

Third. Horticultural books, which treat of fruit trees, of grafting and pruning of vineyards, of small fruits, which every family can raise with but little expense, but which add to the comfort of the table and swell the purse from which the housewife purchases the many little things needed in her family.

Fourth. Books which treat of floriculture, window gardening, and the care of lawns and shrubbery with a view of beautifying the laborer's home. The poetry of rural life is the beauty of the rose, the wild flowers on the prairie or in the woods. The æsthetic side of the child's nature will always respond to the influence of chaste, pure, beautiful surroundings.

Fifth. On the shelves should be books treating of arboriculture. The child should be interested in trees, how to plant and transplant them. Which trees are most useful for timber, for fruit, for shade, for beauty, and which are of the most rapid growth, may be useful subjects for research and discussion.

Sixth. On another shelf should be found books that are to be read in connection with mineralogy, meteorology, and geology. Elementary books along these lines at the disposal of the pupil and the teacher add to the interest of the school and success of the teacher's work.

Seventh. There should be also a miscellaneous collection suitable for reading at the fireside or in the family circle. Not every new book that is published should find lodgment in the school library. Only those should be given a place which are pure in style and elevating in sentiment. Dickens and Hawthorne, Cooper and Prescott, Tennyson and Longfellow, must ever hold the first place as choice English classics. The dictionary and reference books should never be omitted.

We make a mistake when we limit the usefulness of the library to the pupils in attendance at the school. There must be found on its shelves books for home reading and for the family circle. History and biology, travels and science, art, poetry, and fiction are all needed to enlarge the horizon of the farmer's knowledge and to make him what he is not now, "citizen of the world." The farmers' institute, the lyceum, the debating club, the mothers' club, should all be stronger and more effective because of the inspiration drawn from books in the school library. Questions which arise in parliamentary law, in civil government, in the State and the national constitutions should all be answered by reference to the best authorities.

The library should be open to the young people who have left school but still reside in the neighborhood. The power and usefulness and the happiness of the teacher will be increased if from the register she would learn their names and then take pains to make their acquaintance and enlist their sympathy in the support of the library and the school. "Anyone who is a pupil of this school can use these books" is too narrow a regulation. "Anyone is welcome to this library who is a resident of the district and will give assurance that the books will be carefully read and promptly returned" would be far better.

In a certain kindergarten room in Ohio the following sentence is posted up where everyone who enters the front door can not fail to see it: "The object of this house is to furnish a center for the social, mental, and moral life of the people; to educate the children, to encourage the parents, and to assist the workers, that life may be brighter and happier for all." Change the word "house" to "library" and you have exactly my idea of the purpose of a library, especially in rural districts.

## THE YALE BICENTENNIAL CELEBRATION.

The two hundredth anniversary of the founding of the institution now known as Yale University was celebrated October 20-23, 1901, with appropriate ceremonies, exercises, and entertainments. The chief features of the programme are here given, together with extracts from the commemorative oration of Mr. Justice Brewer and from the address of President Northrop, of the University of Minnesota.

## PROGRAMME.

*Sunday, October 20.*

- I. Public worship in the Battell chapel; sermon by the Rev. Joseph Hopkins Twichell, senior fellow of the corporation. (10.30 a. m.)
- II. Services in the churches of New Haven, with sermons special to the occasion. (10.30 a. m.)
- III. Services in the Battell chapel; address on Yale in its Relation to Christian Theology and Missions, by Rev. George Park Fisher, professor of ecclesiastical history. (3 p. m.)
- IV. Organ recital in the Battell chapel. (8 p. m.)

*Monday, October 21.*

- I. Dedication of the gateway erected by the class of 1896 in memory of Ward Cheney and Gerard Merrick Ives, who gave their lives in the service of their country. (9.30 a. m.)
- II. Address on Yale in its Relation to Law, by Thomas Thacher, of the New York bar. (10.30 a. m.)
- III. Address on Yale in its Relation to Medicine, by William Henry Welch, professor of pathology in Johns Hopkins University. (11.30 a. m.)
- IV. Address of welcome, by Arthur Twining Hadley, president of the University. Responses by Hon. Anthony Higgins (for the graduates); the mayor of New Haven; the governor of Connecticut; United States Senator Platt of Connecticut; James Williams, D. C. L., Fellow of Lincoln College, Oxford (for the universities of Great Britain and Ireland); Fiódor Fiódorovitch Martens, LL. D., professor in the University of St. Petersburg (for the universities of continental Europe); President Dabney, of the University of Tennessee (for the universities of the South); President Harper, of the University of Chicago (for the universities of the West); President Eliot, of Harvard (for the universities of the East). (3 p. m.)
- V. Reception of delegates, guests, and representatives of the alumni by the president of the University. (5 p. m.)
- VI. Torchlight procession of students and graduates (about 5,000, in characteristic costumes), starting from the campus at 9 p. m. The procession was led by the State military, and 25 bands were interspersed at intervals.

*Tuesday, October 22.*

- I. Address by Cyrus Northrop, president of the University of Minnesota, on Yale in its Relation to the Development of the Country. (10.30 a. m.)
- II. Address by Daniel Coit Gilman, president of Johns Hopkins University, on Yale in its Relation to Science and Letters. (11.30 a. m.)
- III. University football game. (2 p. m.)
- IV. Choral performance of *Hora Novissima* by the Gounod Society at the Hyperion Theater. Conductor, Horatio Parker, professor of the theory of music and composer of the oratorio. (4.30 p. m.)

- V. Student dramatic performance on the campus, with singing of college songs. Scenes from the history of the college, presented under the auspices of the Yale Dramatic Association. Illumination of the campus. Singing by graduates with student chorus (600 voices), under the leadership of Samuel Simons Sanford, professor of applied music.

*Wednesday, October 23.*

- I. Procession of guests and graduates on the college campus and the city green, headed by the President of the United States and the president of the university. (10 a. m.)
- II. Commemoration exercises, Hyperion Theater: Poem by Edmund Clarence Stedman. Greek festival hymn, composed by Thomas Dwight Goodell, professor of the Greek language and literature. Address on Yale's Relation to the Public Service, by Hon. David Josiah Brewer, Justice of the United States Supreme Court. Conferring of honorary degrees. (10.30 a. m.)
- III. Concert by the Boston Symphony Orchestra, Hyperion Theater. (2.30 p. m.)
- IV. Dedication of Woodbridge Hall. (4 p. m.)
- V. Farewell reception by the president of the university and Mrs. Hadley. (5 p. m.)

#### SPECIAL EXHIBITIONS.

In connection with the celebration there were several special bicentennial exhibitions, as follows:

- I. Exhibition of paintings in the south gallery of the School of the Fine Arts, the centers of interest being the 110 works of John Trumbull and the collection of portraits by Prof. Samuel F. B. Morse.
- II. In the Peabody Museum there were four special exhibits prepared for the celebration: A dinosaurian reptile, a skeleton of an ancestor of the dog family, a model in papier-maché of a dinoceras, and the Newton collection of meteorites.
- III. In the university library was an exhibition of documents, books, and views, illustrating the early history of the college.
- IV. A considerable part of the Morris Steinert collection of keyed and string musical instruments, recently given to the university, was exhibited in the foyer of the Hyperion Theater.

#### BICENTENNIAL PUBLICATIONS.

With the approval of the president and fellows of the university a series of volumes was prepared by a number of the professors and instructors, and issued in connection with the celebration as a partial indication of the character of the studies in which the university teachers are engaged. The series includes 25 titles.

#### RELATION OF YALE TO THE PUBLIC SERVICE.

[From the commemorative oration of Hon. DAVID JOSIAH BREWER.]

\* \* \* In the general thought of education all colleges and universities are alike. As human faces have general features in common, so have educational institutions, and yet there is always something which individualizes each. "One star differeth from another star in glory." If Yale has had a generous curriculum, so have other institutions. If she has had learned and distinguished instructors, so have they. If she has had graduates who have done grand work in life, so have they.

I turn from those forces and facts in which Yale's life has been common with the lives of other educational institutions to some matters of difference—things which individualize her.

Note the declared purpose with which she began life, and the spirit in which that purpose has been carried into effect. That purpose was, as expressed in her charter, now two hundred years old, to fit young men "for public employment both in church and civil state." \* \* \*

She was the first educational institution in the world to make the fitting for public service the expressed and dominant purpose of her educational work. In this country the two earlier colleges were Harvard, in Massachusetts, and William and Mary, in Virginia. In neither of their charters is there any recognition of public service as the purpose of their lives or training. Even if similar language be found in the charters of educational institutions across the waters prior to that time, it must be remembered that public service there meant service of the monarch. So it may fairly be claimed that Yale was the first educational institution in the world to make training for service of the public the supreme object of her life and work.

What a noble, inspiring purpose! True service of the public is not mere office seeking or office holding, for either of them may go with the poorest kind of service and with constant thought of private gain or personal ambition. It is a striving to promote the interests of the great body of the people; a seeking of the general welfare; an effort to make the lives of all sweeter, purer, nobler; it is service of the public and for the public.

All the true education is a blessing. It is an honor to any institution to be able to say, "I have educated this distinguished scientist, this wise philosopher, this learned historian, this great professor;" but it is a far higher honor for an institution in these United States of America to be able to say, "I have trained my graduates to good citizenship."

That was the expressed purpose of Yale's life, and as a dominant purpose always molds and controls one's activities it is not strange that her sons should be conspicuous for their devotion to the public welfare. This is said in no disparagement to other colleges and universities, for it is a fact redounding to the honor of all that the educated men of America have furnished most shining example of pure, unselfish devotion to the public interests. Every such institution can point to conspicuous examples among her sons—many conspicuous in the present day (thank God, there have always been in this country college men ready to recognize a true Washington, whether his first name were George or Booker), but I do make bold to say that the lives of the great body of her graduates bear witness to Yale's constant loyalty to her expressed purpose. \* \* \*

The overshadowing political fact of the last four centuries is the evolution of the problem of government of, by, and for the people. To him who believes that the world's life is not a mere succession of accidents, but a movement of forces along the lines of an infinite purpose, it is not strange that many things were contemporaneous with and helpful to the solution of this problem. It was a day of great mental and moral upheaval, unrest, and activity. The invention of printing, the unchaining of the Bible; the spirit of chivalry, outgrowth of the Crusades and feudal life; the birth of international law, founded on moral obligations; the opening of a new continent to the civilized world—all these things gathered about and tended to the successful working of the great political problem. On the virgin soil of this new continent the most vigorous spirits of the most virile races sought homes far from the overshadowing influences of monarchical systems; and here began, at first in a feeble way but with constantly gathering strength, the inauguration into the life of the world of the thought that every man is free and every man a ruler. It was at such a time, on such a continent, and during the evolution of this great problem that Yale came into being and has lived her life. What a magnificent opportunity! How great the need of such an institution! Popular government was not fashioned in an hour or born

in a day. Its relations to society and social order were not established by a single act or accomplished by colonial charters, the Declaration of Independence or the Federal Constitution. Slowly the structure of popular government was to rise—did rise—and skillful must be its architects, patient and faithful its toilers. And to the work of educating its architects and training its toilers Yale devoted her life. Ignorance would have wrecked the movement; ambition and selfishness would have stayed its growth. In fullest sympathy with the thought which underlies the problem, Yale strove to give her students the best of education and to fill them with the spirit of public service. Is it strange that her sons have ever been faithful workers on the great structure? Is it strange that the common people heard her gladly and sent their sons to receive her training? \* \* \*

Another significant feature of Yale's life is her relation to religion. Public employment in church was one of the avowed purposes of her creation. The first rule prescribed by the founders at their first session after the granting of the charter directed the rector to "instruct and ground them (the students) well in theoretical divinity." The first formal professorship in the institution, created nearly three-quarters of a century before the establishment of a separate theological department, was a professorship of divinity. During the first hundred years 40 per cent of her graduates entered the ministry.

The founders were Congregational ministers, robust in theology, as became a minister in those days. While they only dimly saw and faintly felt the higher truth, love the fulfilling of the law, they believed in righteousness and judgment; they knew the line and plummet. Committing the control of the new college to their own denomination, they wisely bound it to no creed, fastened it to no dogma. Doubtless, as Judge Baldwin said, "The religious liberty for which the Puritans crossed the sea was simply liberty to make their form of religion the law of a new community." Yet Yale was always broadly catholic. In the volume issued by President Clap, in 1765, concerning the history of the college and its rules of life, he says: "Persons of all denominations of Christians are allowed the advantage of an education here, and no inquiry has been made, at their admission or afterwards, about their particular sentiments in religion." From the very beginning Yale has stood with an open door toward all true religion. Early she transferred the urim and thummim on the breastplate of Aaron into the motto of her life, "*Lux et veritas*" and ever has she walked, guided by that motto in her training of the young for public employment in church and civil state. She anticipated Goethe's dying call for "*mehr Licht*;" Cardinal Newman's "*Lead, kindly Light; \* \* \* Lead thou me on*;" and ever has she, ignoring its sneer, sought the answer to Pilate's immortal question, "What is Truth?"

So much for the past; that at least, as Webster said, is secure. And now for the present and future. It is the law of life, at least of that which appears in material forms, that there is growth, maturity, then decay and death. We have seen that Yale has grown. She stands to-day a marvelous institution. Is this only the ripening, to be followed by decay and death? Has she, like the great multitude of human institutions, outlived her usefulness with nothing before her but the sad processes downward to dissolution and death?

I turn again to her relations to the great work of fitting for public service, and find an answer in the need of such work for the preservation and perpetuation of popular government and her fidelity to her declared purpose in respect thereto. The conditions of life, social and political, are not as they were. We stand in a wondrous hour. It is the time of marvelous achievements, the day of magnitudes and magnificences. The great army of civilization is marching from victory to victory. Yet now, as in the days of Patrick Henry, amid the shouts of joy and triumph are notes of discord, the cry of the modern John Hooks, hoarsely bawling, "Beef!" "Beef!" "Beef!"

The structure of popular government in this Republic towers above the horizon of the world great and strong, and yet the question of its permanence is not settled. Its possibilities of good are greater than ever before, yet it lives under new conditions and faces new dangers.

New occasions teach new duties; time makes ancient good uncouth;  
They must upward still, and onward, who would keep abreast of truth.

Consider these things which are rapidly changing all conditions of life, especially those in this country. From the beginning of time till within the last century there was no substantial improvement in the means of travel or communication. The only motive power was the wind of animal strength. And during all these unnumbered centuries the camel and horse grew no swifter, the ox no stronger. The caravan moved with the same slow pace at the beginning of the nineteenth century as when Abraham went out from his father's house to become the founder of a new race. The wind now blows no more strongly or swiftly than when Paul's vessel was driven about the Mediterranean by the tempestuous Euroclydon. The post-office and telegraph were things unknown. But with the introduction of steam and electricity, transportation, travel, and communication have wonderfully changed. Time and distance are almost annihilated, and each year is adding speed, capacity, and comfort. We talk around the globe in a minute; every morning the events of the world are spread before us in the daily press. The post-office takes the letter from our doors and speedily delivers it anywhere in the land. We travel around the world in a month. Vessels larger than the ark in which Noah floated all the undestroyed animal life of the world and carrying in their immense capacity a multitude greater than that which fought for liberty at Bunker Hill cross the Atlantic in less time than it took John Adams to go from Boston to Philadelphia to sign the Declaration of Independence. The most distant islands of the sea are brought near to our shores. The divergence, isolation, and animosity of races and people, typified by the story of the dispersion at the Tower of Babel, are yielding to the unifying influences of steam and electricity. The steam engine and the telegraph are laying the foundations of a new tower which shall pierce the blue heavens, within whose temple walls a united humanity shall worship the Infinite Ruler. The forces of life are centripetal and not centrifugal. Union and unity are the potent words. Neighbor has become a recognized term in the vocabulary of nations. Our recent war with Spain for the deliverance of Cuba, with its resulting acquisition of Porto Rico and the Philippines, was but one act in the great drama whose far distant prelude was ignorance, oppression, and hate, and whose final song shall be the angel anthem first heard by Judea's shepherds on Bethlehem's plains, and yet to rise from every human lip, earth's glad reply to heaven's prophetic message.

Add to this the other recent products of inventive skill, and the many wondrous machines of relieving the hand, and by which all work is done with unexampled exactness and rapidity, as well as on a scale of constantly increasing magnitude; add, also, the wonderful increase in our population, the thronging multitudes coming out of every people and race on the face of the earth, with different habits of thought, different notions of government, and different degrees of intelligence, and we have some of the elements which are changing the conditions of the great problem of popular government.

These various causes are operating in our midst to produce wealth, consolidation, centralization. The rapidity and multitude of mercantile transactions is seen in colossal fortunes; in gigantic undertakings, in enormous financial consolidations and corresponding organizations of labor. Local self-control is giving way before the pressure for centralized power. The town meeting is supplanted by the State legislature, while the latter in its turn is yielding to the expanding power of Congress. Political parties are largely under the management of

bosses, and the whole great forces of industry, business, and politics seem passing under the dominance of single central control.

Is this centralizing tendency antagonistic or helpful to the Republic? Is it consistent with popular government? Apparently it is antagonistic, against the republican thought of equality of right; each man a ruler and equally sharing the responsibilities and powers of government. Forms may not be changed. Power seldom cares about forms; it seeks the substance of control. Many and insidious are the temptations which attend the efforts of power to centralize and establish itself: wealth and its offer of luxuries, sweetness of office holding, popular applause, even though manufactured and purchased. He who stands in the center has these and a thousand other strings reaching to every side of the surrounding circle.

We hear to-day many a financial and industrial leader asserting that there is no need of a college training except for the few who wish to follow a merely professional life; that the time occupied in such training is lost to him who seeks to take part in the great industries of the day; that more wisely would it be spent in learning all the machinery and mysteries of organization and business. These assertions have a deeper significance than is ordinarily credited to them. They are the outcry of power against equality; the challenge of the forces which seek to polish the material to those which aim at the elevation of the intellectual and spiritual.

If the end of life be the mere perfection of the organization, the mere building up of colossal machines for doing work and making money, then it may be that the young man should commence as soon as possible to learn all the details of organization, all the workings of the machine. But surely the purpose of life is broader, and includes the relations of the individual as well as of the organization and the machine to the larger public and to popular government.

You can not stay this movement toward consolidation and centralization. It is a natural evolution. The commercial spirit is taking advantage of the wonderful facilities given by steam and electricity. Injunction against strikers will not stop it, legislation against trusts will not. Attempting to stay the movement of its chariot wheels by injunction or statute is lunacy, compared with which Dame Partington's effort to stop the Atlantic with a mop was supreme wisdom. Appeal must be taken to the great court of public opinion, whose decrees are irresistible. In that court every man is counsel and man is judge. That court may not stay the movement, but will control it. It can make the movement, with all the wonderful things attending it, subserve the higher thought of ennobling the individual. Who shall lead and guide in that court? Not the demagogue, appealing for selfish purposes to ignorance and prejudice. In the opening hours of the French Revolution Mirabeau roused the rabble in Paris, and the roused rabble whirled social order into chaos, provoking Madame Roland's dying words, "Oh, Liberty, what crimes are done in thy name!" We want no Mirabeau here. We turn to the educated lover of his country, the one who believes in her institutions, who would not destroy but keep pure, and is filled evermore with the thought that true service of public is the greatest glory of man. We look to him in that court for the preservation of the liberty of the individual against the threatened dominance of wealth and organization; to reinvigorate the so-called glittering generalities of the Declaration of Independence; and to fill the land with such a spirit of independence and liberty as shall give new emphasis to the grand old song, "America, the land of the free." We look to him in that court to exterminate the assassin and to put an end to anarchism, so that nevermore in the history of this Republic shall the sad story be told that during forty years, out of seven men elected to its highest office three perished by the hand of the assassin.

Here, then, is my answer to the leader of the organization. The organization

may need only one trained in its workings—an always reliable cog in the machine; but the Republic needs something larger, stronger, grander—something more than a cog. It needs the educated man, and that educated man to whom organizations and individuals are simply instruments to subserve the higher interests and glory of the Republic. So it is that in these days of tremendous material activities there is as never before the need for educational institutions filled with the spirit of devotion to the public service. \* \* \*

#### YALE IN ITS RELATION TO THE DEVELOPMENT OF THE COUNTRY.

[From the address by CYRUS NORTHROP, president of the University of Minnesota.]

\* \* \* The real history of a country is not the record of its great men either in war or in peace. It is rather an account of the development and progress of the people; and especially so in this country, where the people's will can govern, and ultimately does govern, and where the wisest leaders, before they speak, listen for the voice of the people. The hope of the country is not in the astuteness and ability of its great men, but in the virtue, intelligence, and good sense of the great body of the people. An institution of learning whose influence, educational and ethical, has permeated the great mass of the people in all parts of the country, affecting alike their ideas, their mode of thinking, their habits of life, their conceptions of public and private virtue, of patriotism, and of religion, has impressed itself upon the character of the nation in a more permanent way and with more wide-reaching results than an institution whose chief glory is the development of a few party leaders.

Probably the man of real genius never owes his success entirely to his college. The greatest men of the world have not got their inspiration from the college curriculum nor the college faculty. Some men have been great without being trained at college, and some have been great in spite of being trained at college. The glory which has been shed on some colleges because eminent men have graduated there is not to be despised, but it is largely accidental. Miami University did not make Benjamin Harrison nor did Dartmouth make Daniel Webster nor did Bowdoin make Nathaniel Hawthorne nor did Yale make John C. Calhoun. These men would have been men of note no matter where they might be graduated. The spirit of man in them was a candle of the Lord, and they could not but shine. \* \* \*

I pass on now to consider Yale's relation to the educational development of the country. Heredity of blood is much less complex than heredity of mind. Genealogical tables are sufficiently intricate, but they are simplicity itself in comparison with tables of the mind's ancestry showing the forces which have operated to produce and invigorate it. No one can possibly estimate the results which come from the work of the successful teacher in molding the character and quickening the intellect of his students, because the influence of this work goes on in future years in widening circles that at last reach the limits of the country and even of the world. Without any doubt many of the men before me to-day owe something for what they are to the teaching and inspiration of the first President Dwight, who put his own impress on Yale College and in no small degree on other colleges, and sent out into the world as students men who have made his influence a continuous power for more than a century.

So, too, a modest, courteous, scholarly gentleman, a graduate of Yale College, teaches his classes for years in Williston Seminary, each year sending a score or more of well-prepared boys to the principal colleges of New England. His life and influence are not such as the historian will take notice of. He has fought no battles. He has led no great parties to victory. He has outlined no grand policy for the country—perhaps he has not even written a book. But the influence of Josiah Clark, of the class of 1833, did not cease when his life was ended here; and

the Williston boys of his day will carry to their graves the memory of that manly and inspiring teacher; and if any of them have done good work in life, they will not hesitate to attribute it, in no small degree, to his teaching and the inspiration of his life.

Two very eminent Yale men who have had much to do with progress in education in this country, in a certain way, are Noah Webster, of the class of 1778, and Joseph E. Worcester, of the class of 1811, both lexicographers, to whose work most of the American people who are at all particular about their speech have been accustomed to refer as the final authority. The universal presence in schools in former times of Webster's spelling book and its disappearance in these later days will largely explain the increased illiteracy of college students in these days. There is nothing which the secondary schools need so much as a revival of Webster's spelling book, if we may believe published statements respecting the deficiency of students in the elements of English—a deficiency which is not always removed by extensive courses in English literature after students enter college.

The great educational work done by Yale is of course the direct work of training its own students. With few exceptions, the graduates of Yale have recognized the training they received as valuable and have been grateful to the college for it. That all chairs have not been filled with equal ability, that the same chair has not been filled always with uniform ability, that some professors have been better teachers than scholars and some better scholars than teachers, and that the undergraduates have always known just how great the faculty was, individually and collectively, every graduate of the college is perfectly aware. It can not be doubted that the work done here for two centuries has fitted men well for the struggle of life, and that most of the graduates of the college have been respectable and respected in the communities where they have lived and have been recognized as men of influence. But who can tell the story of their lives? In the triennial catalogue of Yale the names of about 20,000 graduates are recorded. Of these about 900 have held positions in Yale or some other colleges, about 3,000 have some special record for public office or work, and about 16,000 have no record beyond their academic degree. Who can tell how much the country or the world owes to these 20,000 men? The number is very small compared with the many millions of people who have lived in the two centuries just gone. And yet I do not doubt that in some way, direct or indirect, the influence of Yale has extended, through those 20,000 graduates, to a large part of these millions, affecting their education, or their ideas, or their principles, or their lives.

It would be invidious to mention the names of distinguished scholars who have contributed to build up the educational work of Yale and make it the potent factor it has been in the education of the country, because it would be impossible to name all. You of former generations and you of the present generation will readily call to mind men who by their learning, vigor, and culture did much more for you than merely instruct. The list is a long and noble one, of which no Yalensian can fail to be proud. Though great men have died, great men have been found to take their places, and the faculty to-day will not suffer in comparison with the faculties of other days.

The roll of presidents is a famous one; but however much we may admire the former presidents, of whom the men in this audience have had personal knowledge—Day, Woolsey, Porter, Dwight, or any of the earlier men—no one doubts that Arthur T. Hadley, son and intellectual heir to the ever-to-be-remembered James Hadley, is at least the peer of the best of them.

Most of the Yale men who have engaged in the work of education have had on them all their lives the stamp of Yale College, and have cherished the Yale ideas and have followed the Yale methods. No other single word describes what these are so well as "conservatism." They have held fast to what was good and

been slow to enter new and untried paths. The education that in the past had succeeded in giving men power has seemed to them good enough for the future, and they have been slow to accept knowledge without discipline or culture without power. As a result, the manliness, force, and independence which particularly characterize the Yale student have been reproduced throughout the country by the permeating influence of Yale training. "A boat race," said a newspaper correspondent last summer, "is never lost by Yale till the race is ended." He meant by that that every particle of strength would be exerted by a Yale crew to the last stroke, so that the race would finally be won, if it were possible, as it generally is. It is that resolute determination to do one's best in a manly way everywhere in life, without affectation or snobbery or parasitical sycophancy or the undue worship of ancestors, that is the characteristic mark of Yale men, and that is sure to appear wherever Yale men teach. And where have they not taught? North, South, East, and West, Yale educators have been at work founding colleges and academies and schools, formulating the principles of public education and making the policy of new States more liberal even than that of the mother New England, stimulating public interest in new methods and building up graded systems of popular education, with all the varied institutions needed for its protection. The earlier development of this work took the form of attempts to establish in new territory colleges as like Yale as possible. Princeton, Columbia, Dartmouth, and Hamilton may be taken as examples. The first three presidents of Princeton were Yale men, and to the efforts of the first president, Jonathan Dickinson (Yale, 1706), more than to the efforts of any other man, are due the founding and early development of Princeton University; the work of Aaron Burr, the second president (Yale, 1735), confirmed the Yale tradition in Princeton; and the name of Jonathan Edwards, the third president (Yale, 1720), according to Hallock, "contributed more to the fame of Princeton on the continent, short as was his presidency, than the name of any other official connected with its history." The first president of King's College, now Columbia, was Dr. Samuel Johnson (Yale, 1714). He was the only Episcopalian clergyman in Connecticut; was highly esteemed by Benjamin Franklin, and was urged by him to become president of the institution founded by him in Philadelphia, afterwards the University of Pennsylvania. When King's College was reorganized as Columbia, William Samuel Johnson (Yale, 1744), a distinguished United States Senator from Connecticut and an eminent lawyer, became the first president. He was the first graduate of Yale to receive an honorary degree in law, having been made a doctor of civil law by Oxford in 1776. Dartmouth College had for its founder and first president Dr. Eleazar Wheelock (Yale, 1733), for thirty-five years pastor of a church in Lebanon, Conn. The story of his work for the Indians and the development of his Indian school into Dartmouth College is too well known to need repetition here. The Yale stamp has always been on Dartmouth, and the spirit of the two institutions has been, and is, not unlike. Hamilton College was established by charter of May 26, 1812. It was founded by a Yale graduate, Samuel Kirkland, of the class of 1768, who drew his inspiration from Eleazar Wheelock, of the class of 1733, president of Dartmouth. Like Dartmouth, Hamilton was the outgrowth of Christian work for the Indians. For fifty years of its existence practically all the presidents and professors of Hamilton College were Yale graduates. Among them were some men so eminent that they will not soon be forgotten.

The ordinance of 1787, providing for the government of the territory northwest of the river Ohio, contained, among other remarkable articles, a requirement of public provision for education. Its language is: "Religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall forever be encouraged."

That ordinance has been most faithfully obeyed within the great region to

which it applied, every State carved out of the territory having made noble provision for public education, from the common school to the university. "Ohio University, established at Athens, Ohio, in 1802, bears the double distinction of being the first college in the United States founded upon a land endowment from the National Government, and also of being the oldest college in the Northwest Territory." Dr. Manasseh Cutler was the father of the university. He was a Yale man, of the class of 1765, and a minister of the gospel, pastor in Ipswich, Mass. He drew up the plan for the college and made it as much like Yale as he could, but the legislature modified his plan and assumed large powers in the election of trustees, so that Ohio University, though a child of Yale, did not ultimately resemble Yale as much as it resembled a State university. But that was not because Dr. Manasseh Cutler had forgotten the character of his Alma Mater or had broken away from his Yale conservatism, but simply because other influences were too strong for him to control. Yale influence was thus the first to start higher education in the great Northwest Territory, and the institution founded by Cutler still lives and prospers, with as many students as Yale herself had when I was an undergraduate.

Twenty-four years later, in 1826, when northern Ohio had been well settled by good people from Connecticut, Western Reserve College secured its charter. It was the first college established in the northern half of Ohio. The project to establish it originated with a Connecticut clergyman, Rev. Caleb Pitkin, a Yale graduate, of the class of 1802. The institution was modeled after Yale, not only in respect to the course of study, but also in respect to its governing board, a majority, as at Yale, being clergymen; and of this majority in the beginning four out of seven were Yale men. The first president who was a graduate of a college was Rev. George E. Pierce, D. D., a Yale graduate, of the class of 1816. Of him it is said that "he was thoroughly imbued with the Connecticut idea of a college." That means the Yale idea. Most of the faculty of Western Reserve College were Yale men, and "for a number of years the institution was modeled upon Yale College in the minutest particular." After this statement it is perhaps needless to add, in the language of the president of another Ohio college, that "from the first Western Reserve has been one of the very best colleges in the country." Graduates of Western Reserve are now at the head of several of the most important departments of Yale, while several of the presidents and many of the professors of Western Reserve have been Yale men. Henry L. Hitchcock, of the class of 1832; Carroll Cutler, of the class of 1854, both presidents, and Henry N. Day, of the class of 1828; Elias Loomis, of the class of 1830; Nathan P. Seymour, of the class of 1834; and Lemuel S. Potwin, of the class of 1854, may be mentioned, not as a complete list, but as a sample of the Yale men who have made Western Reserve, now expanded into a university, the excellent college it has always been.

Illinois College was established in 1829 at Jacksonville, in the limits of what is now the imperial State of Illinois. All the influence leading to the establishment of this college originated at Yale or with Yale men. The promoters of the enterprise "followed the advice of the president and professors of Yale College, and these venerable advisers warned against subjecting the institution to political or denominational control." Rev. Dr. Edward Beecher (Yale, 1831) was the first president. Rev. Dr. Julian M. Sturtevant (Yale, 1826) was his successor, and his presidency was long and prosperous. The college was founded when Illinois had no colleges and had a population of only 160,000. Yale put her impress on the young State and has kept it there to a greater or less degree ever since.

Beloit College was founded in southern Wisconsin in 1848. All of its first faculty of two were Yale men. Its first president was Rev. Dr. Aaron L. Chapin (Yale, 1837), who held the office for thirty-six years—till 1886. To-day, as ever, Yale is represented in the faculty of Beloit. The ideas of the founders of Beloit

were the same old conservative Yale ideas which have so generally characterized Yale educators, whether at home or abroad. As the Beloit men themselves expressed it, "Education was understood to mean chiefly a self-development of the individual under training to a true self-possession and command of his best faculties." To-day Beloit and Yale are alike presided over by one of their own brilliant graduates. What Arthur T. Hadley is to Yale, Edward D. Eaton is to Beloit. And if I were seeking in the whole West for a young Yale, I should go at once to Beloit; and I have no hesitation in saying that there is no denominational or independent nonsectarian college in the West that is better than Beloit. President Eaton is a graduate of one of the departments of Yale.

I have chosen to speak of these colleges, not because Yale men were to be found in their faculties—there are many colleges all over the country that can not be named to-day of which the same is true—but because these institutions seem to have been created as well as developed by Yale influence, and in their career they have largely affected the character of the great Northwest, all of them having been established most opportunely by Yale influence within the territory dedicated to freedom and education and religion by the ordinance of 1787.

Passing from the consideration of institutions intended to reproduce Yale, I come next to consider the work of a few men who have been notable as educators. Foremost among these, worthy to be classed with Horace Mann in consideration of the originality of his plans and the extended scope of his work, was Henry Barnard, of the class of 1830, who closed his long career of usefulness in this first year of the twentieth century, a man whose influence upon the schools and the secondary education of the country was so pronounced that the largest educational convention of the year, with its 10,000 teachers from all parts of the country, fitly paused in its deliberations to celebrate at one entire session the remarkable achievements of this distinguished educator. He was a man of original ideas. He believed in progress. He never rested satisfied with what most of the world was ready to accept as the ultimate attainment. For him there was always something better further on, and the great army of educators, good and bad alike, were compelled at last to follow his leading. And he is not the only one who has gone out from Yale and has done a broader educational work than that outlined by her traditional policy. Indeed, it may be confidently asserted that the work done by Yale graduates as educators outside of New Haven in recent years has shown a much less close conformity to the conservative ideas of Yale than that done in the first half of the century. Too much honor can not be given to Daniel C. Gilman, of the class of 1852, first president of Johns Hopkins. He went out from Yale to assume the presidency of the University of California, and after some years of vigorous work in which he succeeded in giving form, purpose, and life to that university he was called to take up a new work in Baltimore. Discarding the traditions of the old colleges of the country, he set himself to the task, not of building up another rival college for undergraduates, but of establishing a genuine university in which graduates of the best colleges of the land could advance in knowledge beyond the limits of all the colleges, under men distinguished for their original investigations and for their great attainments in the subjects which they undertook to teach. How great his success was you all know. How much the old colleges are indebted to him for a new impulse and for his grand leadership in creating a real university the faculties of those colleges very well know, and how great a service he rendered to the country can be witnessed by hosts of bright graduates of Johns Hopkins filling most important positions in most of the leading colleges of the country and bringing to their work a new inspiration derived from great teachers and new methods of scientific investigation. And among the great men whom Gilman gathered around him, with a judgment that was almost faultless, we are proud to name one of yesterday's ora-

tors, Dr. William H. Welch, the most distinguished pathologist and bacteriologist of our country. The direct influence upon the colleges of our country exerted by Johns Hopkins, planned and administered by Dr. Gilman, can hardly be overestimated. The methods of study and the learning of that university are being reproduced from the Atlantic to the Pacific in every institution that has money enough to secure graduates of Johns Hopkins for its faculty. A number of American colleges have thrown aside the bands which compressed them and have expanded into genuine universities. But it was Daniel C. Gilman who led the way, and every man who cares for progress in educational work and for the highest learning will acknowledge that the United States owes a debt of gratitude to Dr. Gilman for the work he has done outside of Yale. President Gilman \* \* \* is even now ready to take up and carry forward successfully another very important educational work as director of the Washington Memorial Association at the capital. \* \* \*

Of Andrew D. White, of the class of 1853, it is difficult to say whether he is more distinguished as a writer and thinker forty years in advance of his age, or as a diplomatist eminent for his services as the representative of his country at the courts of Russia and Germany, or as an educator blending the purposes of a land-grant college with the broad educational ideas of Ezra Cornell, and establishing and directing successfully for years that unique institution, Cornell University. Certainly his success in any one of these directions has been sufficient to satisfy the ambition of most men. As president of Cornell he did much to promote new theories of education and to enlarge the scope of educational institutions. The institution which he created had little resemblance to Yale, but it is not unlike the leading State universities of the West. The conditions of the endowments were doubtless in a large degree responsible for this; though no one supposes that Dr. White, even if given a free hand, would have attempted to reproduce a Yale at Ithaca. Something new, and as far as possible original, must be the outcome of his labors; and such, in the judgment of the Yale faculty at the time, was the outcome. As the years go on institutions, like men, learn from experience and soon drop off their unpleasant features and assume new ones that are desirable. This has been the history of Cornell, and, without losing in any degree her individuality, she has at last fallen practically into line with all the successful universities of the country. Dr. White gave to her service some of the best years of his life and not an inconsiderable part of his fortune.

Chicago University, which, though a mere child in age, has the size, strength, ambitions, and activity of the full-grown man, owes its existence and resources in the last analysis to the thought and suggestion of a Yale graduate; and owes its development, nerve, and originality to its first president, Dr. William R. Harper, who graduated at Yale as doctor of philosophy in 1875, and who as a professor at Yale had the opportunity to fill himself with the Yale spirit, if he did not secure it as an undergraduate at Muskingum College. Perhaps he did, for the first preceptor of that institution was David Putnam, grandson of Gen. Israel Putnam and a graduate of Yale in the class of 1793. Time will not permit an extended notice of Dr. Harper's great work in Chicago, and it is not necessary; for in these days the University of Chicago is very much in evidence, and the world knows how much the amiable, versatile, and progressive first president, Dr. William R. Harper, has done for education. I do not claim it all as a part of the glory of Yale, but I do claim an undivided and indivisible share.

I should be glad to pay a just tribute to the work done in Atlanta by Horace Bumstead, of the class of 1861; in Tulane University, at New Orleans, by William Preston Johnston, of the class of 1852; in New York by Charlton T. Lewis, of the class of 1853; in Rochester by Augustus H. Strong, of the class of 1857; in Cornell by Moses Coit Tyler, of the class of 1857; in Lincoln and Iowa City by

George E. MacLean, of the theological class of 1874, and by many others whose work is eminently worthy of special mention. But I can not further deal with individuals, but must briefly state the essential facts.

Yale furnished the first president of at least 18 colleges, and the list is remarkable as much for the distinguished character of the institutions as for their number. I name them: Princeton, Columbia, Dartmouth, University of Georgia, Williams, Hamilton, Kenyon, Illinois, Wabash, University of Missouri, University of Mississippi, University of Wisconsin, Beloit, Chicago, California, Cornell, Johns Hopkins, and Western Reserve. One hundred and five graduates of Yale have been president of a college, and at least 85 different colleges have at some time had a Yale graduate for president. Among these are the State universities of Wisconsin, Minnesota, Iowa, North Dakota, Pennsylvania, Louisiana, Mississippi, Wyoming, Indiana, Georgia, Missouri, Vermont, California, and Oregon, and probably others. Among the other colleges (not State institutions) are Dickinson, Middlebury, Hampden-Sidney, Amherst, Rutgers, Trinity, Lafayette, Transylvania, Tulane, Lake Forest, Pomona, and Whitman, and the Imperial University of Japan. More than 600 graduates of Yale have been professors in some college. I wish I could name them, including the distinguished men who have done their work here at Yale; but the mere reading of the names of professors, the chairs they filled, and the colleges they served would require the entire time permitted for this address. No one can doubt that the influence of these men in so many institutions in all parts of our country has contributed much to the advancement of higher learning in all sections, to the elevation of the people, and to the prosperity and true grandeur of our Republic.

The prairies that for hundreds of miles stretch in almost unbroken continuity through the West do not excite in the traveler to the Pacific any especial emotion of wonder. Such emotion is excited by the tall peaks farther west that tower heavenward—the sentinels of the Rockies—grand, gloomy, solitary, sublime. But the prairies, monotonously level and tame though they are, can feed the world.

The largest part of the alumni of the college are like the prairie—inconspicuous but useful. Some of the others are like the foothills—elevated but small in comparison with Shasta's heaven-piercing head. Comparatively few rise to mountain heights, and hardly one attains the grandeur of the solitary peak to whose majesty the world does homage. But the inconspicuous lives are not always the least useful lives. The men with the longest record in the triennial catalogue are not necessarily the men who have done the most good. Many a graduate, as principal of an academy, a high school, or a preparatory school of some kind, has done a work that in its breadth, power, and beneficence is not equaled by the work of more conspicuous men in higher fields. I would rather have the glory which rests upon the memory of Dr. Arnold, of Rugby, than the halo which encircles the proudest don of Oxford. It is a great thing to be a real thinker. It is a great thing to have a noble character. But it is a greater thing to plant your thoughts in intellects where they will grow and to put your principles, which have made character, into hearts where they will be cherished. In this thought the teachers of all grades can rest content. And Mother Yale, as she calls the roll of her sons who are worthy of her love, will not omit a single one, however humble, if only he has done what he could.

---

#### THE KINDERGARTEN IDEAL OF NURTURE.<sup>a</sup>

By SUSAN E. BLOW.

The distinctive merit of the kindergarten is its proclamation of conscious nurture as a universal and compelling ideal. We may outgrow all the instrumental-

---

<sup>a</sup> Read before the International Kindergarten Union, at Boston, 1900.

ities through which it now seeks to embody this ideal. We may increase and improve its gifts and occupations. We may create new and more beautiful plays, pictures, and stories. We may, in time, call forth a genius who will write a more profound and tender mother play. But to Froebel must belong forever the glory of having first appealed to humanity to consecrate itself to the high privilege of nurture and of having defined so clearly what nurture implies that the imperative ideal can never again cease its knocking at the gate of conscience.

The name which Froebel gave to the institution he founded suggests the ideal he was seeking to embody. "Gardens are not wild nature, but "nature mingled with man's mind." The gardener recognizes that each plant is a plastic energy which obeys an inward though unconscious ideal. He can modify plants only as he influences them to modify themselves. Planting them in prepared soil, granting them their requisite supply of heat and moisture, giving them plenty of room to grow, watching, tending, grafting, and, if need be, pruning them, he aids them to vent their energies in such ways as to secure their healthy development.

This analogy suggests the first specification in the Froebellian ideal of nurture, which is that nothing shall be poured into the child, but that the privilege of the kindergartner is to incite him to pour out himself. Giving expression to what is in him, he shall begin to discover what he is. Piqued by the contrast between the object in his mind and his crude product, he shall freely submit himself to the drudgery necessary to acquire skill. Stimulated by production to investigation, he shall produce himself as student and seek with reverence and docility to appropriate the rich treasures of human experience. Thus play, or self-expression for the mere sake of self-expression, marks the earliest period of development; constructive work, or the production of consciously planned objects, characterizes the second period; study, or the temporary ascendancy of the learner over the doer, distinguishes the third period; while the goal of the whole educational process is the man or woman capacitated by assimilation of the wisdom of the race for the highest practical efficiency and the most resolute and loving self-devotion.

The kindergarten receives the child at the climax of that first period of development during which the free energy of the soul vents itself in the form of play. Its distinctive feature is that into the form of play, which is the form of freedom, it pours those rational ideals which are the substance of freedom. Through this infusion of the ideal it makes play the first instrument for conquest of the external world and the spontaneous self-incitement of the soul to self-mastery.

Had Froebel only emphasized the fact that mental life, like physical life, works from within outward, and that play is the highest reach of childish activity because it is "self-active representation of the inner life from inner necessity and impulse," he might have become the greatest of educational anarchists, but he could never have been the wise and tender apostle of nurture. His claim to our admiration and gratitude is, that having recognized that since mind develops through self-expression, we must not pour into the child, but help him to pour out himself, he advanced to the further question, What self shall the child pour out? and answered unequivocally, he shall pour out the rational self, which is implicit in every human being, that self which is defined in the course of history, revealed in art, literature, religion, incarnated in institutions, and interpreted in philosophy. Latent in each child of man is that generic humanity which has wrought all these marvels. Therefore, in their spontaneous play, little children try to repeat the typical deeds of mankind. Their attempt is self-defeating, because it is blind, and their plays are not pictures, but caricatures of human effort and achievement. Taught by his genius what little children were trying to do, Froebel came to the help of nascent humanity with the ideal of nurture and the instrumentalities of the kindergarten. By wisely abetting the child's efforts to dig, sew, weave, build, dance, sing, model, draw, and paint, he made these

traditional games and occupations a means of approach to the practical fine arts and a primal revelation of will as the power which converts matter to human uses and informs it with human ideals. Then, seizing upon those imitative plays wherein the children of all nations and all times have tried to picture the domestic, social, industrial, political, and religious life into the midst of which they are born, he evolved a series of dramatic games through which the playing child begins to discern the lineaments of his ideal selfhood, and thus to recognize the difference between what he is and what he ought to be.

Reverting to the analogy of the garden as a place where human intelligence assists the struggle of nature, we may remind ourselves that inferior plants are improved by grafting upon their stock a scion or branch of some more highly developed plant of identical or nearly allied type. Grafting does not diminish the energy of life within the plant, but utilizes it to a finer result. It enables the wild briar to produce garden roses and the crab-apple tree to yield large and luscious fruit. The superiority of the grafted plant is due to the fact that the scion is allied in the form of its energy to the stock upon which it is grafted, but has already developed the higher potencies of this energy. In exact analogy with this procedure the kindergarten grafts upon the instinctive plays of universal childhood the higher realization of their own ideal, and thus while preserving unimpaired the form of freedom, makes play the first means of revealing, developing, and confirming the colossal as opposed to the petty selfhood.

It is because Froebel's apotheosis of play is not yet generally understood that too many existing kindergartens caricature his method and too many critics confound his ideal with the practice of his blind or half-seeing followers. Any person who asserts that the kindergarten is a place where children should play what they choose, as they choose, proves that he has mastered but one aspect, and that the less original aspect of Froebel's thought. Recognition of "the deep meaning that lies hid in childish play" is as old as Plato, and in Froebel's own time this meaning had been brilliantly disclosed by many great writers. No educator to-day questions the value of free play. No educator denies that through the untrammelled exercise of his own proclivities the child reveals and establishes his individuality. No educator challenges the assertion that without free play the child would lose all originality and become a mere machine. No educator refuses assent to the proposition that in his free play the child should not be interfered with, but should be left to exercise his powers according to his own caprice. On the other hand, no disciple of Froebel who has the least insight into his educational ideal will claim that free play belongs in the kindergarten. The child does not need the kindergartner to help him do what he pleases, as he pleases, neither does the kindergartner need two or three years of training to enable her to accomplish this feat.

To deny that Froebel attempted to rationalize play is our first offense against the great apostle of nurture. Our second and more heinous offense is the claim that in later periods of education he wished to preserve even the form of play. In common with all educators worthy of the name, he recognized the ineradicable distinction between play and work, but he advanced upon other educators through tracing the process by which childish play passes over into work, and by creating the kindergarten to abet the evolutionary effort of the mind. If we accept the formula of science, that all differences of kind result from the gradual accumulations of differences of degree, we must recognize that Froebel has done original and valuable service in abetting the process of mental evolution, and if we study fairly the results of his method as carried out in the best kindergartens, we shall be convinced that it increases power of attention and love of work.

The tendency to transform the kindergarten into a play room where children act out their own caprices is simply one manifestation of a spirit visibly at work

in many other spheres. In our family life it is depriving children of their only natural and inalienable right—the right to pass the period of childhood in an atmosphere of love, faith, and obedience. Parents are so afraid of attacking the child's freedom that they make him an anarchist, and foster in him from the hour of birth the feeling that his whole little world must adapt itself to his whim. The worst faults are met with timid protest, and righteous indignation against all that is base, cruel, and impure is dead as that faith in a moral and militant universe, whence it originally proceeded. From a home where his caprice has been his only law the child too often passes into a kindergarten where caprice is both theoretically and practically extolled as the great instrument of education, and where nothing is required of any mother's darling but that which he himself elects to do. From this caricature of a kindergarten he is promoted to a school where his own ignorant preference determines his studies, and whose teachers, beguiled by the seductive word "interest," relax moral discipline and lose all power to incite attention. During the whole progress of his so-called education he is reading books which celebrate the exploits of detached and self-sufficient boyhood and youth. What wonder that by the time he is sent to college or thrown out into life he has confounded the idea of freedom with the idea of omnipotence, and has been confirmed in the ruinous fallacy that the universe exists for his sole behoof.

The original germ of the pestilent malady which has attacked our family and school life, and whose ravages, were this the fitting time and place, might easily be shown also in our industrial, political, and religious life, is a sometimes conscious, but more often subconscious, definition of freedom which preserves its form, but destroys its substance. No man is free who does not himself decide freely what he will do. No nation is freely governed which is not self-governing. No church respects the freedom of the soul which imposes upon its votaries uncomprehended dogmas. True; and yet no man is free who, however freely he chooses what he will do, chooses to do evil; no nation is free which has not raised in rational laws bulwarks against human passion, and no religion is free save one that knows and declares the true God—the Being Himself eternally free and eternally the conferrer of freedom. Mere spontaneity without rational ideal is the freedom of Caliban—"Freedom, freedom, heyday, heyday freedom!" It is the freedom which Tennyson describes as "Freedom free to slay herself and dying while they shout her name." It is the freedom which Goethe satirizes in Auerbach's cellar—"Where boon companions filled with wine declare they feel like swine," so cannibalic jolly. Upon which Mephistopheles sarcastically comments, "See! now the race is happy; it is free." It is the freedom-destroying freedom whose dialectic has been once for all traced by Shakespeare, a freedom wherein—

Each thing meets

In mere oppugnancy. The bounded waters  
Should lift their bosoms higher than the shores,  
And make a sop of all this solid globe;  
Strength should be lord of imbecility,  
And the rude son should strike his father dead;  
Force should be right, or, rather, right and wrong,  
Between whose endless jar justice resides,  
Should lose their names, and so should justice, too.  
Then everything includes itself in power,  
Power into will, will into appetite;  
And appetite an universal wolf,  
So doubly seconded with will and power,  
Must make perforce an universal prey,  
And, last, eat up himself.

The truth is that no man knows how to be free until he has been educated for freedom. From its original slavery to the sensations stirred by organism and

environment mind emancipates itself through commanding itself to attend to one thing and neglect all others. Hence the individual is capacitated for intellectual freedom through the athletic discipline which constantly raises attention to a higher power. In like manner he is qualified for moral freedom by that warfare between his lower and higher nature incited by directing his attention to moral ideals, and he has achieved such measure of political freedom as he now enjoys through that age-long struggle which has defined the rights which political freedom implies. Political liberty does not mean to do as you please any more than does moral or educational liberty. Political liberty means the right of each individual to be secure in his person, house, paper, and effects; it means freedom of speech, of the press, and of religion; it means even for the criminal the right of trial by a jury of his peers; it means for all citizens education and the possibility of participation in the governing power. We are so accustomed to all these specifications in the idea of freedom that we sometimes forget that they do not come by nature, and ignore the fact that until a people learns them it can not be free. Let us remind ourselves that for a single implication in the idea of freedom (the relationship between taxation and representation) our Revolutionary war was fought, and that because we ourselves violated in practice a principle of freedom which we had proclaimed our land was drenched with blood during four terrible years of civil conflict.

Substantial freedom is never a dower. It is always an achievement. When, however, any individual has himself learned how to be free he can nurture other individuals into freedom, and when a great people has learned how to be free it can nurture less advanced people into freedom. Such nurture is possible because all ideals of freedom, whether intellectual, moral, or political, are concrete definitions of that self-shaping energy which is the true self in every individual, and which in all individuals is alike. What do we mean when in our Declaration of Independence we affirm that all men are born free and equal? Surely through the coercion of heredity and environment all men are born unfree. Surely through differences of natural endowment and opportunity all men are born unequal. Shall we, therefore, confess with Rufus Choate that the great instrument from which we date our national life consists after all of mere "glittering generalities," or have we eyes to discern with the seer of Concord its "blazing ubiquities?"

Strange as it may seem to all who have learned to know their true selfhood, most of us confound our selfhood with the nature with which we were born. Really, this so-called nature is nothing but the matter which is given to the individual to transform precisely as the whole world is given to man collectively. The mere deposit of ancestral deeds in nerve cells and brain fibers is not you. You are the energizing spirit who is to seize upon this given material and build therewith. Even the character you build is not you, for incited by false ideals you may build a character which, later, you, the wise judge, shall condemn to be torn down. Your nature is what your ancestors made by deeds. Your present character is what you have made by deeds. Your true self is the self-making, self-unmaking energy which teaches some nerve cells new reaction, which atrophies others by disuse, which refuses to be bound by past failures, which scorns to be the slave of past successes, but ever young, fresh, radiant with divine activity, achieves the peace of eternal self-creating.

With insight into this truth we know that the author of our great Declaration was right, though perhaps he may have written better than he knew. By nature man is a slave; nevertheless he is born free in virtue of his power of self-making. From the point of view of endowment and opportunity inequality is the law of our life; nevertheless, since each man is a self-shaping energy all men are equal, and before this supreme and final equality the greatest temporary inequalities vanish. Enlightened by this truth we know that the immaculate conception is

no isolated miracle of history, but the perpetual miracle of human experience, and that every man claims with right "heredity from God." Therefore, to free the meanest slave the hero may gladly shed his blood; therefore, to redeem the cannibal the missionary may wisely accept the possibility of martyrdom; therefore, in consciously nurturing the divine self in the little child the mother and kindergartner may enter into a joy unspeakable and past finding out.

The thesis I have been maintaining is that freedom and nurture are correlative ideas, and that because man is a free, self-shaping energy, he can be educated to realize the ideals of freedom. If, however, I have succeeded in pointing out the difference between mere spontaneity and rational freedom, you will anticipate the statement that the converse of my thesis is also true, and that the child, the savage, the ignorant man, the evil man, need nature, not because they are free, but because they are unfree. Hence the aim of nurture itself is to lift its object beyond the need of nurture. When the child matures, when the ignorant man learns, when the evil man reforms, he passes out of the realm of nurture into the realm of justice, which, granting him absolute liberty to choose his deed, holds him accountable for the choice he makes with all its consequences. The youth ready to undertake his share of the world's activity enters as member into the great institution of civil society, to come under its stern law, that he who will not work shall not eat. He enters social and political life to come under the sterner law, which metes to him the reward of penalty for his every deed. The great problem of all education is by nurture to capacitate for freedom, and in proportion as the capacity for freedom is developed, to deliver the object of nurture even from its own influence. With this problem our greatest educators and greatest statesmen are wrestling to-day.

Since, however, the world will always have its infant individuals, and for many ages is sure to have its infant races and nations, I hold that while Froebel achieved a practical revolution in the education of little children, by embodying in the kindergarten games and gifts the ideal of conscious nurture, he began a far greater revolution by his definition of this ideal, and by his appeal to all mature humanity to accept its high privilege. The deepest implication of his thought is that correlation between the ideal of nurture and the ideal of potential as opposed to actual freedom, which I have tried to indicate. Since the child is a self-making energy he can not be molded by external pressure into the image of an ideal in the mind of the educator. Since he is not only a self-making energy, but possesses likewise a nature deposited by ancestral deeds, and since he himself is blind to the difference between his true selfhood and his merely natural proclivities, it is a parody of education to claim that he shall determine what he is to do and how he is to do it. But since the self-making energy which constitutes his true selfhood is in every individual, and is the same in all individuals, since it is defining itself in history and revealing itself in human institutions, the educator who knows its nature can influence its manifestations, and thereby help the child to a higher and more balanced development. It follows that those who would enter upon the privilege of nurture must themselves be nurtured into nurturers, and the implicit logic of Froebel's life reached its explicit conclusion when in his reverent age, he stood among the eager girl students to whom he declared his ideal, and in whom he fanned to flame the spark of self-consecration. At Liebenstein the great apostle of childhood became also the apostle of womanhood. Through the kindergarten he had transfigured the nursery and the elementary school. With the establishment of the first kindergarten training school he began a movement whose final triumph shall be the conscious education of maidenhood for the supreme vocation of womanhood.

Are we not all beginning to feel that there is some crying defect in the education we give young women? Do we not sometimes wonder why, since the majority

of women are to be wives, mothers, and home makers, we fail to prepare them for these vocations? Does it take long years of practice to master a musical instrument, and yet may any woman by mere natural instinct play upon that most delicate of all instruments, the soul of a young child? Is good housekeeping a gift of nature, or may it be that the waste in some homes, the unpalatable and indigestible food in others, the want of taste in others, might be prevented by a better education? May it be because we do not teach young women the things they ought to know that the unrest of women waxes every day, and that impulses and tendencies which are developing an increased momentum threaten to make the men of all civilized races nomads without families and without homes? And, finally, must there not be something radically wrong in an education which is obscuring in the minds of young women the ideal of sweet reasonableness, which is quenching in their hearts the impulse of self-devotion, and which is taking from their manners that gracious courtesy and charm which are the outward and visible signs of modesty, gentleness, and self-control?

Men of science have made us familiar with the fact that when for the first time a mother forgot herself in caring for her babe, nature emerged from darkness into the morning twilight of her last and greatest creative day. The light which in that silent and dateless moment dawned feebly in the heart and upon the world now blazes in the solar ideals of ethics and religion, and kindles countless responsive flames of patriotic service, philanthropic devotion, and pious self-surrender. Consciously repeating the unconscious process of social evolution, Froebel places the little child in front of the great army of advancing humanity, and in his cry, "Come, let us live for the children," utters in articulate speech the ideal whose blind impulsion set in motion the drama of human history. The feebleness and helplessness of infancy called forth the impulse of nurture and created mothers. The dependence of mother and child called forth in man the impulse of protection and created husbands and fathers. The close and constant intercourse between members of the primitive family quickened a sense of parental, filial, and fraternal obligation, and stirred in the depth of the human soul its first faint presentiment that "man is made of social earth."

Since all higher institutions have been evolved from the family, and since the creator of the family was the baby, evidently the baby was the founder of civilization, and civilization should do all she can for him who has done so much for her. Or, to be serious, since blind nurture was the moving force in the original drama of social evolution, may not a conscious and compelling ideal of nurture qualify us to reenact this drama in a higher form, and may not the prologue to this new drama be the dedication of woman through a sufficing education to her supreme vocation?

Those who are familiar with the work of the best kindergarten normal schools know that they give something which students do not get either in school or college, and there is developing so strong a sense of the value of this distinctive gift that I expect in the near future either to witness the invasion of the girls' college by the kindergarten, or to behold a general evolution of kindergarten colleges which shall supplant all institutions where that impulse of nurture which originally created woman, and which must give her forever her distinctive type, is ignored in her education. For while the true woman craves higher education and rejoices in the expansion of her personality, she is unwilling "to deck herself with knowledge as with a garment, or to wear it loose from the nerves and blood that feed her action." The kindergarten training school says to her: "Learn all you can, be all you can, and then use all you are and all you know to uplift, fortify, and illuminate that nurturing activity to which nature has devoted you, for which history has prepared you, and to which you are forever called by the appealing voices of the feeble infant, the helpless child, the erring youth, the despondent

toiler, the sufferer racked by pain, the mourner sinking in a flood of sorrow, and the sinner heartbroken by the vision of what he is in the light of what he ought to be." Thus lifting the aboriginal impulse of womanhood into a conscious and compulsory ideal, the kindergarten satisfies both the new and widely felt craving for self-culture and the radical feminine need of self-consecration. When I am in my most hopeful mood I dream of a great college for young women where this phase of the Froebellian ideal may receive a more adequate development than has been possible hitherto. The city that first establishes such a college will take the next great step in the forward march of education.

Froebel did a great deed when, having clearly defined the ideal of conscious nurture, he sought its practical embodiment in the kindergarten. He did a greater deed when, recognizing that through nurturing activity mere feminine humanity is lifted into womanhood, he established the first kindergarten training school. But he did his greatest deed when, having risen to the thought that nurture was a duty obligatory upon man no less than woman, he declared that the final goal of all education was to nurture nurturers. "Answer me," he says, writing to fathers and mothers, "answer me but one question. What is the supreme gift you would bestow on the children who are the life of your life, the soul of your soul? Would you not above all other things render them capable of giving nurture? Would you not endow them with the courage and constancy which the ability to give nurture implies? Mother, father, has not our common effort been directed toward just this end? Have we not been trying to break a path toward this blessed life? Has not our inmost longing been to capacitate our children for this inexpressible privilege?"

Much educational practice is feeble and vacillating because neither parents nor teachers know just what they want to do. Froebel is splendidly consistent because his ideal never wavers. Recognizing that one great object of education is the nurture of nurturers, he takes every step with his eyes fixed upon this goal.

In view of the grand privilege to which the new age invites the world, must we not recognize that the farthest sweep of Froebel's prophetic vision is that the ideal of nurture is not exhausted in its application to infancy and early childhood, neither does it bind the conscience of woman while leaving unbound the conscience of man. Indeed, the more heroic work of nurture must be done by men, or must in large measure remain undone. Every modern nation harbors in its midst savages, barbarians, pagans, and, worse than all of these, degenerates of many kinds. Nevertheless, while all varieties of intellectual and moral type coexist in the modern world, that world as a whole is inspired by a new ideal. Past epochs of civilization granted freedom and opportunity to individuals and to classes, and their proudest achievement was the production of great personalities. But no ancient nation even dreamed of claiming for all men freedom and opportunity to seek life's highest ends. To-day we flout the idea that the world exists for the benefit of an elect minority, and demand for the whole of humanity every right that we claim for ourselves. This demand of our own souls can be satisfied only as we consecrate ourselves to new duties, and supremely to that duty of loving nurture through which alone men can be capacitated for freedom. The savages of America must be nurtured into civilization. The pagans in America must be nurtured into Christianity. Nor is our duty done if we limit our nurturing activity to our fellow-countrymen. We stand at the dawn of a new era, an era wherein great Christian nations are called upon to devote themselves to brave and loving nurture of barbarous and arrested peoples. To refuse this call by selfishly exploiting such peoples for our own advantage will mean to forego our supreme privilege. To respond to the appeal of the new historic era by a universal extension of the ideal of conscious nurture will mean the realization of man's long dream of a golden age.

I have made confession of three articles of the kindergarten creed. We believe in conscious nurture of the free self-activity of childhood. We believe in the consecration of woman to a nurturing life. We believe that men and nations should participate in woman's supreme privilege. The fourth article of our creed gives the reason for the justification of all the others. We believe that God is the supreme nurturer, and that the world is the cradle wherein He nurtures nascent humanity so that it may grow into His image. "I count it," says Emerson, "a sufficient explanation of that phenomenon we call the world that God would educate a human soul." The nurturing activity which satisfies omniscient love through all eternity may well appeal to what is likest God in the human soul."

The final source of all ideals of life is the character of the Being from whom the universe is supposed to originate, by whom it is sustained, and approximation to whom is the impulsion under which it moves toward its far-off goal. Thus the despotisms of Asia are imitations of the despotism of Brahm, and the mental arrest of Asia is an object lesson on the blight of intellect by the doctrine of a supreme principle which is not akin but antagonistic to human personality. Such freedom as occidental nations have thus far achieved is the direct outcome of belief in a social and self-communicating God, ever calling forth from the abyss of nothingness souls free like Himself, and to whom He gives an infinite universe as a theater of activity and an instrument of education. To know such a God is to be inspired with the correlative idea of freedom and nurture, for only the free soul can be nurtured and only conscious nurture can respond to the need of the free soul. It will always be true that—

He only earns his freedom and existence  
Who daily conquers them anew.

It will always be true that the "eternal womanly," or that divine nurturing activity, whose fairest natural analogue is mother love, makes possible the struggle for freedom and assures to it a certain victory.

## BIOGRAPHICAL NOTICE OF JOSEPH LE CONTE.<sup>a</sup>

By S. B. CHRISTY.

*University of California, Berkeley, Cal.*

In the death of Joseph Le Conte, at Yosemite, Cal., on July 6, 1901, the institute has lost one of its most distinguished honorary members and the University of California its most beloved professor.

The South has produced many distinguished men. In the law, in politics, and in war they have made their mark, and we are all proud of their records. But in science not so many have achieved distinction. The Le Conte family is thus the more remarkable, in that it has produced three men of eminence in that field, while there are descendants of promise yet to be heard from.

Joseph Le Conte was born February 26, 1823, at Woodmanston plantation, Liberty County, Ga. He came of Huguenot ancestry on his father's side and Puritan on his mother's. His mother died when he was only 3 years old, and he was brought up by his father with the most tender care. This father was a very remarkable man; a good physician, a skillful chemist and naturalist, a great hunter, fond of all manly sports, and a passionate lover of nature. Young Le Conte owed much to his father's training, but he was partly prepared for college by Alexander Stephens, who entered into all the sports of his pupils, and strongly

<sup>a</sup>Abridged from a paper read before the American Institute of Mining Engineers at the Mexican meeting, November, 1901, and printed in Vol. XXXI of the Transactions of the Institute.

impressed them with his own intense hatred of lying and all forms of deceit. His training for college comprised the "Three R's," Latin and Greek through Livy and Xenophon, and mathematics through algebra and geometry.

His life on the plantation at that time was an ideal one; and, as one reads his description of it in his autobiography, one can not but regret the passing away forever of a stage of civilization that made such an existence possible. It was an admirable training for the future lover of nature. Hunting, fishing, boating, swimming, riding were constant sources of enjoyment and profit. In all forms of athletics he was wonderfully proficient. Of a slight, but wiry build, he was capable of performing many feats of strength and agility better than many strong men of nearly double his weight.

At 14 he was prepared to enter college, but it was wisely decided to have him wait a year; so at 15 he went to college at Athens, Ga. Of this period, he writes:

I may add, here, that for me the so-called dangers of college life never existed. I saw much of vicious conduct among students, of course; but whether such example injures or not depends entirely on inheritance and early training. For myself, I never felt the least temptation to join in vicious courses, nor have I ever been enticed by others to do so. College students are not so bad as some seem to think. They never deliberately try to lead anyone astray. They simply seek congenial association. Indeed, I believe that college is the safest place in the world for young men. It is impossible always to remain in the bombproof of home. One must go out into the world and fight the battle of life. Now, college men are a picked set, far safer than the average.<sup>a</sup>

He graduated at Athens, Ga., in 1841, at 18 years 5 months. There was then no opportunity to study nature for its own sake, and as the nearest approach to it we find him, in 1843, a student of medicine in the College of Physicians and Surgeons in New York. In the summer of 1843-44 he took a trip of several months, with one of his cousins, right into the heart of what was then a wilderness, inhabited only by Indians and Indian agents. His course took him through the Lake Superior country (at that time just being prospected for copper) into Canada, and then down the Mississippi River, long before such towns as Minneapolis were founded.

This trip left a great impression upon his mind. He made en route a number of geological observations, the importance of which he was then too young to realize, which were afterwards confirmed and more fully appreciated by other observers.

In 1845 he graduated from the medical school and settled down as a practicing physician in Georgia.

In the practice of medicine he was moderately successful; but his heart was not in the work. He felt, probably, more keenly than most, the responsibility for the life of his patients, and the lack of preparation which the medical training of that time gave for what he himself terms "the awful responsibilities of a medical practitioner." Then, too, it was characteristic of the man to shrink from practical details; they did not interest him; his nature reached out to solve the larger problems of the mind. He had at this time three medical students, and teaching them interested him far more than the practice of medicine. He confesses to having felt a strong sense of wasted life, though he carefully concealed it from all, even from his wife.

Richard Owen, the comparative anatomist, first interested him in the "homologues of the human skeleton," and this led him to decide shortly after (in 1850) to become a pupil of Agassiz. He went to Cambridge in August:

The university does not open till October, but that does not matter. I did not come to Harvard to enter the university, but only to study with Agassiz, and

<sup>a</sup>This, as well as the other quoted matter in this paper, is taken from Professor Le Conte's unpublished autobiography, a work which Professor Christy characterizes as one of the most fascinating stories he has ever read.—ED.

we (Dr. Jones and myself) went right to work. The first work he put us at was very characteristic of the man. He thought a moment, and then pulled out a drawer containing 500 to 1,000 separated valves of unios.

There were 50 to 100 different species, all mixed up. "Pair these valves," said he, "and classify into species—names no matter—but separate in species." He left us alone—very severely alone. We worked on these shells for one whole week. He looked at the work from time to time, but made no remark. Finally we told him we had done the best we could. He examined carefully, and was greatly pleased. It happened just then that there entered the room a friend of his just from Europe, M. Ampère, son of the great electrician. He introduced us, and remarked that these pupils of his had just amended correctly the classification of Lea, the great authority on unios.

I only give this as an example of his method of teaching. He constantly carried it out, with some modifications. He set us tasks; we worked unaided, with only a hint here and there. As we became better acquainted, however, finding us already well advanced in thoughtfulness, he often gave us long talks, expounding his biological philosophy and inviting discussion, which we were not slow to accept. He thus scattered unpublished thoughts and suggestions broadcast on all sides with a free hand. \* \* \*

There are two types of great men. Men of one class are great by the quantity and importance of their work, but when you come in contact with and measure them intellectually they seem of ordinary stature. Their work is greater than themselves, though surely patience and persistence are admirable qualities which ought to be added to their work in estimating their greatness. Those of the other class, the nearer you approach them the greater they grow. They are themselves greater than all their visible results. These are the great teachers. Their spirit and enthusiasm are contagious, their personality is magnetic. They not only think intensely, but they are the cause of thought in others. Agassiz was pre-eminently of this class.

A year later (in 1852) Le Conte accepted the professorship of science at Oglethorpe University, Midway, Ga. He was expected to teach all the sciences except astronomy, which went with the chair of mathematics. For \$1,000 a year he actually did teach mechanics, physics, chemistry, geology, and botany. A year later he was called to a better position in his own university at Athens, Ga., where for five years he was able to confine himself to natural history, though he had to teach French for a year. In 1857 he was called to the professorship of chemistry and geology at South Carolina College, Columbia, S. C., where he remained till after the war.

Speaking of the outbreak of the war of 1861, he says:

At first I was extremely reluctant, and even opposed, to the movement. I doubted the necessity of secession; I dreaded the impending conflict and the result. A large number of the best and most thoughtful men in the South felt as I did; but gradually a change came about—how, who can say? It was in the atmosphere. We breathed it in the air; it reverberated from heart to heart; it was like a spiritual contagion—good or bad, who could say? But the final result was enthusiastic unanimity of sentiment throughout the South. Those who were the latest and the most reluctant, because they saw the seriousness of the result, were also the most earnest and most reliable. Those who did not join in the movement (with very few exceptions, like Pettigrew) were untrue men in every way, both North and South alike.

Professor Le Conte carried on his teaching till the college was disbanded, as the war became more desperate, and then offered his services to the Confederates, and was employed as chemist and geological expert in the search for deposits of niter and the manufacture of explosives. He suffered all the horrors of war except death in his immediate family. For three years he had the barest and coarsest of food, never tasting tea, coffee, or sugar for that time, and, strange to say, though fond of them, hardly feeling their loss. At the end of the war all his property was gone. His Georgia home had been in the path of Sherman's army, and everything he possessed except the land was gone.

Regarding the actual loss to the South from the emancipation of the slaves, Professor Le Conte maintained at the time, and always afterwards, that it was

not necessarily a loss like that due to the burning of a house. He pointed out that—

Where the black labor remains reliable, and the management is judicious, the land makes as much as ever it did, and the owner is as rich as ever he was; he has suffered no loss. \* \* \* But in some places the labor continues to be utterly unreliable. This is especially true of the so-called "black belt," where the blacks are greatly in excess, and still more especially true in Liberty County, Ga., where my own landed property is situated. I have there more than 2,000 acres of land, half of it rich land. It has never made me one cent since the war. The negroes will not work for wages. They can live on fish, crawfish, and oysters, almost without work. A little patch of cotton will make more tobacco and coarse clothing than they can use. They have no ambition to improve, and live almost like animals. The whites have nearly all quit the country and gone somewhere else. The whole lower and richer part of the county is practically given over to the blacks.

In 1869 Professor Le Conte left Columbia to accept a call to the University of California, whither his brother John had preceded him a year before. He was expected at first to teach, alone and without assistants or laboratory appliances, botany, zoology, and geology. He was compelled to give his instruction entirely by lectures. This he did for many years, and he developed a method of lecture instruction that has probably never been excelled by any teacher of these subjects. Later he was relieved from the heavy task of carrying these three subjects, and confined his teaching entirely to geology. But it was doubtless fortunate for his students that he taught these related subjects for so many years, since otherwise his wonderful grasp of the doctrine of organic evolution would have been impossible. As it was, he welded these three subjects, zoology, botany, and geology, all studied by the comparative method, into an organic unity that made a never-to-be-effaced impression on all his hearers.

It was probably for him, and certainly for California, fortunate that he came when he did to the State University. One can best understand this from his own words:

I have said that my intellectual activity was powerfully stimulated by my coming to California. There were many reasons for this: First, the reaction from the long agony of the war. Abstract thought was almost impossible, for anxiety during the war, and the presence of its ruinous results afterwards. Second, the splendid field for geological research offered here. Third, contrary to my expectations, I found here an exceptionally active, energetic, and intelligent population. What California wanted then (and still to some extent wants) is a more thorough organization of society—an organized public opinion—conventions, traditions—with them, wholesome restraining influences on the weak and the vicious. But the strong and the virtuous do not need these—indeed, are perhaps better without them. Family and name have little influence here; every man must stand on his own merits.

I threw myself into my work with all my energy. I enjoyed my teaching intensely, and this made my teaching correspondingly interesting to my students. I never tire of my subject. Although I have gone over my course in geology now fifty times, I am still as interested in it as ever. Although the whole subject is perfectly familiar to me, I never enter my lecture room without two hours' intense preparation. I must revive my interest; I must get up steam. I am firmly convinced that investigation ought never to be separated from teaching, as many suppose; that not only is one a better teacher from being an investigator, but he is also a better investigator for being a teacher. Nothing so clears up the thought as the earnest attempt to make it clear to others by personal address. Almost every good thought I ever had came first into my mind during the heat of direct preparation for my class lectures. Nearly everything I ever wrote was first given in my class room, and written out and perfected afterwards. Whatever success I have ever achieved in teaching has been the result of my intense interest in my subject and in my students.

His first geological studies date back to that long trip to the Lake Superior region, where he was present at the first opening up of the copper mines; but even then he was more interested on the scientific than on the technical side.

His work with Agassiz on the coral reefs of Florida gave another impetus to his tastes. His search for nitre deposits for the Confederate government, during the dark days of the war, brought him into the practical branch of our profession. But his coming to California, then a virgin field to geologists, inaugurated a new era in his life.

In his vacations he ranged the foothills and the Sierras of California, the Cascades of Oregon, and then into British Columbia. He visited the Comstock mines of Nevada in their prime. He first noted the extent and significance of the great Columbia lava flood that stretches down into northern California. He developed and perfected his theory of mountain formation, and worked out a number of important problems in California geology. Perhaps our greatest interest attaches to his studies in the origin of metalliferous veins. His visits to Virginia City, Nev., to the California gold veins and auriferous gravel deposits, and, most of all, to the sulphur banks, California, and Steamboat Springs, Nev., where traces of cinabar (and, in the latter, also gold, silver, and copper) were still being deposited, stimulated his interest to the highest pitch.

The world is certainly indebted to him for his *Elements of Geology*, which presents the subject, stripped of every needless technicality, so as to make it interesting to every intelligent reader. I do not know a book in any language which so clearly opens the delights of the science he loved best to the beginner; and anyone who has imbibed its spirit has drawn a lesson from the book of nature which will always give to life new meaning and interest.

He was much interested in the remarkable fossil footprints that had been discovered in some sandstone beds. Dr. Harkness and others had claimed that some of these had been made by prehistoric men. Professor Le Conte examined them with Dr. Harkness and several others, and each wrote a paper, Dr. Harkness arguing in favor of the human origin, and Dr. Le Conte against it. It is needless to add that the latter view is now accepted. The following interesting observations were made at this time by Professor Le Conte concerning the convicts who were employed in blasting out fresh exposures in the formation:

While here my observations on criminals interested me greatly. They enjoyed the work and the investigation immensely and very intelligently. We were all working together, and all intensely interested together. We entirely forgot that they were criminals, and some of them murderers. We were all simply fellow-men, and for the time companions. For all we could see they were much like average men, neither better nor worse. The effect of the work sentiment on them was wonderful. Before sullen and dull, now bright, eager, cheerful and happy. What a reformatory measure such work would be if it could be continued indefinitely.

But it is probably as a teacher of the new gospel of evolution that Professor Le Conte will be best remembered. He was not one of the first to accept it. As a disciple of Agassiz, who never accepted it, he at first was strongly opposed to it; but the more he studied it, the more he attempted to explain it to his students, the more its importance was forced upon him. His strong religious nature made him weigh it in the balance, lest it might contain some flaw or unhappily undermine the religious faith of some tender youth. Of his famous book on evolution he says:

Its success exceeded my utmost expectation. The intelligent public seemed to have been waiting for such a book, especially the third part, viz: *The Relation of Evolution to Religious Thought*. Since its publication I have received letters from clergymen personally unknown to me, and of every denomination, thanking me for the boldness and yet the temperateness of the book. I have also received letters—30 or 40—from young men personally unknown to me—young men of high intelligence, many of them scientific—from all parts of the United States, thanking me for a book which had saved them from rank materialism. I have also received letters from England, France, and Italy, from men of the highest

distinction. There can be no doubt that the book was timely and has done much good.

It would be out of place for me to make a critical estimate of his work, even if I felt equal to the task, but I give instead his own modest estimate of it, as furnished in his autobiography, which is certainly an underestimate.

Now, looking back over a long life of incessant activity, what have I done of value to the world? What have I added to human thought? What influence for good may I hope to leave behind?

I. In science. To touch only on the most important points:

(a) My paper in 1839 On Correlation of Vital and Physical Forces, I think, gave both impulse and greater definiteness to scientific thought on that subject. Carpenter, in the last edition of his physiology, gives me credit for distinct advance on this subject.

(b) My researches on the phenomenon of binocular vision, I am sure, did clear up the thought in this field. I claim, and have been generally accorded, the credit of several original thoughts which have remained the permanent possessions of science: (1) Demonstration of the real nature of the Horopter. (2) Demonstration of the true theory of binocular perspective. (3) Demonstration of certain fundamental psychical phenomena in binocular vision, and a new mode of diagrammatic representation based thereon. These phenomena had been observed by some, but not understood. Their explanation had been hinted at by others, but never clearly brought out before. (4) Certain peculiarities of phantom planes not explained before.

(c) In geology, I believe some real substantial advance in science was made in my series of papers: (1) On the Structure and Origin of Mountain Ranges. (2) On the Genesis of Metalliferous Veins. (3) Especially those on the Critical Periods in the History of the Earth. (4) The demonstration of the Ozarkian, or, better, the Sierran, epoch as one of great importance in the history of the earth. I might mention several others that I believe are of prime importance, but I am willing to stand by these.

(d) In biology, my views on glycogeny, although not yet certain, have undoubtedly contributed to clearness of scientific thought on that important subject.

II. In philosophy. I look back with especial pleasure on my writings on evolution. I lay no claim to the discovery of new facts bearing on the theory of evolution, but only to have cleared up the nature and scope of evolution, and especially to have shown its true relation to religious thought. It is well to stop a moment to show the different rôles of different thinkers on the advance of this subject. Leaving out of account mere vague philosophic speculations like those of ancient philosophers, and those of Swedenborg in modern times, I would say that the rôle of Lamarck was to introduce evolution as a scientific theory. The rôle of Darwin was to present the theory in such wise as to make it acceptable to, and accepted by the scientific mind. The rôle of Huxley was to fight the battles of evolution, and to win its acceptance by the intelligent popular mind. It was the rôle of Spencer to generalize it into a universal law of nature, thereby making it a philosophy as well as a scientific theory. Finally, it was left to American thinkers to show that a materialistic implication is wholly unwarranted—that it is entirely consistent with a rational theism, and with other fundamental religious beliefs. My own work has been chiefly in this direction.

If one were asked to characterize his activities in a single sentence, it could be best done in his own words:

The domains of science and philosophy are not separated by hard and fast lines; they largely overlap. It is in this border land that I love to dwell.

Perhaps one of the most interesting of Professor Le Conte's addresses was the one he delivered before the Philosophical Union of the University of California, at its public annual meeting in 1895. The address of the evening had been on the theme *The Conception of God*, by Prof. Josiah Royce, of Harvard University. In the course of the discussion Professor Le Conte said:

I can only admire, not criticise, the subtle method of Professor Royce in reaching the conclusion of the personal existence of God. I have my own way of reaching the same conclusion; but, in comparison, it is a rough-and-ready way. His is from the point of view of the philosopher; mine from that of the scientist. I am not saying that his is not the best and the most satisfactory, but only that

it is a different way. He has given you his; I now give you, very briefly, mine—as I have been accustomed to give it:

Suppose, then, I could remove the brain cap of one of you and expose the brain in active work, as it doubtless is at this moment. Suppose, further, that my senses were absolutely perfect, so that I could see everything that was going on there. What would I see? Only decompositions and recompositions, molecular agitations and vibrations; in a word, physical phenomena, and nothing else. There is absolutely nothing else to see. But you, the subject of this experiment, what do you perceive? You see nothing of this; you perceive an entirely different set of phenomena, namely, consciousness—thought, emotion, will, psychical phenomena; in a word, a self, a person. From the outside we see only a physical form, from the inside only psychical phenomena.

Now, take external nature—the cosmos—instead of the brain. The observer from the outside sees, and can see, only physical phenomena; there is absolutely nothing else there to see. But must there not be in this case also, on the other side, psychical phenomena—consciousness, thought, emotion, will; in a word, a self, a person? There is only one place in the whole world where we can get behind physical phenomena—behind the veil of matter—namely, in our own brain, and we find there a self, a person. Is it not reasonable to think that if we could get behind the veil of nature, we should find the same, that is, a person? But, if so, we must conclude an Infinite Person, and therefore the only complete personality that exists. Perfect personality is not only self-conscious but self-existent. Our personalities are self-conscious, indeed, but not self-existent. They are only imperfect images and, as it were, separated fragments of the Infinite Personality, God.

He went on to agree with the explanation given by Professor Royce as to the necessity for moral evil in the world—that it would be impossible for a moral being to exist without freedom to choose between right or wrong—and continued:

As already said, then, I believe Professor Royce gives a true answer so far as moral evil is concerned, although he misses the emphasis which evolution gives that view. But other evil—physical evil—he gives up, in his book, in despair. And yet, from the point of view of evolution, this is exactly the form of evil that is most explicable. For as moral evil is a necessity for a progressive moral being, just so, and far more obviously, is physical evil a necessity for a progressive rational being. As one form of evil is closely connected with our moral nature, so is the other indissolubly connected with our intellectual nature. Let me explain: The necessary condition of any evolution is a struggle with an apparently inimical environment. For example, the end and goal, the significance, the only *raison d'être*, of organic evolution in general is the achievement of a rational being—man. The necessary condition of that achievement was the struggle with what seemed at every stage an inimical—i. e., evil—environment. But looking back over the course in the light of its glorious result—the achievement of man—we at once see that what seemed evil is gloriously good. Now, it is equally the same with human evolution in relation to physical evil. The goal and end, the *raison d'être*, of social progress is the achievement of the ideal man, both in knowledge and character. But the attainment of perfect knowledge is impossible except in the presence of what seems at every state an evil environment, and by conflict with it. But evidently such an environment is evil only through ignorance of the laws of nature. Evil is therefore the necessary spur that goads us on to increase of knowledge. We are but foolish little children at school. Nature, our school-mistress, chastises us relentlessly until we get our lessons. It is quite evident that without this scourge of evil humanity would never have emerged out of animality, or, having emerged, would never have emerged beyond the lowest stages. It is also evident that perfect knowledge of the laws of nature would remove every physical evil. Looking back over the course, then, from the elevated plane of perfect knowledge, and perceiving that the attainment of that plane was conditioned on the existence of evil—on punishment for ignorance—shall we any longer call it evil? Is it not good in disguise?

But it may be answered, "Yes, this is all true, if we accept evolution by struggle as a necessary process; but why may not that same result have been attained in some less expensive and distressing way?" I answer, because, as already seen, no other process is conceivable that would result in a moral being; and the achievement of such a being is the purpose of all evolution. One law, one process, one meaning and purpose, runs through all evolution, and that purpose is only revealed at the end. As, in biology, the laws of form and structure are best studied in the lowest organisms, where these are simplest, but those of function are studied

best in the highest organisms, because only there clearly expressed, just so the laws of process in evolution are best understood in its lower and simpler stages; but the end, the purpose and meaning of the whole process from the beginning, is not fully declared until the end. That end is the achievement of a moral being; a moral being without struggle with evil is impossible because a contradiction in terms; and the same law must run throughout. \* \* \*

The effect produced by this remarkable address was very powerful. It could not be said to be a demonstration in the strictly logical sense, but those who heard him felt that he had reached out into the outer twilight, beyond the daylight of reason, and had grasped something more than a shadow. His characteristic power to produce this effect, in handling a difficult subject, was, no doubt, due to his genius for reasoning by analogy. This is commonly admitted to be one of the most dangerous methods of reasoning. But this has always seemed to me to be only another way of saying that only a man of genius is able to discover the true analogy among the thousand seeming analogies that trap the ordinary mortal. Many of the greatest of scientific discoveries have been made by discovering true analogies, even when it was afterwards necessary to corroborate them by the logic of mathematics. It was in this method of reasoning by analogy that Professor Le Conte was strongest. His long habit of comparative study in zoology, botany, and geology had educated a faculty naturally very strong in him to the highest state of efficiency. And the skill with which he used it aroused the admiration of all who heard him. It enabled him to bring out the common ideas in apparently conflicting theories and to show that these conflicting views were often only partial views of the same truth which could be wholly grasped only by combining them. No one could be associated with him in the class room without being ever afterwards conscious of a wider and a more generous outlook.

---

#### ADDRESSES DELIVERED AT THE JOHNS HOPKINS UNIVERSITY CELEBRATION.

[The celebration of the twenty-fifth anniversary of the founding of Johns Hopkins University and the inauguration of Ira Remsen, LL. D., as president of the university took place February 22 and 23, 1902. In view of the concurrence of the two events mentioned, the occasion was made more than usually imposing. The large number of delegates that attended, representing the principal institutions of learning in the United States and Canada, testified to the deep and widespread interest felt in the proceedings. The following extracts from the addresses delivered on the occasion are here reprinted.]

[From the address of President Emeritus DANIEL C. GILMAN.]

\* \* \* As religion, the relation of the finite man to the Infinite, is the most important of all human concerns, I begin by a brief reference to the attitude of universities toward faith and knowledge. The earliest universities of Europe were either founded by the church or by the state. Whatever their origin, they were under the control, to a large extent, of ecclesiastical authorities. These traditions came to our country, and the original colleges were founded by learned and godly men, most of them, if not all, ministers of the gospel. Later came the State universities, and later still the private foundations like that in which we are concerned. Gradually, among the Protestants, laymen have come to hold the chief positions of authority formerly held by the clergy. The official control, however, is less interesting at this moment than the attitude of universities toward the advancement of knowledge. To-day, happily, apprehensions are not felt to any great extent respecting the advancement of science. It is more and more clearly seen that the interpretation of the laws by which the universe is governed, extending from the invisible rays of the celestial world to the most minute mani-

festations of organic life, reveal one plan, one purpose, one supreme sovereignty—far transcending the highest conceptions to which the human mind can attain respecting this sovereign and Infinite Power. Sectarian supremacy and theological differences have dwindled therefore to insignificance in institutions where the supreme desire is to understand the world in which we are placed and to develop the ablest intellects of each generation, subservient to the primeval injunction, “Replenish the earth and subdue it; and have dominion over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the earth.” Notwithstanding these words, the new biology—that is, the study of living creatures—encountered peculiar prejudices and opposition. It was the old story over again. Geology, early in the century, had been violently attacked; astronomy, in previous centuries, met its bitter opponents; higher criticism is now dreaded. Yet quickly and patiently the investigator has prosecuted and will continue his search for the truth, heedless of consequences, assured by the Master’s words—“the truth shall make you free.”

Still the work goes on. Science is recognized as the handmaid of religion. Evolution is regarded by many theologians as confirming the strictest doctrines of predestination. The propositions which were so objectionable thirty years ago are now received with as little alarm as the propositions of Euclid. There are mathematicians who do not regard the Euclidean geometry as the best mode of presenting certain mathematical truths, and there are also naturalists who will not accept the doctrines of Darwin, without limitation or modification, but nobody thinks of fighting over the utterances of either of these philosophers. In fact, I think it one of the most encouraging signs of our times that devout men, devoted to scientific study, see no conflict between their religious faith and their scientific knowledge. Is it not true that as the realm of Knowledge extends the reign of Faith, though restricted, remains? Is it not true that Science to-day is as far from demonstrating certain great propositions, which in the depths of our souls we all believe, as it was in the days of the Greek philosophers? This university, at the outset, assumed the position of a fearless and determined investigator of nature. It carried on its work with quiet, reverent, and unobtrusive recognition of the immanence of divine power—of the Majesty, Dominion, and Might, known to men by many names, revered by us in the words that we learned from our mothers’ lips, Almighty God, the Father Everlasting.

Another danger, thirty years ago, was that of conflict between the advocates of classical and scientific study. For many centuries Greek and Latin were supreme in the faculty of liberal arts, enforced and strengthened by metaphysics and mathematics. During the last half century, physical and natural sciences have claimed an equal rank. The promotion has not been yielded without a struggle, but it is pleasant to remember that in this place no conflict has arisen. Among us, one degree, that of Bachelor of Arts, is given alike to the students of the Humanities and the students of Nature, and the degree of Doctor of Philosophy may be won by advanced work in the most remote languages of the past or in the most recent developments of biology and physics. Two illustrious teachers were the oldest members of the original faculty—one of them universally recognized as among the foremost geometricians of the world, the other renowned for his acquaintance with the masters of thought in many tongues, and especially for his appreciation of the writers of ancient Greece, upon whose example all modern literature is based.

Our fathers spoke of “church and state,” and we but repeat their ideas when we say that universities are the promoters of pure religion and wise government. This university has not been identified with political partisanship—though its members, like all patriots, have held and expressed their opinions upon current questions, local and national. Never have the political views of any teacher helped or hindered

his preferment, nor have I any idea what would be the result of the party classification of our staff. This, however, may be claimed. The study of politics, in the sense of Freeman, "History is past politics and politics present history," has been diligently promoted. The principles of Roman law, international arbitration, jurisprudence, economics, and institutional history have here been set forth and inculcated, so that in every part of the land we can point to our graduates as the wise interpreters of political history, the strong promoters of democratic institutions, the firm believers in the merit system of appointments and in local self-government.

A phrase which has lately been in vogue is original research. Like all other new terms, it is often misapplied, often misunderstood. It may be the highest occupation of the human mind. It may be the most insignificant. A few words may therefore be requisite to explain our acceptance of this word. When this university began, it was a common complaint, still uttered in many places, that the ablest teachers were absorbed in routine and were forced to spend their strength in the discipline of tyros, so that they had no time for carrying forward their studies or for adding to human knowledge. Here the position was taken at the outset that the chief professors should have ample time to carry on the higher work for which they had shown themselves qualified, and also that younger men, as they gave evidence of uncommon qualities, should likewise be encouraged to devote themselves to study. Even those who were candidates for degrees were taught what was meant by profitable investigation. They were shown how to discover the limits of the known; how to extend, even by minute accretions, the realm of knowledge; how to cooperate with other men in the prosecution of inquiry, and how to record, in exact language and on the printed page, the results attained. Investigation has thus been among us the duty of every leading professor, and he has been the guide and inspirer of fellows and pupils, whose work may not bear his name, but whose results are truly products of the inspiration and guidance which he has freely bestowed.

The complaint was often heard in the early seventies that no provision was made in this country for post-graduate work except in the three professional schools. Accordingly, a system of fellowships, of scholarships, and of other provisions for advanced study was established here, so well adapted to the wants of the country at that time that its provisions have been widely copied in other places. It now seems as if there was danger of rivalry in the solicitation of students, which is certainly unworthy, and there is danger also that too many men will receive stipendiary encouragement to prepare themselves for positions they can never attain. In the early days of the French Academy, when a seat in that body was a very great prize, a certain young man was told to wait until he was older, and the remark was added that in order to secure good speed from horses a basket of oats should always be tied to the front of the carriage pole as a constant incitement. It would indeed be a misfortune if a system of fellowships should be open to this objection. Nevertheless, whoever scans our register of Fellows will discover that many of the ablest men in the country of the younger generation have here received encouragement and aid.

When this university began, the opportunities for scientific publication in this country were very meager. The American Journal of Science was the chief repository for short and current papers. The memoirs of a few learned societies came out at slow intervals and could not be freely opened to investigators. This university in the face of obvious objection determined to establish certain journals which might be the means of communication between the scholars of this country and those abroad. Three journals were soon commenced: The American Journal of Mathematics; the American Journal of Philology; the American Chemical Journal. Remember that these were "American" journals in fact as well as in name, open to all the scholars of the country. Other periodicals came afterwards,

devoted to history and politics, to biology, to modern languages, to experimental medicine, and to anatomy. Moderate appropriations were made to foreign journals of great importance which lacked support, the English Journal of Physiology and the German Journal of Assyriology. Nor were the appropriations of the trustees restricted to periodical literature. Generous encouragement was given to the publication of important treatises, like the researches of Dr. Brooks upon salpa; to the physiological papers of Dr. Martin; to the studies in logic of Mr. Peirce and his followers; to Professor Rowland's magnificent photographs of the solar spectrum; to the printing of a facsimile of the earliest Christian document after the times of the Apostles; and recently, with the cooperation of the University of Tübingen, to the exact reproduction by Dr. Bloomfield of a unique manuscript which has an important bearing upon comparative philology.

I am not without apprehensions that our example to the country has been infelicitous, not less than thirty institutions being known to me which are now engaged in the work of publication. The consequence is that it is almost impossible for scholars to find out and make use of many important memoirs, which are thus hidden away. One of the problems for the next generation to solve is the proper mode of encouraging the publication of scientific treatises.

I can not enumerate the works of scholarship which have been published without the aid of the university by those connected with it—studies in Greek syntax, in mathematics, in history, in chemistry, in medicine and surgery, in economics, in pathology, and in many other branches. The administration now closing can have no monument more enduring than the great mass of contributions to knowledge, which are gathered like the cairn of boulders and pebbles which commemorates in Cracow the burial place of Kosciusko, a bibliothecal cairn, in the office of the trustees, to remind every officer and every visitor of our productivity in science and letters.

There are many who believe that the noblest work in which we have engaged is the advancement of medical education and science. Several agencies have been favorable. The munificence of the founder established a hospital which was recognized as soon as it was opened as the foremost of its kind in Christendom. He directed that when completed it should be a part of the university, and, accordingly, when the time came for organizing a medical and surgical staff the principal professors were simultaneously appointed to the chairs of one institution, to the clinics of the other. They were to be constantly exercised in the relief of suffering and in the education of youth. For the lack of the requisite funds the university at first provided only for instruction in those scientific branches which underlie the science of medicine. At length the organization of the school of medicine was made possible by a very large gift of money received from a lady of Baltimore who was familiar with the requirements of medical science, and eager to see that they were met. By her munificence the university was enabled to organize and maintain that great department which now reflects so much honor upon this city, and which does so much by example, by publication, by systematic instruction, and by investigation to carry forward those varied sciences, anatomy, physiology, physiological chemistry, pharmacy, pathology, and the various branches of medicine and surgery. In accordance with the plans of the university the generous donor made it a condition of her gift that candidates for the degree of doctor of medicine should be those only who had taken a baccalaureate degree based upon a prolonged study of science and the modern languages.

A four years' course of study was also prescribed and women were admitted to the classes upon the same terms as men. The liberal and antecedent aid of women throughout the country in the promotion of these plans is commemorated by a building inscribed "The women's fund memorial building." The excellent laboratory facilities, the clinical opportunities, the organization of a training

school for nurses, and especially the ability of the physicians and surgeons, have excited abundant emulation and imitation in other parts of the country—a wonderful gain to humanity. It is more and more apparent among us that a medical school should be a part of a university and closely affiliated with a hospital. It is also obvious that the right kind of preliminary training should be antecedent to medical studies.

I must ask the indulgence of our friends from a distance as I now dwell for a moment on the efforts which have been made to identify the Johns Hopkins University with the welfare of the city of Baltimore and the State of Maryland. Such a hospital and such medical advisers as I have referred to are not the only benefits of our foundation. The journals which carry the name of Baltimore to every learned society in the world are a minor but serviceable advantage. The promotion of sanitary reform is noteworthy, the study of taxation and in general of municipal conditions, the purification of the local supply of water, the advancement of public education by courses of instruction offered to teachers, diligent attention to the duties of charity and philanthropy, these are among the services which the faculty have rendered to the city of their homes. Their efforts are not restricted to the city. A prolonged scientific study of the oyster, its life history, and the influences which help or hinder its production, is a valuable contribution. The establishment of a meteorological service throughout the State in connection with the Weather Bureau of the United States is also important. Not less so is the geological survey of Maryland, organized with the cooperation of the United States Geological Survey to promote a knowledge of the physical resources of the State, exact maps, the improvement of highways, and the study of water supplies, of conditions favorable to agriculture, and of deposits of mineral wealth within this region. To the efficiency of these agencies it is no doubt due that the State of Maryland has twice contributed to the general fund of the university.

Nor have our studies been merely local. The biological laboratory, the first establishment of its kind in this country, has carried forward for many years the study of marine life at various points on the Atlantic and has published many important memoirs, while it has trained many able investigators now at work in every part of the land. Experimental psychology was here introduced. Bacteriology early found a home among us. The contributions to chemistry have been numerous and important. Here was the cradle of saccharine, that widely diffused and invaluable concentration of sweetness, whose manufacturers unfortunately do not acknowledge the source to which it is due. In the physical laboratory light has been thrown upon three fundamental subjects—the mechanical equivalent of heat, the exact value of the standard ohm, and the elucidation of the nature of the solar spectrum. For many years this place was the chief seat in this country for pure and advanced mathematics. The study of languages and literature, oriental, classical, and modern, has been assiduously promoted. Where has the Bible received more attention than is given to it in our Semitic department? Where the study of ancient civilization in Mesopotamia, Egypt, and Palestine? Where did the Romance languages in their philological aspect first receive attention? To American and institutional history persistent study has been given. Of noteworthy significance also are the theses required of those who are admitted to the degree of Doctor of Philosophy, which must be printed before the candidate is entitled to all the honors of the degree. \* \* \*

[From the address of President Harper, of the University of Chicago.]

We are celebrating, in these days, not only the twenty-fifth anniversary of the Johns Hopkins University, the completion of a quarter of a century of magnificent work by a great university—we are celebrating also the close of the first period of university education in these United States.

During this first period the university idea has been introduced and established. Nor does the time within which this has taken place date far back. There were no universities in this country before the war. There were, in fact, no large colleges. But within thirty years institutions have come into existence, possessing not only the name but the character of universities, and old institutions have changed not only their character but their names. In other words, the university idea has, beyond question, established itself upon a strong foundation.

(2) The first period has seen the substantial beginning of a differentiation between the college and the university. Some universities, which include also college work, are drawing a sharp line between the two. Some colleges are recognizing the fact that their future usefulness depends upon their remaining colleges, rather than upon making an effort to become universities. There are still some institutions in which this distinction is not appreciated; that is, institutions in which the college work is conducted as if it were a kind of university work, or in which the university work is conducted as if it were still work of a college character. But the separation is proceeding as rapidly as could be expected, perhaps even more rapidly than could be desired, and it is a change full of significance for the future of university education.

(3) This first period has seen a remarkable growth in the recognition given the work of research and investigation. The professor of former times had little or no opportunity for any work aside from teaching. It is undoubtedly true that in most of our institutions too much lecture work is still required of certain men who have shown special skill in research. But how different is the situation to-day in comparison with that of thirty years ago. William Dwight Whitney, if he were living to-day, would not be compelled to teach French and German to engineering students in order to eke out a livelihood.

The spirit of research, once hardly recognized in our higher educational work, is now the controlling spirit, and opportunities for its cultivation abound on every side.

(4) In its very last days this first period has seen tangible evidence that a new period, a second period, is being ushered in; for what other interpretation than this may be suggested for the remarkable things that have recently taken place? With the many millions of dollars given directly for research and higher education; with the new foundations which have recently come into being on the Atlantic coast, in the Mississippi Valley, and on the Pacific coast; with the results already obtained in the several lines of research and investigation by university men whose names have become famous for the work they have accomplished; with the maturity that comes from many years devoted to the highest educational ideals, as witnessed by the splendid history of this university, surely there is reason to believe that in the East, in the West, and in the Far West we are preparing to enter upon a new period in the development of university education.

That this is a common belief, it seems to me, is shown by the fact that within two years the leading universities in the country—fourteen in number—have joined themselves as institutions in an association for the study and consideration of problems which concern university as distinguished from college work.

It would be interesting, if one had time and ability to perform the task acceptably, to consider in a prophetic way what perhaps this new period on which we now enter will produce. Perhaps I may be allowed a sentence or two.

(1) It will see still greater development. Up to this time we have known what could be done by a university with an annual expenditure of \$1,000,000 or so. In this next period there will be institutions which will have \$10,000,000 with which to conduct a year's work. This will mean not merely growth, but in a large measure reorganization; at all events, organization on new lines.

(2) The new period will see still greater differentiation; the higher work of the

university will be separated more clearly from the lower work of the college; many colleges will undertake to do work of a more distinctly college character than that which they are now doing, and many high schools will rise to the grade and dignity of colleges. But further, institutions will distribute the work of higher education, some undertaking work in one group of departments, some work in another group. Only a few institutions will endeavor to cover the entire ground. The principle of specialization will be applied to institutions.

(3) In the new period the United States will receive proper recognition for university work, and, while American students, it is hoped, will always find it advantageous to visit Europe, the time is near at hand when the students of European countries will take up residence in our American universities.

(4) The new period will see an intermingling of university work and university ideals in all the various activities of our national life; in the business world, in the political world, and in the literary world. The old idea of separation from the world at large is fast disappearing, and the new day has already dawned in which the university is to do notable work in fields hitherto almost unknown and by methods hitherto almost untried.

In all this change which has come about in thirty years the Johns Hopkins University has been the principal factor. The ideals of its founders, the contributions of its professors, and the work of its alumni have constituted the principal agency which has brought about this wonderful growth.

During the first period the Johns Hopkins University has been the most conspicuous figure in the American university world, and to its achievements we are largely indebted for the fact that we may now enter upon a higher mission. \* \* \*

[From the inaugural address of President REMSEN.]

\* \* \* The American university as distinguished from the college is a comparatively recent product of evolution or of creation. Being young, its character is not fully developed, and we can only speculate in regard to its future. On an occasion of this kind, when one of the young universities of the country is celebrating in a quiet way the twenty-fifth anniversary of its foundation, and when a new presiding officer makes his first appearance before a large assembly, it seems fitting that he upon whom has been placed the responsibility of guiding for the present the affairs of the university should take the opportunity thus afforded of giving expression to a few thoughts that suggest themselves when one begins to reflect upon the significance of the university movement in this country. Every one at all acquainted with educational matters knows that the differentiation of the university from the college is the most characteristic fact in the history of higher education during the past quarter century. It is well that we should ask ourselves, What does this tendency mean? Whither is the movement likely to carry us?

While from the beginning the authorities of the Johns Hopkins University have maintained a collegiate department as well as a graduate or university department, and have endeavored to make this as efficient as possible under existing circumstances, the subjects that present themselves in connection with this branch of our work are so familiar and have been so much discussed that I can pass over them now without danger of giving the impression that we consider these subjects of less importance than those more directly connected with the work of the university. At all events, in what I shall have to say I propose to confine myself to the latter.

The idea that a student who has completed a college course has something yet to learn, if he chooses the career of a teacher or scholar, does not appear until quite recently to have taken strong hold of the minds of those who had charge of the educational interests of our country. Perhaps it would be better to put it in

this way: They do not appear to have thought it worth while to make provision in the system for those who wanted more than the college gave. The college has for its object the important work of training students for the duties of citizenship, not primarily the duties of scholarship; and no one doubts that in the main they have done their work well. Nor does anyone doubt that whatever may come the college has a leading part to play in this country. Collegiate work by its very nature necessarily appeals to a much larger number than university work. But college work requires no apologist nor defender. It appeals strongly to the American people, and it is well that it is so. The college is in no danger of annihilation, though the indications are that it will undergo important modifications in the future as it has in the past. Upon this subject much might be said, and I feel strongly tempted to enlarge upon it, notwithstanding the intention already expressed of confining myself to problems more directly connected with the university proper.

There is, however, one phase of the college problem that is so closely connected with that of the university that I can not avoid some reference to it. There is a marked and rapidly growing tendency to make college work the basis of the work in professional schools. As is well known, some of our medical schools now require a college degree for admission. The average age of graduation from our leading colleges is so high that the students can not begin their professional courses until they are from 22 to 23 years of age on the average. Then, too, the length of the professional courses is greater than it formerly was, so that some of the best years of life are taken up in preparatory work. One thing seems to admit of no denial, and that is that in so far as it prevents students from beginning their professional studies or their work in business life until they have attained the age of 22 or 23 our present system is seriously defective. The defect is one that must be remedied. Various efforts are now being made looking to improvement, but it is not yet clear how the problem will be solved.

In this country the name university in the new sense is frequently applied to one department, and that is the philosophical department. This has to deal with philology, philosophy, history, economics, mathematics, physics, geology, chemistry, etc.; in short, it comprises all branches that do not form an essential part of the work of the departments of medicine, law, and theology. A fully developed university, to be sure, includes at least four departments—the medical, the legal, the theological, and the philosophical; or, in other words, the university faculty comprises faculties of medicine, of law, of theology, and of philosophy.

The new thing in educational work in this country is the philosophical faculty of our universities.

This meets the needs of those students who, having completed the college course, and having, therefore, had a good general training that fits them for more advanced study, wish to go forward in the paths of learning, and, so far as this may be possible, to become masters of some special branch. Most of these students are preparing to teach in colleges and elsewhere, so that the philosophical department of the university is to-day a professional school just as much as the medical or legal department. On the completion of the college course the student holds the same relation to the philosophical department of the university as to the other departments or to the professional schools; and the age question is fully as important in the case of the student in the philosophical faculty as in the case of those who are to enter the professional schools. Now, if it be conceded that the training of specialists—not necessarily narrow specialists, but necessarily those who are thoroughly grounded in some one subject—I say, if it be conceded that the training of specialists is essential to the growth of the highest scholarship, then by advancing the age of graduation from our colleges we are interfering with the development of scholarship in the highest sense, because the greater

the age of graduation from the colleges the less will these graduates be inclined, or be able, to take up the advanced work that is essential to convert them into scholars. But let me close what I have to say on the subject by the safe prediction that the time will come when the work of our colleges will be adjusted to the work of the various faculties of the university, so that the passage from the one to the other will not involve something unnatural—either hardship to the student, or a telescoping of college and university, which now, on the whole, furnishes the best way out of the existing difficulty.

I have said that the new thing in educational work in this country is the philosophical faculty of our universities. The growth of the work of the philosophical faculty has, however, undoubtedly influenced that of the other faculties, more particularly the medical. Gradually the medical schools—those connected with the universities, at least—are adopting university standards. The same is true to some extent of schools of law and of theology. So that I think it is safe to assert that the great activity that has characterized the work of the philosophical faculties of our universities has tended in no small measure to the improvement of the work of our professional schools. It has lifted them to a higher level, and that is a result that the world at large may congratulate itself upon.

One of the most remarkable facts in connection with what we may call the development of the university idea in this country is the surprisingly rapid increase in the attendance upon the courses offered by our philosophical faculties during the last few years. In what I shall have to say I shall for the present use the term "graduate student" in the restricted sense which it has come to have, meaning a college graduate who is following courses offered by the philosophical faculty of some university, and excluding, therefore, those who are studying medicine, or law, or theology in universities.

I have recently asked the United States Commissioner of Education to help me answer the following questions:

1. How many graduate students were in the United States in the year 1850?
2. How many in 1875?
3. How many in 1900?

The answers are these:

1. In 1850 there were 8 graduate students in all of the colleges of the country. Of these 3 were enrolled at Harvard, 3 at Yale, 1 at the University of Virginia, and 1 at Trinity College.

2. In 1875 the number had increased to 399.

3. In 1900 the number enrolled was 5,668.

At present the number can not be far from 6,000.

In order that these facts may be properly interpreted we should know how many Americans are studying in foreign universities. The records show that in 1835 there were four American students in the philosophical faculties of German universities; in 1860 there were 77; in 1880, 173; in 1891, 446; in 1892, 383; in 1895, 422; and in 1898, 397.

These figures show clearly that the increase in the attendance at American universities is not accounted for by a falling off in attendance at German universities. On the other hand, they do show that for the last ten years at least there has been no increase in the attendance at German universities, but rather a slight decrease.

Six thousand students are, then, to-day pursuing advanced courses in our American universities, while not longer ago than 1875 the number was only about 400. In this connection it must further be borne in mind that during this period the colleges have not relaxed in their requirements. The tendency has been in the opposite direction. So that it means to-day more rather than less than it did in 1875 to be a graduate student. That there is an increasing demand for uni-

versity work is clear, and it seems to be destined to play a more and more important part in the development of our educational methods.

Now, what is the cause of the rapid increase in the demand for university work or the rapid increase in the attendance upon university courses? No simple answer would be correct. Probably the principal direct cause is the increased demand on the part of the colleges, and to some extent of the high schools, for teachers who have had university training. The degree of doctor of philosophy being the outward and visible sign of such training, many colleges have virtually taken the ground that none but Ph. D.'s need apply. This would, of course, tend directly to increase the attendance at the universities. Operating in the same way is the multiplication of chairs in the colleges. While not long ago one man often taught a number of subjects, sometimes related, sometimes not, the college authorities are coming more and more to intrust a single subject to a single man. The old-fashioned professor who would teach any subject in the curriculum with equal success is a thing of the past except in a few remote regions. The university-trained man has largely taken his place, and the universities are spreading their influence into the nooks and corners of the country through these men.

I need not discuss this phase of the subject further. It will, I am sure, be acknowledged without argument that it is desirable that our college faculties should be made up of men who have enjoyed the best educational advantages. In supplying such men the universities are doing a work of the highest value for the country. If nothing else were accomplished by our universities they would be worthy of all the support they get. The results of their work in this direction are not as tangible as that of the work of the colleges, for the latter reach much larger numbers and in ways that can be more easily followed. But, if we keep in mind the fact that the college is dependent upon the university for its faculty and that the character of the college is in turn dependent upon the character of its faculty, it will be seen that whatever good may come from the college is to be traced directly to work done by the universities. In order to keep our colleges up to a high standard it is absolutely necessary that our universities should be maintained on a high plane. This university work is not something apart, independent of other kinds of educational work. It is a necessary part of the system. It affects not only our colleges, but our schools of all grades, and must, therefore, have a profound influence upon the intellectual condition of the whole country. It is difficult, perhaps, to prove this, but it seems to me that the statements just made are almost self-evident truths.

But the universities are also doing another kind of work of importance to the country. Through their specially prepared men they are doing something to enlarge the bounds of knowledge. To be sure, such work is also being done to some extent in our colleges and elsewhere, but the true home of the investigator is the university. This work of investigation is as important as the work of training men. What does it mean? All persons with healthy minds appear to agree that the world is advancing and improving. We see evidences of this on every side. Those results that appeal most strongly to most of us are, perhaps, the practical discoveries that contribute so much to the health and comfort of mankind. These are so familiar that they need not be recounted here. If great advances are being made in the field of electricity, in the field of medicine, in the field of applied chemistry, it is well to remember that the work that lies at the foundation of these advances has been done almost exclusively in the universities. It would be interesting to trace the history of some of these advances. We should find that in nearly every case the beginning can be found in some university workshop where an enthusiastic professor has spent his time prying into the secrets of nature. Rarely does the discoverer reap the tangible reward of his work—that is to say, he does not get rich—but what of it? He has his reward,

and it is at least a fair question whether his reward is not higher than any that could be computed in dollars and cents.

The material value to the world of the work carried on in the university laboratories can not be overestimated. New industries are constantly springing up on the basis of such work. A direct connection has been shown to exist between the industrial condition of a country and the attitude of the country toward university work. It is generally accepted that the principal reason why Germany occupies such a high position in certain branches of industry, especially those founded upon chemistry, is that the universities of Germany have fostered the work of investigation more than those of any other country. That great thinker and investigator, Liebig, succeeded during the last century in impressing upon the minds of his countrymen the importance of encouraging investigations in the universities, and since that time the German laboratories of chemistry have been the leaders of the world. In Germany the chemical industries have grown to immense, almost inconceivable, proportions. Meanwhile the corresponding industries of Great Britain have steadily declined. This subject has recently been discussed by Arthur C. Green in an address read before the British Association at its meeting at Glasgow last summer. The address has been republished in *Science*, volume 2, page 7, of 1902. I call the attention especially of our business men to this address. I think it will show them that university work in some lines at least is directly and closely connected with the industrial position of a country. Speaking of the coal-tar industry, the author of the paper referred to says:

In no other industry have such extraordinarily rapid changes and gigantic developments taken place in so short a period—developments in which the scientific elucidation of abstract problems has gone hand in hand with inventive capacity, manufacturing skill, and commercial enterprise; in no other industry has the close and intimate interrelation of science and practice been more clearly demonstrated.

And further on:

Again, besides the loss of material wealth which the neglect of the coal-tar trade has involved to this country, there is yet another aspect of the question which is even of more importance than the commercial one. There can be no doubt that the growth in Germany of a highly scientific industry of large and far-reaching proportion has reacted with beneficial effect upon the universities, and has tended to promote scientific thought throughout the land. By its demonstration of the practical importance of purely theoretic conceptions it has had a far-reaching effect on the intellectual life of the nation. How much such a scientific revival is wanted in our country the social and economical history of the past ten years abundantly testifies. For in the struggle for existence between nations the battle is no longer to the strong in arm, but to those who are the strongest in knowledge to turn the resources of nature to the best account.

What I want to make clear by these quotations and references is that universities are not luxuries, to be enjoyed or not, as we may please. They are necessities. Their work lies at the very foundation of national well-being.

But there is another aspect of university work of greater importance than that of which I have spoken. I mean the intellectual aspect in the highest sense. The world is advancing in other ways than along material lines. While, as I have pointed out, the material interests of the world are connected with the intellectual condition, there are thoughts, there are ideas, that are above material considerations, ideas pertaining to the history of mankind, to the origin and development of the universe, to the phenomena of life, to the development of thought, to the significance of religions. All these are of importance, and the character of a nation is determined by the extent to which these ideas are cultivated. There is call for investigation in every subject—in the various branches of philology, in history, in economics, in archaeology, as well as in the natural sciences, and here again the universities furnish the workers and the workshops.

There are, then, deep-seated reasons for encouraging the work of our universities in every possible way. We can not afford to let them languish. The interests involved are too great. The more clearly this is recognized the better for us.

The rapid advances that have been made in university work in this country have brought us somewhat suddenly face to face with new educational problems, and we have not yet had time to adjust ourselves to the new situation thus created. We are in the experimental stage. We are trying to determine how we ought to deal with our graduate students in order to get the best results; how, in general, to make the work as efficient as possible.

As one who, with others, has been engaged for twenty-five years in studying the new problems and in attempting to solve them, I may be permitted to say a few words in regard to one of the most important problems that the universities have to deal with at present. I refer to the problem of the professors. Having been a professor for about thirty years, and having during that time known intimately many of those who belong to this class and worked with them, I feel that I may speak of the professor problem with some confidence.

The university is what the professors make it, and the president has no more important duty to perform than that of seeing that the various chairs are filled by the right kind of men. He should not take the full responsibility of selection. He should take all the good advice he can get. He is sure to have some that is bad. He should, however, not only take advice, but he should endeavor to determine for himself by every available means whether or not the persons recommended to him are worthy of appointment. He should not shirk this responsibility. A mistake in this line is almost as difficult to rectify as a mistake in the matrimonial line—perhaps more difficult. It is, therefore, doubly important that an appointment should be made with great deliberation and with a full realization of the gravity of the act. It is not, however, the process of appointing that I wish especially to speak of, though much that is interesting to university circles might be said on this subject. It is rather the principles that are involved. What constitutes a good professor? What kind of men are the universities looking for? Is the supply of this kind of men equal to the demand? These are some of the questions that suggest themselves in this connection. Let me attempt to answer them briefly.

The development of universities in this country has created a demand for a kind of professor somewhat different from that demanded by the college. It would not be difficult to describe the ideal university professor, but we should gain little in this way. I shall assume that he has the personal traits that are of such importance in those who are called upon to teach. A man of bad or questionable character, or of weak character, is no more fit to be a university professor than to be a college professor or a teacher in a school. That is self-evident. At least it seems so to me. Leaving these personal matters out of consideration, the first thing that is essential in a university professor is a thorough knowledge of the subject he teaches and of the methods of investigation applicable to that subject; the second is the ability to apply these methods to the enlargement of the field of knowledge; and the third is the ability to train others in the use of these methods. But a knowledge of the methods, the ability to apply them, and the ability to train others in their use will not suffice. The professor, if he is to do his duty, must actually be engaged in carrying on investigations both on his own account and with the cooperation of his most advanced students. This is fundamental. It may be said, and this can not be denied, that there is much research work done that is of little value to the world; that, in fact, much of that which is done by our graduate students is trivial, judged by high standards. It would be better, no doubt, if every professor and every advanced student were engaged upon some problem of great importance to the world. But this is out of the question in any

country. Few men possess that clearness of vision and that skill in devising methods, combined with the patience and power of persistent application, that enable them to give the world great results. If only those who can do great things were permitted to work, the advancement of knowledge would be slow indeed. The great is built upon the little. The modest toiler prepares the way for the great discoverer. A general without his officers and men would be helpless. So would the great thinker and skillful experimenter without the patient worker, "the hewer of wood and drawer of water."

Of so-called research work there are all grades. A man may reveal his intellectual power as well as his mental defects by his investigations. But it remains true that the university professor must be carrying on research work or he is failing to do what he ought to do. It is part of his stock in trade. He can not properly train his students without doing such work and without helping his students to do such work. One of the best results of carrying on this research work is the necessary adoption of world standards. A man may teach his classes year after year and gradually lose touch with others working in the same branch. Nothing is better calculated to keep him alive than the carrying on of a piece of work and the publication of the results in some well-known journal. This stimulates him to his best efforts, and it subjects him to the criticism of those who know. He may deceive his students and himself—no doubt he often does—but he can not deceive the world very long. The professor who does not show what he can do in the way of adding to the knowledge of the world is almost sure to become provincial when he gets away from the influence of his leaders.

Other things being equal, the professor who does the best work in his special branch is the best professor. The universities want leaders. Unfortunately, the number of these is quite limited, and it is not surprising that there are not enough to go around. It is becoming very difficult to find properly qualified men to fill vacant university professorships. Given sufficient inducements and it would be quite possible to "corner the market." There are at least half a dozen, probably more, universities in this country on the lookout for young men of unusual ability. They are snapped up with an avidity that is a clear sign of the state of the market. One of the greatest obstacles in the way of the advancement of our American universities to-day is a lack of enough good professional material. Fortunately, the universities are themselves providing the means by which this obstacle may be overcome, though not as rapidly as we should like. That is, however, not the fault of the universities. Some deeper cause is operating. Nature does not seem to supply enough raw material. It is often raw enough, to be sure, but its possibilities are limited.

This, too, suggests another question of deep import for the intellectual development of our country. Do our ablest men enter universities and engage in advanced work? This is a question which it is very difficult, if not quite impossible, to answer. I think it is not uncommonly assumed that they do not; that our ablest men, our best thinkers, are not in the universities. It is often said that they are in the law or in business. It may be. Certainly the great jurists and the great business men seem to be relatively more numerous than the great university teachers. I should not think it worth while to touch upon this subject were it not for the fact that recently the suggestion has been made that some of the men who become great in other lines might be induced to enter the academic career if only sufficient inducements were offered. The proposition is that a marked increase in the emoluments of professors would tend to attract some of the best material from other fields. I do not feel sure of this. In any case, the subject is hardly worth discussing. Whatever improvement is to come will come slowly, and this is fortunate. A sudden increase of the salaries of the leading professors of this country to, say, \$10,000 or more, would not suddenly change the status of

these professors among their fellow-men, and, while the professors might be pleased, and probably would be, the main question is, Would this change have any effect in the desired direction? Speculation on this subject seems to me of no value. If it be true that the men of the best intellects do not find their way into university circles, it is safe to assume that this is due to a great many conditions, and that the conditions are improving. The intellectual standards of our colleges and universities are gradually being raised. We can not force matters.

The best thing we can do for our students is to give them good professors. Sumptuous laboratories, large collections of books and apparatus, and extensive museums are well enough. They are necessary, no doubt. But I fear they are too much emphasized before the public. A university is, or ought to be, a body of well-trained, intelligent, industrious, productive teachers of high character provided with the means of doing their best work for their students, and therefore for the world. \* \* \*

---

### ADDRESSES AT THE INSTALLATION OF PRESIDENT BUTLER, OF COLUMBIA UNIVERSITY.

[The installation of Nicholas Murray Butler, LL. D., as president of Columbia University took place April 19, 1902. The following extracts from the addresses delivered on that occasion are reprinted from the Supplement to the Columbia University Quarterly of June, 1902.]

[From the address by President ELIOT, of Harvard.]

The choice of president which the trustees of Columbia have made accords with the practice of the great majority of the larger American universities during the past thirty-five years. They have chosen a layman. In this respect Columbia acts now as Harvard, Yale, Pennsylvania, Johns Hopkins, Cornell, Michigan, Wisconsin, Minnesota, Northwestern, Missouri, Tulane, Colorado, California, Leland Stanford Junior, and Columbia itself have already acted. Moreover, the layman in this last instance is one whose life has been devoted to teaching and to educational authorship and administration.

All the American institutions of higher education have of late manifested a decided tendency to give their highest administrative positions to teachers or investigators, or writers on education, or to men who have united two of these functions. Many of the small colleges which were originally denominational in character, while preferring ministers as presidents, have chosen ministers who have been also professional teachers. For very successful instances of this procedure I need go no further than Dartmouth and Amherst. The young but vigorous University of Chicago acted on this principle in choosing its first president. The tendency is greatly to be commended, for the profession of education is certainly entitled to its own high administrative offices. This policy, however, which may now be said to have been adopted by the American institutions of higher education, marks emphatically the passing of the great business of education from the hands of the clerical profession—a significant change.

President Butler comes to his great office at a fortunate moment. The planting of the university on a new and admirable site has been in good part accomplished through the administrative genius of his predecessor. The organization of Columbia as a true university, with a series of departments or schools whose courses lead to properly coordinated degrees, has been well begun. The professional schools of Columbia will doubtless soon be firmly based on the departments which give the first degrees in arts and sciences, so that professional study in Columbia will begin where the culture courses in arts and sciences leave off.

Until lately the true relation between professional courses and culture courses found no expression in the organization of any of the American universities, and

it still finds no expression in the organization of the great majority of those universities. When all the leading universities of the country require a degree in arts or science for admission to their professional schools of law, medicine, divinity, teaching, architecture, and applied science, an effective support will be given to the bachelor's degree in arts and science, such as has never yet been given in the United States, and the higher walks of all the professions will be filled with men who have received not only a strenuous professional training, but a broad preliminary culture.

It is plain that the future prosperity and progress of modern communities is hereafter going to depend much more than ever before on the large groups of highly trained men which constitute what are called the professions. The social and industrial powers and the moral influences which strengthen and uplift modern society are no longer in the hands of legislatures, or political parties, or public men. All these political agencies are becoming secondary and subordinate influences. They neither originate nor lead; they sometimes regulate and set bounds, and often impede. The real inventions and motive powers which impel society forward and upward spring from those bodies of well-trained, alert, and progressive men known as the professions. They give effect to the discoveries or imaginings of genius. All the large businesses and new enterprises depend for their success on the advice and cooperation of the professions. \* \* \*

[From the address by President PATTON, of Princeton.]

\* \* \* We are living at a time when the interest of leading men in the affairs of our universities is widening every day. Men of wealth are giving with more than princely liberality to their endowment. They are doing this under the influence of high patriotic motives, rightly judging that to diffuse a taste for intellectual enjoyment among the people is to elevate the race and contribute to the sum of human happiness, and that the union of high ideals of living with a grasp of fundamental principles that underlie our social life is one of the surest guaranties of national stability. There is, however, a reciprocity of obligation arising out of this state of things. The universities must come out of their cloistered seclusion. They must understand that they are a part and that they have a part to play in the nation's life if they are to prove themselves worthy of the benefactions which they have received and which they are expecting. The world of science, the world of letters, and the world of philosophy have hitherto been regarded as the special domain of the university; but the university, if it is to do its full duty to the country, must take an interest also in the great world of affairs. The problems of government and the principles that underlie the phenomena of commerce must come within the purview of the university professor; and the student must acquire in our great seminary centers, or he at least must be given an opportunity to acquire, a philosophic insight into the fundamental concepts that control the practical affairs of life.

We shall continue, I suppose, to discuss as best we may the university curriculum, and whether in the end we shall approach a common position in regard to it: whether we shall tend toward perpetuating several fixed types of university study, one can not well predict; but of this I am sure: That in all our discussions we must remember that the will of the student is a factor to be reckoned with. Because a course of study is ideally the best it does not follow that it can be successfully made the curriculum for a young man who has attained his majority. When a student reaches the age of 20 or 21 it is too late to put before him the principle of "utility made compulsory" as a university programme. And while I thoroughly believe that in the earlier stage of a boy's life it is no small part of his education to be required to do what he ought to do, however irksome it may be, because it is his duty to do it, I am also of the opinion that, considering the

age to which a young man has arrived when he enters the university, there is more outcome of culture in some studies which are less cultural in themselves, but which the student loves, than in some other studies which, though more essentially cultural, are nevertheless those which he hates and will not study.

I am sure, too, that the increased demand for time which is being made by the professional school is raising very serious questions in regard to the undergraduate curriculum, which we must heed. In some way that delightful period of comradeship, amusement, desultory reading, and choice of incongruous courses of what we are pleased to call study, which is characteristic of so many undergraduates, must be shortened in order that more time may be given to the strenuous life of professional equipment. What is the best mode of solving this problem I am not prepared to say, but I think that Columbia has taken a very important step in the direction of its solution.

I do not think that we can feel entirely satisfied with the results of our elaborate scheme of university education. We have multiplied, it is true, the subjects of study, and the wishes and aptitudes of the student are consulted as never before; but there is danger that the undergraduate will be brought into contact with unrelated scraps of knowledge on many subjects instead of having a cultivated mind and commanding a single department. I sometimes think that the most useful professor in a university is not necessarily the specialist nor the man of greatest acumen in a department, but rather the professor of encyclopedia, whose business it would be to discuss the relations of the various departments of instruction to each other; for, after all, of what value is a knowledge of the scattered facts that belong to the various provinces of academic study if the student has no world view under which he can organize his material? A bare knowledge of facts, no matter from what quarter they may come, is a matter of comparatively little worth. It is only when the student has hit upon some key to nature's cipher, it is only when he is using his facts in verification of some scientific hypothesis, that he is doing truly valuable scientific work. Otherwise he is only a census taker in the kingdom of nature; a cataloguer in the great library of truth, writing titles and reading the backs of books. I therefore consider it a good omen that the trustees of this university have chosen a philosopher to fill the presidential chair; for, be the facts what they may which come under the notice of the student, it is the philosopher, the apostle of the idea, who is needed to make these dry bones live.

[From the address by President HARPER, of Chicago University.]

Institutions of every kind sooner or later adjust themselves to the forward movement of civilization. This is particularly true of educational institutions, and among these such adaptation is especially to be noted in institutions of a higher grade. The history of higher education in the United States, from the year in which Harvard was founded to the present time, is, in fact, the history of the growth and development of American civilization. Each type of institution—for example, the New England college as it existed a hundred or more years ago in New England and exists to-day scattered all through the Western States; or the State university, which, in its proper form, may be said to be the product of the last half century; or the school of technology, in most recent years taking its place side by side with or as a part of the university; or the university in the stricter sense, which is the product of the last two decades—each type of institution, I say, represents a phase of growth or a stage of growth in the life of a nation. It is the very latest phase of institutional development that is illustrated by the growth and character of the university whose guests we are this afternoon.

The trend of life in these last years seems to be toward that centralization which finds its most tangible expression in the growth of great cities. The same tendency

has shown itself in many of the activities which make up life, as well as in those things which relate to the places of living. Many have taught this as the most distinctive movement of the last quarter of a century. Everything points to an intensification of this movement rather than to its diminution. The city of a hundred thousand inhabitants fifty years ago is the city of a million to-day. What will the city of a million to-day be fifty years hence? No man can prophesy. While in connection with this massing together of human souls much is to be deprecated, and much of the good of life is lost, it is also true that by this concentration of human effort and the intense competition thereby provoked the world as a whole will be the gainer rather than the loser.

Just as in this way great multitudes of people are brought together in the various interrelationships of common life, so there are coming to exist types of educational institutions, lower and higher, adapted to this new environment. The public-school system of a city of two or three millions of inhabitants is an entirely different system from that which is adapted to the needs of a city of fifty or one hundred thousand people; and in our great modern cities there is to-day being wrought out a kind of school work as different from that of even fifty years ago as the methods of transportation and communication to-day are different from those of the same period.

It is just so with higher education. A university which will adapt itself to urban influence, which will undertake to serve as an expression of urban civilization, and which is compelled to meet the demands of an urban environment will in the end become something essentially different from a university located in a village or small city. Such an institution will in time differentiate itself from other institutions. It will gradually take on new characteristics, both outward and inward, and it will ultimately form a new type of university.

The urban universities found to-day in three or four of the largest cities in this country and the urban universities which exist in three or four of the great European centers form a class by themselves, inasmuch as they are compelled to deal with problems which are not involved in the work of universities located in smaller cities. These problems are connected with the life of the students, the care of thousands of the students instead of hundreds; the management of millions instead of thousands of dollars; the distribution of a staff of officers made up of hundreds instead of tens. Not only do new problems present themselves, but many of the old problems assume entirely different forms. The question, for example, of coeducation is one thing if considered from the point of view of an institution located in a village and having 200 or 300 students; it is, of course, a different thing in an institution having a thousand students and located in a small city, but it is a problem of still another kind when the institution has three or four thousand students and is in the heart of a city of one or two millions of people. The standards of life are different, and the methods of life are greatly modified; and what is true of this problem is true of a score or more.

In so far as an institution is intended to represent the life of those about it, their ideals, and their common thought, the task before an urban university is something as new and strange and complicated as is the life, political and individual, of these same cities; and just as the great cities of the country represent the national life in its fullness and in its variety, so the urban universities are in the truest sense, as has frequently been noted, national universities. \* \* \*

[From the address by United States Commissioner HARRIS.]

It is my part on this auspicious occasion to remind you of the public schools of the country and to bear testimony to the general interest everywhere in the event of to-day, not only throughout the State universities and city high schools, but among the teachers and superintendents of the elementary schools.

For you, sir, who come to-day to succeed a long line of distinguished presidents in this venerable seat of learning, you have for many years made yourself a welcome member of the National Association of Teachers and aided its deliberations by your counsels. You have endeared yourself to its members by your frank and cordial fellowship. From the first you have associated yourself with that goodly number of leaders in higher education in our land who have realized how important it is to conduct even the most elementary education of the people in the light of the highest and best in human learning. You have labored for the enlightenment of the masses, and you have seen that this enlightenment must come not from a people's school which gives possession of a limited number of technical acquirements, skilled manipulation, and trained facilities, but rather from a school which opens to the minds of the children a vision of the far-off shining summits of human achievement in letters, and art, and in heroic service to humanity.

Elementary education ought to create a divine discontent with all kinds of arrested development. It ought to kindle an aspiration for daily growth by means of the library, the periodical, the social gathering.

Man alone of living creatures on the face of this planet can make a ladder of the past and climb thereon by progressive ascent from generation to generation.

The university reveals many rounds of this ladder, while the elementary school reveals only one or two rounds and may be so poorly taught as to occasion a belief in the mind of the average pupil that he has reached in six or eight years a level summit of all that is solid and enduring in human progress.

From this Philistinism it is the good fortune of our land to have defenders not only in the choice of leaders of the corps of instructors in elementary schools, high schools, and State universities, but in all public-spirited professors and presidents of privately endowed institutions.

Statistics collected from all parts of the land show that the acting majority of the people share your convictions in this matter. The nation grows in wealth from decade to decade, and the people show their desire to better the condition of their children by giving them an opportunity for more education. Thus the number of college students in each group of 1,000,000 of our population has now reached 1,285 persons, while thirty years ago it was only 590, and the people seem intent on giving the opportunity of a secondary education as well as a primary education in all parts of the United States. During the past ten years the number of public high schools supported by taxation increased from 2,526 to 6,005, and the number of students enrolled in them increased from 203,000 to 520,000, or two and one-half times the former number. Eight years' schooling belongs to the elementary school course and four years' more to the high school course; thus the voting population of the United States have chosen to add four years more of instruction to the eight years given in the elementary schools. While twelve years of free public education are possible in all of our cities and large villages, the people have not been able as yet to avail themselves of it. The actual average amount of schooling obtained in public and private schools throughout the United States in the year 1900 amounted to five years of two hundred days' actual attendance each. But this small amount of schooling, which hardly sufficed for reading, writing, the elements of arithmetic, and geography, is 50 per cent greater than the amount of the average education received thirty years ago.

In the two parts of higher education the first, or that of undergraduate study in the college, is devoted to learning principles that will connect the present with the past and unite them in one organic whole. The student must learn to interpret the present in terms of the past and also the past in terms of the present, so that he may acquire a habit of seeing the world as a progressive development from nature to man and from man as animal towards man as image of the

Divine. Higher education is a course in philosophy in so far as it shows to the student how all branches of human learning form a connected whole and in so far as it creates in him the habit of looking upon each branch as a contribution to the better understanding of all others.

But higher education does not end until it has taught the student how to concentrate all his powers on a special investigation, using his experience and his acquired learning to assist in the discovery of something that is new and useful. \* \* \*

[From the inaugural address of President BUTLER.]

\* \* \* The shifting panorama of the centuries reveals three separate and underlying forces which shape and direct the higher civilization. Two of these have a spiritual character, and one appears to be, in part at least, economic, although clearer vision may one day show that they all spring from a common source. These three forces are the church, the state, and science, or, better, scholarship. Many have been their interdependences and manifold their inter-twinings. Now one, now another seems uppermost. Charlemagne, Hildebrand, Darwin are central figures, each for his time. At one epoch these forces are in alliance, at another in opposition. Socrates died in prison, Bruno at the stake. Marcus Aurelius sat on an Emperor's throne, and Thomas Aquinas ruled the mind of a universal church. All else is tributary to these three, and we grow in civilization as mankind comes to recognize the existence and the importance of each.

It is commonplace that in the earliest family community church and state were one. The patriarch was both ruler and priest. There was neither division of labor nor separation of function. When development took place, church and state, while still substantially one, had distinct organs of expression. These often clashed, and the separation of the two principles were thereby hastened. As yet scholarship had hardly any representatives. When they did begin to appear, when science and philosophy took their rise, they were often prophets without honor either within or without their own country, and were either misunderstood or persecuted by church and state alike. But the time came when scholarship, truth-seeking for its own sake, had so far justified itself that both church and state united to give it permanent organization and a visible body. This organization and body was the university. For nearly ten centuries—a period longer than the history of parliamentary government or of Protestantism—the university has existed to embody the spirit of scholarship. Its arms have been extended to every science and to all letters. It has known periods of doubt, of weakness, and of obscurantism; but the spirit which gave it life has persisted and has overcome every obstacle. To-day, in the opening century, the university proudly asserts itself in every civilized land, not least in our own, as the bearer of a tradition and the servant of an ideal without which life would be barren and the two remaining principles which underlie civilization robbed of half their power. To destroy the university would be to turn back the hands upon the dial of history for centuries; to cripple it is to put shackles upon every forward movement that we prize—research, industry, commerce, the liberal and practical arts and sciences. To support and enhance it is to set free new and vitalizing energy in every field of human endeavor. Scholarship has shown the world that knowledge is convertible into comfort, prosperity, and success, as well as into new and higher types of social order and of spirituality. "Take fast hold of instruction," said the Wise Man; "let her not go; keep her, for she is thy life."

Man's conception of what is most worth knowing and reflecting upon, of what may best compel his scholarly energies, has changed greatly with the years. His earliest impressions were of his own insignificance and of the stupendous powers and forces by which he was surrounded and ruled. The heavenly fires, the storm cloud and the thunderbolt, the rush of waters, and the change of seasons

all filled him with an awe which straightway saw in them manifestations of the superhuman and the divine. Man was absorbed in nature, a mythical and legendary nature, to be sure, but still the nature out of which science was one day to arise. Then, at the call of Socrates, he turned his back on nature and sought to know himself, to learn the secrets of those mysterious and hidden processes by which he felt and thought and acted. The intellectual center of gravity had passed from nature to man. From that day to this the goal of scholarship has been the understanding of both nature and man, the uniting of them in one scheme or plan of knowledge, and the explaining of them as the offspring of the omnipotent activity of a Creative Spirit, the Christian God. Slow and painful have been the steps toward the goal, which to St. Augustine seemed so near at hand, but which has receded through the intervening centuries as the problems grew more complex and as the processes of inquiry became so refined that whole worlds of new and unsuspected facts revealed themselves. Scholars divided into two camps. The one would have ultimate and complete explanations at any cost; the other, overcome by the greatness of the undertaking, held that no explanation in a large or general way was possible. The one camp bred sciolism; the other narrow and helpless specialization.

At this point the modern university problem took its rise, and for over four hundred years the university has been striving to adjust its organization so that it may most effectively bend its energies to the solution of the problem as it is. For this purpose the university's scholars have unconsciously divided themselves into three types or classes: Those who investigate and break new ground; those who explain, apply, and make understandable the fruits of new investigation, and those philosophically minded teachers who relate the new to the old and, without dogma or intolerance, point to the lessons taught by the developing human spirit from its first blind gropings toward the light on the uplands of Asia or by the shores of the Mediterranean, through the insights of the world's great poets, artists, scientists, philosophers, statesmen, and priests, to its highly organized institutional and intellectual life of today. The purpose of scholarly activity requires for its accomplishment men of each of these three types. They are allies, not enemies; and happy the age, the people, or the university in which all three are well represented. It is for this reason that the university which does not strive to widen the boundaries of human knowledge, to tell the story of the new in terms that those familiar with the old can understand, and to put before its students a philosophical interpretation of historic civilization is, I think, falling short of the demands which both society and university ideals themselves may fairly make.

Again, a group of distinguished scholars in separate and narrow fields can no more constitute a university than a bundle of admirably developed nerves without a brain and spinal cord can produce all the activities of the human organism. It may be said, I think, of the unrelated and unexplained specialist, as Matthew Arnold said of the Puritan, that he is in great danger because he imagines himself in possession of a rule telling him the *unum necessarium*, or one thing needful, and that he then remains satisfied with a very crude conception of what his rule really is, and what it tells him, and in this dangerous state of assurance and self-satisfaction proceeds to give full swing to a number of the instincts of his ordinary self. And these instincts, since he is but human, are toward a general view of the world from the very narrow and isolated spot on which he stands. Only the largest and bravest spirits can become great specialists in scholarship and resist this instinctive tendency to hasty and crude philosophizing. The true scholar is one who has been brought to see the full meaning of the words development and history. He must, in other words, be a free man, as Aristotle understood the term. The free man is he who has a largeness of view which is unmis-

takable and which permits him to see the other side, a knowledge of the course of man's intellectual history and its meaning, a grasp of principles and a standard for judging them, the power and habit of reflection firmly established, a fine feeling for moral and intellectual distinctions, and the kindliness of spirit and nobility of purpose which are the support of genuine character. On this foundation highly specialized knowledge is scholarship; on a foundation of mere skill, deftness, or erudition it is not. The university is concerned with the promotion of the true scholarship. It asks it in its scholars who teach, it inculcates it in its scholars who learn. It believes that the languages, the literatures, the art, the science, and the institutions of those historic peoples who have successively occupied the center of the stage on which the great human drama is being acted out are full of significance for the world of to-day, and it asks that those students who come to it to be led into special fields of inquiry, of professional study, or of practical application, shall have come to know something of all this in an earlier period of general and liberal studies.

Mr. Emerson's oration before the oldest American society of scholars, made nearly sixty-five years ago, is the magnetic pole toward which all other discussions of scholarship must inevitably point. His superb apology for scholarship and for the scholar as Man Thinking opened an era in our nation's intellectual life. The scholar, as Mr. Emerson drew him, is not oppressed by nature or averse from it, for he knows it as the opposite of his soul, answering to it part for part. He is not weighed down by books or by the views which Cicero, which Locke, which Bacon have given, for he knows that they were young men like himself when they wrote their books and gave their views. He is not a recluse or unfit for practical work, because he knows that every opportunity for action passed by is a loss of power. The scholar, in short, as the university views him and aims to conserve and to produce him and his type, is a free man, thinking and acting in the light of the world's knowledge and guided by its highest ideals.

In this sense the university is the organ of scholarship, and in this sense it aims to be its embodiment. The place of scholarship has been long since won and is more widely recognized and acknowledged than ever before. The church and the state which first gave it independence are in close alliance with it and it with them. The three are uniting in the effort to produce a reverent, well-ordered, and thoughtful democratic civilization in which the eternal standards of righteousness and truth will increasingly prevail.

But a university is not for scholarship alone. In these modern days the university is not apart from the activities of the world, but in them and of them. It deals with real problems and it relates itself to life as it is. The university is for both scholarship and service; and herein lies that ethical quality which makes the university a real person, bound by its very nature to the service of others. To fulfill its high calling the university must give, and give freely, to its students, to the world of learning and of scholarship, to the development of trade, commerce, and industry, to the community in which it has its home, and to the State and nation whose foster child it is. A university's capacity for service is the rightful measure of its importance. The university's service is to-day far greater, far more expensive, and in ways far more numerous than ever before. It has only lately learned to serve, and hence it has only lately learned the possibilities that lie open before it. Every legitimate demand for guidance, for leadership, for expert knowledge, for trained skill, for personal service it is the bounden duty of the university to meet. It may not urge that it is too busy accumulating stores of learning and teaching students. Serve it must, as well as accumulate and teach, upon pain of loss of moral power and impairment of usefulness. At every call it must show that it is—

“Strong for service still, and unimpaired.”

The time-old troubles of town and gown are relics of an academic aloofness which was never desirable and which is no longer possible.

In order to prepare itself for efficient service the university must count in its ranks men competent to be the intellectual and spiritual leaders of the nation and competent to train others for leadership. Great personalities make great universities. And great personalities must be left free to grow and express themselves, each in his own way, if they are to reach a maximum of efficiency.

Spiritual life is subject neither to mathematical rule nor to chemical analysis. Rational freedom is the goal toward which the human spirit moves, slowly but irresistibly, as the solar system toward a point in the constellation Hercules; and rational freedom is the best method for its movement. Moreover, different subjects in the field of knowledge and its applications require different approach and different treatment. It is the business of the university to foster each and all. It gives its powerful support to the learned professions, whose traditional number has of late been added to by architecture, engineering, and teaching, all of which are closely interwoven with the welfare of the community. It urges forward its investigators in every department and rewards their achievements with the academic laurel. It studies the conditions under which school and college education may best be given, and it takes active part in advancing them. In particular, it guards the priceless treasure of that liberal learning which I have described as underlying all true scholarship and gives to it full-hearted care and protection. These are all acts of service direct and powerful.

The university does still more. It lends its members for expert and helpful service to nation, State, and city. University men are rapidly mobilized for diplomatic service, for the negotiation of important treaties, for the administration of dependencies, for special and confidential service to the Government, or some department of it, and the task done, they return quietly to the ranks of teaching scholars, as the soldiers in the armies of the war between the States went back to civil life without delay or friction. These same university men are found foremost in the ranks of good citizenship everywhere and as laymen in the service of the church. They carry hither and yon their practical idealism, their disciplined minds, and their full information, and no human interest is without their helpful and supporting strength. It is in ways like these that the university has shown a thousand times that sound theory and correct practice are two sides of a shield. A theorist is one who sees, and the practical man must be in touch with theory if he is to see what it is that he does.

What the future development of the great universities is to be perhaps no one can foresee. But this much is certain, every city which because of its size or wealth or position aims to be a center of enlightenment and a true world capital must be the home of a great university. Here students and teachers will throng by the mere force of intellectual gravitation, and here service will abound from the mere host of opportunities. The city, not in its corporate capacity, but as a spiritual entity, will be the main support of the university, and the university in turn will be the chief servant of the city's higher life. True citizens will vie with each other in strengthening the university for scholarship and for service. In doing so they can say, with Horace, that they have builded themselves monuments more lasting than bronze and loftier than the pyramids reared by kings, monuments which neither flood nor storm nor the long flight of years can overturn or destroy. Sir John de Balliol, doing a penance fixed by the Abbot of Durham; Walter de Merton, making over his manor house and estates to secure to others the advantages which he had not himself enjoyed, William of Wykeham, caring generously for New College and for Winchester School; John Harvard, leaving half his property and his library to the infant college by the Charles, and Elihu Yale, giving money and his books to the collegiate school in New Haven,

have written their names on the roll of the immortals and have conferred untold benefits upon the human race. Who were their wealthy, powerful, and high-born contemporaries? Where are they in the grateful esteem of the generations that have come after them? What service have they made possible? What now avails their wealth, their power, their high birth? Balliol, Merton, Harvard, Yale are names known wherever the English language is spoken, and beyond. They signify high purpose, zeal for learning, opposition to philistinism and ignorance. They are closely interwoven with the social, the religious, the political, the literary history of our race. Where else are there monuments such as theirs?

Scholarship and service are the true university's ideal. The university of to-day is not the "home of lost causes, and forsaken beliefs, and unpopular names, and impossible loyalties." It keeps step with the march of progress, widens its sympathies with growing knowledge, and among a democratic people seeks only to instruct, to uplift, and to serve, in order that the cause of religion and learning and of human freedom and opportunity may be continually advanced from century to century and from age to age.

[From the speech of President ROOSEVELT at the alumni dinner.]

\* \* \* When it comes to rendering service, that which counts chiefly with a college graduate, as with any other American citizen, is not intellect so much as what stands above mere power of body, or mere power of mind, but must in a sense include them, and that is character. It is a good thing to have a sound body and a better thing to have a sound mind; and better still to have that aggregate of virile and decent qualities which we group together under the name of character. I said both decent and virile qualities—it is not enough to have one or the other alone. If a man is strong in mind and body and misuses his strength, then he becomes simply a foe to the body politic, to be hunted down by all decent men; and if on the other hand he has thoroughly decent impulses but lacks strength, he is a nice man but does not count. You can do but little with him.

It is in the battle of life as it was in the great civil war. It was absolutely necessary in the civil war that a soldier should have patriotism, that he should have devotion to the country; but no matter how devoted he was to country, if he had a slight tendency to run away his usefulness was impaired thereby. And so in the unending strife for civic betterment, small is the use of those people who mean well but who mean well feebly. The man who counts is the man who is decent and who makes himself felt as a force for decency, for cleanliness, for civic righteousness. That is the man who counts. He must have several qualities. First and foremost, of course, he must be honest, he must have the root of right thinking in him. That is not enough. In the next place, he must have courage; the timid good man counts but little in the rough business of trying to do well the world's work. And finally, in addition to being honest and brave he must have common sense. If he does not have it, no matter what other qualities he may have, he will find himself at the mercy of those who, without possessing his desire to do right, know only too well how to make the wrong effective.

To you, the men of Columbia here, the men of this great city, and the men who when they graduate go to other parts of the country, to you we have the right to look in an especial degree for service to the public. To you much has been given, and woe and shame to you if we can not rightfully expect much from you in return.

We can pardon the man who has had no chance in life if he does but little for the state, and we can count it greatly to his credit if he does much for the state. But upon you who have had so much rests a heavy burden to show that you are worthy of what you have received. A double responsibility is upon you to use aright, not merely the talents that have been given to you, but the chances you

have to make much of these talents. We have a right to expect service to the state from you in many different lines: in the line of what, for lack of a better word, we will call philanthropy; in all lines of effort for public decency.

Remember always that the man who does a thing so that it is worth doing is always a man who does his work for the work's sake. Somewhere in Ruskin there is a sentence to the effect that the man who does a piece of work for the fee, normally does it in a second-rate way, and that the only first-rate work is the work done by the man who does it for the sake of doing it well, who counts that fact as itself his reward. In no kind of work done for the public do you ever find the really best, except where you find the man who takes hold of it because he is irresistibly impelled to do it; because he wishes to do it for the sake of doing it well, not for the sake of any reward that comes afterwards or in connection with it. Of course, gentlemen, that is true of almost every other walk of life, just exactly as true as it is in politics. A clergyman is not worth his salt if he finds himself bound to be such for the material reward of that profession. Every doctor who has ever succeeded has been a man incapable of thinking of his fee when he did a noteworthy surgical operation. A scientific man, a writer, a historian, an artist, can only be a good man of science, a first-class writer, a first-class artist, if he does his work for the sake of doing it well; and this is exactly as true in political life, exactly as true in every form of social effort, in every kind of work done for the public at large. The man who does work worth doing is the man who does it because he can not refrain from doing it; the man who feels it borne in on him to try that particular job and see if he can not do it well. And so it is with a general in a field. The man in the civil war who thought of any material reward for what he did was not among the men whose names you read now on the honor roll of American history.

So the work that our colleges can do is to fit their men, fit their graduates to do service; to fit the bulk of them, the men who can not go in for the highest type of scholarship, to do the ordinary citizen's service for the country; and they can fit them to do this service only by training them in character. To train them in character means to train them not only to possess, as they must possess, the softer and gentler virtues, but also the virile powers of a race of vigorous men, the virtues of courage, of honesty—not merely the honesty that refrains from wrongdoing, but the honesty that wars aggressively for the right—the virtues of courage, honesty, and finally, hard common sense.

## FREE TEXT-BOOKS—BENEFITS, OBJECTIONS, AND COST.<sup>a</sup>

### I.—BENEFITS AND OBJECTIONS.

#### DELAWARE.

*Dover.*—Benefits: All pupils have books whenever a class is formed. Poor children placed on same footing as more favored ones. Expense to community as a whole is far less.

Objections: We note no serious objections unless it be that fewer books (text) are found in homes.

#### MAINE.

*Bangor.*—Benefits: Prompt supply. Variety. Lengthened school life of child. The advantages over disadvantages are perfectly overwhelming.

Objection: Dirt.

<sup>a</sup> Reprinted from the Michigan School Report of 1898, Part III, pp. 100-109; prepared by State Superintendent Jason E. Hammond from replies by city superintendents to a circular letter of inquiry sent out by him.

*Bath.*—Benefits: The rich help the poor, making education free and equal to all. It actually takes less money from the town and facilitates equipment.

Objections: Disseminating infectious disease. By care this is reduced to a minimum and practically no objection.

*Belfast.*—Benefits: Uniform text-books. Benefit to poor children. All children have good books. All children held responsible to city, hence the value in this regard not noticed under old system.

Objections: No serious objection, unless the spread of disease, which can be guarded against.

*Bideford.*—Benefits: Relieves the parent of a heavy expense annually, and is practically no burden to the taxpayer. Books are bought by the city much cheaper than they were by private individuals. Every pupil is sure to have a proper supply of books at the beginning of the year.

Objections: The only objection is the soiled condition of the books when they have been used and are put into the hands of other pupils.

*Lewiston.*—Benefits: Better supply. Changes more easily made.

Objections: Our pupils should possess and retain certain books.

*Rockland.*—Benefits: Uniformity. Plenty of them. Kind we wish.

Objections: Children being obliged to use books used by others the year before.

*Saco.*—Benefits: Every pupil has a book, the poor as well as the rich.

Objections: There is a greater destructiveness of books on the part of the pupils. If parents were obliged to pay for them, children and parents would have more respect for them and use them with more care. It is the unthrifty families who destroy the books and double the expense to the city. Adds greatly to care and labor of school committee or superintendent.

#### MARYLAND.

*Belair.*—Benefits: Popularizes the system generally; keeps all pupils properly equipped for their work; greatly relieves teachers, thus leaving their best energy for teaching; removes the pauper stigma from those unable to buy or hire books; largely increases attendance.

Objections: Claimed by some to be too parental; chance to spread contagious diseases; deprives child of benefits of a home library. The last alone has any weight.

*Frederick.*—Benefits: Enables principal to supply pupils with necessary books in all grades. Puts all pupils on an equality. No exemptions required for indigent pupils. Work of schools more effective. Less friction between teachers, patrons, and school officers.

Objections: A few taxpayers object on the score that they are required to help pay for books for other people's children. They make same objection to taxation for free schools.

#### MASSACHUSETTS.

*Boston.*—Benefits: It can safely be claimed that present method can hardly be improved upon for the promptness with which pupils can begin their work at opening of year.

*Brockton.*—Benefits: Children all supplied with books when needed. No delay. Objections: No books in their homes after they leave school.

*Cambridge.*—Objections: None.

*Everett.*—Benefits: All pupils fully provided with similar text-books. Total cost to city less than as though books were bought by individuals.

Objections: Pupils do not own books. Different pupils use same books at different times. Books become soiled, perhaps contain disease germs.

*Haverhill.*—Benefits: Uniformity of text-books and supplies, and the same always at hand when needed.

Objections: Leads to extravagant use of such. No foundation for home libraries.  
*Lowell*.—Benefits: They put each child on same footing in regard to their text-books.

Objections: Do not know of any.

*Lynn*.—Benefits: Uniformity of text-books. Better care of books is enforced by teachers. Increased attendance. Less objection by parents to making needed changes in text-books.

Objections: Pupils have to use books that have been used by other pupils, and complain that the books they get are not in proper condition.

*Medford*.—Benefits: All supplied promptly at beginning of year. Easier to get the best or to change when a better book appears. More varied assortment can be used.

Objections: Pupils do not have anything at home; no dictionary, even, when they leave school. Discourages pupils for owning anything, and leads them to expect the State to do everything for them.

*New Bedford*.—Benefits: Economy. Actual cost per pupil much less. Great economy in time. Books are ready for use promptly. Justice is done. In a system of compulsory education books and supplies should be furnished.

Objections: Demand upon teachers' time in distributing and caring for them. Danger of contagious diseases. Creates in pupils' minds a feeling of public dependence. Do not think this last is extreme at all.

*North Adams*.—Benefits: Saves money, time, and trouble.

Objections: None.

*Pittsford*.—Objections: None.

*Salem*.—Objections: Single objection is the great lack of books in homes.

*Somerville*.—Benefits: Uniformity; promptness in beginning work; no differentiation between rich and poor; ease of change; better care.

Objections: Carelessness in use. Absence of books in home after child leaves school.

*Springfield*.—Benefits: Economy in use; bought at wholesale; in use longer; a larger variety of books possible; pupils promptly supplied; time of teachers and pupils saved.

Objections: About only objection is possibility of communicating contagious diseases. With proper care this objection may be met satisfactorily. In this city all books are covered when passed from one pupil to another.

*Taunton*.—Benefits: Economy both in time and money. Increased school attendance of poorer class. Schools are in fact "free."

Objections: A child using another's dirt. Takes away foundation of one's library. Schoolbooks are nucleus of private library. Think one more careful of his own things than when they are too free.

*Waltham*.—Benefits: Poor pupils supplied. School begins first day.

Objections: High-school pupils have no books with which to continue study after leaving school.

*Weymouth*.—Benefits: Every child has books and material and all (rich and poor) are treated the same.

Objections: Dirty books are apt to fall into clean hands.

#### MICHIGAN.

*Detroit*.—Benefits: The cost is very much less than if purchased individually, and the books are kept in better condition.

Objections: None.

*Menominee*.—Benefits: Books are uniform and all have books all of the time. Cheaper. Enables us to enforce the truancy law more easily. Get full wear of books.

Objections: Do not know of any. Those given usually are weak when advantages are known by experience.

*Muskegon*.—Benefits: (1) Economical. (2) Educational. (3) Ethical.

Objections: (1) Sanitary—Danger from contagion. (2) Educational—Value and opportunity that comes from ownership of books is lost to a certain extent.

*Saginaw*.—Benefits: Cheapness; large increase of attendance; prevents all delays in securing books at beginning of term; teaches neatness and care of property; aids systemization of school work.

Objections: Fosters a nonbook-buying habit. Takes away almost the only library thousands of homes possess.

*West Saginaw*.—Benefits: Books on hand to begin work at once. The economy permits of a larger number of books for pupil. Pupils learn to be neater and less destructive.

Objections: Some books get so dirty, but by a system of fines this is being overcome.

#### MINNESOTA.

*Duluth*.—Benefits: The desirable books can always be had. Each pupil can be supplied irrespective of their means. Pupils are taught to respect the property of others. Pupils have advantage of greater variety of books.

Objections: Chief objection the spread of disease through indiscriminate use of the books, but if proper care is used and the books frequently covered this is reduced to a minimum.

*Minneapolis*.—Benefits: Work taken up at beginning of year, and no children are absent on account of lack of books.

Objections: We have abolished the plan so far as high school is concerned. There was feeling that text-books such as are used in high school should be owned by the pupils.

#### MONTANA.

*Butte*.—Benefits: It places the poor child on an equality with the rich. Affords poor parents no excuse for not sending children to school.

Objections: The heavy taxpayers are about the only kickers.

#### NEBRASKA.

*Columbus*.—Benefits: Economy; easy gradation; promptness in beginning work. Objections: Produces carelessness in handling books. Lack of appreciation of books. Liability to transmit disease.

*Falls City*.—Benefits: The poor children have same opportunity for study as the rich. The burden of expense falls upon those best able to bear it. Economy.

Objections: Those having no children in school claim they are unjustly taxed.

*Fremont*.—Benefits: They are incalculable. I know of no greater calamity that could befall our schools than a return to old system. When schools are supplied, the work is satisfactory from beginning of first day, and more work is accomplished by schools. To have these books for use, realizing they are public property, and being held responsible for them, teaches pupils a valuable lesson in care of property, and makes them recognize the rights of the public.

*Grand Island*.—Benefits: Uniformity. All pupils well provided. Books better cared for. No expense to people moving into new districts.

Objections: The only objections we hear—and they are few—are from those who have no children in school.

*Hastings*.—Benefits: Great saving of expense to consumers, the same book serving for from four to seven years in successive classes. Any desired change of texts can be made on terms involving less loss. Satisfactory books are always at hand when work demands.

Objections: There is a feeling of very general, almost universal, satisfaction with our free text-book law. We believe it to be the ideal solution of this question.

*Kearney.*—Benefits: Certainty of uniformity. Teachers can do the work more easily and accomplish more. Saves time and bother.

Objections: The expense. There is a waste from carelessness that the best care can not avoid. It makes the facility for getting an education too easy and the less appreciated. Some parents seem to think they should be paid for the privilege of educating their children, besides having everything furnished them.

*Norfolk.*—Benefits: Satisfactory work. Cheaper books. Sufficient books for all pupils.

Objections: Tendency on part of pupils to depreciate value of books. Pupils on leaving school have generally no books of their own.

*Omaha.*—Benefits: No delay in getting books. No excuse for trying to attend school without books. Gives poor children same facilities as rich. When books become unfit for use can be destroyed. Costs community not more than half the other plan.

Objections: Some children want to own books they use. Has tendency toward paternalism among people who think the government should furnish everything. Some children become wasteful if not watched. Objections not to be compared for a moment with benefits of plan.

*Plattsburgh.*—Benefits: Only to supply pupils who are too poor to buy.

Objections: Objectionable from a sanitary standpoint. It has been demonstrated that pupils are more destructive with books which cost them nothing.

*Schuyler.*—Benefits: Greater freedom in classifying pupils. Allows poor people to educate their children. Promotes better attendance. Easier to change for a better book.

Objections: Spreads contagious diseases. Pupils do not take as good care of books. Pupils can not form a library of their own.

*Wahoo.*—Benefits: They can be bought cheaper in quantities, and each pupil is sure to be provided with suitable books.

Objections: Pupils are not so careful of the books as they would be of private property.

*York.*—Benefits: Cheaper. Books always ready for classes. Pupils properly supplied.

Objections: A neat pupil having occasionally to use a book after a careless one.

#### NEW HAMPSHIRE.

*Concord.*—Benefits: Schools begin work the first day of school.

Objections: Books become filthy in time. Good agent for transmission of disease. Inclined to make next generation improvident.

*Manchester.*—Benefits: Great convenience, and saving of many dollars to patrons of the public schools.

Objections: Nonownership by pupils for future reference.

#### NEW JERSEY.

*Newark.*—Benefits: Abundant and prompt supply. Greatly diminished expense, owing to use of books by succeeding classes. Equalization of school requirements, lessening social distinctions, and making logical compulsory attendance.

Objections: Depriving some children and families of ownership of books. In some minds a spread of contagious diseases—a difficulty easily remedied.

#### NEW YORK.

*Ithaca.*—Benefits: Change when advisable without burden to parents; saving in expense; prompt supply. Necessary accompaniment of a compulsory-education

law. The poor are neither humiliated nor encouraged in pauperism; do not have to beg for their supply.

Objections: Possibility of contagion; no encouragement to permanent retention of books, nor purchase of private library. Lack of books for reference in homes.

*Lansingburg*.—Benefits: All have books. Many would not have them at all or late in the term.

*Saratoga Springs*.—Benefits: Uniformity, abundance of books. No waiting for pupils to get books, hence a gain in time. Ability to change unsatisfactory books.

Objections: I can see none.

*Syracuse*.—Benefits: Schools ready for work at beginning of term. Do not have to wait until pupils get ready to buy books. No trouble to change text-books. Saving of one-sixth of cost.

Objections: None.

*Yonkers*.—Benefits: Books and supplies can be bought more advantageously for the taxpayers when bought in large quantities by board.

Objections: We have found none.

#### PENNSYLVANIA.

*Allegheny*.—Benefits: Saving in cost of 40 per cent. Greater promptness in getting classes supplied. Largely increased attendance. Absolutely free public-school system.

Objections: No objection whatever. All the theoretical objections urged before we adopted the system have failed absolutely to materialize.

*Altoona*.—Benefits: Cost to the district 25 to 50 per cent less than at retail.

Objections: Carelessness and extravagance on part of pupils.

*Erie*.—Benefits: Greater regularity of attendance; longer continuance in school, especially in high school, where cost of books was burdensome; benefit to poor, because free books promote freer attendance.

Objections: Absence of books in home after child leaves school. Lessens interest of parent in school and therefore lessens his sense of individual responsibility in making provision for education of his children. Books being free, children become careless in use of them.

*Harrisburg*.—Benefits: Saving of expense to parents. Pupils always supplied with books. Increased attendance.

Objections: When a pupil leaves school he has not text-books at home. Danger of disease.

*Hazleton*.—Benefits: We have them on hand for immediate use. All are supplied. Easier to get very best. More supplementary books can be obtained. Hundreds of children come to school who could not do so before; this is particularly true in grammar and high-school grades.

Objections: Some danger from infection. Less books found in homes. Pupils are without books during the vacations. First and third objections, however, are obviated by local regulations, and the second by establishing libraries.

*Pottsville*.—Benefits: Better attendance at school, especially in the higher grades.

Objections: Books used by different pupils. Pupils not returning books at close of school.

*Reading*.—Benefits: More pupils take advantage of educational privileges as there is no increase of taxation to parents for school purposes.

Objections: Pupils do not own books after leaving school.

*York*.—Benefits: Less cost to community. All provided with necessary material. Relief to the poor.

Objections: None that can not be met.

## RHODE ISLAND.

*Bristol*.—Benefits: Places all pupils on same footing.

*Pawtucket*.—Benefits: Increased attendance, particularly in higher grades. Saving of time; scholars always well supplied.

Objections: Some claim handling of books by different pupils and carrying them into all kinds of homes is unhealthy for scholars; liable to carry disease.

*Peacedale*.—Benefits: Every pupil is supplied.

Objections: None.

*Woonsocket*.—Benefits: Increased attendance. Saves time, books always on hand. Easier to change books when old and out of date.

Objections: Microbes. Lack of interest because there is not individual ownership. Children have no books after leaving school.

## VERMONT.

*Bellows Falls*.—Benefits: Pupils all have books ready to start in together. Lifts burden from poor and enables many to attend high school who otherwise could not possibly go. Lengthens school life of average child.

Objections: Unless care is taken there is slight danger from contagious diseases, though this is oftener from pencils or penholders. In some families about all the books purchased were text-books; tendency now is to have no books at all.

*Bennington*.—Benefits: Economy; greater variety and number of books possible; better condition of books.

Objections: Many of the text-books should be owned by pupils for future use. Responsibility of teacher in care of books.

*Rutland*.—Benefits: All pupils supplied alike and more regular attendance.

Objections: I know of no serious objection with us.

## WISCONSIN.

*Berlin*.—Benefits: Uniformity of books; all supplied and at a cost less than to buy, while school with careful management meets with a small profit.

*Eau Claire*.—Benefits: Many pupils attend schools who would not be able to meet the expense of text-books and would be obliged to drop out of school.

Objections: Only objection is using books after they are soiled.

*La Crosse*.—Benefits: Greater economy to the people. No loss of time for lack of books. Greater variety of books may be used. Easier to keep up to date with text-books. Gives better satisfaction to patrons. Better attendance.

Objections: After a time have to use some soiled books. No sense of ownership in books by pupil.

*Marinette*.—Benefits: Everybody has material and books of the right kind to work with. Pupils are trained to take care of books. An obsolete text-book may be readily exchanged. By system of transferring all of the best readers and supplementary reading may be had at no greater outlay than if but one reader were used throughout.

Objections: Great care to teachers and superintendent. Possibility of trying to economize, thus lowering quality. Paternalism fostered. Parents and pupils learn to expect to be given things.

*Portage*.—Benefits: Children of the poor are not subjected to any humiliating distinction. Economical. Teachers are relieved of all annoyance resulting from an insufficiency of books. Any desirable change in books can be made without friction and without loss.

Objections: Have never heard any objection raised that was not frivolous.

TECHNICAL EDUCATION IN GERMANY.<sup>a</sup>

Since the close of the Franco-Prussian war the development of Germany has been remarkable. Hamburg has risen from the sixth largest port in Europe to nearly the first; German cottons are sold in Manchester, German steel in Sheffield and Leeds, German silks in Paris, and "Made in Germany" is a familiar mark to us. From 1875 to 1895 the population increased from 45,730,000 to 52,250,000. The working energy, during the same period, increased from twenty-five to more than forty-six million foot-pounds daily, or about four times as fast as the population. Between 1889 and 1896 the exports from Germany to China

<sup>a</sup> Abridged from a paper on the need of technical education, by Prof. Victor C. Alderson, dean of the Armour Institute of Technology, read before the Chicago Literary Club, October 20, 1902, and printed in Nature February 12, 1903.

increased 86 per cent; to Japan 92 per cent. The tonnage of German vessels trading with these countries has trebled since 1886. The number of German steamers in 1871 was 150; in 1897 this number had increased to 1,125. During the same period the tonnage increased from 82,000 to 900,000. That Germany has been successful in a commercial way during the past thirty years is not to be denied. Her success can be traced to her belief in the industrial value of scientific research and to her fostering care of the technical education of her people.

From an examination of special industries we can obtain a clearer idea of this influence. Consider the beet-sugar industry. In 1840 154,000 tons of beets were treated, yielding 8,000 tons, or  $5\frac{1}{2}$  per cent of raw sugar. In 1899, with improved scientific processes, 12,000,000 tons were crushed, yielding 1,500,000 tons, or 13 per cent of raw sugar. This increase from  $5\frac{1}{2}$  to 13 per cent is the direct result of the work of technical men in control of the industry. Not only is Germany no longer dependent upon the West Indies for her sugar, but in one year she has sold Great Britain \$50,000,000 worth. The manufacture of alcohol from potatoes is another lucrative field for German technologists. The cost has been reduced to about 25 cents per gallon, and experiments are in progress to determine its efficiency as fuel on steamers. The manufacture of artificial indigo by a chemical process was discovered in Germany in 1866. Less than 40 workmen were then employed; now more than 6,000 men and a staff of 143 scientific chemists are employed in the industry. The natural indigo is almost driven out of the market. They have also discovered a method for obtaining from steel processes ground slag which is used as a fertilizer, and England, although she produces quite as much steel as Germany, has become a good customer for the article. Recently there came the discovery by a chemist named Giebler of a process of hardening steel which makes it, it is said, 14 per cent stronger, 50 per cent lighter, and one-third less costly than the Krupp or Harvey steel. Twenty-five years ago the English and French makers of scientific instruments of precision were far in advance of the German. However, through the organization of the Reichsanstalt, an institution for original research and the standardizing of instruments, supported by the Government, Germany has become the manufacturer of the best scientific instruments in the world. The value of her exports in this line is nearly \$2,000,000, three times what it was fifteen years ago, and the work gives employment to 15,000 people.

The Germans are fully alive to the necessity of being well prepared to engage in the struggle for industrial supremacy. Prince Bismarck once said: "The war of the future is the economic war, the struggle for existence on a large scale. May my successors always bear this in mind and take care that when the struggle comes we are prepared for it." Bismarck's behest has been heeded. The Germans, by dint of long and thorough preparation, are ready for an economic war. For more than thirty years they have been preparing, and we can see in all directions the steps that have been taken to improve the technical sides of education, so as to produce men who are capable of carrying Germany to the front in this industrial and commercial struggle. The system of German technical schools comprises first a group of Technischen Hochschulen, situated at the capitals of the German States, like those of Berlin, Dresden, Munich, and Karlsruhe. These are of the very highest grade, admitting only students who have completed a Gymnasium or Realschule course of study. They have without exception developed gradually from mere trade or building schools. Most of them were founded in the twenties and thirties of last century, and one—the Charlottenburg—was founded as early as 1799. These schools are all beautifully housed, have superb equipments, and are doing a high grade of professional engineering work. Next below them in educational rank comes a great number of trade schools, like the textile school of Crefeld. These trade schools are located at the center of

the industry to be benefited and are distinctly utilitarian in character. Besides these, there are many continuation and manual training schools. So numerous are these specialized schools that a German can always find one in which he can learn the latest and best principles, devices, and methods of any trade or profession he may desire to follow. Add to all these the latest German innovation of commercial high schools and colleges of commerce, then wonder, if you can, why German competition is so keen and why German trade and industry are reaching every market the world over. The Germans have discovered that the secret of success in trade and industry depends upon education; not upon the education of the library and cloister, but upon the education of the laboratory, the shop, and the modern lecture room.

## REPORT ON DRAWING IN WESTERN NORMAL SCHOOLS.

[Adopted by the Western Drawing Teachers' Association May 9, 1902.]

In the territory represented by the Western Drawing Teachers' Association there are 15 States, Wisconsin, Minnesota, Iowa, Illinois, Michigan, Indiana, Missouri, California, Oregon, Washington, North Dakota, South Dakota, Kansas, Colorado, and Texas. In these States there are 40 State normal schools.

Your committee sent to the presidents or principals of these schools a circular letter, reading as follows:

At the last meeting of the Western Drawing Teachers' Association, held April 23 to 25, 1901, at Rock Island, Ill., a committee was appointed to investigate conditions governing the preparation of normal students for the teaching of drawing. It was thought advisable to gather statistics from the normal schools of the West, with a view to bringing valuable information before the association. The association hopes that there may be a united effort among public school workers to raise the standard of art instruction, in order that teachers may be better prepared to handle a subject which has become vital in American education. Will you aid us in our work by filling out the inclosed blank?

The questions asked on the circular blank were the following:

1. Is drawing taught in your school?
2. Is it an obligatory study?
3. During how many years is it required?
4. How much time per year is devoted in your school to the subject?
5. What is the character of the instruction?
6. Is your drawing department well equipped?
7. Have your graduates found themselves suitably prepared for teaching drawing when becoming teachers?
8. What has been the art training of your teacher of drawing?
9. What salary is paid the drawing teacher?
10. How many normal students does the teacher of drawing instruct?
11. Does she also have charge of her subject in a practice school?
12. Will you send an exhibit of drawing to the next meeting of the Western Drawing Teachers' Association, at Minneapolis, May 7 to 9, 1902?

Response was made by 34 of the normal schools; the remaining 6 could not be heard from. Your committee regrets that it is unable to bring before you the complete information that it considers desirable. Many schools did not seem willing to answer all the questions asked. When a normal school principal stated that he was not permitted to say what salary was being paid the drawing teacher, there was nothing further for the committee to do.

To know that thirty-two periods are being devoted to the teaching of drawing in a school, when the principal refuses to state the length of a period is not very satisfactory. When asking what the training of the supervisor has been, to receive the answer that it has been good is not altogether comprehensive.

However, notwithstanding the many difficulties encountered, many principals

seemed anxious to further the work of the committee and to express interest in and appreciation of the work of the association. We feel that the information obtained is sufficient to be of much interest and value to the association.

In the 34 normal schools heard from drawing is taught. It is an obligatory study in all but two—Cape Girardeau, Mo., and Terra Haute, Ind.

The time over which work in drawing extends varies from six weeks in Moorehead, Minn., to three years in Houston, Tex. Of 21 schools stating the number of hours devoted to the subject, the average is one hundred and thirty-six hours. In 4 schools students have less than eighty hours' training. The greatest amount of time devoted to the subject is three hundred and twenty hours in the course at Los Angeles, Cal.

Opinion seems to differ widely as to what constitutes a good course of study. One normal school states: "We teach art, not the old-time magazine and perpetual model drawing." Another states: "Our teachers are not artists, and the elementary work we do is not art. We endeavor to prepare our students to use drawing in elementary work." A few of the outlines of the courses of study in drawing seem to the committee comprehensive and well ordered, but most of them not good and some decidedly bad.

Regarding equipment of 33 schools, 12 consider themselves well equipped for art study, 13 moderately so, and 7 not equipped.

In answer to the question, "Have your graduates found themselves suitably prepared for teaching drawing when becoming teachers?" of 27 schools willing to answer, 14 find that they are prepared, 3 fairly well prepared, 2 not prepared, 3 not often prepared, 4 can not tell, and 1 hopes that they are.

Of the training of teachers, 9 have received instruction at Pratt Institute, 3 at the Massachusetts Normal Art, 1 at Chicago Art Institute, 1 at the Cooper Institute, 1 at the Columbus (Ohio) Art School, and 1 at the New York Academy of Design. Of the remaining 11, regarding whom answers were received, 3 have had extensive studio work, 7 have had only the training afforded by the regular normal schools and colleges, and 1 is "a 19-year-old girl," a born genius, picked up at home.

The salaries paid drawing teachers in normal schools heard from are as follows:

One teacher receives \$2,000; one, \$1,530; three, \$1,300; three, \$1,200; five, \$1,100; five, \$1,000; one, \$950; five, \$900; one, \$850; four, \$800; one, \$700; one, \$600; two, \$500, and one, \$350.

In 16 of 35 schools the salaries are below \$1,000.

In 26 schools the drawing teachers have charge of work in a practice school and in 5 schools instruct the normal students only.

The number of students being instructed in the various schools varies from 10 to 500. At present in 30 schools there are 5,067 prospective teachers receiving art instruction.

After the compilation of the above a list of 40 supervisors was made representing the territory of the Western Drawing Teachers' Association. A circular letter was addressed to these asking if they found the graduates of State normal schools, as a rule, fitted to teach drawing efficiently.

Thirty-one answers were received. Four teachers spoke words of commendation:

I find that the teachers who have had the training of the normal schools of the State are the most efficient in the corps in my line of work.

IDA M. CRAVATH, *Madison, Wis.*

I will say that I have found normal graduates well fitted to teach drawing, but I must add that my experience is limited, being only in connection with the Los Angeles State Normal, of California.

MAY GEARHART, *Berkeley, Cal.*

I find graduates of State normal schools better prepared to teach drawing than those without normal training. The training in normal schools is inadequate, however, and the graduates themselves feel it so. They speak of the lack along creative lines in their development.

GRACE C. SYLLA, *Akron, Ohio.*

The matter, according to my experience, is wholly relative. The teachers we receive from the State normal schools are so much better prepared to do intelligent work without drawing outlines than those received from other sources that we are very thankful to think that the course is somewhat adequate. Though they may not be able to draw, they are able to approach the subject with some intelligence. I think I may safely say that our normal graduates are as well prepared to teach drawing under a good supervisor as they are to do most of the other work of the school, and the condition is improving every year. That there is large need and room for such improvement goes without saying.

MARY G. DIEM, *Winona, Minn.*

Supervisors from the following cities reported that they did not find State normal graduates fitted, as a rule, to teach drawing: Youngstown and Dayton, Ohio; Detroit, East Saginaw, and Bay City, Mich.; Indianapolis, Evansville, Fort Wayne, Marion, and South Bend, Ind.; Eau Claire, Oshkosh, and West Superior, Wis.; Minneapolis and Stillwater, Minn.; Burlington, Iowa; Colorado Springs, Denver (Dist. No. 17), and Pueblo (Dist. No. 1), Colo.; Joplin, Mo.; Alameda and Oakland, Cal.

We quote briefly from some of the letters as follows:

I think that I can safely say in my seven years' experience as supervisor I have never found a normal graduate who was prepared to teach the subject intelligently.

My heart aches with each succeeding September as I realize afresh how poorly prepared our otherwise good teachers are to handle the subject.

I most sincerely trust that the day is not far distant when the teachers' (prospective) preparation for and ability to handle art as taught in our public schools shall be subject to as severe tests and requirements as is any of the other branches.

MARGARET SHEARDOWN, *Calumet, Mich.*

We have had a number of graduates from various normal schools, and none have been able to teach drawing successfully. In fact, their knowledge of the subject is so limited that it seems ridiculous to say that they have studied art.

Hoping that this state of things may be overcome in the near future,

ALICE E. HALL, *Fort Wayne, Ind.*

Do I find graduates of State normal schools, as a rule, fitted to teach drawing efficiently? No; it has not been my pleasure to have so fortunate a corps.

So many of the high schools do not have drawing; then, too, the rural schools are without. Consequently the normal students are poorly prepared to receive sufficient training within the twenty weeks' allotted art course.

Allow me to plead less methods in normal art work, perspective and freehand work in light and shade and color. The supervisor will supply help in methods and the proper adjustment to grades, but finds uphill work with the normal graduate who puts in her time with discussions and methods. Give me the teacher who can sketch a little, has some idea of correctness of light and shade, knows simple rules (and applications thereof) in perspective, and her work proves efficient.

Sometimes she comes from the normal so full of cubes and prisms and drawing books that it is hard to get her to dare to do free work.

If every normal demanded an examination, be it ever so slight, in drawing, it would force the drawing into the high schools and set the "districts thinkin'." Of course all normal schools would have to agree on an examination, or else the students might vote against it and attendance might suffer.

ANNA EARL GRADY, *Superior, Wis.*

In answer to your question I can give an unqualified "No." Not only are they unqualified, but some are prejudiced against the work and seem to have no conception of what art education desires to do for the child.

A very large part of the teachers with whom I come in contact are from private normals. While they are just as poorly qualified, they are not prejudiced. I think the work should not stop with the State normals, but should be carried into all schools where teachers are trained.

Call on me for any aid that I can give along this line.

J. L. MASSENA, *Marion, Ind.*

Almost without exception I find normal-school graduates poorly prepared to teach drawing. Indeed, I find it impossible to have them teach in the schools where I supervise without asking them to attend special meetings for instruction for the best part of a year. Almost invariably they are deficient in elementary observation and expression. Generally the work they show as having been done at normal schools would not be accepted from our high-school pupils. Their deficiencies seem to be the result of too little time devoted to the subject and superficial instruction; and yet, as Cabrill Compayro says in his report on the educational exhibit of the United States at the Paris Exposition, "Drawing is king in the schools of America."

CHAS. M. CARTER, *Denver, Colo.*

In my seven years' experience in Indianapolis I have found only two graduates of State normal schools who were fitted upon entering our schools to teach drawing.

WILHELMINA SEEGMILLER, *Indianapolis, Ind.*

In the last annual report of the superintendent of the Minneapolis schools to the board of education a report from the supervisor of drawing, Miss Bonnie Snow, is published. In this the statement is made:

We are doing all we can to teach the children in the grades how to draw, how to appreciate and enjoy nature and art; but we are doing very little in our high schools to strengthen the teachers of the next generation to know more about the technical side of the subject. In this we are open to criticism. The normal schools in their turn are perhaps more directly responsible for the woeful lack of knowledge of drawing on the part of their graduates. The average normal-school course of study was planned, apparently, years ago, before drawing and its related art subjects entered so vitally into the course of study of the average public school. Hence their students, coming to them, it is true, in ignorance of the subject, are expected in six weeks' or at most in three months' time to learn enough about it to fulfill the requirements of the average school curriculum. It is because I feel so positive that the trouble lies in the lack of preparation on the part of the teacher in this line of work that I have sought to better the conditions so far as lies in my power. A very large part of my time is devoted to the teaching of teachers—doing practical normal-school work, instead of depending on pure supervision. I do not speak of this in a spirit of complaint, but only to put before you a truthful statement of the conditions under which we work.

From lack of experience in working with normal-school graduates the supervisors of Decatur, Ill.; Duluth, Minn.; Davenport, Iowa; and St. Joseph, Mo., reported that they were unable to answer the question.

To sum up, two supervisors find graduates fitted to teach drawing, one as well fitted as to teach most other things, one more nearly fitted than if not instructed, four can not say, and twenty-three say "No," most of them very emphatically.

As the conclusion of its investigations your committee reports that it believes drawing is not being well taught in the majority of Western State normal schools, and that in consequence superintendents are finding it very difficult to secure the services of well-instructed teachers, supervisors are expending much unnecessary force in training normal graduates, the graduates themselves have much difficulty and disappointment when they find themselves almost or wholly unfitted to teach a required subject, and large numbers of children suffer while teachers are becoming, under much hardship, prepared to teach a subject that has become a vital and established part of American education.

Your committee feels that conditions will not very materially improve until normal schools require some preparation in drawing before students are admitted

and until teachers' examinations are established in drawing, as in other subjects, by the cities and towns.

When superintendents of schools demand that teachers entering their schools be prepared to teach drawing as other subjects, there will be more time devoted to the subject in the normal schools, better equipment, much better salaries paid the drawing teachers, the drawing courses enriched in the high schools, and a better teaching and understanding of art throughout the West.

Respectfully submitted.

WILHELMINA SEEGMILLER,

*Supervisor of Drawing, Indianapolis, Ind.*

BONNIE SNOW,

*Supervisor of Drawing, Minneapolis, Minn.*

HELEN FRAZER,

*Supervisor of Drawing, Columbus, Ohio.*

FLORENCE ELLIS,

*Supervisor of Drawing, Grand Rapids, Mich.*

CHARLES M. CARTER,

*Supervisor of Drawing, Denver, Colo.*

## CHAPTER XIV.

### THE EDUCATIONAL PROGRESS OF THE YEAR 1901-02.

By WILLIAM R. HARPER,

*President of the University of Chicago.*

[Reprinted from the Proceedings of the National Educational Association, 1902.]

In attempting a survey of the progress of educational work during the period of a single year, one quickly discovers three or four things: (1) That such a survey will contain no adequate presentation of the mass of material which may rightly lay claim to be included—a volume of hundreds of pages being hardly sufficient, much less a paper of forty or fifty minutes; (2) that no sharp line can be drawn between different years, since the more important events really assume the nature of movements, and most of them cover a period of several years; (3) that prejudice against taking forward steps in education has been greatly diminished, and skepticism as to the value of the old conventional usages in schools and colleges is largely on the increase; (4) that, whatever may have been true in the past, no very close connection any longer exists between the educational movements of England and the Continent and those of our own land. At all events, we may no longer be counted merely as followers; in some respects we may, perhaps, claim the position of leadership.

#### TRIBUTE TO COL. F. W. PARKER.

In the field of elementary education the most significant single event—that which has touched the largest number of persons and affected them most keenly—has been the death of Col. Francis W. Parker. As in the case of most men who have accomplished much, the greatness of his work was not fully apparent until he was taken away. The universal appreciation of his leadership, the universal testimony to the greatness of his career, and the universal mourning over his sudden death, together constitute the most striking event of the year. That he should be taken away at the very moment when he was about to enjoy the fruition of a lifetime's work, and that he should not be permitted to enter the buildings on whose plans he had spent so much time and energy, was indeed pathetic; but that he had built foundations broad and strong for future work in the field of elementary education; that he had made noteworthy contributions to the cause of public school education; that, indeed, he was one of the great leaders of the last quarter of a century—is everywhere acknowledged. Although he was an officer of the University of Chicago, I may be permitted to say these things in view of the fact that his connection with the institution was so brief; and I am sure that the general educational public will approve the policy adopted by the university, to go forward with the work which he established and to undertake the accomplishment of this work in accordance with his purpose and his spirit. To this is pledged the faculty of the school of education, so closely connected with him personally and officially, and to this is pledged also the new director,

Mr. Dewey. It is not too much to expect that this faculty shall develop, on the foundations which have already been laid, a great and noble institution from which good and only good shall emanate for the public school system of the country.

#### CURRICULUM OF THE COMMON SCHOOL.

The curriculum of the common school in these last years has greatly expanded, and now includes much material drawn from the departments of natural science, drawing, art, manual training, as well as from those of history and literature. This material is so various in its character and so large in its amount as to produce "a stuffed condition of the school course which occasions uneasiness and distress." The "new education" has given us certain problems that urgently demand solution. It is generally understood that these problems group themselves under two heads: (1) How to select in each department of study the most important topics for treatment, and (2) how to bring these various departments of study into such relationship with each other that each will contribute to the other, and that waste shall be reduced to a minimum. So far as I am able to gather the facts, it may be said that no new principles or theories have been projected during the past year. Leaders in the new education have concentrated their efforts upon its practical side. In many quarters there has been conducted quiet investigation of the problems just mentioned. The educational theory and practice, which is based on the teachings of psychology and the history and development of the culture of the race, is becoming more and more generally accepted; but it requires just such critical and scientific study as that which is being given it in educational circles throughout the various sections of the country. The changes that have already come are almost greater than can be calculated. It is essential, however, that the severest tests be applied, and that the most rigid scientific criticism be encouraged.

#### TRAINING IN ÆSTHETICS.

No one can fail to see the increasing acknowledgment in the modern education of the child of the importance of training in æsthetics. In more than one great center there has been manifested a growing desire to decorate and beautify the buildings. It has been suggested that perhaps in no former year has greater interest been taken in the architecture of the school buildings than during this year. The work accomplished in this regard in the cities of Boston, New York, and Chicago deserves especial mention.

#### RAISING THE NORMAL SCHOOL STANDARD.

It is true, perhaps, that the teacher is beginning to recognize more clearly the importance of study for the sake of information as distinguished from that of method study. This difference is the old bone of contention between the normal school and the college. A radical step, and one which seems to acknowledge this general principle, has been taken during the past year in the city of Chicago. The city normal school, whose function it is to train teachers for the elementary field, has advanced its course of study to three years, and has made its requirement for admission coordinate with that of the leading colleges in the country. This step will surely be followed by other normal schools. In establishing and maintaining such scholastic standards the public normal schools join with the schools and departments of education in the colleges and universities to strengthen the equipment which has hitherto seemed sufficient for the corps of elementary teachers. The old requirement was that of the high school curriculum, with the adding of one or two years of professional training. This means that larger familiarity with the subjects taught—in other words, broader scholarship—will

henceforth be demanded. The most serious drawback to the advancement of the work in the elementary schools along the lines of the educational theories of recent times has been the utterly inadequate scholastic training of the teachers who undertook professional investigation. The need of broader scholarship has nowhere been more deeply appreciated than among the teachers themselves, and in testimony of this statement we need only recall the interest and support of that great multitude of elementary teachers who spend a part of their vacations in the summer schools and colleges. The encouragement of summer study by the superintendents of the great cities, and the avidity with which such opportunities have been seized, present a situation heretofore unknown, and one from which the greatest possible results may be expected. It is not method study simply that these teachers hunger for; it is rather information on special subjects in which they have discovered their weakness.

#### LARGER FREEDOM FOR THE TEACHER.

This suggests another characteristic of the teacher's work, which stands to-day in marked contrast with that of even recent years. I have in mind the larger freedom accorded each individual teacher; freedom from the old conventions and ideas as to what constituted curriculum as well as method. The breaking up of these formal conceptions has resulted in a spiritual liberty formerly unknown and capable of producing the largest efficiency in the work of the individual teacher. The work is no longer so mechanical. The presentation of these new subjects compels variety of method, and it is a noteworthy fact that with this greater freedom from conventional treatment there is a growth of mind and spirit which gives an inspiration and arouses an enthusiasm incomparable with that of the old régime. There are some who think that this freedom of the teacher has had its origin in the efforts made within these later times to adjust the work of the school to its environment; to have the child study things instead of studying about things; to bring him into contact with real life instead of that which represents life. It has seemed to me that all of this is strictly parallel with that freedom of the teacher which is found in elective work as compared with work prescribed; and while in the latter case there will always be prescribed work, and in the former case we must recognize the necessity of a certain amount of rigidity, in both movements we are tending toward larger spiritual as well as intellectual liberty.

#### KINDERGARTEN WORK FIRMLY ESTABLISHED.

The friends in the stronghold of kindergarten work, Chicago, have been greatly exercised lest a backward step should be taken in this important field. At times it seemed to the public that the whole department of kindergarten work was to be abandoned in the city of Chicago for lack of funds. It is probable that nothing could have done more to arouse the public interest in the subject than the danger which was thought to exist. It may be said with confidence that at no previous time has the position of the kindergarten work been more strongly established, and to my mind this constitutes one of the most important facts in the educational history of the year. The place of the kindergarten has been established in the minds of the great majority of Chicago citizens and all future budgets must contain liberal provision for this division of educational work. The superintendent of Chicago schools has strongly favored the placing of kindergarten work in the schools, especially in those of the poorer districts. In arrangements made for next year the same number of schools as for last year has been retained, but their effectiveness has been doubled, so that twice as many children will be cared for.

## CENTRALIZATION OF SCHOOLS.

Much may be expected from the campaign now being made in Michigan in behalf of the centralized rural school. Strong public sentiment has been aroused, and while hitherto the State grange has opposed every movement in this direction, a large part of its membership has come to advocate the proposed change. The district schools will be great gainers from this movement.

## AGRICULTURE IN RURAL SCHOOLS.

An interesting development in connection with the rural schools, especially in the States of Wisconsin and Missouri, is to be noted in the introduction of instruction in agriculture. This, of course, corresponds to the introduction of industrial or manual training in the city schools. It is an application of the now generally recognized principle of bringing the school work into close touch with the home life of the pupil; and it may safely be predicted that no more important application of the principle has yet been discovered. The nature of the subjects thus introduced and their pedagogical possibilities combine to make this step one of marked significance in the history of education. The complete reports of the revision of the public-school system of Ohio have not yet been published, but from private information it may be said that a most rigid revision of the system has been adopted, and that the Ohio public-school system may henceforth take its place side by side with that of other States which have in these last years made great progress.

## SUPERINTENDENT'S TENURE IN CHICAGO.

In addition to the significant steps taken by the board of education of the city of Chicago in enlarging the curriculum of the State normal school from two years to three, mention must also be made of the even more significant action involved in giving the superintendent an appointment for five years instead of one. This action, coupled with the general policy adopted in connection with the appointment of teachers, the large number of new buildings provided for, make the past year one of the most eventful in the history of the Chicago schools. It is generally recognized that these forward steps are in accordance with public sentiment, and are the outgrowth, in large measure, of seed sown in former years. The splendid battle fought in 1899 and 1900 by Mr. Andrews, now chancellor of the University of Nebraska, has secured results which but for this battle would have been impossible.

## THE SOUTHERN EDUCATION BOARD.

The Southern Education Board, which was the outcome of the Capon Springs conference held in Winston-Salem, N. C., in 1901, has already shown its strength and its power to accomplish good results. For the first time in the history of Southern education a comprehensive undertaking has been launched founded upon true principles. That educational work in the South should have to do with the education of the white man as well as the negro; that it should be worked out, for the most part, by Southern men; and that it should begin with the public school in the South are principles which appeal directly to the common sense of every intelligent thinker. It is confessedly true that the Southern States have not received their proper share of the great gifts for education. Twenty-five per cent of the population of our country should receive a larger proportion than 3 per cent of the general contributions to education. The Southern board will surely have the sympathy and cooperation of every friend of education in the North, and it is a source of satisfaction that in the membership of the board we recognize the names of men who are known in the North as well as in the

South for a true interest in sound education. The distinctive interest of this board, as has been officially announced, is in the public school, and it is particularly concerned in those forms of education "which look toward thrift, industry, and usefulness. This fact will guarantee, in part at least, the adoption of the principles of the new education. Dean Russell, of the Teachers College, New York City, in a personal letter makes this statement:

We have been changing our conception of what education is. Formerly the school aimed very largely at *learning*. Now we are including *doing* as an element in a good education that should perhaps be as prominent as the learning. We are stimulated in this direction by the Southern board above mentioned, for they stand very strongly for industrial education, in which a student consumes perhaps half of his time in the study of books and in reflection and the other half in *doing* or *making* something. In my opinion this tendency of the Southern board and of the Southern schools is reacting powerfully upon the conception of education in the North. In fact, for several years Hampton has been a most ardent advocate of an education which gives about equal prominence to learning and doing, and in this respect has been in advance of Northern institutions. We seem to be gradually accepting the Hampton view in the North, although we have been approaching the same idea from another side. The nature of the child, of course, requires a large amount of motor activity, and the demands of society also favor a kind of education which includes the execution of one's ideas. These latter two facts therefore, as well as the influence of the Hampton and Tuskegee schools, have led us to make a great advance in favor of more doing, making, executing, in the common schools.

As a result of this advancement, the three R's are not crowded out, but they are growing relatively less prominent, and much greater emphasis than heretofore is being thrown upon proper materials with which to work with the hands in the schoolroom. Just as the kindergarten has given much study to the gifts—that is, to the materials out of which the children shall make all sorts of objects—so the elementary school-teachers are being stimulated to make an extensive study of the proper materials to be used for construction of objects in grade work. Thus we are debating about the extent to which clay, paper, pasteboard, wood, bent iron, etc., shall be used, and this will probably be a more prominent topic in the future.

#### THE GENERAL EDUCATION BOARD.

A still more recent forward step in the interests of Southern education is the organization of a body called the General Education Board. The function of this board is entirely distinct from that of the Southern education board. The latter exists for the purpose of developing an educational sentiment. The former board has been organized to receive, hold, and dispose money for Southern education. The board has already at its command a fund of more than a million dollars. Its methods of work are those born of large experience, and its breadth of sympathy and its wisdom have already been satisfactorily administered. No stronger agencies, no agencies more greatly needed, have been established in any sphere of work, educational or industrial, in this last year than the agencies named—the Southern Education Board and the General Education Board.

#### CURRICULUM OF THE SECONDARY SCHOOLS.

In connection with the curriculum of the secondary schools, four or five tendencies may clearly be noted. Some of these are progressive; some of them may, perhaps, be regarded as characteristic of movement backward. In the latter class belongs, in the opinion of the writer, the disposition to give up provision for instruction in Greek. That there exists such a disposition can not be denied. It seems to grow out of the desire to make way for more practical subjects; but the fact is that as many people desire Greek to-day as at any time in the past. The more practical subjects are called for by another class of students. The introduction of business and industrial courses is rapidly increasing the number of high-school students, but these new students are in addition to those who other-

wise would take up high-school work. It is difficult, of course, in most communities to make provision for a subject in which the class is ordinarily so small, but by proper arrangement of courses such work can be provided for in connection with the Latin at a minimum of cost. And especially in this great Western country should every effort be made to conserve those studies which represent the ideal in thought and life. Principals and teachers will do well to read that most interesting paper, prepared just a year ago, on "The social need of Greek," by Mr. E. Benjamin Andrews, in which he shows so conclusively that "while a majority of educated persons in a society may be ignorant of Greek, all can not be. A remnant large enough to diffuse the cultivation proceeding from it must know the tongue, and that at first hand." His conclusions were, in part, as follows:

1. Social, and not merely individual, needs should be borne in mind in all large educational planning.
2. All believers in a rich and rounded social education should feel, think, speak, and act appreciatively toward Greek study.
3. Colleges and high schools with reasonably ample facilities should be encouraged to continue teaching Greek if already doing so; if not, to begin.
4. Since the excellence of the Greek discipline is less obvious than that of most studies, teachers should see that pupils likely to profit by it in a high degree at least consider this discipline, and should advise those pupils, if they wish, and such a course is possible, to elect and pursue Greek.
5. Pupils in Greek who show special ability and taste for it should be urged to the utmost proficiency in it.

#### COMMERCIAL AND INDUSTRIAL COURSES.

A second tendency, already noted, is the introduction of courses of instruction relating to commercial and industrial subjects. The passing year has seen great strides forward in this particular. Is this phase of secondary work moving perhaps at too rapid a rate? We must not forget that years are required to develop a new subject for practical educational results. Are we throwing aside those subjects whose educational value has been tested beyond question for the sake of introducing new subjects which, at all events, for a long period must prove to be of lesser value? The present writer has no desire to make objection to the introduction of new subjects, provided such introduction is accomplished cautiously and judiciously. Objection is made only to the adoption of too large a number of subjects, for which good methods have not yet been found; the promiscuous and miscellaneous use of anything that meets the demand of a passing craze. In any case, in meeting the demands thus made, redoubled effort must be put forth to work out the methods by which this new material may be adapted to the needs of a true education. It must follow, as a matter of course, that if elementary instruction draws material from the industrial, political, commercial, and agricultural realms, such material must also find its place in secondary instruction. But the problems connected with its introduction are not such as to find easy solution; and it may fairly be questioned whether, up to this time, the results achieved have been in any sense satisfactory. I would not suggest that this work is not to be continued, but it must be acknowledged that the most urgent need exists for caution and for a scientific study of the questions involved.

#### COLLEGE ENTRANCE CERTIFICATES AND EXAMINATIONS.

The third tendency which during the present year has attracted special attention is the substitution of the certificate system for examinations in connection with college entrance. To those of us who are familiar with the working of this system in the West this proposition has in it nothing that is new. It would seem, however, that this idea, born in the West, is making its way slowly but surely into the Eastern sections of the country. The indications are quite clear that

before long the certificate system in one form or another will be adopted by Eastern institutions. An important step in this direction has been taken within the year by the United States Military Academy, at West Point. In accordance with recent regulations made by its faculty and approved by the Secretary of War, candidates who are graduates of high schools will be accepted for membership in the first year. The regulations of the Military Academy are more liberal than they should have been made, inasmuch as graduates of three-year schools as well as those of four-year schools are eligible for admission. A modification of these rules will be adopted.

The success of the college entrance board of the association of the Middle States and Maryland has been greater than could have been anticipated. The work of this board is an intermediate step between the Eastern plan of entrance examinations set by each college for itself and the Western plan of certificates. It is openly asserted by some of the strongest adherents of the college entrance board that its work is paving the way for the adoption of the more general certificate plan. In this connection I might quote from a letter written me by the principal of a prominent New England academy: "The most important event of the year in secondary education has been the expansion of the work of the college examining board into New England, whereby at present all the New England colleges, excepting Harvard, will receive the college board certificates in place of their own examinations."

At several meetings of the high school and college teachers held last autumn in New England to discuss the question of joint boards of examination for entrance, such as the Middle States have adopted, this movement, though strongly urged by Harvard University and by Yale University, was overwhelmingly defeated. On the other hand, a motion made to revise, coordinate, and extend the certificate system met with great approval.

It is thought by some of the ablest representatives of secondary education in New England—among others Principal Coy, of the Hotchkiss School—that the experience of the past year includes as an encouraging feature the change on the part of the colleges to revert to the old standards of requirements which laid emphasis upon power and discipline rather than upon technical knowledge. It is believed that a beginning in this direction has already been observed, and that there exists a widespread conviction that such a course is required by sound doctrine. Certain Western institutions have laid emphasis upon this point for several years. It is gratifying to note that the recognition of this principle is gaining ground in the New England colleges. The principle involved is one essential to the best interests of secondary education, and unless this principle is adopted unreservedly, secondary training will not only lose a large share of its value, but in many cases prove distinctly injurious.

#### ELECTIVE WORK IN SECONDARY SCHOOLS.

The tendency toward the introduction of elective work in secondary schools has unquestionably increased during this past year. In so far as such election is virtually an arrangement of studies in groups of closely connected subjects, no exception to it may be taken; but to the proposition that the average secondary student is able, even with the parents' help, to select his subjects, and that such selection, because it is an election on his part, is preferable to the grouping of subjects which the best experience has approved, the writer desires to enter earnest protest—a protest based upon experience with students of a still maturer age. It has been my experience, after careful study of the facts as brought to light in the operation of different systems, that the average boy or girl in the freshman or sophomore college year exhibits an utter inability to make wise decision between various courses of instruction. The choice will be determined, in a majority of

instances, by the hour of recitation or some statement concerning the course by a fellow-student. Least of all does he have in mind the relationship of the course to the work which lies before him. I am therefore strongly of the opinion that unless the choice of subject in secondary work is practically controlled by the principal, election will prove injurious rather than helpful. Much is said, in connection with the open elective system, both in secondary school and college, of the advice given by instructors and the assistance rendered by parents, but practical experience goes to show that no one is more easily influenced by whims than the parents, and that too frequently the instructor is a specialist who has little interest in or knowledge of subjects outside of those with which he himself is directly connected.

#### DEMAND FOR SPECIAL TEACHERS.

The rapidly growing demand on the part of high schools and academies for teachers of athletics, manual training, and domestic science is significant of important educational tendencies, and the demand is no less significant than the fact that at the present time teachers in these specialties are so few that the demand can not be met. It is no longer possible for a teacher of Latin or a teacher of mathematics to perform service in these new departments. Not only is the amount of work called for too great, but the training required is of so special a character that a teacher is not fitted to perform the work who has not received special instruction. It would be well for the cause of secondary education if some of those teachers who to-day are preparing themselves for the teaching of English or Latin or mathematics were to consider whether they might not be more certain of a strong position if their special training should be made in one of these more practical subjects.

#### HIGHER STANDARD FOR HIGH-SCHOOL TEACHERS.

An interesting feature of the year that has closed has been the not infrequent announcement of the appointment in secondary schools of a man or woman holding the degree of doctor of philosophy. The number of high-school teachers having the full college training has been greatly increased during the year, at least in Western schools. There is, to be sure, some danger that the newly fledged doctor of philosophy will have become so great a specialist as to be unfitted to teach the elementary courses required in the high school. But this is by no means so true of the doctor of philosophy trained in an American institution as of the doctor of philosophy trained in a foreign university. American universities, while laying equal stress upon research, do not fail to keep before the mind of the candidate for the doctorate the practical side of life and teaching, and it will mark a splendid point of realization in the history of secondary work when a proportion at least of the teachers in any secondary school shall be doctors. Side by side with this point is that very closely related demand which calls for special pedagogical training of college graduates who desire to become high-school teachers. It appears, on the one hand, that the average secondary teacher shows a remarkable lack of broad, liberal knowledge. Men, as a matter of fact, go through our American colleges without securing accurate knowledge in any subject which they study, and the close of their college course finds them in possession of no really solid mass of facts to build upon. It is maintained by some of our secondary-school leaders—for example, Dr. Julius Sachs, of the Collegiate Institute in New York City—that this statement holds good of work in the classics as well as in subjects like history and modern languages. It is the testimony of the teachers in the normal schools and teachers' colleges that they are unable to take up the discussion of methods of teaching in secondary subjects because they find themselves immediately confronted with the necessity of teaching the subject-matter. This difficulty, I maintain, will never be adequately met until those who plan for

themselves a career in secondary teaching have done that work in a particular department which is now ordinarily done for a doctor's degree. On the other hand, it is equally true that many teachers are found to possess the necessary scholarship who lack the knowledge of pedagogical principles that is needed for the simplest kind of instruction. The best teachers, in my experience, are often those who at first show no special ability for teaching, but have given themselves to the study of the principles of teaching and have overcome difficulties that at first seemed insuperable. In both directions, therefore, the movement forward is encouraging.

#### TREND OF HIGH-SCHOOL DEVELOPMENT.

A remarkable fact in connection with secondary schools is their phenomenal growth. I do not stop to present the statistics, for these have been indicated on more than one previous occasion. If it is true that the number of high-school students has doubled within the last decade; that the great majority of all students who enter college now come from the high schools (it is an interesting fact that even in New England, Dartmouth College should receive from high schools more than 100 of the 141 members of its present junior class); that the number of high schools is increasing rapidly in every State, and that the scope of their curricula is growing almost at a pace with the increase in numbers, the time has surely come when this factor in our educational machinery deserves greater consideration than it has hitherto received. Wedged in between the great common-school work and the higher work of colleges and universities, its prominence in the past has not been commensurate with its importance. The high-school curriculum can not longer be regarded as one to be adjusted as a preparation for college. It may be questioned whether preparation for college is the most important subdivision of high-school work. In any case these schools have come to occupy a unique field independent of higher institutions. In many sections of the country the work is coordinate with the work of the smaller colleges, and the preparatory schools connected with the smaller colleges no longer occupy their former place of importance and dignity. In fact, the high school is rapidly coming to be a rival of the smaller college itself. In some States the high school now does the work of the freshman year, and even some of the work of the sophomore year, this being recognized and accepted by the State universities. This tendency, while subversive of the relationships which have hitherto existed between college and preparatory school, and while injurious in the extreme to the growth and development of the smaller college, is a tendency which is invaluable and which deserves encouragement. It is a movement in the interests of economy, of better secondary education, and of better and broader higher education. The time is coming when, in every State, the leading high schools will carry the work to the end of the sophomore year in college. Nothing can be said in justification of the policy of stopping at an earlier point than this.

#### COMMISSION ON ACCREDITED HIGH SCHOOLS.<sup>a</sup>

If, as it has been suggested, the most significant step in the field of secondary education in the Eastern States has been the successful inauguration of the College Entrance Board, it is perhaps true that the most significant step in the West has been the establishment of the North Central Association of Colleges and Secondary Schools, of its commission on accredited schools. This commission was established in 1901 and made its first report at the annual meeting held in Cleveland March 28, 1902. The commission consists of about 40 members, equally divided between colleges and secondary schools. Its purpose is to effect reason-

<sup>a</sup>The subject of admission to college on certificate of accredited secondary schools is treated in Chapter XII of this Report (pp. 527-539).—ED.

able uniformity in requirements for admission to college. If the plan recommended is put into operation, any student graduated from any school on the accredited list may without difficulty enter any college in the association.

The report defines a unit course of study as a course covering a school year with four or five periods of at least forty-five minutes each per week. It is recommended that the high-school curriculum contain not less than 15 such units, and that the same number be accepted as fulfilling the requirements for admission to college. Of these 15 units there shall always be 3 in English and 2 in mathematics.

The report also presents:

1. Definitions with detailed suggestions as to the ground to be covered in each unit of the several subjects of the high-school curriculum.

2. A plan of school inspection in accordance with which the list of accredited schools may be formed.

3. Suggestions for the assignment of college credit for high-school work done in advance of the college-entrance requirements.

In defining and describing unit courses of study the commission has based its recommendations on the definitions of the college entrance examination board of the Middle States and Maryland, the committee of twelve of the American Philological Association, the committee of twelve of the Modern Language Association, the committee of seven of the American Historical Association, and the department of science of the National Educational Association.

I wish to join with the distinguished educator of the State of Michigan, Mr. A. S. Whitney, in the following statement:

I believe that this movement of the North Central Association defining units of study and the way in which these should be pursued, together with the simplification and unification of high-school inspection by the various universities and colleges, will prove the most important uplift given the high schools for many a day. It will furnish something tangible, systematic, and scientific which will form a guide for all schoolmen to follow.

#### TRAINING OF MANUAL-TRAINING TEACHERS.

I can not conclude my statement concerning the secondary schools without mentioning the change which has been decided upon during the present year in the plans of the Chicago Manual Training School, an institution which has influenced secondary education in the West perhaps more than any other scholastic institution in the Mississippi Valley. By the terms agreed upon the institution will be associated with the new school of education in the University of Chicago. Special buildings for the prosecution of its work on a larger scale are being erected. Its work will remain a distinct and separate work, although associated in the closest possible manner with the other secondary work of the school of education. The trustees of the school believe that the time has come for it to enter upon a higher function than that which it has hitherto enjoyed, namely, that of training teachers for special departments of manual-training work. The educational world recognizes the valuable service which Mr. Belfield has performed in the cause of manual training, and stands ready to award him the credit which is his in view of the pioneer service he has rendered.

#### NEED FOR ENDOWED ACADEMIES.

My last point is to call attention to the lack of interest in the work of the academy as distinguished from that of the high school. The strongest supporter of the high schools believes as cordially as ever in the necessity of the academy. The high school can not, in the nature of the case, be a boarding school. The need of boarding schools for boys and boarding schools for girls is everywhere acknowledged, but such schools can not be made strong and effective so long as

they are dependent on the funds for their support. In the great flood of benevolence which now flows toward colleges and universities men and women are forgetting the necessity of strongly endowed academies. I can not here enter upon an argument in behalf of the academy, but it is safe to say that, just as there is a place for the State university and for the university established by private munificence, so there is a place for the academy as well as for the high school supported by the city.

No one can doubt that the onward movement of secondary education during the past year has been as great as that of any preceding year in the decade.

#### INCREASE OF HIGHER EDUCATION.

Every succeeding year of the past decade has witnessed a greater interest on the part of the American people at large in the work of higher education. The year just passing has contributed as much, perhaps, as any two or three of the preceding years. This larger interest is manifested by the increased attendance at all institutions giving instruction in higher work, by the greater numbers of men and women preparing themselves for the work of instruction in higher institutions, and by the larger public generosity which is manifesting itself on every possible occasion. In each of these particulars the advance during the past year has been significant. Many of our institutions are actually overcrowded, the numbers being greater than can be adequately cared for. The number of graduate students in our universities has more than doubled in five years. It is from this source that men and women are being selected to fill the chairs of our colleges and universities. Every week, and in some weeks every day, the public press announces gifts for higher education of \$50,000 to \$100,000, and larger sums. The Federal Government appropriates in one bill \$6,500,000 for the Military Academy at West Point; in another bill, even a larger sum for the Naval Academy at Annapolis. This increase in the numbers of students and in the numbers of those preparing for professorial work is not limited to any one section of the country. It reaches from the East to the far West. Nor are the gifts for education limited to the East, to the Central States, or to the West. They are being poured out lavishly in every direction, and are given alike to the smaller institutions and to the large universities.

#### HIGHER COMMERCIAL AND TECHNICAL EDUCATION.

An important feature of higher educational work in most recent times is the attention which is being given to commercial and technical instruction. The time has come when the university is compelled to adjust itself more definitely to its environment. The prevailing characteristic of the modern environment is now included under these words: Commercial and technological. In spite of the fact that in Boston there exists the greatest technical school in America (the Massachusetts Institute of Technology), Harvard University is compelled, so says its president, to establish by the side of it another school of technology. This is necessary in part because students who wish to attend school at Harvard desire instruction in technology, and also because a university must serve as the true expression of the sentiment of its period. The State universities have naturally led the way in the development of technological work. Other universities must follow if they are to meet the demands of the times. It still remains to be seen whether the steps that have been taken in the direction of commercial education of a college grade will realize the hopes of those who have engaged in it. After all, it is to be remembered that the main purpose of a college course is not the information which the student gains; and yet it is to be conceded that any ordi-

nary subject, well studied, may be used advantageously for the purposes of general education.

#### FEWER BACHELOR'S DEGREES.

A strong movement seems to have set in in the direction of reducing the number of bachelor's degrees to one. Following the lead of Harvard University, several institutions, including Columbia and Cornell, have given up the degrees of bachelor of science and bachelor of philosophy, and bestow upon all students who finish the college course the degree of bachelor of arts. This policy can, at all events, be defended on the ground of simplicity. It does away with distinctions which may seem to have lost their force. The strongest argument that has been urged is that by concentrating effort in the preservation of this degree the college course will be saved, where otherwise it is in danger of being lost. It may be questioned whether this tendency will go much further. It is surely doubtful whether it is to become universal. There are those who believe that the distinctions proposed in the different degrees are distinctions based upon real differences; that a course, the larger part of which is in science, may properly be called a course in science, and the degree given be a degree in science. The word "science" is one which its enthusiastic advocates should honor by use rather than dishonor by rejection. By the side of the old college of arts, the characteristic feature of which was the study of the classics, there have grown up two sister colleges—that of science and that of modern history and literature. Surely this fact may well be recognized, and nothing is gained by adapting the old degree to the new college, when it is so easy to employ a degree the name of which explains itself. This step can hardly be regarded as a forward step in education. The breaking down of real distinctions means backward movement, not progress.

#### MORE TRAINING FOR COLLEGE INSTRUCTORS.

It is generally conceded that the instruction given to students in the earlier college years has greatly improved within a short period. The custom of appointing as tutors or instructors students who had just graduated from college has almost disappeared in the better class of institutions. It is now expected that an instructor shall have had at least three years of special training in the subject in which he is appointed to give instruction. In some institutions there must be added to this at least one or two years of class-room instruction before an appointment is made. Not long since it was a common complaint that students in their freshman year received poorer instruction than in the last years of the academy or high school; and there was ground for this complaint. It can no longer be made, however, in view of the men appointed in all our institutions to do the earlier college work. In many institutions the oldest and most experienced professors give a portion of their time to freshman and sophomore classes.

#### STUDENT LIFE DEMOCRATIC.

A recent discussion in the *Century Magazine* on the growth of luxury in student life seems to have shown that, in so far as there has been a growth in this particular, it has not exceeded the similar growth in ordinary American life. Student life in our colleges and universities differs very slightly from the life of young men and women in any other sphere. Nowhere is life more democratic. It is impossible in student life that the influence of wealth should be felt. In most institutions the man who earns his livelihood by waiting on table occupies as high a position in the estimation of his fellows, if he is himself worthy of it, as does the man whose father is worth millions. The passing year has furnished no evidence that our higher institutions are moving further away from the people. The

fact that entering classes have been larger than ever indicates a confidence on the part of the American public in the purposes of the college and a faith in its ability to work out these purposes.

#### COLLEGE ATHLETICS.

The much-discussed subject of college athletics has received no important contributions during the year. Three things may perhaps be noted: First, the more stringent rules adopted by the Western colleges for the regulation of intercollegiate athletic work, and the general opinion that Western college athletics are now practically free from professionalism; second, the policy of many institutions to organize games between different divisions of the university itself, as well as to develop a special team for intercollegiate or interuniversity work; third, a growing feeling that the charging of large fees for admission to games savors too much of professionalism.

It may be feared that within a comparatively short time the rivalry between closely located institutions, East and West, has developed some antagonism. In not a few institutions there seems to exist a strong spirit of personal hostility toward other institutions with which competition in athletics is undertaken. Some of this same spirit has been manifested by home teams toward visiting teams, as well as by visiting teams toward the teams on whose grounds the games have been played. It is hardly necessary to say that such manifestations are a mark of deterioration and indicate that instead of making progress we are losing ground. Such an attitude of mind is hardly worthy of a true sportsman; much less does it accord with the high academic spirit. If such feelings are a necessary part of intercollegiate athletics, the sooner intercollegiate athletics are abandoned the better for all concerned. One can not believe, however, that these manifestations are anything more than passing phases, which in another year will have been forgotten, and that in their place there will arise a stronger spirit of dignified and friendly rivalry, characteristic at once of the gentleman and the scholar.

#### FRATERNAL FEELING BETWEEN UNIVERSITIES.

The head of a prominent State university in the West has written to me that in his opinion one of the leading features of the educational advance of the year "is the measure of fraternal regard which has grown up between leading institutions of higher learning. If this existed before it has certainly had a marked advance in the course of the last twelve months, and it is a very important factor in the future of American education." No one can doubt the truth of this statement, made by President Draper, of the University of Illinois. It is not too much to say that nowhere in the various activities of the world has fraternal regard shown itself more distinctly, nowhere has the spirit of cooperation been manifested more definitely, than among the higher institutions of learning. A conspicuous example of the good feeling existing between institutions is the interchange of professors which has grown up during these last years, the trustees of one university consenting to the transfer, for a certain period, of a particular person to another institution. A most striking case of this kind is the arrangement by which the corporation of Harvard University has recently given leave of absence to a professor in its law school with the understanding that he shall accept for that period the deanship of the new law school of the University of Chicago, and undertake to establish in connection with the latter university a school which shall, at all events in some measure, partake of the strength and characteristics of the Harvard school. What greater evidence of good will and mutual interest could be presented? This spirit of fraternal regard has been shown most tangibly in the four great academic festivals of the year held in connection with the celebration of the

Yale bicentennial, the celebration of the twenty-fifth anniversary of the Johns Hopkins University, the inauguration of President Butler at Columbia, and the centennial celebration of the Military Academy at West Point. At each of these celebrations representatives of many institutions were assembled. It seemed to be the prevailing opinion that good relationships between institutions of higher learning are not only conserved but greatly encouraged by such gatherings. In any case it is evident that, so far as the faculties are concerned, old hostilities have disappeared. In spite of the sharp competition which necessarily exists, feelings of the most friendly character are entertained, officially and unofficially, by one institution for another. It is evident to all that such gatherings are the means by which higher education makes a most forceful impression upon the consciousness of the people of the United States. The country knows no kind of celebration more brilliant or more effective than that which is connected with the two-hundredth anniversary of a university, or even with the twenty-fifth anniversary of an institution of higher learning; and the time has come when the inauguration of the president of a large university is of greater importance and attracts more general interest than the inauguration of the governor of a commonwealth.

#### CHANGE IN THE ATTITUDE OF BENEFACTORS.

The president of Harvard University has called my attention to a change which, as he puts it, "has been strikingly illustrated during the year now almost finished in the altered taste of benefactors in regard to objects of endowment. The older endowments of Harvard College were for mathematics, divinity, Greek, Latin, moral philosophy, and belles-lettres. The subjects which most easily enlist the interest of benefactors now seem to be medicine, architecture, history, economics, and government. Intelligent benefactors are generally moved by some far-reaching hope for good. This change indicates that the hopes of our generation concerning the future progress of civilized man are somewhat different from those during the earlier part of the eighteenth and nineteenth centuries."

The experience of Harvard is the experience of many universities, and no year has furnished more evidence of this change in the attitude of benefactors than the year just closed.

#### A BACHELOR'S DEGREE AS A CONDITION OF ADMISSION TO THE PROFESSIONAL SCHOOL.

In certain quarters much enthusiasm has been exhibited over the proposition to limit admission to professional schools to those who have already taken the bachelor's degree. The most conspicuous examples of this policy are the Johns Hopkins School of Medicine and the Harvard Law School. During the year the Columbia Law School and the Harvard School of Medicine have adopted the policy. Within two weeks the President of Yale University has expressed in no uncertain way his opinion that "this movement is a movement in the wrong direction." In this opinion I am compelled to join; and, if all the facts were announced, I am persuaded in my own mind that a large proportion of the membership of the very faculties through which this change has been brought about would agree substantially with Mr. Hadley's point of view. Men who are to do work that shall count in their professions must find themselves in possession of the technique of the profession before they have reached an age when such technique is impossible. Besides this, the earlier courses in law, in medicine, in divinity, are as truly disciplinary and as productive of culture as any subjects that are offered in the college curriculum. Many men who are preparing for a profession are distinctly injured by the last year or two in college instead of being benefited thereby. There are some men for whom the college atmosphere, as dis-

tinguished from that of the professional school, is not a wholesome one. Men who in college idle away their time in many cases find the more strenuous life of professional training exactly suited to their needs. The value of this movement, both from the point of view of the college and from that of the professional school, may, therefore, be doubted. In any case, a middle ground, requiring two or three years of college work, is a superior policy for the next decade.

#### SHORTENING THE COLLEGE COURSE.

The feeling grows stronger in every quarter that the college course, at least for those who are to engage in a profession, must be shortened. It does not seem that the Harvard plan of three years meets with general favor, even in Cambridge, although, according to the official report, 40 per cent of the men now graduating from Harvard College finish their academic work within three years. It would seem to be a better plan to allow those who do not contemplate a professional course of study to take the full four years of work in college, and to arrange for the other class to count their early professional work as a part of the work accepted for the bachelor's degree. A great forward step in the direction of this policy has been taken in the recent action of Yale. This policy has been adopted as the basis for the organization of the schools of medicine and law in the University of Chicago. It is the most practicable solution of the problem which confronts us, and bids fair to be the commonly accepted solution within a short time.

#### MORE WOMEN DESIRED ON COLLEGE FACULTIES.

Considerable comment has been made, although in a quiet and cautious way, upon the apparent scarcity of women possessed of the proper qualifications and training for the highest positions in college work. A prominent educator (I think it best to withhold mention of his name) has gone so far as to say that this scarcity is greater to-day than it was five years ago. Several suggestions have been made in explanation of the fact. For myself, I am not convinced that the proposition itself is true. The women now being graduated, with the doctor's degree, from our strongest institutions, are, in almost every particular, as able and as strong as the men. If opportunity were offered, these women would show that they possess the qualifications demanded. The fact is that to women there do not come the opportunities to show their strength which come to men. In colleges and universities for men only, women may not find a place upon the faculty. In a certain great State university, in which there are as many women students as men students, women are represented in the faculty by a single individual, and she has been appointed within the last three years. In some of the women's colleges women find a place. In others, second-rate and third-rate men are preferred to women of first-rate ability. The number of faculties of colleges and universities on which women have appointments in any number is very small, and even in certain institutions in which women have gained secure footing there is often greater or less distress among the men of the various departments if even one or two women are appointed. And yet, is it possible that the heads of our State institutions—institutions which are established by the people and conducted with the people's money; institutions which are professedly democratic beyond all others—deliberately refuse to recommend the appointment of women even when they have attained equal rank with men in scholarship and efficiency? So far as I can ascertain, during the past year the appointments of women, east and west, even in coeducational institutions, have numbered very few—fewer, perhaps, than ever before. Is this progress? Or is it rather a concession to prejudices which, instead of growing weaker, are growing stronger? I

venture to ask the regents of our State universities and the trustees of our coeducational institutions to consider this question; and I think it not inappropriate to suggest for the consideration of the trustees of certain women's colleges the question whether, in this matter, they have given to women the full opportunity which they deserve.

#### TENURE OF OFFICE OF PROFESSORS—FREEDOM OF TEACHING.

A burning question during this past year has been that which relates to the tenure of office of professors. That words have been spoken on both sides of the question is evident from the following statements, taken from personal letters addressed to me by two eminent presidents of universities. One of these gentlemen writes as follows:

Another tendency characteristic of the passing year, and tending toward reform, is the growing feeling that the professor's chair is sacred only as its incumbent makes it so, and that it is the right and duty of a university not to retain men deficient in character or ability as judged by the reasonable standards of the institution itself.

Another equally prominent president writes from the other point of view:

I can think of nothing so important to be touched upon in such a review as that which you propose as the danger of professorial degradation. This danger is mainly twofold: One arising from the extremely low salaries many institutions of considerable character are paying to titular professors, who, in the nature of the case, must be most ill-furnished for the work; and, secondly, from the tendency in certain quarters to snub professors, to treat them as underlings, and to constitute the head of the university a mere business boss. It is not at all the issue of academic freedom in the old sense, but rather one of personal freedom, manliness, and self-respect on the part of professors. I deem this a real danger vastly greater than any in which academic freedom, in the old sense, has ever stood in this country.

Here, then, is the issue; and it is an issue squarely drawn. Has progress been made in this respect, or has ground been lost in these last months? I have no hesitation in finding an answer to this question. Every month of the last twelve months has added to the security and permanence of the professor in the prosecution of his work. Every month has added to his dignity and to the importance which attaches to his words. Every month has made it clearer that public sentiment is on the side of the professor in any contest entered into with the institution of which he is a member. Within five years the sentiment has become almost universal that, once a man is appointed to do work in a university, the university is responsible for the appointment, but not for the views which the man later may propound. Gradually, but surely, even the common people are coming to perceive the difference between the university and the individual professors who form its staff. The time has not yet come, to be sure, when the people make distinctions of this same kind between the president of an institution and the institution itself. It is still wrongly understood that the words of a president must be words carrying with them the force and influence and authority of the university as a whole. Ten years from now, in the West and Northwest, men will be able to make this additional distinction. But great has been the progress which has thus far obtained in the attitude of the public toward the individual professor. It is asked, however, and not without reason: "Is there no limit to the indiscretion which a professor may commit in language or in deed? Are there no circumstances under which, by common consent of all concerned, the resignation of a professor may wisely and justly be demanded?" I take the liberty of repeating on this occasion words which I have used within the year in another address:

The greatest single element necessary for the cultivation of the academic spirit is the feeling of security from interference. It is only those who have this feel-

ing that are able to do work which in the highest sense will be beneficial to humanity. Freedom of expression must be given the members of a university faculty, even though it be abused; for, as has been said, the abuse of it is not so great an evil as the restriction of such liberty. But, it may be asked, In what way may the professor abuse his privilege of freedom of expression? Or, to put the question more largely, In what way does a professor bring reproach and injury to himself and to his institution? I answer: A professor is guilty of an abuse of his privilege who promulgates as truth ideas or opinions which have not been tested scientifically by his colleagues in the same department of research or investigation. A professor has no right to proclaim to the public as truth discovered that which is yet unsettled and uncertain. A professor abuses his privilege who takes advantage of a class-room exercise to propagate the partisan views of one or another of the political parties. The university is no place for partisanship. From the teacher's desk should emanate the discussion of principles, the judicial statements of arguments from various points of view, and not the one-sided representations of a partisan character. A professor abuses his privilege who in any way seeks to influence his pupils or the public by sensational methods. A professor abuses his privilege of expression of opinion when, although a student and perhaps an authority in one department or group of departments, he undertakes to speak authoritatively on subjects which have no relationship to the department in which he was appointed to give instruction. A professor abuses his privilege in many cases when, although shut off in large measure from the world and engaged within a narrow field of investigation, he undertakes to instruct his colleagues or the public concerning matters in the world at large in connection with which he has had little or no experience. A professor abuses his privilege of freedom of expression of opinion when he fails to exercise that quality—which, it must be confessed, in some cases the professor lacks—ordinarily called common sense. A professor ought not to make such an exhibition of his weakness, or to make an exhibition of his weakness so many times, that the attention of the public at large is called to the fact. In this respect he has no larger liberty than other men.

But may a professor do all of these things and yet remain an officer in the university? Yes. The professor in most cases is only an ordinary man. Perfection is not to be expected of him. Like men in other professions, professors have their weaknesses. But will a professor under any circumstances be asked to withdraw from the university? Yes. His resignation will be demanded, and will be accepted, when, in the opinion of those in authority, he has been guilty of immorality, or when for any reason he has proved himself to be incompetent to perform the service called for. The public should be on its guard in two particulars—the utterance of a professor, however wise or foolish, is not the utterance of the university. No individual, no group of individuals, can speak for the university. A statement, by whomsoever made, is the statement of an individual.

#### JUNIOR COLLEGES.

President Jordan, of the Leland Stanford Junior University, has suggested to me that among the various important movements of the year is the disposition of small colleges to become junior colleges, turning their graduates over to the universities at the beginning of the junior year. I may not dwell upon this opinion longer than to say that, within my own observation, many facts pointing in this direction have occurred. When some of our smaller colleges shall have come to appreciate the fact that their position in the educational world will, indeed, become a higher one if they will limit their work to that which they can do with thoroughness and satisfaction to all concerned, and will encourage their students at the end of the sophomore year to take advantage of the larger foundations to

be found in the State universities and in the great cities of the country, a great step forward will have been taken. The adoption of this policy by even a few will inaugurate a movement the ultimate results of which will be of incalculable value to the cause of higher education.

#### TRANSFER OF THE CONTROL OF EDUCATION TO THE LAITY.

No fact has been commented on more widely than that which has been thoroughly illustrated by the change of presidency at Princeton; namely, the transfer of the control of education from the clergy to the laity. In the Association of American Universities only one institution is under the administration of a clergyman; that one is the Roman Catholic University at Washington, and is essentially a theological institution. Special attention was drawn to this fact in the address of Mr. Eliot at the Columbia celebration. The significance of it is self-evident, and, when coupled with the fact that so small a number of college graduates in our universities now plan for the profession of preaching, the significance grows even more startling. Moreover, from no quarter, not even from the clergy, do we find criticism of this policy. It seems to meet with general favor and approval. Surely, if anywhere, the old régime would have continued in Princeton; but even at Princeton the new policy has been adopted. The fact is itself a commentary upon the function and place of higher education in the public mind. It is an epitome of the great change which has taken place within so short a time. One may not be too sure that this change is altogether good. Time alone will determine whether something is not lost in this transfer. It does not mean that our institutions of learning are any less religious either in fact or in theory, for it may be confidently maintained that never, in the history of higher education, has the religious spirit prevailed more widely, or extended more deeply, than at present. It does not mean that questions of ethics or of philosophy occupy a less prominent place than in former years. It does not mean that biblical instruction is now taking a secondary place in comparison with that which it has hitherto occupied; for here again, as everyone knows, never before in the history of college education have biblical studies occupied the place in academic instruction which they hold to-day. But if it does not mean these things, what does it mean? Simply that the work of education is itself a profession, separate and distinct from preaching. Just as, in olden time, when specialism introduced itself, he who had formerly been sage and soothsayer and priest was compelled to specialize, and three different classes of teachers, under different names, arose to do the work, namely, the sage, the prophet, and the priest; so to-day the training of the preacher is not the training which ordinarily is best adapted to prepare a man for the work of a university presidency. In truth, the position of the university president has become a unique position, a profession by itself; one the demands of which are greater perhaps than those made upon any other profession. This new phase is a growth of the last two decades. What its future development will be no one can prophesy; but it stands out to-day as distinct from the office of the clergy, on the one hand, as from that of the specialist in any department of science, on the other. The college president must be a specialist, and he must also be a generalist. Scholarship is expected of him; at the same time, thorough business training. The capacity for desk work is demanded, and, besides, skill in public speaking; and, above all, if not knowledge of all things, at least sympathy with all knowledge. The past year has made large contribution to the further differentiation of this new character in modern life.

#### THE RHODES SCHOLARSHIPS AND THE CARNEGIE INSTITUTION.

The two greatest single events in the history of higher education during the past year—indeed, during the past ten years—are those connected with Mr.

Rhodes's proposition for American and colonial scholarships, at Oxford, and the foundation of the Carnegie Institution in Washington for research work. It is intensely interesting to note that these two great events were announced within ninety days of each other, and that the one is distinctly for educational purposes, the other for purposes of research, the two thus covering the entire function of the modern university. It is interesting to note further that in one case the provision is made by a foreigner, although intended to benefit American youth, and that in the other case the provision is also made by a man of foreign birth, its purpose being to elevate and dignify and increase the possibilities of research work in the land of his adoption. The members of the National Educational Council can not fail to have noted that the action of Mr. Carnegie was the direct result of a report made by a committee of this council a year ago, and that the Carnegie Institution has been established on precisely the lines laid down in the report of this council's committee.

The president of one of our oldest institutions writes to me privately this statement concerning these great gifts: "The relation of the great gifts of the past year to the future, like those of Carnegie or Rhodes, is so problematical that I do not, so early as this, venture to estimate their importance."

It is plainly possible that great injury to the cause of education may result from gifts of this magnitude, unless they are properly administered. On the basis of important testimony, coming to me directly from leaders of education in Scotland, I am convinced that Mr. Carnegie's gift to Scotch universities up to the present time has resulted in far greater injury than good to those institutions and to the cause of education in that country. One of the most dangerous weapons in the world is a large sum of money badly administered in a good cause. It is, therefore, as has been suggested, too early to hazard an opinion on the good or evil results of these gifts. That both of them have great possibilities of good no one can deny. The Carnegie fund has been established for research and ought to contribute largely to institutional cooperation; but if, instead of encouraging the work of research and investigation as already established in our institutions of learning, it endeavors to detach such work from those institutions and to gather to itself the responsibility and the credit for such work; if, instead of strengthening the work where it already exists, it undertakes to establish new foundations, independent of these institutions, in order that its own work may be more tangible, it will prove to be the greatest curse to higher education in this country instead of a blessing. If the Rhodes scholarships are to be employed to detach from the American environment 100 or more young men of special ability each year and transport them to foreign soil in order to imbue them with foreign ideas at an age when they are peculiarly impressionable; if the purpose of this foundation is to draw all men to a recognition of the doctrine of imperialism as it is embodied in the British Empire, the execution of this trust may prove a curse instead of a blessing to those who avail themselves of its privileges.

But there is no good reason to suppose that these injurious results will follow. The men to whose trust has been committed the Carnegie Institution are men of broad sympathies and of large ideas. Although thus far no sufficient indication has been given of the policy of the institution to lead us to suppose that the original proposition of institutional cooperation has a large place in the minds of those immediately in control, time will convince all who have relationship to this institution that only such a policy will be productive of the best results. And, surely, in the disposition of the Rhodes scholarships there will be employed that same large wisdom which has thus far characterized British statesmanship and diplomacy. The form of the gift is sufficiently indefinite to make it possible to modify the original proposition and to permit these scholarships to be for graduate work rather than for undergraduate work. In any case, regulations may

easily be established which will make profitable this temporary sojourn of American youth in a country so closely connected with our history and our sympathies. England and America stand together to-day, and in the future will continue to stand together, in all great international and humanitarian movements; and this additional bond of union may be not the least important one in bringing about great international reforms, in which England and the United States shall take the lead.

#### CONCLUSION.

We who are workers in the educational field to-day live in a period of great and wide-reaching opportunity. Our predecessors knew nothing of the advantages which we enjoy. The outlook which presents itself to us would have been for them an utterly impossible one. Greater wisdom is needed to-day, in view of these new and splendid opportunities. The work of the teacher grows more and more secure, and is more and more highly esteemed by the people at large. It is the highest career man or woman is permitted to follow. The greatest of all men was a teacher, a man who employed the methods of a teacher, and was recognized as such by all who met him. In view of the achievements of the past, and the possibilities and opportunities of the future, let us "gird our loins," put on new strength, and take up the burden of life for another year with new courage and with a never-failing faith in the dignity and value of the work which God has given us to do.

To the more than one hundred leaders in education in the elementary, the secondary, and the higher fields of work who, by their suggestions, have aided me in the preparation of this paper, I wish to make acknowledgment of my indebtedness.

I have intentionally omitted the consideration of the educational literature of the year, as well as the trend of educational matters across the ocean. It was necessary to place some kind of limitation on the scope of the paper.

## CHAPTER XV.

### EDUCATION IN FRANCE.

France, Republic: Area, 204,092 square miles; population, 38,517,975 (1896). Civil divisions having special functions in educational administrations: departments (90 in number, including 3 in Algiers); communes, cities or villages.

Retrospective and current survey of State education; the system of primary school inspection; the new scheme of secondary education; the law subjecting religious orders to civic authority; conspectus of courses of study in the University of Paris; the new university doctorates; international correspondence of students; the teaching of "la morale" in the primary schools; the simplification of French syntax. (Report, 1901, Vol. 1, pp. 1081-1133.)

#### TOPICAL OUTLINE.

Statistical summary for 1900-1901. Constitution of the State system. Historical development of the system.

*Primary education:* Detailed statistics, current and comparative; school enrollment and attendance; the teaching force; expenditures. Agencies complementary to the school: Evening classes; popular lectures; insurance societies ("Petites Caix"); associations of former pupils ("Petites A"); school patronage associations; university extension; sources of support. Educational statistics of French cities having more than 100,000 inhabitants. Statistics of illiteracy.

*Secondary education:* Statistics; scope; unsatisfactory condition arising (1) from the influence of the rival schools of the religious orders, (2) from the want of scholastic advance; law against the religious orders; the new plan of secondary studies as set forth by Dr. Compayré; comparative view of curricula 1886-1902; chronological review of the successive modifications of secondary schools since 1789.

*Higher education:* Statistics, current and retrospective; historic review of the development of French universities, after report of M. Liard; particulars of recent expansion, from report of M. Maurice-Faure; admission of foreign students to French universities; table of higher technical schools.

*Appended paper:* The professional and financial status of French primary teachers as developed by a recent inquiry.

<sup>a</sup>Report of M. Maurice-Faure, for the Chamber of Deputies, session 1902, pp. 2, 3.

## SUMMARY OF THE YEAR, 1900-1901.

From the above summary it appears that in the year 1900-1901 there were enrolled in the primary schools of France, including infant schools, a total of 6,277,340 pupils. Omitting the infant schools, the enrollment in primary schools was 5,530,232, equivalent to 14.19 per cent of the population. Of this enrollment 75 per cent were in State primary schools. Secondary schools for boys enrolled 165,148 students, of which total 53.4 per cent were in State schools (lycées and communal colleges). The universities registered 31,389 students, of whom the vast majority, viz, 95 per cent, were in the State institutions.

In addition to the State universities there are numerous special schools for advanced study and research under the control of the minister of public instruction and supported by the State (see footnote, p. 698), and several State technical schools of university rank under the control of other ministers (table, p. 710). The numerous municipal schools of similar character complete the public provision for the highest order of specialized education. The number of students belonging to the high-grade special schools can not be exactly stated. Of those in attendance upon the specialized schools of liberal culture, i. e., the École des Hautes Études, Collège de France, etc., many are borne on the university registers as candidates for degrees. The number of students in the special technical schools is approximately 3,500.

Technical schools of a somewhat lower grade are very numerous, including 35 schools of arts and trades dependent upon the ministry of commerce, enrolling about 5,500 pupils; 13 municipal technical schools in Paris, with 1,380 pupils, and a large number of private schools, supported by private societies or by manufacturers.

The three principal secular associations engaged in the maintenance of schools of this class report for the year 1899-1900 an average attendance upon their classes in Paris (chiefly evening classes) as follows:

	Students.
The Polytechnic Association .....	13,380
The Philotechnic Association .....	9,920
Union Française de la Jeunesse .....	11,348
Total .....	34,748

The expenditure for the schools and universities under the control of the minister of public instruction is met by State and local funds. The appropriation for this purpose from the State treasury amounted in 1901 to \$41,393,296 (206,966,483 francs). Of this total about 76 per cent, \$31,426,215 (157,131,075 francs), was for primary education.

The most important event of the year under review has been the enforcement of the law for the regulation of the religious associations, which represent about one-third of the teaching power of the State. The influence of these associations, especially in the department of secondary education, has been regarded by the republican government as adverse to its policies, and this feeling was one of the provoking causes of the measure which subjects the associations to the civil authority. As regards the right of the State to determine the conditions upon which the associations may exist and carry on their operations in France, the new law simply reaffirms the policy sanctioned by previous laws, but the vigorous enforcement of the law is a new departure. The bearing of this law upon educational interests and the significance of the statistics summarized in the foregoing table will be more fully disclosed by the details which follow.

#### CONSTITUTION OF THE STATE SYSTEM OF EDUCATION.

The State system of education is characterized by centralized control, thorough organization, and comprehensive scope. The executive chief is a cabinet officer, the minister of public instruction (at present M. Chaumié). The minister has extensive administrative power, and also takes the initiative in measures for the development of the system. He supports his propositions in debate in either chamber, but votes upon them only in the chamber of which he is a member.

For the supervision of the system the country is divided into seven inspectorial districts, to each of which an inspector-general is annually assigned. These officials are chosen from educational experts and appointed by the President of the Republic upon the nomination of the minister, from whom they receive their instructions and to whom they report directly. (Formerly there were general inspectors, also, for special branches—music, gymnastics, drawing, etc.—but the tendency is to concentrate the work in the hands of the general inspectors. A special inspector of drawing is still retained, and there is also a corps of general inspectresses of infant schools.)

To the central authority belongs, also, the superior council of public instruction, which deliberates upon all matters referred to it by the minister, and constitutes also a final court of appeal in respect to disputed questions and cases of discipline.

The council consists of 60 members, one-fourth appointed by the President of the Republic and the remainder elected by their colleagues (professors and teachers), the term of service being four years.<sup>a</sup>

The minister is also assisted by an advisory committee (*comité consultatif*), formed by his own appointment from the company of general inspectors, honorary or acting, and from the highest officials of the system of public instruction.

The centralized control of the system is facilitated by its organization into academies<sup>b</sup> or administrative divisions, 17 in number. Each academy comprises

<sup>a</sup>The elective principle was established by the law of 1880, reorganizing the councils and admitting representatives of secondary and primary education. Among the appointed members are found at present the names of M. Bayet, chief of the department of superior education; Mme. Dejean de la Batie, directress of normal school, Fontenay-aux-Roses; M. Gréard, for thirty years vice-rector of the Paris University; M. Liard, successor to M. Gréard; M. Rabier, director of secondary education; M. Boutmy, distinguished for his writings on political science.

Among the elected members are the well-known names of M. Lavissee, member of the French Academy; M. Leroy-Beaulieu, member of the Academy of Moral and Political Sciences; M. Berthelot, distinguished chemist; M. Brouardel, of the Paris Faculty of Medicine; M. Croisset, dean of the Faculty of Letters of the Paris University; M. Boissier, of the French Academy; M. Jost, inspector-general of primary education.

<sup>b</sup>The word academy, besides this special use in relation to the system of public instruction, signifies also a society of *littérateurs*, savants, or artists. It is used absolutely for the French Academy.

a university, one or more university faculties, a group of secondary schools (*lycées* and communal colleges), and its quota of primary schools. The chief officer of the academy is the university rector, who is appointed by the President of the Republic, and subordinate only to the minister of public instruction. The authority of the rector extends to all grades of education, but the interests of higher and secondary education absorb most of his attention; hence the general conduct of primary education is relegated to the academic inspectors, of whom there is one for each department comprised in the academy.

The academic rector is assisted by a council of university professors, of whom four are his own nominees and the remainder elected by their colleagues.

The local unit for primary school administration is the department, a civil district which, for educational purposes, is treated as a subdivision of the academy. There are in all 90 departments (including 3 in Algiers), which are unequally distributed among the 17 academies.

The educational authorities for the department are (1) the prefect or civil chief, an appointee of the President of the Republic; (2) the educational council, 4 of whose 14 members belong to the civil council of the department, 2 are primary inspectors, and the remainder teachers elected by their colleagues; (3) the academy inspector, appointed by the minister of public instruction. Each department has also a corps of primary inspectors, in the proportion of 1 to every 150 schools. To this class of officials falls the inspection of individual schools, the conduct of teachers' meetings and of the examination of pupils for the *certificat d'études*.

With the exception of the departmental prefect, the educational officials are all chosen upon professional grounds. The rector of an academy must have the doctor's degree, and in addition must have given proof of administrative ability. The academic inspectors are chosen by the minister generally from the professors of secondary education or from the body of primary inspectors; in any case, they must have had experience in teaching or in school administration.

The primary inspectors are selected by competitive examination from the élite of the teachers. The examination is the same as for the directors of normal schools, and includes, besides general branches, pedagogy, school law, and school management.

#### HISTORICAL DEVELOPMENT OF THE SYSTEM.

The system of public instruction comprises three departments—primary, secondary, and superior—each under its own chief or director.<sup>a</sup> This division follows the lines of historic development. The secondary schools (State *lycées* and communal colleges) form with the universities a system of liberal education, crowned by specialized training for the learned professions. In this respect they preserve something of the relations that existed before the Revolution between the University of Paris, the mother university, and the colleges that clustered around it. The separate administration of secondary and of higher education is a survival from the Imperial University. The work of the Republic in these two provinces has been that of gradual transformation in the spirit of scholastic freedom and in

<sup>a</sup>It is worthy of note that the frequent change of ministers has had little effect upon the administration of the system, since it has been the policy to retain the chiefs of the three divisions of the system, irrespective of these changes. Thus M. Buisson was director of the department of primary education from 1877 to 1897, when he succeeded M. Marion in the chair of pedagogy at the Sorbonne. His successor, M. Bayet, has just been transferred to the post of director of higher education in place of M. Liard, who has been chosen to succeed M. Gréard as vice-rector of the Academy of Paris. M. Rabier remains as director of secondary education. The rectors of the academies are also retained during long periods, as illustrated by the career of M. Gréard, who has directed the affairs of the Paris Academy throughout the whole period of the Republic. Nearly equal in duration has been the service of Dr. Compayré, rector of the academy of Lyon, formerly of the academy of Lille.

accordance with modern demands. On the other hand, the system of State primary schools is almost wholly the creation of the Republic.

The work was begun in 1878 by the appropriation of a fund of \$23,000,000 to be advanced to the communes, one-half in subventions, the other half in loans, to aid them in building schoolhouses. The want of adequate provision in this respect made it impossible to carry into full effect the law of 1833 (Guizot's law), requiring every commune to maintain a public school, supported in part, at least, by a communal tax. This obligation had been extended by Duruy's law (1867), which required every commune of 500 or more inhabitants to maintain a separate school for girls. Under both laws (i. e., 1833 and 1867) a parochial school might be adopted as a public school. The first official school statistics published under the Republic (1876-77) showed for the 36,097 communes 71,547 schools. Of these, 59,021 were classed as public schools, but of this number, 13,205, or 22 per cent, were schools belonging to religious orders.

If instead of schools the number of classes be considered, it appears that 32 per cent were in charge of members of religious orders.

The measures by which the Republic has freed the public schools from all relation to the church were adopted under the direction of Jules Ferry, who was appointed minister of public instruction in 1879. He began the work by a law passed August 9, 1879, imposing upon each department the creation of a normal school for women teachers upon the same guarantees as those required by the law of 1833 for the normal schools for men.

This law, with the subsequent foundation of the higher normal schools, St. Cloud and Fontenay-aux-Roses—intended to train professors for the departmental normal schools—completed the provisions for training a body of teachers devoted to the service of the Republic.

There followed in rapid succession the measures by which this minister perfected the national system of primary education, namely, the law of June 16, making the public primary schools free schools, and requiring all primary teachers to be provided with a State diploma, "*brevet de capacité*" (letters of authorization from ecclesiastics had been previously accepted in lieu of a diploma), the law of March 28, 1882, rendering primary instruction obligatory (choice of means being left to parents), and the law of October 30, 1886, regulating the organization and work of the public schools and forbidding the future employment in them of teachers belonging to the religious orders. (Five years were allowed for carrying this clause into effect in schools for boys; in respect to schools for girls, no time limit was fixed.)

By reference to Table III, page 674, it will be seen that in 1900 the religious orders enrolled in their schools about 28 per cent of the children in primary grades. The recent law making these orders subordinate to the State is in strict accord with the policy of Jules Ferry.

Under the law of July 15, 1889, the State assumed the payment of the salaries of teachers, thus converting the teachers into employees of the State instead of the commune or city.

Comparatively little is left to local initiative in respect to the support of public education. Even the local school tax is levied by the State and collected by State officers.

The mayor and civil councilors of every commune (city or rural) have the right to inspect the local schools in respect to the condition of school buildings, furniture, and supplies, and the health and conduct of pupils; but they have no authority over the schools.

There is also a school committee (*commission scolaire*) in each commune appointed by the academy inspector in advice with the municipal council to super-

visé and encourage school attendance. In Paris and Lyon there is a local committee for each municipal arrondissement.

While the central authority regulates the essential conditions of the school work there is a wide field for local effort in the support of additional and optional features, and the chief cities of France have shown immense energy and ambition in the development of their school systems beyond the minimum requirements of the law.

### PRIMARY EDUCATION.

#### DETAILED STATISTICS OF PRIMARY EDUCATION, CURRENT AND COMPARATIVE.

The following statistical details showing the development of primary education under the Republic are from the official statistics published quinquennially (the last bearing date 1896-97) and from reports submitted in recent years to the Chamber of Deputies by the chairman of its financial committee.

The status of the communes with respect to the establishment of schools in 1897 was as follows:

Total number of communes .....	33,520
Number having one or more public schools .....	35,618
Number having only private schools .....	39
Number maintaining a public school with another commune .....	815
Number having no school .....	48
Communes of 500 inhabitants or more .....	18,539
Number having a public school for girls .....	17,185
Number having only private schools for girls .....	708
Number having no separate schools for girls .....	646
Communes of less than 500 inhabitants having a separate school for girls ..	3,601

Table I shows the number of children of legal school age for the years specified, the ratio of the school population to the total population, and the ratio of school enrollment to population.

TABLE I.—*Retrospective view of population, as shown at census dates, and ratio of enrollment in primary schools to total population.*

Year.	Total population.	Increase (+) or decrease (—).	Children between 6 and 13, inclusive.	Increase (+) or decrease (—).	Ratio to total population.	Ratio of enrollment in primary schools to total population.
		Percent.		Percent.	Percent.	Per cent.
1876 .....	36,905,788	.....	4,502,506	.....	12.2	12.78
1881 .....	37,672,048	+2.1	4,586,349	+1.85	12.17	13.97
1886 <sup>a</sup> .....	38,218,903	+3.55	4,729,144	+5.03	12.4	14.46
1891 .....	38,343,192	+ .32	4,639,526	—1.89	12.1	14.49
1896 .....	38,517,975	+ .79	4,636,381	— .07	12.03	14.57
1901 .....	38,961,945	+1.15	.....	.....	.....	14.20

<sup>a</sup> Algiers included for this and subsequent years.

Tables II and III show the distribution of pupils for the years specified among the different classes of public schools.

## SCHOOL ENROLLMENT AND ATTENDANCE.

TABLE II.—*Retrospective view of pupils in the primary schools at specified dates.*

Year.	Total number of pupils.	Boys.	Girls.	In public schools.	In private schools.	In secular schools.	In schools belonging to religious orders.
1876-77.....	4,716,935	2,400,882	2,316,053	3,823,348	893,587	2,648,562	2,068,373
1881-82.....	5,341,211	2,708,510	2,632,701	4,359,256	981,955	3,567,861	1,773,350
1886-87.....	5,596,919	2,829,127	2,767,792	4,505,109	1,091,810	3,877,185	1,719,734

1899-1900.....	5,530,232	2,766,268	2,763,964	4,158,912	1,371,320	3,953,742	1,576,490

TABLE III.—*Proportion of total enrollment in different classes of primary schools at dates specified.*

Year.	Public.	Private.	Secular.	Schools of religious orders.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
1897.....	76	24	-----	-----
1840.....	76.5	23.5	-----	-----
1850.....	78.3	21.7	71.2	28.8
1866.....	78.3	21.7	62.4	37.6
1877.....	81	19	56	44
1881-82.....	81.6	18.4	66.8	33.2
1887-88.....	79.9	20.1	69.5	30.5
1888-89.....	79.05	20.95	69.63	30.27
1891-92.....	77.1	22.9	70.1	29.9
1896-97.....	75.7	24.3	70.7	29.3
1898-99.....	75.3	24.7	71	29
1899-1900.....	75.2	24.8	71.5	28.5

It will be seen that the maximum enrollment was reached in 1888-89. The decline between that year and 1896-97, the last year for which the analyzed statistics have been given, took place wholly in France proper, as is evident from the fact that the enrollment in Algiers increased during the period from 78,001 to 104,207. Excluding Algiers, the decrease in enrollment for France only was from 5,545,400 pupils to 5,427,211, or 2.1 per cent. This decline is attributed by the official reporter to the following causes: (1) Decrease in the school population of France (ages 6 to 13), which, as shown in Table I, amounted to 3,145, or 0.07 per cent, between the census years 1891 and 1896; (2) rapid advance of pupils in the primary schools, with the result that the leaving certificate (*certificat d'études primaires*) is obtained at an earlier age than formerly; (3) less vigorous enforcement of the obligatory school law.<sup>a</sup>

The decline in public-school enrollment became somewhat marked after 1889-90, or toward the end of the period assigned for the full secularization of the schools for boys. A transfer of pupils has been going on since that date from public and secular to private church schools, as appears from the following analysis of the

<sup>a</sup> Statistique de l'enseignement primaire (1893-97), pp. ciii, cv.

enrollment at the beginning and end of the half decade covered by the last official report:

Classification of schools.	Enrollment.		Per cent of in- crease (+) or decrease (-).
	1891-92.	1896-97.	
SECULAR.			
Public:			
Boys -----	2,318,349	2,292,659	- 1.1
Girls -----	1,434,901	1,487,766	+ 3.7
Private:			
Boys -----	53,955	48,199	-10.7
Girls -----	97,772	83,202	-11.3
CLERICAL (UNDER RELIGIOUS ORDERS).			
Public:			
Boys -----	33,969	25,766	-30.3
Girls -----	490,964	384,149	-21.8
Private:			
Boys -----	396,576	415,943	+ 4.9
Girls -----	730,984	793,754	+ 8.6

The greatest falling off, it is seen, was in public schools for boys conducted by members of religious orders. Virtually this class of schools has now disappeared. At the same time there has been a very marked decline in the corresponding class of schools for girls. The schools that have gained by the change are chiefly private schools belonging to the religious orders.

By a comparison of Tables I and II it will be seen that the school enrollment is considerably in excess of the number of children of school age (6-13). Detailed analysis of the ages of school children shows that only a small proportion escape entirely the obligation to attend school; at the same time the irregular attendance of many pupils and the early age at which the large proportion of children, especially in the rural sections, leave school, are causes for serious apprehension. In his report to the Chamber of Deputies, M. Maurice-Faure <sup>a</sup> says: "The obligatory law is ignored or partially evaded in many communes. \* \* \* Legislation seems to have failed of its purpose, probably because at first its application was neglected by the authorities, who failed to realize that if they were negligent at the outset they would hardly have the face to insist later that parents should perform this new duty."

The school committees (commissions scolaires), composed by the joint action of the municipal councils and the academy inspector and of members designated by the law, are of little account. Complaint is made that the local members of the committees are too often indifferent and sometimes even hostile to the public schools. In view of this condition the minister of public instruction has issued a letter to the departmental prefects, calling for special reports on the subject of school attendance, with statements as to the causes of irregularity in this matter.

The certificate of primary studies, instituted in 1834 and recognized by the law of 1882 as a means of stimulating an interest in elementary study, has conduced in part to the early withdrawal of pupils from school. The certificate exempts the holder from the obligation to attend school, and the reports show that a large proportion of children who come up to the examination for this award are at the minimum age (11 years) allowed for candidates. For the majority of the successful candidates the examination is the end of school life. In the twenty years, 1877-1897, the number of certificates awarded rose from 36,841 to 186,031, an increase

<sup>a</sup> Rapport fait au nom de la commission du budget, 1902. Service de l'instruction publique (Chambre des Députés).

of 404 per cent. In the last-named year there were reported in the superior primary schools, which admit pupils possessed of the certificate of primary studies, a total of 64,658 pupils. The usual course of these higher schools is of two years' duration (in the larger cities increased to three or four years). It is apparent that only a small proportion of pupils who secure the certificate pass on to the higher grades.

The solicitude of the Government as to the relative influence of public and parochial schools in securing the support of parents is indicated by the official discussions of the subject of school attendance; but apart from this question which concerns France alone, the various suggestions as to means for promoting regular attendance and for prolonging school instruction are of general interest. The measure of first importance relates to the higher primary schools.

Attendance upon these schools in the period from 1892 to 1900 increased from 45,599 pupils to 62,982, or 38 per cent. During the last four years of the period there was a slight decrease (1,696) in the number enrolled. This falling off is, however, merely apparent. It results from the transfer of eleven higher primary schools of Paris, with an attendance of 2,505 pupils, to the charge of the ministry of commerce. The transfer has come about from peculiarities of the French administration, and is only significant in this survey as a sign of the general demand that higher primary schools shall have a distinctly industrial bearing. This demand is more readily met in the cities than in the rural regions, owing to the nature of the local industries, and consequently it is in the cities that the higher primary schools are well sustained. In the chief cities the expenditure for these schools is met entirely by local funds, and the schools are very perfectly organized and equipped.

Recently an endeavor has been made to enhance the importance of the higher primary schools by making them annexes of the local colleges. This experiment, which has been tried in a few departments, has already produced such excellent results that it is certain to be extended. "By this means," says M. Maurice-Faure, "it will be possible to increase the educational provision of cities without imposing upon them heavier financial burdens, and the arrangement gives to parents facilities for choosing the courses of study most advantageous to their children." In other words, while recognizing the necessity of maintaining the industrial bearing of the training afforded by the higher primary schools, the Government seeks also to make those schools the preparatory step to a more liberal education for those children whose parents are ready to avail themselves of the wider opportunities.

Attendance upon the higher primaries is fostered also by scholarships (*bourses*), State and municipal. These funds are of three classes: "*Bourses d'internat*" (not to exceed \$100 per annum), which cover the cost of living in the boarding department, if the school has one; "*bourses familiales*" (\$100), which are in the form of an allowance for expenses at home, and *bourses* of support (\$20 to \$80). In 1897 the number of scholarships allowed was 1,006—viz, 626 to boys and 380 to girls.

The vast majority of primary-school pupils have, however, no hope of entering the higher primary schools. Their school training, as M. Buisson has pointed out, "is too brief; it covers only the earliest years. The impressions which it makes, vivid and inefaceable though they may be, are only the impressions of childhood, and other impressions—the stronger impressions of youth and of adolescence—soon come to obscure the earlier. A moral influence which ceases to operate the day after the child's confirmation may perhaps affect the child, but it can not form the man." This limitation is not a defect of the primary school, but simply an unalterable condition. It calls for other agencies which may supplement and

extend the work of the primary schools. To meet this requirement, common to all countries, extraordinary efforts are now being put forth in France. The nature of these efforts will be seen by the summary given further on under the head of agencies complementary to the school.

## THE TEACHING FORCE.

Of the teachers employed in the public schools, 97 per cent on a total of 105,774 employed in 1897 were possessed of diplomas and 43 per cent of the highest diploma (*certificat d'aptitude pédagogique*). The proportion of certificated teachers in the private schools was 87 per cent on a total of 46,503.

The remarkable progress made by France in securing trained teachers for its public schools is due in great measure to the liberal provision of normal schools and the high standard at which these are maintained. Every department has complied with the law requiring the establishment of two normal schools, one for men and the other for women, or has been authorized to combine with another department for this purpose. The State shows its solicitude in this matter by the maintenance of two superior normal schools, one for men at St. Cloud, the other for women at Fontenay-aux-Roses, in which professors are trained for the primary normals. These two superior schools are really post-graduate institutions, requiring for admission either the higher diploma of pedagogy or a bachelor's degree.

The following statistics show the relative status of the primary normal schools at the beginning and end of the last half decade reported:

	Number of schools.	Number of students.	Number of officers and teachers.
1891-92.			
Normal schools for men.....	87	3,878	890
Normal schools for women.....	85	3,707	711
1896-97.			
Normal schools for men.....	87	3,865	897
Normal schools for women.....	85	3,871	852

The total number of graduates during the half decade 1888 to 1892 was, from the schools for men, 7,189; from the schools for women, 5,615. The corresponding numbers for the half decade 1893 to 1897 were, men, 6,199; women, 6,139. Total for the decade, 25,142, or an average of 2,514 annually.<sup>a</sup>

## EXPENDITURE.

The total expenditure for primary education in 1896-97 amounted to 214,015,250 francs (\$42,803,050). This sum includes expenditure for primary normal schools and for infant schools, the current expenditure for the primary schools proper (elementary and superior) not being separately presented. On the basis of this total the expenditure per capita of enrollment in public primary schools (*viz*,

<sup>a</sup>The unsatisfactory status of the French teacher as regards salary and resulting social condition is set forth in the paper appended to this chapter, entitled "The professional and financial status of the French primary teachers." The spirit which pervades the professional instruction of teachers is shown by the closing lecture of the course in pedagogy at the Sorbonne, session of 1899, delivered by M. Buisson. Translation in Chapter XVI.

4,642,609, infant schools included), says M. Levasseur, is found to be 46 francs (\$9.20). It is difficult to institute comparisons on this basis, because of changes in the financial administration since 1890, but this the statistician has attempted with results that are shown in the following table. These results, he explains, are not exactly comparable, but they establish beyond doubt the fact of steady increase in the per capita expenditure for public primary education.

These estimates do not include the payment of interest on the moneys advanced for school buildings. If this item were included in the estimate for 1896-97, it would raise the per capita expenditure to 56 francs (\$11.20).

The expenditure for private primary schools is not known,<sup>b</sup> but on the supposition that it is relatively the same as for the public schools, the total annual expenditure for primary education is estimated by M. Levasseur as 293,000,000 francs (\$58,600,000), not including rents for hired buildings and interest on money invested in school property. Including these items the estimated amount is increased to 350,000,000 francs (\$70,000,000).

AGENCIES COMPLEMENTARY TO THE SCHOOL.

Under the above caption are included a variety of agencies intended to promote the intellectual, industrial, and social welfare of the masses. Among the efforts of this kind in which the educational side is particularly emphasized are systematic courses of lessons for youths and adults and popular lectures conducted by teachers and professors of the regular schools. This work, fostered by the Government, has extended throughout France. In 1900 the number of courses of lessons under public auspices reached a total of 40,329 (28,536 for young

<sup>b</sup> According to a recent estimate, 60,000,000 francs (\$12,000,000) are annually raised for the church schools. All Catholics, even the humblest and poorest, cooperate in the work. The money "is chiefly raised by what is called 'The Sou of Christian Schools,' a widespread interdiocesan guild whose headquarters are in Paris. This guild enrolls most of the devout Catholics of France and binds them to a share in the good work. Some undertake to give a sou a week, some a sou a day, some more."

men, 12,793 for young women); private associations maintained 5,000 similar courses, making a total of 45,000 courses of lessons on various subjects, with an attendance in round numbers of 556,000 (400,000 young men and 156,000 young women).

The popular lectures numbered in the same year 25,065, while the attendance was estimated at 3,000,000. As a rule the lectures are illustrated by magic-lantern views, of which 29,000 collections were furnished by the Government for the use of the lecturers. The *Ligue de l'Enseignement*, a private society engaged in the work, distributed 44,986 views.

Among the efforts intended particularly to promote the social welfare of the young are the mutual-insurance societies (*Petites Cavé*). This work, which comprised 10 groups in 1895-96, numbered 2,017 in 1901, representing 12,000 schools and more than 500,000 pupils. The contributions amounted to nearly 3,000,000 francs (\$600,000), of which 700,000 francs (\$140,000) were disbursed to members on account of sickness. This relief is given, not as a charity, but as a restitution or reciprocal assistance. That part of the fund which is not used in relief is invested for the contributors and returned to them when they leave school in the proportion of their original deposits. The system has spread from the day schools to the evening classes for adults.

Many students in lycées and colleges have also been induced to join the societies, which thus tend to promote the sense of common interests among those whom fortune has separated.

In three departments needy children who have no money to deposit have been made members of the societies by contributions from public funds.

Associations of former pupils are being formed all over France for the purpose of maintaining the paternal relations begun in the schools and also of exciting the friendly interest of former pupils in those who have taken their places in the schools. These associations, familiarly known as the "*Petites A.*," held a congress at Montpellier in 1901 which has given an immense impetus to their cause.

The school patronages are associations of benevolent and public-spirited persons whose mission it is to look after school children during their holiday seasons and more particularly after they have left school. These societies seek to provide innocent amusements for the young, that may counteract the temptations of the saloon, and to find suitable employment for those who are in danger of sinking into idleness or vagabondage.

In view of these vigorous efforts on the part of the Government and the loyal supporters of the public schools, it is but just to recognize that abundant precedents for these fraternal and relief associations are found in the system of education maintained by the church. The members of the religious orders devoted to teaching have been distinguished by their solicitude for the moral good and the industrial welfare of the poor. The secular public school in its elementary form is lacking in many restraining influences which the older system threw around the young, and it is the recognition of this fact that has inspired the unusual effort on the part of the Government and the adherents of the new order of things to create new agencies to meet a great public need.

The university extension work (*universités populaires*) is intended not only to provide instruction, but to exercise a salutary influence upon society by bringing together citizens belonging to different classes.

The work was begun at Paris some years ago by a workingman of unusual intelligence, M. Deherme, aided by a university professor, M. Gabriel Scailles, who was devoted to an ideal of social reform. The movement spread rapidly and to-day includes 30 centers in Paris and its suburbs and more than 100 in the whole of France. These centers are becoming more and more the animating source of a propaganda of socialistic doctrines.

The expenditure for these "complementary works" is borne by private societies and by contributions from State and local funds. The contributions from the societies for this purpose amounted in 1900 to 1,250,000 francs (\$250,000); from the municipalities to 2,218,000 francs (\$443,600), of which sum Paris furnished 974,125 francs (\$194,825); from the departments 62,500 francs (\$12,500); in all, 3,530,500 francs (\$756,100). The State appropriated for the work 200,000 francs (\$40,000), which were expended in awards, in the form either of medals with a money prize or sums of money. These awards are bestowed upon the members of the regular teaching force in recognition of their service in the classes for adults.

By a decree of January 10, 1901, the number of medals to be awarded was fixed as follows: Fifty medals of silver, with a prize of 100 francs; 100 silver medals, with prizes of 75 francs; 400 bronze medals, with a prize of 50 francs. Fifty-eight thousand three hundred and eighteen candidates were put on the list for these awards and an official commission appointed to decide upon their relative merits.

Besides the medals, the State has awarded the following special distinctions for devotion to this cause: Eighteen "palms" of officers of public instruction; 80 "palms" of officers of academy; 619 gifts of books; 3,076 diplomas of honor; 5,405 letters of commendation.

Of the appropriation of 200,000 francs, 116,970 francs (\$23,394) were divided between the departments to be awarded in sums not less than 25 francs each to teachers named by the prefects for their service in promoting the complementary courses of instruction.

The entire disposition of the 200,000 francs was as follows:

	Francs.
Medals with prizes.....	41,000
Gift books.....	13,000
Money indemnities to teachers.....	116,970
Diplomas.....	3,786
Magic-lantern views.....	8,000

The enrollment in the public classes for adults in Paris, corresponding to our city evening schools, was 4,094 (2,507 men, 1,587 women). The examination for the certificate of primary studies was attended by 28,197 day school pupils, of whom 21,377 passed, and by 1,353 from the adult classes, of whom 1,024 passed.

There are eight municipal high schools (écoles primaires supérieures) included in the foregoing table, six for boys and two for girls; the former enrolled 4,681 pupils, the latter 710, total 5,391. The seven municipal technical schools for boys, not included in the table, enrolled 1,419 pupils, and the six industrial schools for girls (for instruction in household arts, dress making, bookkeeping, etc.) enrolled 1,514 pupils.

There are also reported 138 workshops for iron and wood work connected with the public primary schools.

The public secondary schools for boys (lycées and colleges), which include primary divisions, enrolled 11,243 students, of whom 4,896 were in the classical course, 2,310 in the modern course, and 4,037 in mixed courses.

The five lycées for girls were attended by 1,574 pupils.

The total expenditure of the city for primary education (including infant schools, elementary and higher primary schools, and technical schools) was 28,256,345 francs (\$5,651,269).

This included the State appropriation for the city schools of 2,704,373 francs (\$540,874), which is turned over to the city authorities.

We complete our survey of primary education, which is intended to secure at least that all citizens shall master the elements of knowledge, by the latest statistics of illiteracy.

*Status of conscripts with respect to illiteracy, 1899.*

	Number of conscripts.							Total.

SECONDARY EDUCATION.

To the department of secondary instruction (director, M. Rabier) belong the lycées, or State classical colleges, for boys, the State lycées for girls, and the communal colleges established by the communal or local authorities and aided by the State. In 1901 the lycées for boys numbered 109 and enrolled 54,839 pupils. The communal colleges numbered 227, with an enrollment of 33,372. This gives a total of 88,202 boys in the public secondary schools. The church secondary schools for boys in 1899 enrolled 91,825 pupils (of these 23,000 in the petits séminaires for students intending to enter the priesthood) and private secular secondary establishments for boys, 10,182.

The public lycées and colleges for girls had an enrollment in 1901 of 14,162 students, and there were also 4,158 girls pursuing courses of secondary instruction in classes under public auspices. The attendance upon convent and private secondary schools for girls is not known.

The professors of secondary instruction (public) are appointed by the minister of public instruction. Their salaries, like those of the professors of superior instruction, are paid by the State, and they are also borne on the pension list.

The lycée is the typical secondary school; the local colleges have the same curriculum so far as circumstances permit; often students pass from a college to a lycée for the completion of their studies.

The following statistics present a comparative view of the enrollment and distribution of secondary students for specified years from 1887 to 1901:

*Enrollment in secondary schools for boys.*

Secondary education, as the term is technically used in France, comprises a complete scheme of education whose goal is the bachelor's degree. It is secondary, not in the sense of a second stage in a continuous process, as implied by the same term in the United States, but in the sense of a higher order of education than that technically termed primary. The distinction between the two arises from the notion that the learned classes, those who are destined for professional careers and for leadership in the State, should be educated from their earlier years in a different manner and in a different class of subjects from the laboring masses. Under this conception the term secondary education carries the idea both of social and of scholastic distinction. The men trained in the secondary schools lead the councils of the nation, shape its policies, and form the enlightened opinion which is essential to its stability; hence the Government is particularly concerned as to the influences which prevail in secondary education and as to its intellectual outcome. In both respects secondary education as organized in France has been unsatisfactory to the present République. As regards curriculum and methods of instruction this dissatisfaction is part of that general unrest in secondary education which is manifest in all countries and which in France as elsewhere has been of much longer duration than the Republic itself. This unrest, which is conveniently though inadequately summed up as the conflict between the classics and the sciences, is, in fact, an inheritance from the eighteenth century. The recent decree for the reorganization of the State secondary schools of France is the solution offered by the Republic for a problem which has occupied every successive government from the Revolution to the present time.

But the existing Government has a cause of anxiety with respect to secondary education quite apart from the question of studies and methods of instruction. Side by side with the State-endowed secondary schools, i. e., lycées and local (communal) colleges, are the private secondary schools, of which the greater part are in the hands of the religious orders. The studies of these independent schools, like those of the State schools are regulated by the requirements for the degree examination, which is a State function, but the spirit and general conduct of the former schools are very different from those of the State schools and apparently more in consonance with feelings of the higher classes of the country.

The decade 1887 to 1897 showed for the private schools a steady annual increase in attendance, while the State schools suffered a proportional decline. The number of students affected was not large, but the importance of the transfer

was greatly emphasized in Government circles by the growing conviction that the schools of the religious orders exercised an influence adverse to republican policies. The apprehensions caused by their increasing prestige and influence was one of the chief causes that led to the law subjecting the religious orders to the supervision of the State. The determination of the Government in this respect is evidenced by additional measures now pending, intended to limit still further the freedom of independent agencies in the sphere of secondary education. On the other hand, it should be observed that the advocates of the principle of "the liberty of instruction," as formulated in the famous law of 1830, utterly disclaim the charge that the schools of the religious orders are animated by a spirit disloyal to the Government.<sup>a</sup>

This disputed matter, which pertains wholly to the political conditions of France, is of less general interest than the measure for the reform of the State secondary schools. The principal features of this measure are set forth in the following citation from a very full exposition of the measure by Dr. Compayré, rector of the University of Lyon. In order to show more fully the bearing of the changes made in the scheme of secondary studies, the new programmes and time scheme tabulated by Dr. Compayré are brought into comparison with the scheme which these replace and also with the general plan of the lycées as formulated by M. Duruy in 1863. To this celebrated minister is due the first comprehensive measure for the adjustment of the secondary programmes to modern demands, and though some portions of his plan were soon discarded, it has furnished a substantial basis for all subsequent efforts in the same direction.

For the purpose of indicating the historic relations of the late reform, a chronological outline of the movement of secondary instruction in France since the Revolution is appended.

#### THE PRINCIPAL MODIFICATIONS RESULTING FROM THE RECENT LEGISLATION.<sup>b</sup>

*Cycles.*—Henceforth [says Dr. Compayré] secondary instruction comprises two cycles, one of four years' duration, the other of three. The studies are arranged in such a way that the pupil, at the end of the first cycle, has already acquired some definite knowledge, which doubtless is small and limited, yet is capable of immediate use in case he should push his studies no further. In order to define well the separation between the two cycles, those pupils who finish their fourth year are called upon to pass an examination, on the completion of which they may obtain a certificate of secondary studies. There is reason to suppose that a certain number of students, those on whom the necessities of life press hardest, or those who have no very decided taste for higher studies, will, after this period of four years, leave the lycée to enter active life and take up a profession.

The four classes of the first cycle retain their present names of *sixième*, *cinquième*, *quatrième*, and *troisième*.

The second cycle is divided into three classes, the *seconde*, the *première*, and, above them, the class of philosophy and mathematics. At the end of this new series the pupils present themselves for the bachelor's degree, which is the final sanction of secondary instruction.

*Duration of studies.*—The duration of the studies is, therefore, seven years for all pupils who continue their course to the end. It is a year less than in the high schools and colleges of the United States, and in Germany also the period of study is longer. But there is good cause for thinking that seven years are sufficient, and, in any event, the new rule adds a year for the pupils of what we called the "modern secondary" course, the duration of which was only six years. We

<sup>a</sup> The opposite views of the law respecting the religious orders are illustrated by two articles, one by M. F. Buisson, wholly favorable to the Government policy, published in the *Manuel Général* of October 4, 1902, and a second article, opposing the extreme policy of the Government, by M. Anatole Leroy-Beaulieu, published in the *Revue des Deux Mondes* of March, 1903. As this matter goes to press the announcement is made that the Chamber of Deputies, by a vote of 300 to 257, has adopted a law refusing authorization for all the religious associations of men engaged in teaching.

<sup>b</sup> From article by Dr. Compayré in the *Educational Review* for February, 1903.

must thank the reformers of 1903 for having resisted the imprudent impatience of unwise pedagogs who, to fall in with our busy, hurried social order, advocate the expeditious methods of rapid preparation. The virtue of secondary teaching lies, in large measure, in its duration, in its slow influence upon the intellect. The best teachers need the help of time, if they wish, not to furnish the memory with hastily acquired and badly digested knowledge, but to act upon intellectual habits and accomplish the education of the mind, which is truly the essential aim of secondary instruction.

*Sections.*—It is in this that the great change brought about by the reform appears. For a long time our secondary teaching knew but a single form, the elements of which were Latin and mathematics. Therefore there was only one category of pupils, all subject to one same programme. Toward the middle of the last century it began to be understood that the same studies were not suitable for all scholars, and Minister Fortoul, during the Second Empire, conceived the plan of separating the pupils into two sections, beginning with the third class. Some were to specialize in literature, the others in the sciences, but they were all to be united for the common subjects of study, Latin translation and French composition. This is what was called the bifurcation system. Some ten years later M. Duruy, one of the greatest ministers public education ever had at its head, pre-occupied by the economic needs of modern society, created alongside the classical course the so-called special course, which, he intended, was to prepare students, by more practical study in the sciences and modern languages, for industrial, commercial, and agricultural pursuits. In 1890 this special course was followed by the "modern course," the creators of which proposed, without the aid of Latin and Greek, to give instruction of a general nature that should not be professional in character, and also might be the equivalent of the classical course. We were, so far, with only two branches in our system, which led pupils to bachelor's degrees that were absolutely distinct and that did not confer the same privileges. Now we shall have four. The system adopted is no longer a bifurcation, but a quadrifurcation.

In the first cycle, however, where the necessity for the same subjects of study is more imperative, we have stuck to the bipartite arrangement. During the first four years of school two parallel courses will be offered to the choice of families and pupils: One, Section A, in which, independently of the studies, common to both sections, Latin will be taught from the first year, and Greek, but only optionally, from the end of the third year (*quatrième*); the other, Section B, which does not carry with it instruction in Latin and Greek, but in which more attention is paid to the teaching of French, the sciences, and drawing.

The full division into sections comes only in the second cycle. Here four groups of studies are offered to the scholars who enter the *troisième*:

Section A: Latin, with Greek.

Section B: Latin, with more thorough study of the modern languages.

Section C: Latin, with fuller study of the sciences.

Section D: The study of languages and sciences without a Latin course.

Only pupils from Section A of the first cycle, those who have already studied Latin, may enter the first three sections of the second cycle, where Latin is more or less fully taught. Into Section D will be admitted the pupils from Section B of the first cycle and also those pupils from Section A—and there will certainly be many of them—who do not care to continue their study of Latin.

Let us observe at once how much this division into sections resembles what you intend carrying out in America. Your high schools, with their four years of secondary studies, correspond to our first cycle, and exactly four distinct courses are what your committee of ten, in 1893, proposed for high-school teaching when it published its fourth table; the classical course, with three foreign languages one of them modern (Latin, Greek, and French or German); the Latin-scientific, with two foreign languages, one of them modern; the modern-language course, with two foreign languages, both modern; and finally the English course, with one foreign language, either ancient or modern.

There is no need of dwelling upon the importance of the reform. We wished to give the pupils the means of choosing the instruction best adapted to their capabilities and their presumable vocation, and also to the economic needs of the districts in which they live. They will now be able at their pleasure to take one road or another, and so work more competently and more enthusiastically, and succeed better in studies which they have of their own accord preferred to others.

Up to the present time there was in the classes of our lycées too large a number of pupils who followed, with no profit, instruction for which they were not fitted. They encumbered the classes, where they formed a kind of *corpus mortuum* and

embarrassed the teacher, whom they reduced to this dilemma, either not to take them into account, considering them a negligible quantity, or, if he wished to be of service to them, to lower his methods of instruction and check the progress of those of their fellow-pupils who could and would go on.

With the variety of the many directions which our pupils may take nowadays, we may reasonably hope that every one of the four parallel courses will be made up of a homogeneous group, where there will be fewer laggards and where everybody will profit by the teacher's lessons.

Note, too, how the optional principle, as made a law in France, differs from what you have set up as a standard in the United States. The French schoolboy can henceforth choose, at least in the latter half of his studies, one of four different ways; but the programme of every one of these is fixed in advance and is obligatory in all its parts. With you, on the contrary, a pupil in one section may, if he wishes, take a part from the course of another section. He enjoys full liberty of choice among all the subjects composing the broad, ideal plan of complete secondary education. To make the difference very plain, let us use a comparison. In a French lycée there are, as if in a railway terminus, four trains about to start. In them travelers to the land of knowledge seat themselves according to their preferences. But once they are shut up in their compartments they must go on to the end toward the destination to which the train is to take them. They can not leave their car at one station or another, to change for one of the other parallel trains. American secondary education affords just this facility to its students; they have the right, if they wish, to leave the car of the line where they engaged a seat, for another car and another line. It is not impossible that experience will lead us on in the near future to further progress, consisting in the substitution of absolute freedom of election among the different subjects of instruction for the limited choice permitted from this time on; so that there would not be four groups of studies only, but a far greater number of combinations, directed and determined, not by an immovable programme, but by the free will of the pupils.

Examinations and degrees: Another difference between the American plan and ours is that in the United States you maintain the diversity and multiplicity of baccalaureates. You have the baccalaureate in arts, corresponding to our former baccalaureate; the baccalaureate in science, the baccalaureate in letters, almost the equivalent of what the modern baccalaureate was in France, and the baccalaureate in philosophy, without counting the degrees in chemistry, mechanical engineering, architecture, agriculture. In a word, you believe that different rewards and titles should answer for different studies. The contrary opinion has just prevailed with us.

We have but one bachelor's degree, the "baccalaureate of secondary education." Doubtless the pupils in the four sections will not have to pass the same kind of examinations. The written and oral tests to which they will be held will vary with the section they have chosen. But, notwithstanding the diversity of examinations, it has been decided that the diploma to which they lead, if taken successfully, will have the same advantages. In short, diversity of examinations, unity of degrees, and equality of the prerogatives attached to them—such is now our scholastic law. The diplomas of this single baccalaureate will open to their holders all the professions, even law and medicine. Till now the bachelor coming from the modern course could not register as a student under the faculties of law and medicine. Among other reasons for this inequality was the fact that the studies of the modern course lasted only six years and those of the classical seven. Now that all courses are of equal length, and end by equivalent though different examinations, where the knowledge of Greek and Latin may be replaced by thorough acquaintance with the sciences and the modern languages, we thought there was no longer any great reason for preserving any inequality as to privileges.

Another important change made in the regulation of the baccalaureate consists in having the examination committees (*jurys d'examen*) composed in part—as they have been already for the modern baccalaureate—of secondary teachers. It is well known how much and how justly has been criticised the old system of intrusting to the professors of the faculties—that is, to university men—the charge of creating bachelors. This meant turning them from their true functions, taking them away from higher instruction to burden them for a portion of the year with the weight of examinations of a lower grade of instruction. A German has said: "In France you take the best-tempered razors to cut pebbles."

For the time being it did not seem possible to relieve the faculty professors completely of this heavy task, but in the different juries there will be associated with them professors from the lycées—three of them if the jury has six members,

two if it has only five. Moreover, the chairmanship of the jury is always in the hands of one of the representatives of the higher branch of instruction."

Subjects of instruction: The subjects of instruction have, naturally, remained the same, being those for a long time recognized by all civilized countries as the necessary elements for general culture and the formation of the mind. They have only been divided and distributed differently from what they were in the old programme, the number of hours devoted to them having been increased or diminished. The intellectual food is still the same; there are the same dishes as formerly, but they are served on several tables, one dish appearing on the menu of one table and not on another, or, if so, in smaller quantity.

Nevertheless the spirit of the instruction, of its methods and its processes, has changed greatly. It has been determined to give a practical turn to certain studies. For example, modern languages will be taught especially from the point of view of their use. Till now they were taught rather from the literary and grammatical standpoint, and in the modern course they were to take the place of Greek and Latin as instruments of intellectual culture. That is no longer the purpose we assign to them in the new courses of study. Now the attempt must be made to teach how to speak and write them. "The aim which the teaching of a modern language must have, during the course of secondary studies," say the instructions accompanying the legislative act, "must be to give the pupil real and effective mastery of that language. \* \* \* The language to be taught, therefore, shall be, not the literary language, but the usual, current speech, that which translates into words all the manifestations of physical, intellectual, and social life. Consequently the direct method must be used, taking as a basis not the mother tongue, but the foreign language. In all the course the teacher will use especially the foreign language; he will forbid himself the use of French."

In like manner, for the study of French, the instructions advise teaching rules by usage. "The teacher must miss no opportunity of showing the pupils that they apply them instinctively. He must constantly connect his instruction with the examples furnished him by the written or spoken language."

Some other regulations give evidence of the positive and practical tendencies of the new plan of studies. For instance, the practical exercises in science introduced in the seconde and première classes and the teaching of ordinary principles of law in the troisième class of Division B. Observe also the innovation of bringing in a course in practical ethics into the quatrième and troisième classes. Up to the present time instruction in ethics was given only in the philosophy class, and then in an abstract and theoretical form. Now, from the first cycle it will be taught, not by a scientific discussion of the principles of ethics, but by a familiar exposition of the principal duties of man. The programme says that this instruction shall consist of "systematic readings, recitations, and talks, planned to strengthen sentiment favorable to moral development and to counter-act opposite tendencies."

The practical aims of the reformers of 1902 are seen finally in the establishment of a special programme of studies, an outside section, so to speak, the principal purpose of which will be the study of the modern languages and the sciences especially from the standpoint of their application. This course of studies will be formed for pupils who have completed the classes of the first cycle and who do not aspire to the baccalaureate. It will last only two years, and may vary in its programmes according to the needs, the particular industries, and the economic conditions of each district. The programmes will be made up by the local authorities and approved by the minister of public education. On the completion of this course the pupils will be called upon to pass an examination, at the end of which a certificate of studies will be given them. This is an interesting first step in the path of decentralization, since this course, opening up a fifth road to students, is not subject to a uniform and unvarying programme, but must be adapted, as to the variety of its subjects of instruction, to the diversity of needs of the districts where it is to be given.

Such is, in its entirety, the new plan of studies for our system of secondary education. In constructing it its authors have also considered its coordination with primary education. What you call in America the "articulation of the school with the college" is an embarrassing problem for us also. It is complicated by the fact that the pupils in the system of secondary education, on entering the sixième class, come from two different sources. Some are from the public pri-

<sup>a</sup> Observe, too, that the examinations for the baccalaureate are divided into two series at an interval of a year. The first part is taken at the end of the première class; the second after the last year of study, that of philosophy and mathematics.

mary school; the others have already had a course of primary studies, lasting usually four years, in the college or lycée. Now, the programmes of the public school and of the primary classes of the colleges and lycées are not identical in every point. Some years ago, it is true, Latin was done away with in the huitième and septième classes, where pupils formerly began to study it; but in return the elements of modern languages were introduced on the plea that the modern languages can not be really learned unless one begins the study of them early. Nothing better, if modern languages were taught also in the public schools; but they are not, and it seems impossible that they will be. Another solution would have been to give up German and English in the primary classes of the colleges and lycées. But that has not been decided upon as yet, and with the new plan of studies, which maintain two hours of modern languages in the neuvième, huitième, and septième classes, the difficulty remains. We shall continue to receive into the sixième class, the first one in the secondary course, pupils some of whom already know a little English or German, while the rest have not studied these languages at all and are on an inferior footing as compared with their classmates.

However this may be, we have every reason for expecting the happiest results from the thorough recasting that has been carried out in the economy of our plans of studies. There will be undoubtedly great difficulties in application, for it is always easier to conceive a reform than to execute it. It will take some time for the teaching staff to fit itself to the new tasks laid upon it. The creation of new officers and also some suppressions will be necessary. The difficulties, moreover, can not be removed in any other way, if we do not increase the number of new professorships in the modern languages and the sciences, to which the reform gives a much greater field than before, except by uniting the pupils of different sections for those subjects which are the same for all. Consequently there is sure to be some disorder and confusion at first. But gradually matters will be set right and experience will suggest certain modifications in a system which, good as it is, is not, however, either irreproachable or unalterable. We have a proof of this in that the new arrangement has already raised numerous criticisms, some of which may seem well founded.

The organization of the lycée classical course under the decree of August 8, 1890, which is replaced by the plan above described, was as follows:

*Organization of the lycée classical course.*

Elementary division:	Average age (years).
Preparatory class (classe préparatoire).....	8
Eighth (huitième).....	9
Seventh (septième).....	10
[Certificate of studies (certificat d'études) to be obtained before admission to the sixième.]	
Division of grammar:	
Sixth (sixième).....	11
Fifth (cinquième).....	12
Fourth (quatrième).....	13
[Certificat d'études necessary for the troisième.]	
Superior division (division supérieure):	
Third (troisième).....	14
Second.....	15
Rhetoric.....	16
[First examination for bachelor's degree.]	
Philosophy.....	17
[Second examination for bachelor's degree.]	

In the class of philosophy options are allowed between three courses; according to the choice the student has his diploma inscribed, "Lettres philosophie," "Lettres mathématiques," or "Lettres sciences, physiques et naturelles."

*Programme of 1890.*

CHRONOLOGICAL VIEW OF SECONDARY SCHOOLS IN FRANCE, INDICATING THE  
COURSE OF THE CONFLICT BETWEEN CLASSICS AND SCIENCES.

1793. Destruction of old classical colleges, course of study in these as follows:  
Six years of letters (Latin, Greek, French); two years of philosophy,  
including elements of mathematics and physics. (Instruction given in  
Latin in classes of philosophy.)
1795. Law creating écoles centrales; programme including drawing, natural  
history, ancient languages (one professor), living languages, mathe-  
matics, physics, chemistry, and in the upper section general gram-  
mar, history, and legislation. (Schools essentially scientific; very few  
established.)
1802. Lycées created; programme organized in two parallel courses, viz, classi-  
cal course (without Greek) and mathematical course.
1809. Consolidated course substituted for parallel courses; Greek restored.
1815. Lycées changed to Royal Colleges.
1821. Ancient supremacy of letters restored; mathematics postponed to, and  
natural history included in, classes of philosophy. (Instruction in philos-  
ophy again given in Latin.)
1826. Extension of mathematics from two to four years (without diminution of  
time allowed for literary studies).
1829. Attempt to reorganize secondary studies, with provision for living languages,  
extension of history, substitution of French for Latin as the medium of  
instruction in philosophy (never practically realized).
1840. Cousin, minister of public instruction, restores exclusively literary char-  
acter of the regular course of secondary studies; special provision for  
scientific students (not leading to degree).
1847. Statute restoring sciences to regular programme.
1850. Name lycée restored.
1852. Secondary schools reorganized in accordance with the statute of 1847.  
Latin omitted from elementary section. Full course organized in two  
divisions—division of grammar, common to all students; superior divi-  
sion, two parallel courses, viz, course of letters, course of sciences.  
Two baccalaureates instituted—letters, sciences.
1863. Bifurcation advanced one class.
1864. Bifurcation suppressed in all classes.

1865. Lycées reorganized by Minister Duruy; bifurcation after second class, or for three upper classes; two degrees, viz, bachelor of letters, bachelor of sciences. Special course of four years created for modern studies.
1872. Jules Simon, minister of public instruction, issues circular proposing change in methods and standards of secondary schools.
1880. Programme modified; time devoted to Latin, Greek, and French in classical section slightly decreased; time for history, geography, and sciences proportionately increased.
1885. Time for letters slightly increased, with loss of time for sciences and modern languages.
1890. Lycées reorganized; bifurcation suppressed; time for Latin, Greek, and French increased, with loss to sciences, modern languages, history, and geography. Options allowed in philosophy between three branches. Single diploma inscribed with the elected study, i. e., "Lettres, philosophie;" "lettres, mathématiques;" "lettres, sciences physiques et naturelles." Special secondary course changed to modern secondary of six years, with extension on the side of culture studies; electives allowed in the last year; new special diploma created, baccalaureate of modern secondary studies.
1901. Lycées reorganized; studies arranged in two cycles, one of four years, the other of three years.
- First cycle offers two courses: (1) Classical course, with obligatory Latin throughout and optional Greek from the end of the third year; (2) Scientific course, without Latin or Greek.
- Second cycle offers for election four groups of studies: (1) Latin, with Greek; (2) Latin, with extended study of modern languages; (3) Latin, with extended study of sciences; (4) modern languages and science, without Latin.
- Single baccalaureate.

---

#### HIGHER EDUCATION.

To the department of higher education (Director M. Liard) belong the universities and the special schools of university rank which are under the minister of education.<sup>a</sup> Paris is the seat of these special schools, and also of the principal university. Under the law of 1896, 15 of the former faculty groups have been organized into independent universities. They registered 29,377 students in 1900, an increase of 11,772, or 68 per cent above the number enrolled in the faculties in 1888.

The professors of the State universities are appointed by the President of the Republic in advice with the minister of public instruction. The choice is made from two lists, one furnished by the university council, the other by the superior council of public instruction. The salaries of professors are paid by the State, and they have a right to a pension.

The official statistics of higher education in France are published decennially, the last bearing date 1889-1899. But the great importance of the law of July 10, 1896, transforming the French faculties into universities, has been made the occasion for publishing a special report by the chief of the department of higher education, M. Liard. Our survey of movements in this department follows substantially this report.

In the introduction M. Liard traces the spirit of the new régime back to the ideas that were promulgated by the French Revolution. The law of 1896, he says—

Marks an epoch in our higher education: it is the end of one period and the beginning of another. For its full comprehension, therefore, it is necessary to consider it in the light of the previous history. The four articles which the law comprises, and which give it a very modest character, are in reality the outcome of a long and laborious process, whose beginnings are found in the action of the Revolutionary assemblies.

In the place of the ancient universities, destroyed by their constitutions, by their abuses, and by their hostility to the philosophy of the eighteenth century, the revolution which sprung from this very philosophy wished to have, for scientific

culture and training, establishments conceived and organized in a manner according with the spirit of science and of the sciences. The Revolution gave rise to a theory of higher education which has been nowhere surpassed and which is nowhere fully realized as yet, unless possibly in some universities in the United States.

From the first day the Revolution conceived higher education as a vast system, at the same time one and multiple, one like the human spirit, the source of all science; multiple as the diverse objects to which this spirit applies itself, open to everything that can be made a subject of study and of research—abstract mathematics, physical realities, moral realities, literary creations, creations of art, applications of science to the technical arts, with as many departments as there are natural divisions of objects, departments distinct but not separated, animated by the same life, the same spirit. This was the encyclopedia as a living reality.

That such was indeed the conception of higher education formed by the French Revolution no one can doubt. The first outlines of it appear in a paper by Mirabeau, and it is more fully expressed in the subsequent report of Talleyrand to the constitutional assembly, and is set forth in striking terms in the report of Condorcet to the legislative assembly. In less noticeable reports under the Convention and the Directory the same idea appears also as a natural expression of the Revolutionary spirit.

While thus recognizing the original of that conception of higher education which the Republic has endeavored to realize, M. Liard admits that it had hitherto failed of practical effect.

The Revolution [he continues] created only special schools; that is to say, establishments limited each to the study of a determinate or of a determined group of sciences: School of mathematics, schools of medicine, school of natural history, school of oriental languages, regarded each as complete in itself. \* \* \* The ideal was of universities in the modern sense of the word; the reality was special schools.

The same policy, as M. Liard explains, was continued by the consulate and by the Emperor. The faculties created by Napoleon were above all things else examining bodies, but in so far as they were teaching establishments at all, they were "special schools of medicine, of law, of letters, of science, having neither the amplitude nor the development which pertains to liberal education in the full sense of the term."

Destitute, or nearly so, of the resources indispensable for scientific research, the special schools or faculties sank to mediocrity. At times, indeed, some one of them "enjoyed the services of eloquent professors, a transient and factitious distinction. Occasionally also an obscure laboratory was the place of a grand discovery. But as a whole these isolated establishments filled no place in the life of the nation or in scientific activity comparable to that of the German universities in Germany."

Through this long period of poverty and inactivity the ideal of the Revolution was not wholly ignored. During the reign of Louis Philippe (1830-1848) it was revived by Guizot on political as well as intellectual grounds. In his memoirs Guizot wrote, as cited by M. Liard, "Paris attracts and morally absorbs all France."

The remedy which Guizot proposed for this evil was the creation of several great universities in the departments.

There should be [he said] in various parts of France great centers of study and of intellectual life where letters and science in all their variety and richness should offer to eager minds solid instruction, equipments for research, honorable careers, intellectual satisfaction, the pleasure of cultivated society. Without doubt eminent teachers and young men of distinction would willingly remain where they should find so many advantages \* \* \* and Paris, without ceasing to be among us the chief center of literary activity and learning, would cease to be a gulf in which are lost many minds capable of a more useful and worthier life.

At the outset the present Republic showed an earnest determination to reform higher education in the spirit of the ideals which had received the approval of the illustrious minister of Louis Philippe. The subject was opened by Jules Simon, minister of public instruction under President Thiers, who in an eloquent address before a united meeting of the learned societies at the Sorbonne urged the creation of universities of which France was destitute. The first general bill dealing with the subject was submitted to the National Assembly by Paul Bert, who proposed "to suppress the useless faculties and transform the others into universities."

Among the savants who advocated this or an equivalent measure are found the names of Claude Bernard, Pasteur, and Hermite. All the brilliant scholars of the day supported the cause. Says M. Liard: "Little by little Renan, Berthelot, Michel Bréal, Ernest Lavisse, Gabriel Monod and others created a literature explaining and justifying the demand for the restoration of higher education by means of universities."

Thanks to this literature, the conception of a university, as opposed to special schools such as had achieved great distinction in Paris, took possession of the leading minds of France, but the obstacles to its practical realization could not at once be overcome.

The law of 1875 which established the liberty of higher education really increased the number of special institutions, as several private faculties, that is, faculties independent of State control, were at once established by the church. However, this same law of 1875 charged the Government to proceed with the preparation of a measure for the reorganization of higher education having especial regard to the unification of the isolated faculties and making adequate provision for the new studies which modern conditions required. From that time successive ministers and the superior council were constantly occupied with the subject. Measure after measure was elaborated, but without results other than the increase of interest in the proposed reforms. In 1883 Minister Jules Ferry addressed a letter of inquiry to all the faculties setting before them the purpose which had taken shape in his own mind, and calling upon the professors for the expression of their own views in the matter.

It is easy to see [observed Minister Ferry], from the various measures that I have taken respecting the faculties during the last five years, that I attach the greatest importance to measures that promise to develop in our institutions of higher education the sense of responsibility and the habit of administering their own affairs. We should achieve great results if it were possible for us to constitute universities comprising, in intimate relation, the most varied departments of knowledge, managing their own affairs, conscious of their duties and of their importance, and animated each with purposes appropriate to their respective localities, but with due regard to the interests of national unity, rivaling the universities of neighboring countries, and exciting, also, between the great cities in which they are located a spirit of emulation which will react to their own advantage. I am aware that time is necessary for such an achievement; that in enterprises of this sort, however worthy the ambition, we should avoid hasty and rash action. I am convinced, however, that the time has come when the question should at least be thoroughly examined. In this serious matter, as in all others, it is through the opinion of the professors themselves, through their experience and devotion, that progress may be hoped for. In this connection I believe it my duty to ask for the expression of their views.

The replies to this circular letter showed that the greater part of the faculties, and especially those that were most fully possessed of the scientific spirit, were in favor of a university constitution. But in the opinion of the Government neither public opinion nor the experience of the faculties themselves justified an immediate radical change of their constitution.

The result of the inquiry, however, strengthened the Government in its purpose of accomplishing the proposed end by successive measures. The first decisive step was taken in 1885 by the passage of two important decrees. Of these decrees

the first, bearing date July 25, empowered the faculties to hold and manage property, and created a general council of each group of faculties as its legal representative. The second decree, dated December 28, extended the authority of this general council to all matters pertaining to the internal affairs of the group, and created also a council of each faculty to administer its separate affairs. A subsequent decree, February 21, 1890, gave the faculties control of their resources and internal affairs. Thus the faculties were gradually freed from slavish dependence upon the State and accustomed to administrative duties. The law of July 10, 1896, restored the old title of university and completed the work of internal organization, which distinguishes an institution from a group of independent bodies. The discussion of these successive measures in the report before us affords an interesting commentary on the persistence of that relation between the Government and higher education which was elaborated by Napoleon. The law of 1896 modified, but did not destroy, that relation, so that even now the French universities are integral parts of an administrative system.

The governing body of each university is a council consisting of the rector, the deans of the faculties, and two delegates from each faculty elected triennially by the professors. This council, subject in certain cases to the approval of the superior council of public instruction, has control over the teaching, discipline, and property of the university. Since, however, the State appoints all professors and pays their salaries, the council has merely advisory power with respect to appointments and the creation, abolition, or modification of professorships. The dean of each faculty, who is its administrative head, represents in the university council both his faculty and the central authority. He is therefore appointed by the minister of public instruction, but for three years only and from candidates agreed upon by the faculties.

The central authority is represented more fully by the rector of the university, who is presiding officer of the university council, and appointed by the President of the Republic.

In 1885, when the council-general of a group of faculties was created, it was decided that the rector was the proper representative of the Government. During the discussion upon the law of 1896 it was suggested by some of the faculties that the president of the council should be chosen from among themselves, and that the rector, representing the State, should simply have a seat in the council, like the curator of a German university. This opinion, however, did not prevail. The rector, who must always be a university man with the degree of Doctor, was accepted as the representative of the State, to which function are added those of executive head and legal representative of the university.

As to the authority exercised by the universities, the law defines the particulars in respect to which they may act independently and those in respect to which their views must be submitted for the final decision of the central authority.

The attributes of the university councils [says M. Liard] may be considered under three heads—civil life, scientific life, and judicial functions.

The civil life is the outcome of moral personality. It is a means of the scientific life; it is, indeed, closely related to the latter. Logically, however, it precedes this.

The civil life of the universities, according to M. Liard, pertains chiefly to the management of their resources. The university council, as the legal representative of a civil personality, an organ of the State and subject to the State, regulates the actual administration of the property of the university. It may deliberate upon but may not decide as to the disposition, acquisition, surrender, and exchanges of these properties; in respect also to loans, the acceptance of gifts and legacies, when these are subject to charges, claims, or special conditions, the council has only deliberative functions. With regard to the offer of subventions, the council

can only give advice, for since these subventions might be intended to support teachings opposed to the public order, it seems necessary to leave their acceptance to the decision of the minister who is responsible to the national legislature. Finally, the council gives its advice respecting the annual budget of the university, of which the amount and the expenditure therefrom are determined by the minister.

Each university has its own income, which is divided into the ordinary income and the extraordinary income. The former comprises the revenues from property and the interest of invested funds, the fees for matriculation, lecture fees, library and laboratory fees, the receipts from university publications, the State appropriations for current expenditures, appropriations by the departments and cities, and all other resources of a permanent character. The extraordinary income includes gifts and legacies, loans, appropriations for building or other special purposes, and all other funds intended to meet temporary demands. Each faculty comprised within a university has its own separate budget. The salaries of all professors are paid from the State appropriations, estimates for the same being annually submitted to the legislature by the minister of public instruction. The university may, however, make arrangements for additional service to be paid for out of its resources.

In giving up to the universities the receipts from fees which were formerly turned over to the State treasury, the legislature decided that they must be applied wholly to objects of immediate advantage to the students, such as the equipment of laboratories, libraries, new buildings, etc. Apart from these specific limitations, the universities have free disposal of their resources.

With respect to the scientific life or scholastic freedom of the universities, M. Liard says:

In each faculty this is the work of the professors; its first condition is scientific liberty; in the limits imposed by his professional title the teacher should be master of his programme. \* \* \* But a professor is not the whole of a faculty, nor a faculty the whole of a university. \* \* \* In the interests both of learning and of students it is necessary that, first in each faculty, and then in all the faculties, of a university the studies should be coordinated. But the university council alone is competent to make this coordination. To this body is delegated the power of deciding absolutely what shall be the course of study, the lectures, and experimental or practical exercises for each school year in all the faculties and schools of the respective universities. In the exercise of this authority the council is limited only by the requirements for the degree examinations established by the State. \* \* \*

In transforming the faculties into universities the law has not suppressed their function of preparing for these examinations.

But, however important this function may be, it does not mark the limit of the scientific life of the universities any more than the degree marks the limits of science.

One of the reasons advanced in favor of the creation of universities is the daily increase of relations, many and vital, between the different sciences, and the appearance of new sciences as yet scarcely defined upon the confines of the older sciences. In order, then, that the development of science itself should be followed it becomes necessary in the organization of higher education to provide for these new relations and interchanges.

In conformity with this view a decree of July 21, 1897, empowered the university councils to control "the organization and the regulation of courses of study, lectures, and experimental work common to several faculties." In the interest of science the councils are also authorized to establish and regulate independent courses of study. \* \* \*

With a view to the same interest also, the councils have been authorized to create university degrees entirely distinct from the State degrees and having a purely scientific value. \* \* \*

In this respect full liberty has been given to the councils. They may create certificates for special studies, and diplomas which, while carrying no legal sanction (that is, as admitting the holder to a professional career in France), are proofs of scientific attainments. The value of these diplomas both in France and

in foreign countries will be increased as science is more and more developed in the universities that award them.

As a result of these departures it has been necessary to give greater recognition to science in the degree examinations and a freer choice of studies. The old system has been modified, the programmes are less rigid, the professors have larger initiative, and the students have some chance to elect their studies.

The character of the university degrees and of the new departments of study created in the universities are set forth more fully in extracts from other sources in subsequent portions of this chapter.

In continuing the report which has been thus far followed M. Liard considers finally the juridical and disciplinary functions of the newly constituted universities. These relate to two particulars, the status of different classes of students and the character of the university discipline. These matters are fully set forth in a ministerial decree of July 21, 1897, which is included in the report by M. Liard. We note here simply that all persons desiring to pursue their studies in the French universities must be matriculated. Formerly this was required only in the case of candidates for a degree. The extended requirement brings all who seek the privileges of a university under its jurisdiction. This measure, with the extensive authority conferred upon the councils, increases the dignity of the universities and their organic unity.

The following details, completing the survey of the transformed universities, are cited from the report of M. Maurice-Faure, of the financial committee of the Chamber of Deputies, on the budget for 1902:

The hopes which prompted the law of July 10, 1896, are being daily realized. Each year gives clearer and clearer evidence of the value of the new régime, and the results accomplished show conclusively that the universities make the best use of their autonomy.

We have found that during the scholastic year 1900-1901, as was the case also in the preceding years, their chief efforts had been expended upon the sciences applicable to agriculture and industry and that the new equipments furnished were designed in particular to meet local or regional demands.

This fact is of special importance, both as indicating the creation of new interests for a part of the youth of France, and the services which the universities are called to render to their immediate neighborhood.

For a long time higher education in France has had no practical aims outside the province of medicine and pharmacy. For a long time the careers for which it prepared were not productive careers in the economic sense of the word. Thanks to the constitution of the universities, to the inspiration coming from the sense of a public mission, and to the general direction given by the minister of public instruction, this condition has changed. The universities now realize that to prepare a great number of men ready to enter into the industrial world with a training appropriate to the economic demands of the country is no unworthy purpose.

Without doubt the universities will continue their researches in pure science, which is the supreme cause of their existence (*suprême raison d'être*), and whose results are a source of wealth for the nation, but we must approve the many efforts on the part of our universities to turn their energies and resources to the organization of instruction in the sciences corresponding to the needs of their respective localities.

Furthermore, we must approve that comprehensive view of the interests of the country which led the administration to open the universities not only to students who have obtained the bachelor's degree in the modern course the same as to those who have the classical diploma, but also to make them accessible to the ablest pupils of the high schools (*enseignement primaire supérieur*).

Thus relations have been established between primary and higher education, which, in the interests of social equality, must be constantly strengthened. This is a very important fact to which the attention of the Chamber of Deputies has not been sufficiently directed. It marks a characteristic evolution in accord with all the opinions and aspirations of French democracy.

The universities respond thus to the hopes of Parliament by constantly new efforts, which draw to them more and more the sympathies of the people. Their laboratories have ceased to be mere marble towers in which savants conceal themselves; their doors are freely opened to all forms of human activity. From

the high spheres of pure and speculative science they have descended to the more modest applications of science to industry, to commerce, and to agriculture. Besides the official programmes, which, in respect to the examinations for State degrees, must be strictly limited, the universities have created courses adapted to their particular localities which have stamped upon each an individual and original character.

The physical conditions of the different portions of the country have given rise to various industries, commercial and agricultural, and serve not only the interests of a single province or university but those of the entire country. Thus the waterfalls of Auvergne, which furnish motive power that may be utilized at a distance, have given rise in the University of Clermont to a course in industrial electricity, which will be of great value to electricians in that region.

France, so richly provided with maritime laboratories, was destitute, until recently, of stations equipped for the study of the flora and fauna of fresh water. In the immense plain of Mont-Dore, in the midst of a series of 20 lakes, the University of Clermont has established a limnologic laboratory. The department of Puy-de-Dôme has promised to aid in the work, which is certain to be profitable to Auvergne and to the entire country.

The University of Besançon has entered upon the work of exploiting the electrical energy of the water courses of the Franche-Comté. It has recently created a course in industrial electricity under the direction of a practical engineer, and subventioned by the department of Doubs and the city of Besançon. The same university had already organized a course in industrial chemistry, which is in full operation, and a course in agricultural botany, which, although only a year old, has already enrolled many students. This year, with the cooperation of the departments of the Franche-Comté, the university has made provision for researches of special interest to that locality as follows: A laboratory for agricultural analysis, a laboratory of agricultural bacteriology, and two stations, one for experiments with seeds, the other for the culture of coniferæ and of the most fruitful plants. Recently, at the request of the council-general of Doubs, the university has undertaken an agronomic map of the department.

The latest enterprise of this university deserves special mention. To the chair of mechanics has been annexed a course of higher instruction in chronometry and the regulation of watches, leading to the diploma of horologic engineer. This course completes the work of the observatory long since established at Besançon, and which has been of great service to the watch-making industry of the region.

The University of Bordeaux continues its work in aid of agriculture. For a long time its laboratories have been devoted to researches into the diseases of the vine. In one of these the remedy for mildew was discovered. The proximity of the university to the department of Landes, where the pine abounds and resin is obtained in great quantities, has led to special equipment for the study of this product. In this work the departments of the Gironde and of Landes, and the chambers of commerce of Bordeaux and of Mont-de-Marsan have cooperated. The theoretic instruction respecting the resinous product is completed by manipulations of the material and visits to the manufactories. In the laboratory experiments are made in new industrial applications of resin.

The creation of a colonial institute at Bordeaux must also be mentioned, for although this is not the work directly and exclusively of the university, nevertheless it has been greatly promoted by the study of exotic diseases in the faculty of medicine and by the courses in ethnography and by the chair of colonial geography in the faculty of letters.

Situated in the center of a region justly celebrated for vine growing, the University of Dijon, in view of the work of Pasteur, is not likely to forget that science has a part to perform in saving the vine. This university has long maintained an important experiment station, but for several years an extension of the work has been greatly needed. Thanks to the cooperation of the city of Dijon and the department of the Côte-d'Or, this has been accomplished by the establishment of the agronomic and œnologic institute of Bourgogne, which is intended not alone for free scientific research or for the formation of future professors, but more particularly for the education of future proprietors.

The University of Grenoble, situated in the midst of a region destined by nature to become a powerful center of electrical industry, has for a long time clearly recognized the particular service that science might render to this locality. The first effort of the university in this direction was the establishment of a course in industrial electricity. The success of this effort has led to other measures of the same kind. From its own resources, aided by the city and by manufacturers,

the university has founded an electro-technic institute, which has just been opened to students.

In the laboratories of this institute will be formed electrical engineers and foremen of electrical industries. This foundation is evidently destined to a great future and well deserves a subvention from the State.

The admirable development made by the University of Nancy, through the application of the law of 1896, is well known. This university, always solicitous for the public welfare, has not been satisfied with the finest assemblage of industrial institutes to be found in France. To the institute of chemistry, the institute of brewing, and the electro-technic institute opened last year and already as prosperous as those of older date, it was determined to add an agricultural institute of the highest order. The new establishment was opened at the beginning of the session of 1901-2. It comprises, as courses of instruction common to all students, agricultural botany, agricultural zoology and zootechnics, and agricultural chemistry and geology, and as special courses of instruction, economic branches, forestry, physics, and practical agriculture.

This provision, which is appreciated by the whole federation of farmers of the northeast of France, will direct many young men toward agriculture, who, without this institute, would turn their minds to pursuits much less useful to the country.

It should be added that through a regulation which permits the forestry school of Nancy to admit nonresident students, students of the forestry section of the agricultural institute of the university will pursue a part of their studies in the school of forestry. It is a cause of congratulation that the university has taken advantage of this provision, instead of endeavoring from false pride to duplicate instruction already admirably organized near by.

At Caen, the professors of the courses in industrial and agricultural chemistry have devoted themselves to valuable scientific investigations relative to the manufacture of cheese and of butter. The results are such that the university expects to be the means of founding cooperative societies similar to those of Denmark, and thereby to contribute to the development of one of the principal agricultural resources of Normandy.

In fine, the University of Lyon has created a course in electro-technical studies, and a course in rural economics as a complement to the agronomic course instituted in the faculty of sciences.

The university hopes soon to establish an agronomic institute which "will not be inferior even to that of Paris, and which will contribute powerfully to the diffusion of rational methods, without which our national agriculture could scarcely withstand the competition with new countries."

The University of Lyon has already a French school of tannery, a school of chemistry, and a school for notaries. It will soon have a school of electricity and it seeks to complete its colonial department with the aid of the chamber of commerce.

The latter, collaborating with the Indo-Chinese government, has already established several courses of instruction relative to colonial affairs, among others a course in the Chinese language. This colonial section is "not intended to form functionaries for the colonial service, but persons who desire to engage in industries or commerce, or whose purpose it is to employ, in these distant regions conquered by our own arms or acquired by our influence, activities not employed in the mother country."

Marseille, which has entered resolutely into the scientific movement, and which deserves every encouragement, has established with the cooperation of the chamber of commerce several courses in subjects relating to colonial life. The creation of a complete colonial department is contemplated.

The following list of additional professorships and special courses of study recently established in the several universities completes the view presented by M. Maurice-Faure.

#### UNIVERSITY OF AIX-MARSEILLE.

*Faculty of sciences.*—Industrial physics, agricultural botany, physiology, agricultural zoology, industrial physics (lectures on).

*Faculty of letters.*—History of Provence, language and literature of southern Europe, economic history and geography, history of the language and literature of Provence (complementary course).

## UNIVERSITY OF BESANÇON.

*Faculty of sciences.*—Industrial and agricultural chemistry, agricultural botany (complementary course), industrial electricity, agronomic station.

*Faculty of letters.*—Auxiliary sciences of history applied to the study of charts and manuscripts relative to the Franche-Comté (complementary course), general bibliography and sources of history of the Franche-Comté (course complementary).

## UNIVERSITY OF BORDEAUX.

*Faculty of letters.*—History of Bordeaux and the southwest of France, language and literature of the southwest of France, colonial geography, Spanish studies (lectures on).

## UNIVERSITY OF CAEN.

*Faculty of law.*—History of the customs of Normandy (complementary course).

*Faculty of letters.*—History of Norman literature and art (chair).

## UNIVERSITY OF CLERMONT.

*Faculty of sciences.*—Limnologic station at Besse.

*Faculty of letters.*—History of Auvergne (complementary course), Romanic art at Auvergne.

## UNIVERSITY OF DIJON.

*Faculty of sciences.*—Industrial physics (complementary course), industrial chemistry, agronomic and oenologic institute of Burgundy.

*Faculty of letters.*—History of Burgundy (complementary course), history of Burgundian art.

## UNIVERSITY OF GRENOBLE.

*Faculty of sciences.*—Industrial electricity (complementary course).

*Faculty of letters.*—Italian language and literature (complementary course).

## UNIVERSITY OF LILLE.

*Faculty of letters.*—Walloon and Picard languages and literatures (complementary course), language and literature and history of Russia and the Slavs (chair), history of the provinces of northern France (complementary course).

## UNIVERSITY OF LYON.

*Faculty of letters.*—History of Lyon and the surrounding region (lectures), colonial history and geography (lectures).

## UNIVERSITY OF NANCY.

*Faculty of letters.*—History of the east of France (chair).

*Faculty of law.*—History of law and of juridical institutions of the East (complementary course).

*Faculty of sciences.*—Chemistry applied to dyeing and printing (lectures), technical electricity (lectures), organic chemistry (complementary course).

## UNIVERSITY OF POITIERS.

*Faculty of letters.*—History of Poitou (chair).

## UNIVERSITY OF RENNES.

*Faculty of letters.*—Celtic language and literature (complementary course).

## UNIVERSITY OF TOULOUSE.

*Faculty of sciences.*—Agricultural botany (chair).

*Faculty of letters.*—Southern language and literature (chair), Spanish language and literature, history of the laws of southern France.

## ADMISSION OF FOREIGN STUDENTS TO FRENCH UNIVERSITIES.

The recent efforts that have facilitated the admission of foreign students to the French universities have been set forth in full in previous Reports.<sup>a</sup> It will suffice to note here that a committee was formed in Paris in 1895 (Comité Franco-Américain), with an advisory branch in Washington, whose purpose it was to familiarize American students with the facilities for advanced study offered by the French universities and with the conditions for admission to the same.

Few foreign students, and especially few American students, were attracted to the French universities because of the difficulty in securing a degree. The German doctorate, on the contrary, could be gained with comparative ease. As pointed out by Professor Furber, of Chicago, to whose efforts the new arrangements are chiefly due:

There was an organic difference in the nature of the German and the French degrees. In Germany the doctorate carried with it no professional prerogatives. Not without further qualifications and severe examinations could the student obtain from the State the license permitting him to practice a profession. In France, on the contrary, the degrees were given, not by the university, but by the State, and clothed the recipient with special immunities and rights. The *licencié en droit* could enter on his legal duties. The doctor of medicine was already a physician, while the license of the other faculties opened public careers in various directions. To render degrees more accessible to foreigners was, therefore, to subject the native youth to sharper competition in acquiring a livelihood, a competition in which, because of his military duties, the Frenchman was at a disadvantage on his own soil. It was due, in fact, to this consideration that at the very time the friends of a more liberal hospitality were endeavoring to secure the foreign student greater privileges, a counter agitation was developed which aimed at curtailing those that he already had.

The arrangements ultimately proposed by the Comité Franco-Américain harmonized all these interests. It was, in fact, the creation of a new university doctorate, which was sanctioned by a ministerial decree of July 21, 1897, in the following terms:

Besides the degrees established by the State, the universities are empowered to institute titles of a nature purely scientific.

These titles shall confer none of the rights and privileges attached by law and regulations to the (State) degrees and in no case shall be declared a substitute. The studies and examinations which shall determine their distribution shall be subject to regulations formulated by the council of the university and approved by the standing committee of the superior council of public instruction. The diploma shall be delivered, in the name of the university, by the president of the council in forms different from the forms of those delivered by the Government.

The doctorates and diplomas created under this decree and available for foreigners are as follows:

University of Paris: Doctorate of letters; sciences; medicine; pharmacy; Protestant theology. (The university doctorate has not yet been adopted for law.) Also diploma of pharmacy and certificate of French language and literature.

University of Aix-Marseille: Diploma of industrial electricity.

University of Besançon: Doctorate of letters; of sciences; also diploma of agriculture.

University of Bordeaux: Doctorate of sciences; medicine; pharmacy; letters; also diploma of pharmacy.

University of Caen: Doctorate of law; also diploma of and certificate of higher literary studies.

University of Clermont: Diploma of industrial electricity.

<sup>a</sup> See in particular Report for 1894-95, vol. 2, p. 305; Report for 1896-97, vol. 1, p. 33 et seq.; Report for 1897-98, vol. 1, pp. 749-759; Report for 1898-99, vol. 1, pp. 1091-1095.

University of Dijon: Licentiate in law; doctorate of laws.

University of Grenoble: Doctorate of letters; law; sciences; also diploma for electro-technical subjects and diploma of French language and literature.

University of Lille: Doctorate of medicine; of pharmacy; of economic sciences; of sciences; diploma of technical studies; diploma of French language and literature; licentiate in mechanics; in physics; in chemistry; in geology.

University of Lyon: Doctorate of medicine; pharmacy; sciences; letters; also diploma of pharmacy; of electro-technical studies; of agriculture; of oratory; of pedagogy; French letters.

University of Montpellier: Doctorate of pharmacy; of medicine; of law; also diploma of legal studies.

University of Nancy: Doctorate of letters; of law; of sciences; of pharmacy; of electro-technical studies.

University of Rennes: Doctorate of letters.

The following statement of the expenses to be met by candidates for the doctorate of the University of Paris is furnished by M. Henri Bréal, corresponding secretary of the Franco-American committee:

Faculty of Protestant theology:	Francs. <sup>a</sup>
4 inscriptions quarterly of 30 francs each .....	120
4 quarterly fees of 2.50 francs .....	10
Examination fees .....	110
<b>Total</b> .....	<b>240</b>

Faculty of sciences:

Annual matriculation .....	20
Annual fees for library .....	10
4 quarterly fees for laboratory of 50 to 200 francs .....	200 to 800
Examination fees .....	140

The total depends on the fees for laboratories and on the number of years of study.

Faculty of letters:

	Francs.
2 annual matriculations of 20 francs .....	40
2 annual fees for library of 10 francs .....	20
Examination fees .....	140
<b>Total if the doctorate is taken in one year</b> .....	<b>200</b>

Faculty of medicine:

16 quarterly subscriptions of 30 francs .....	480
16 fees for library of 2.50 francs .....	40
16 fees for practical exercises of 15 francs .....	240
8 examination fees of 80 francs .....	640
<b>Total</b> .....	<b>1,400</b>

Faculty of pharmacy:

Annual matriculation .....	20
Annual fees for library .....	10
4 quarterly fees for laboratories of 150 francs .....	600
Examination fees .....	100
<b>Total if the doctorate is taken in one year</b> .....	<b>730</b>

<sup>a</sup> A franc is ordinarily reckoned at 20 cents, or 5 francs to \$1, but the exact rate of exchange is at present 19.3 cents per franc.

*Higher technical schools under other ministries than that of public instruction (ministry of agriculture, of commerce, of war, etc.).*

Institutions.	No. of students.	Budget (State appropriation).
		<i>Francs.</i>

<sup>a</sup> Admitted in 1900.

The independent or private school of political sciences (École Libre des Sciences Politiques), Paris, registered 600 students in 1901.

#### THE PROFESSIONAL AND FINANCIAL STATUS OF FRENCH PRIMARY TEACHERS.

Notwithstanding the efforts which the State has lavished upon primary education there is a weak point in the system which seriously impairs its efficiency. The teachers upon whom the ultimate success of the work depends are the most poorly paid servants of the State. The loyalty of these devoted adherents of the new social order and their faith in the good intentions of the Government have supported them under a strain which becomes every year more intolerable. Apart from the actual want suffered by many teachers, the spectacle of their distress deters promising young people from entering upon the teaching career, the normal schools cease to attract, and the service is losing the respect of the classes upon whom the Republic counts for its support. The situation has been brought clearly to view through the efforts of M. F. Buisson, whose eminent service to the cause of popular education has won the regard of every patriotic spirit and the unbounded confidence of the teachers. At his instance, and supported by the prestige of his name, the *Manuel Général de l'Instruction Primaire*, the oldest and most authoritative of French journals of primary education, has conducted an exhaustive inquiry into the financial condition of the primary teachers of France.<sup>a</sup>

The purpose of the inquiry, as explained in the introductory announcement, was not to seek and expose particular complaints, but to collect and present to the public, to Parliament, and to the ministry complete and exact information, offered without passion or prejudice, characterizing the normal average condition of the teacher, and when analyzed in detail furnishing some indications as to attainable reforms.

To this end the inquiry forms were drawn up in very precise terms, so that the particulars elicited could be readily tabulated and analyzed. This work was done under the supervision of M. Levasseur with the collaboration of the statistical division of the labor bureau. The results thus obtained furnish the most complete presentation of the living conditions of primary teachers, both actual and as compared with those of persons in other employments, that has ever been made for

<sup>a</sup> See *Manuel Général* of April 26, 1902.

any country. It leaves no question as to the inferior condition of the teachers and the necessity of an increase in their salaries.

The presentation created a profound impression and led to an immediate increase of the State appropriations, which furnished some amelioration of the evils. This addition amounted to 5,011,200 francs (\$1,002,240), of which 3,811,200 francs (\$762,240) were to be used to increase the number of higher salaries, thus giving greater chance for immediate promotion, and 1,200,000 francs (\$240,000) to increase the number of pensions, thus making way for promotions by the retirement of persons past service. In the meantime, several bills have been introduced into the Chamber of Deputies, proposing radical changes in the classification of teachers, the conditions for promotion, and the scale of salaries.

For an understanding of this very important movement for the improvement of the teaching service, we consider here: (1) The present provision respecting the classification and salaries of teachers; (2) the actual conditions developed by the inquiry.

For admission to the public teaching service of France one must be a citizen of the country, native or naturalized, and, if a man, at least 18 years of age. Women may enter the service at 17 years.

No one can be a teacher in France (not even in a private school) who has not obtained at least the *brevet élémentaire* (teacher's diploma of the lower degree).

Teachers of State schools are divided into *stagiaires* (probationers), and *titulaires* (having a certified title). A *stagiaire* becomes a certified teacher (*titulaire*) by passing an examination in the theory and practice of teaching and securing favorable report for his work as probationer. He may then be appointed as an adjoint (assistant) in a school.

The *brevet supérieur* (higher State diploma) is only required in the case of masters of the higher primary schools, but, nevertheless, it is held by a large proportion of teachers in the elementary schools. All persons who aspire to become fully certificated teachers must secure the "*certificat d'aptitude pédagogique*" (the highest teachers' diploma). This distinction, as already stated, is held by about 97 per cent of the teaching force.

It should be recalled that probationers (*stagiaires*) are appointed by the academy inspector, who alone has the right to make up the list of candidates from whom the department prefect may appoint full teachers.

Not only is the entrance into the teaching service thus carefully guarded, but the teacher's salary and advancement in the service are also under strict regulation. The salary of the *stagiaire* is 900 francs (\$180) per annum. The certified teachers in the elementary primary schools are divided into five classes, with salaries fixed as follows:

Class.	Male teachers.		Female teachers.	
	Francs.	United States equivalent.	Francs.	United States equivalent.
Fifth class .....	1,000	\$200	1,000	\$200
Fourth class .....	1,200	\$240	1,200	\$240
Third class .....	1,500	\$300	1,400	\$280
Second class .....	1,800	\$360	1,500	\$300
First class .....	2,000	\$400	1,600	\$320

Each class contains a certain percentage of the whole body of teachers; hence the significance of the expression "*la pourcentage*," constantly occurring in discussions of the service. By the law of July 15, 1889, the percentages were fixed as follows:

"*Stagiaires*, 15 per cent; fifth class, 25 per cent; fourth class, 25 per cent; second class, 10 per cent; first class, 5 per cent."

Promotion from one class to another depends upon (1) efficiency as attested by the reports of the primary and academy inspectors; (2) length of service.

Teachers of the fifth and fourth classes can only be promoted after five years' service. For promotion to the second and first classes, the teacher must hold the "*brevet supérieur*" and have served at least three years in the preceding class. It is further provided that teachers who have served ten years are eligible for the fifth class; if the service is fifteen years, the teacher is eligible for the fourth class; if twenty years, for the third class, and twenty-five years for the second class. There is, however, a restriction which reduces even the chance for promotion which the law seems to give, since no promotion can be made to a class so long as it has its full contingent. Under this system the upper classes became so congested as to block promotions, and thousands of teachers seemed doomed to wear away their lives on the lowest salaries.

As a partial relief to this unfortunate condition, a change was made in 1900 in the percentage allowed to each class of teachers. The stagiaires were reduced from 15 to 10 per cent of the total, and the fifth class from 25 to 20 per cent, while the third class was raised to 25 per cent and the second to 15 per cent. The addition already noted of five million francs to the annual appropriation was necessary, however, to give practical effect to the change in the percentages. The increase provided for the retirement of a large number of aged or infirm teachers and the augmentation of salaries as required by the readjustment of the positions.

In the public discussion of the salaries emphasis has been placed upon the additional emoluments which teachers receive from the individual communes.

Every commune must provide a lodging for the teacher or its money equivalent, and a commune may increase the salary. Outside of the large cities, however, the local increase of salaries is seldom granted without the requirement of other teaching.<sup>a</sup>

The rural teacher is expected to act as secretary to the mayor of his commune, whose office is generally on the school premises. For this service he may, and often does, receive compensation.

Once appointed titulaire the primary-school teacher has practically a life tenure of his position, as he can only be removed for immorality or incompetence. As members of the civil service teachers are carried on the pension list and may demand their retirement at 55 years of age if they have twenty-five years' service to their credit. The years passed in the normal school after the student reaches 20 years of age count toward the pension. The rate of pension is based on the average of the teacher's salary for the last six years. For twenty-five years' service the pension is reckoned at 50 per cent of the average, with one-fiftieth for every year's extra service. The pension can not be lower than 600 francs (\$120) per annum for men and 500 francs (\$100) for women. Hitherto, as we have seen, the annual appropriations for pensions have not sufficed to prevent the block in promotions.

To complete the view of the nominal advantages offered by the teaching career, it should be added that the required term of military service (three years) is reduced to one year for teachers. Until recently teachers were exempt from military service, and the sons of rich peasants, it is said, often entered the normal school to escape military service; but zealous teachers complained of a privilege which seemed to put a stamp of effeminacy upon their profession and which also drew to it men having no real interest in the work. The one year's service was

<sup>a</sup> The only obligatory expenses in respect to public schools now left to the communes besides the residence for the teacher are: Provision of site and school building; school furniture and equipments; heating and lighting school premises; wages of the maid employed to attend to the children in the infant school (if there be one), and of the caretaker of the primary school (the latter seldom provided in small communes).

accorded in response to this spirit of patriotic and professional pride, but it has not proved very satisfactory, as the great body of those affected would as lief serve the full three years as to be marked off from their comrades by a term of one year.

An additional privilege accorded to primary teachers is that of free tuition for their sons in the national lycées and communal colleges (law of 1900) and they have the right to travel by rail at half the regular fare.

In this summary of the conditions affecting teachers, no reference has been made to the directors of primary schools or to the teachers of the higher primary schools. The former receive an additional sum of \$40 per annum if in charge of a school of three or four classes and of \$80 for a school of more than four classes. Teachers of the higher primary schools, like those of the elementary grades, are divided into five classes—promotion from one class to the next higher being regulated as in the case of the elementary teachers. The high-school teachers receive better salaries, the scale rising from 1,800 francs (\$360) to 2,800 francs (\$560).

The position of these higher-grade teachers is distinctly better than that of the lower grade, and the question of raising their salaries is agitated as a measure of public advantage rather than of personal necessity.

It remains now to present, briefly, the actual condition of the French primary teacher as disclosed by the recent investigation.

Replies to the inquiry issued by the Manuel Général were received from 3,472 teachers (men only), about 7 per cent of the total number of men<sup>a</sup> employed in the public schools. They were located in 2,924 different communes, or 8 per cent of the total number.

The chief particulars elicited are summarized in the following tables. The first and second tables relate to the professional and civil status of the teachers responding:

*Professional situation of the teachers responding.*

Class of teachers.	Total.	Number of years of service.							Un-known.
		0 to 4.	5 to 9.	10 to 14.	15 to 19.	20 to 24.	25 to 30.	Over 30.	
First class .....	67	-----	-----	-----	-----	3	13	50	1
Second class .....	233	-----	-----	-----	-----	8	89	170	5

Stagiaires .....	405	39	33	13	2	1	-----	1	316	-----
Unknown .....	10	-----	-----	-----	-----	-----	-----	-----	-----	10
Total .....	3,472	817	959	665	269	115	56	20	549	12

<sup>a</sup> As only 107 women teachers responded to the inquiry they were not considered in the final summary.

From the first of the above tables it appears that while the greater part of the stagiaires represented in the replies count less than five years' service, a considerable number—nearly 39 per cent—exceed the five years, or the normal period for promotion; the majority of teachers in the fifth class count between ten and fourteen years of service; the majority in the fourth class count between fifteen and nineteen years' service, and the majority in the third class between twenty and thirty years. A very small proportion of those in the second class and first class have had less than twenty-five years' service. Hence it would seem that a French teacher must work a quarter of a century before he reaches the modest annual salary of \$360.

With respect to the second of the above tables, the reporter notes that the proportion of unmarried teachers—16 per cent of the number considered—is below the proportion of the unmarried in the population as a whole, viz, 22 per cent.

The results of this inquiry of greatest general interest relate to the incomes of teachers.

The inquiry with respect to incomes specified the following sources: (1) Professional, comprising all the receipts pertaining to the position held by the individual teacher; (2) supplementary, comprising receipts for extra services, i. e., teaching in evening classes, clerical work, etc.; (3) salary of wife or other sources of family income.

The following table presents a summarized view of incomes from all the sources named above under two classifications: First, classification by communes; second, classification by grade of teachers.

*Summary of teachers' incomes.*

Classes of communes.	Total number of teachers.	Number of teachers receiving—				
		More than 3,000 francs (\$300).	2,001 to 3,000 francs (\$400 to \$500).	1,501 to 2,000 francs (\$300 to \$400).	1,201 to 1,500 francs (\$240 to \$300).	1,200 francs (\$240) and less.
Communes of 0 to 500 inhabitants.....	2,210	153	671	831	346	209
Communes of 501 to 1,000 inhabitants.....	511	51	184	101	53	122
Communes of 1,001 to 2,000 inhabitants.....	305	41	88	51	55	70
Communes of 2,001 to 3,000 inhabitants.....	133	11	34	23	23	37
Communes of 3,001 to 4,000 inhabitants.....	73	13	18	15	19	8
Communes of 4,001 to 20,000 inhabitants.....	142	21	38	56	38	9
Communes of 20,001 to 50,000 inhabitants.....	38	8	16	10	3	1
Communes of more than 50,000 inhabitants.....	50	14	21	12	3	-----
Total .....	3,462	312	1,070	1,079	545	456

Classes of teachers.	Total.	Number of teachers receiving—				
		More than 3,000 francs (\$300).	2,001 to 3,000 francs (\$400 to \$500).	1,501 to 2,000 francs (\$300 to \$400).	1,201 to 1,500 francs (\$240 to \$300).	1,200 francs (\$240) and less.
First class.....	67	33	34	-----	-----	-----
Second class.....	263	70	166	27	-----	-----
Third class.....	847	137	374	332	4	-----
Fourth class.....	1,071	56	297	481	233	4
Fifth class.....	809	16	188	215	238	152
Stagiaires.....	405	-----	11	24	70	300
Total .....	3,462	312	1,070	1,079	545	456

Communes not reporting, 10.

Attention is called to the fact that the small communes were more largely represented in the replies than the larger ones. The proportion of each class of communes responding to the total number of the class was as follows:

Class of communes.	Per cent responding.
0 to 500 inhabitants .....	50
501 to 1,000 inhabitants .....	27.5
1,001 to 2,000 inhabitants .....	15
2,001 to 3,000 inhabitants .....	3.7
3,001 to 4,000 inhabitants .....	1.5
4,001 to 20,000 inhabitants .....	2
Above 20,000 inhabitants .....	.3

The two following tables relate to incomes for strictly professional service. The first of these shows the proportion of teachers in each class receiving stated incomes; the second table shows the amount of income received by specified percentage of teachers in each class.

*Incomes from professional sources only, including salary, allowance for house, pay for extra teaching.*

Classes of teachers.	Number of replies from each class.	1,200 francs (\$240) or less.	1,201 to 1,500 francs (\$240 to \$300).	1,501 to 1,800 francs (\$300 to \$360).	1,801 to 2,000 francs (\$360 to \$400).	2,001 to 2,500 francs (\$400 to \$500).	2,501 francs (\$500) and over.
First class .....	67	-----	-----	-----	-----	50	50
Second class .....	263	-----	-----	3	51	35	11
Third class .....	847	-----	3	73	14	8	2
Fourth class .....	1,071	0.2	80	15	2.8	2	0.3
Fifth class .....	809	43	44	11	2	0.4	-----
Stagiaires .....	405	90	8.4	1.2	-----	-----	-----
Total .....	3,462	21	37	25	9	6	2.4

*Different incomes from professional services by classes.*

Class of incomes.	Number of replies.	Percentage of each class of incomes received by—					
		First-class teachers.	Second-class teachers.	Third-class teachers.	Fourth-class teachers.	Fifth-class teachers.	Stagiaires.
1,200 francs (\$240) and less. ....	714	-----	-----	-----	0.3	43	51
1,201 to 1,500 francs (\$240 to \$300) ..	1,269	-----	-----	2	67	23	2.7
1,501 to 1,800 francs (\$300 to \$360) ..	878	-----	0.9	70	18	10	18
1,801 to 2,000 francs (\$360 to \$400) ..	301	-----	45	40	10	5	-----
2,001 to 2,500 francs (\$400 to \$500) ..	217	16	42	31	9.6	1.4	-----
2,501 francs (\$500) and over .....	83	40	35	22	3.6	-----	-----
Total .....	3,462	-----	-----	-----	-----	-----	-----

From the first of the two tables immediately preceding it appears that the income from professional work (regular and accessory) does not exceed 1,200 francs (\$240) for 21 per cent of the teachers responding; 1,500 francs (\$300) for 53 per cent; 1,800 francs (\$360) for 83 per cent; 2,000 francs (\$400) for 92 per cent; only 6 per cent receive an income between 2,000 francs (\$400) and 2,500 francs (\$500), and only 2 per cent an income above 2,500 francs (\$500). Further, it is seen that after many years of service the French teacher must still remain at a very low salary. For instance, of the teachers of the fifth class, who have had at the least four or five years of service and more often ten or fifteen years, it is found that 87 per cent have incomes not exceeding 1,500 francs (\$300): of teachers in the third class who count as a rule from twenty to thirty years' service, 73 per

cent have not obtained more than 1,800 francs (\$360), while only 10 per cent of this class exceed 2,000 francs (\$400).

The last table shows that great inequalities of income are found among teachers in the same class, and also that the same rate of income may be obtained by teachers in different classes. These inequalities arise from the varying opportunities for extra teaching outside of the regular school duties.

But a statement of incomes does not of itself enable us to appreciate the actual conditions of the teachers. A more important consideration is that of the relation of the income to the supply of the necessary demands of life. This can only be understood by an examination of the expenditures, which are set forth in a series of tables of which only the summary is here reproduced.

*Annual expenditures.*

Classification of incomes.	Number of teachers reporting.	House.	Food.	Heat and light.	Clothing.	General household.	Insurance and saving.	Other expenditures.	Total.
		<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>
3,000 francs (\$600) and more .....	357	225	1,520	150	510	523	447	250	3,625
2,000 to 3,000 francs (\$400 to \$600) .....	1,144	145	1,103	124	373	250	228	182	2,495
1,500 to 2,000 francs (\$300 to \$400) .....	1,035	114	888	105	287	112	121	130	1,757
1,200 to 1,500 francs (\$250 to \$300) .....	488	85	732	77	235	44	73	125	1,376
1,000 francs (\$200) and less .....	392	57	596	43	181	11	61	117	1,066
Total .....	3,416	125	971	105	329	180	173	158	2,096

The condition of the teachers is also shown to be greatly inferior to that of other employees in the lower grades of the civil service, as will be seen by the following comparative statistics submitted to the Chamber of Deputies in connection with a summarized report of the investigation here reviewed.

*Salaries of teachers compared with those of other civil employees.*

TEACHERS.

[Age at entrance into the service, 20 years.]

First.....		3,300	660

a Per month.

It is interesting to compare the salaries of French teachers tabulated above with the following average salaries of teachers in the United States and in England.

*Average annual salaries of teachers in the United States for 1900.*

	Men.	Women.
United States.....	\$342.36	\$282.02
North Atlantic Division.....	513.97	370.77
South Atlantic Division <sup>a</sup> .....	165.87	158.98
South Central Division <sup>a</sup> .....	203.32	165.45
North Central Division.....	389.62	303.52
Western Division.....	448.99	373.89

<sup>a</sup>The figures for the two Southern divisions do not adequately represent the professional incomes of teachers in the Southern States, as in some of these States it is a common practice for the patrons of a school to contribute to increase the salary of the teacher received from public funds, or to engage him to conduct his school as a private school after the public term has expired.

*Average annual salaries of certificated teachers in England for 1899.*

Grade.	Men.	Women.
Principals.....	\$720	\$470
Assistants.....	510	380

The facts presented in the above tables show conclusively the inadequacy of the teachers' salaries and their inferiority to those of other employees of the Government. The letters accompanying the tabulated details impart to them a personal and, at times, pathetic interest. Their general character is shown by the following citations from two letters included in the number selected out of the collection by M. Buisson to be submitted before the Chamber of Deputies. A teacher in the Department of Eure (northern France) concludes his statement as follows:

For myself I have no longer cause for complaint. There are now two of us earning and, thanks to the good health of both, we are hopeful. But can I forget the condition in which I lived for many years? \* \* \* I had been forced to contract a debt of 500 francs (of which 200 were for doctor and medicines), although I worked from sixteen to eighteen hours daily. I could not afford to join one of the mutual aid associations. If I had sought a better position, this would have necessitated moving—an expense which was beyond me.

I conclude (1) that it is impossible for a young man from 20 to 25 years of age to make both ends meet with 900 francs (\$180) a year; (2) it is impossible for a married man from 25 to 30 years of age to live on 1,000 (\$200) a year; (3) it is very difficult for a man 35 years of age, the father of a family, to support his wife and children on 1,200 francs (\$240) a year.

A second teacher contrasts the condition of persons in his calling with that of other civil employees, as follows:

In 1899 one of my pupils in the continuation class presented himself, in July, at the examination for a teacher's diploma (brevet); he failed in the second part of the examination; fortunately, he gained admission to a normal school, and in October tried again for the diploma, but failed in orthography. He was at the time 18 years of age and of average intelligence. In November he passed the examination for admission to the postal service and in the following May received an appointment in Paris. He passed two months in learning telegraphy at a salary of 50 francs a month, after which he was promoted to the position of a traveling substitute clerk. He wrote to his parents that he was receiving 120 francs a month and should need no further assistance. The first of October following his position was still further improved, as he was made full traveling clerk. Taking advantage of Easter holiday he paid a visit to his family and friends. In talking with me he said (I use almost his own words), "I am glad indeed that I failed to get the brevet. I am traveling clerk; the journeys are wearisome, but we have plenty of time to rest. I receive 180 francs (\$36) a month with transportation. I can provide for myself without help from my relatives."

He met his old comrades and talked freely with them, and as a result two pupils whom I was preparing for the normal school have changed their minds. They are going into the postal service.

#### Second example:

In the village is a family of 4 children, 3 sons and a daughter, whose father is a miner. Thanks to the continuation class, the two elder sons became teachers, after an excellent training in the normal school and the possession of the higher diploma (brevet supérieur). The youngest son presented himself at the same time for admission to the postal service and to the normal school. He was accepted for both and chose the postal service. He is inferior to his brothers, naturally, as he has not had the normal school course; however, he has a better career. It is easy to see why. He passed his term of military service in Africa, and was able to provide for himself without calling for aid from his people. He secured an appointment in the postal service of Algiers and reached a salary relatively large. His father said to me one day, "The youngest is the one who has succeeded best; he gets the most money; he lives most at his ease." "Yes," I replied, "but he cost you a great deal while he was awaiting his appointment (surnumérariat)." "You are mistaken," rejoined the father, "he cost me less during that time than the others while they were in the normal school." These examples are conclusive and show why the normal schools are no longer filled.

The writer continues:

The condition of the directors in some exceptional schools is very satisfactory, but the great body of the teachers can not possibly live on the salary allowed. If a man marries a woman who is also engaged in the work, the double salary

may suffice for their necessities, otherwise the prospect is hopeless indeed. I speak from experience. For six years—from my twenty-third to my twenty-ninth year—I was principal of a school of two classes in the chief town of the canton. Near me lived a road surveyor of my own age, who had failed in the examination for the brevet, but who earned 2,100 francs a year; a receiver of taxes, whose inferiority was well known, but who reached a salary of 3,000 francs, and other functionaries who esteemed me because of my superior knowledge, but who pitied me for my position.

Among my assistants there was one, a married man, having one child 3 years old, who had obtained both the superior diploma and the certificate of pedagogic capacity; at 31 years of age he was receiving only 1,000 francs (\$200); a second, also a married man with an infant child, possessed the superior diploma and qualified for the certificate of capacity which constitutes one a full teacher, and receives the same sum; a third assistant, also in receipt of 1,000 francs, has a wife who is a teacher, and their combined salaries enable them to live more comfortably.

The above citations bear out the impressions expressed by M. Buisson in his review of the whole correspondence:

In these letters [he says] there is much to encourage and console those who have had faith in secular education and lay teachers. The tone is dignified even when complaint is uttered. They express confidence in the force of public opinion and the firm conviction that the Republic will do what is necessary and do it quickly. This manner of setting forth the truth and claiming what is morally due is vastly superior at once to that resignation which was formerly regarded as the chief virtue of the poor and to that violent language in which the discontented so often indulge. To-day our teachers indulge neither resignation nor revolt. They are as far from gloomy, paralyzing hopelessness as from the angry passion which gives one over to rancor and hate. They know their rights, and they maintain them. They explain their situation freely, but they do not forget what the school work of the third Republic signifies. They simply show that it is necessary to complete it, to guarantee it against every disaster, and that after millions have been expended on the schools it must be possible to expend a few hundred thousand in order that the teacher should be materially what everyone knows he ought to be.

The letters frequently include propositions of law for the remedy of the evils described. None of these have been considered here, as they are of interest chiefly to the officials whose business it is to draft a bill. The inquiry so ably conducted has created a profound impression. Even in the public press the situation disclosed is discussed as a "national peril." As already indicated, it has resulted in immediate efforts at temporary relief, pending legislation which will radically improve the financial status of teachers.

## CHAPTER XVI.

### EDUCATION OF THE WILL.

CLOSING LECTURE OF THE COURSE IN PEDAGOGY DELIVERED AT THE SORBONNE  
JUNE 22, 1899, BY F. BUISSON, PROFESSOR AT THE SORBONNE.

LADIES AND GENTLEMEN: It is not customary to write a closing lecture, and I only decided to prepare the present one in response to a request made by some of you who wished, as they told me, to preserve a kind of memento of the principal ideas which we have been considering in the present course, and of the pedagogical instruction which can be derived from them. I will endeavor to afford you some satisfaction in this respect without attempting to disguise from myself that such a summary as I am compelled to give will be necessarily abrupt and dry. All that gives animation to instruction will have disappeared, and only the skeleton will remain.

The course for this school year (1898-99) was devoted to the education of the will.

What is the will? This was our first question, and I do not venture to flatter myself that we found a final answer to it, even from the special point of view of education. At any rate we endeavored to get rid of two widely diffused errors.

#### I.

In the first place, we labored to combat an abuse of the old psychological terminology, which makes the will a "faculty" in the narrow and rigid sense to which the word is confined by the school of Cousin. "The fundamental and gross error," as M. Hannequin<sup>a</sup> boldly says, "which has produced a conception of the doctrine of the mental faculties most radically contrary to the spirit of science, and which is the most serious obstacle to the development of psychology," is that instead of applying to that doctrine the method of induction which connects one fact to another, all research is dispensed with by referring all facts directly to an assumed cause which is itself found to be only a word. How do we explain a phenomenon in any of the sciences of observation? By demonstrating experimentally that it always follows certain other phenomena and varies with them. "The cause of the tone of a tuning fork is the motion of its branches and the vibratory motion which it communicates to the air. The cause of the radiance of hot bodies, i. e., of the phenomena of light, is the undulations of the ether. The cause of the explosion of powder is its chemical energy, i. e., the molecular movements of its chemical constituents, which become movements of translation under the influence of the spark. The cause of the circulation of the blood is found in the contractions of the heart and arteries, these contractions being themselves conditioned by the decompositions and undulations of the nervous matter. Everywhere the cause of a phenomenon is found in the phenomena which precede it, never in occult forces such as the sonoric force, the caloric, explosive, or circulatory force, or the light force." On the other hand, in psychology, as we learned it at college, there was a yielding to the ancient temptation to explain everything by some word which in reality explains nothing. The same answer which was

<sup>a</sup> Introduction à l'Étude de la Psychologie, pages 108 et 112.

given in response to the question, Why does opium produce sleep? Because it possesses soporific qualities, was repeated everlastingly; and when we were asked, Why do we think? the answer was, Because we have a thinking faculty. We will, because we are endowed with the faculty of willing; we feel, because we have the faculty of feeling, and so on.

To realize an abstraction, to take a general term which embraces a certain number of facts as the explanation of those facts, has always been and is still the natural and almost irresistible tendency of the human mind. Let us try to resist this tendency. Nor is this all. Not only is the name of a faculty only a label for designating a whole group of facts under a single term, but it is a label which presents those facts as if they were isolated and distinct, while nature never isolates or distinguishes them fully. In reality, in life, always and everywhere, the psychical act is complex. There is no sensation as such, pure and simple, without some admixture of intelligence and will; neither is there a voluntary act or an act of the intelligence which is wholly independent of pleasure or pain.

To represent the will as a special power of the mind, opposed to sensation on the one hand and to intelligence on the other, is at once to condense and simplify wrongfully facts which the laws of logic may compel us to look at separately, but which are only the diverse aspects of one and the same act. Indeed, it is only for the sake of analysis that we distinguish these inseparable phenomena in order to discern them more clearly, and divide them in order to particularize each. Nothing would be more legitimate than for us to try to follow each of the vital phenomena of the mind—the will, for example—through its own development, disregarding all the rest, as if it were like a single straight line, autonomous and independent, and as if it had never had anything in common with the phenomena of representation or the affections, provided that in doing so we do not become our own dupes, and, after having artificially dissociated our phenomena, forget to recompose them if we wish to recover their true nature; and, provided also that, after having placed as it were one of the innumerable and imperceptible filaments of our complex psychical life under the microscope, we do not forget that all of them together in the living being form the most inextricable network, and that the miracle of life consists in their indissoluble solidarity, their close and mutual interdependence. In short, after using language, that marvelous instrument of purely logical analysis, let us remember to enter again into the living reality and restore to it its character as the richest and most mysterious of syntheses. Let us free ourselves from the illusion due to words; from the superstition that words must represent entities. Let us observe facts instead of cataloguing terms. Let us endeavor to discover, by introspection and by all the other means of investigation, direct and indirect, now at our disposal, what an act of the will really consists of, what it presupposes, what elements of sensation and representation it contains, what part of it is conscious and what unconscious, spontaneous or deliberate, primitive or acquired, how much it owes to instinct, to heredity, to personal initiative, to habit, and to impulse. In a word, let us face the problem in its complexity, and not allow our curiosity to be extinguished by a too easy answer and a too simple explanation.

## II.

The second great error from which we tried to free ourselves is a consequence of the first. This second mistake is that we only observe the will in its perfect state, at the summit of the hierarchy of beings, in the adult man, and in man himself only in a small number of acts which combine in themselves all the conditions of the perfection of free will.

Doubtless it is in this manifestation that we are to seek the finished type of will,

which reaches its highest degree in what Kant would define as moral determination. But this pure act of pure spirit does not appear in the history of living beings as a sudden miracle. "For the evolutionist," says M. Ribot, "the will can only be the supreme form of activity, the last step in an upward movement which presupposes all the preceding ones." It is the last term of the long vital procession which begins with animal life and continues step by step until man is reached, and which, even then, goes on increasing from infancy to adult age, from the savage to civilized man, from the common man to the man of genius.

Below, far below the ideal act of a will absolutely free and disinterested there is revealed a whole series of acts already voluntary, conscious determinations, movements due to an intention which the agent alone knows, and choice which may be called free in the sense at least that the chooser judges it to be free. The natural history of the will precedes its psychology. The time has passed when it was thought to be a profanation of the word to admit that there are proofs of the existence of the will in animals as there are of sensation and reasoning. While recognizing, with Maudsley, that "the will certainly appears to be the final bloom in which nature causes the most marvelous of her wonders to appear," we must also acknowledge with M. Ribot that the will "has a very humble origin," and that the first form under which it appears in the world can not be distinguished from that property of living matter which physiologists call irritability.

In common then, with Bain, Wundt, William James, and Fouillée we attempted to disentangle what another philosopher has called "the history of the development of the will," and to follow it from the first traces of appetency, from that kind of vital reflex action which, gradually becoming associated with consciousness, memory, and rudimentary experience, becomes desire, and then is fixed in a permanent inclination, to the point at which, out of the mass of natural inclinations, one general direction of the whole is distinguishable, a force which, at first feeble and groping, ends by becoming the free and rational will. This series of phases in the evolution of the will is reproduced in the infant. The newborn child is alive, but his life only manifests itself by reflex movements which, day by day and week by week, become transformed into instinctive movements and then into those which are manifestations of desires which the child feels. The impulse to act is at first entirely organic, but comes to be accompanied by sensations and reactions which become gradually differentiated and distinct until the moment when clear consciousness is attained and the specific phenomenon of humanity—language—appears.

Thus we have become accustomed to regard the will as the expansion in humanity of what Schopenhauer called "the will-to-live," or, in other words, as the most complex and the loftiest form of life, which is only made possible by a powerful synthesis of instinct and intelligence, of activity and passivity, of spontaneity and reflection, of a multiplicity of impressions and a unity of law granted by reason.

If these observations do not enable us to give a definition of the will, they at least lead us to call it, as M. Ribot does, "a resultant." They also help us to foresee how varied, complex, and progressive the education of the will must be in its turn, and how much more, therefore, the will merits the title of "a resultant."

### III.

M. Vacherot used to say, "History shows us in large characters what psychology compels us to decipher in traces so fine and delicate that we can hardly discern them." So we turned to history to find out what the will is. And history—the history of philosophy and of religion, as well as of human institutions and societies—answered us by a kind of paradox. To take a most striking example, we found the very same doctrine which Saint Augustine made prevalent in the first

years of Christianity—the somber doctrine of predestination and enslaved will—reappearing in the dawn of modern times. “No,” said Luther, “I am not free. Free will is an empty word. And if it were otherwise, and even if God Himself were to offer me free will as a gift I should refuse it.” “No,” said Calvin, translating the same sentiment into formulas pitilessly precise, “the will of man is nothing, can do nothing, is worth nothing; in the hands of God man is like clay in the hands of the potter. The creature can demand no reasons from his Creator; he has not even the right to beg for justice, because God’s justice is not our justice, and we can only adore and tremble.” And this utter annihilation of the human will by the divine, this final and superhuman effort to which, until then, only a few thinkers and saints had attained in moments of ecstasy, Calvin undertook to convert into a current and popular educational doctrine. “Upon this rock,” says Michelet, “he built the church and the city.”

Now, that same Calvinistic education, so sternly trampling liberty under foot, became the very education which spread over the face of the earth, engendering free men and free peoples. Contemning human will, it produced heroic wills, creating legions of martyrs, who were sent to the stake and the scaffold. It gave the people of the United Provinces strength to undergo the most frightful orgy of massacres recorded in history. Through it the French Huguenots endured forty years of persecution, filling dungeons and meeting torture and death rather than consent to bow to an image of the Virgin or the Host. It produced heroes like Marnix de Saint Aldegonde and Coligny, John Knox and William of Orange; it raised up innumerable Protestant preachers, who resumed their work immediately after the slaughter of Saint Bartholomew, and inspired the men who voluntarily became galley slaves after the revocation of the edict of Nantes, who might have escaped by a word, but would not. Nearer us, in the bosom of Catholicism, we find another example of the same historical paradox. We studied it while reviewing the life at Port Royal. Never were the sense of humility, the conviction of the nothingness of man, and the effacement of human liberty before Divine Sovereignty more profound in Catholic souls than at Port Royal. And nevertheless it is there that we find in Jansénius, Saint Cyran, and Arnaud, and in the poor, humble, trembling nuns of Port Royal that very force—the will—which they seem to have tried to destroy, again prevailing with incomparable strength. There we find French subjects whose submission to the civil power was most exemplary, and faithful Catholics to whom even the mere thought of disobedience to the Church was intolerable, nevertheless resisting both King and Pope. Their resistance, to be sure, was respectful and pious, but it forbade any triumph over their conscience and was unshaken by either the edicts of the King or the bulls of the Pope. Notwithstanding that their faith condemned them to the most illogical of contradictions their resistance endured for a century.

We meditated upon these lessons of history and came to understand their apparent contradiction. It is not denying the existence of the human will to make it subordinate to the divine will, that is to say, to a law which serves as its foundation, rule, and cause. Will is not caprice, and man must not entertain the illusion that he is either its author or its end. He does not suffice for himself, but his existence, his intelligence, his free activity all require a point of support firmer than himself. This explains why he will do for duty’s sake what he would not do for self-interest alone. Duty is the great mainspring of the will, because it is superior to and communicates something eternal and absolute to the will which the will alone could never give itself. The human will, moved and regulated by respect for the divine will, annihilates itself in appearance, but in reality attains its highest degree of force, grandeur, and fixedness. It blends itself, so to speak, with the law, the majesty of which it borrows. To obey God, which is nothing else than to obey one’s conscience, is the highest act of liberty.

## IV.

Can such historical studies as these, when compared with psychological observations, aid us in laying the foundations of a pedagogy of the will? It would appear at first that the doctrines of the education of the will might be referred to one of two great schools, one of which finds its most perfect expression in the philosophy of Kant, the prototype of which in the past was stoicism, and which may be defined as the education of the will by the will itself. It is the affirmation of duty and implies, as a consequence, a constant appeal to effort. "I ought, therefore I can, therefore I will." Morality is liberty governing itself and obeying itself alone. How can we learn to will? By willing. From this comes the permanent tension of all the springs of our spiritual machinery. The categorical imperative is the supreme law of action.

No one can deny the sublimity of this austere conception, but who will maintain that it alone can satisfy the whole of human nature? Therefore this haughty and uncompromising method of education has not prevailed. The average man and average society have had a much more eclectic and empirical conception of the education of the will. The idea of effort is not excluded from this conception, but it enters into it only in the proportion of the possible, and this proportion is quite restricted. According to this conception, pure will should be assisted by auxiliaries which are often more efficacious than the will itself, viz, interest, pleasure, habit, imitation, the hope of reward, and the fear of punishment—all the innumerable forms, in short, under which the gentle pressure of authority is insinuated into our minds. Instead of a combat in which victory must be obtained by main strength, this education becomes a series of stratagems contrived to turn obstacles aside, to make prudent use of circumstances, to take advantage of all propitious moments, and, when necessary, to come to terms with the enemy. The aim is not to effect a radical and decisive moral revolution, but to find means to make the will pliant, to discipline the character, to hold the passions in check either in order to wear them out or to divert them, to establish a relative harmony between nature and reason, and to assure to the will a nominally absolute power while modifying it in fact by all the concessions which human weakness can take from it.

Such are the two systems, or rather the two kinds of minds, when brought in contrast. By a familiar but perhaps not too inexact a comparison, they bring to mind the two immortal types in which Molière seems to have intended to incarnate them—*Alceste* and *Philinte*.

But is it really true that we must choose between these two pedagogical directions, or rather is it possible to make such a choice?

The new psychology, which is in reality only the old severely revised, extending its investigations beneath the surface of words to the things themselves, and studying the living man of flesh and bones instead of the empty phantom which formed the abstract idea of man in himself, answers "No" to this question. No, things are neither so simple nor so fixed. In psychology as well as in physiology we can say: *Homo fit, non est*. And in the same way, we say that the will grows and is not born ready-made. Why, then, speak of a rigid system of education which would treat the will as if it were a constant quantity perfectly well known? If you trace the curve of development of this faculty you will at the same time trace the curve of the corresponding education. The narrow, dogmatic school of pedagogy which admits of but one view of the education of the will is doomed to disappear together with purely formal and verbal psychology.

And thus we were led to take up in detail, in chapter after chapter, a careful examination of the facts. We studied the birth, growth, and completion of voluntary action in each part of human life in hopes of deriving from our observations some pedagogical rules. At first glance this field of study seems so vast and

its aspects are so various that one could not expect at most anything more than a multitude of very diverse partial conclusions and practical results of very limited scope. Nevertheless, as we proceeded it seemed to us not only that the confusion grew less, but that some general lines became clearly distinguishable.

## V.

The first domain which we entered was that of physical activity. We asked what part the will plays in that form of action, and consequently what ought to be the education of the will with relation to it. In this inquiry we had the good fortune to find as a guide a savant who had studied the same questions before us from the point of view of hygiene. From our references to his results you were able to appreciate how much the admirable work of Dr. F. Lagrange had contributed directly to the physiology of exercise and indirectly to the pedagogy of physical education. Although we could not follow him in the details of his learned work, we could nevertheless accept his conclusions and derive from them a guiding idea. We found that Dr. Lagrange had reached a general law of the muscular mechanism which he had derived, not from philosophical or even scientific theories, but from rigorous methods of observation.

What he calls "*exercice*," or, speaking more generally, the sum total of the movements of the body, passes through three stages so distinct that their intimate connection is sometimes lost sight of, and he has sought to bring this relation into its proper light. In the first place, he points out, there are *reflex* or *instinctive movements*, which are destitute of order, connection, succession, or regulation; then come *coordinated voluntary movements*, which are prolonged and sustained by the same power which has the consciousness of producing them; and, finally, there are the *movements which have become habitual*, which are instantaneous in quickness and so easy to produce that they are almost unconscious. These are the three ages of muscular action. At first there is only a confused *appetition*, which becomes transferred into spontaneous and disordered movements. Then the will actuates the muscle and produces the characteristic phenomenon known as effort, which is a kind of concentration of the nervous force. Finally, assiduous repetition of effort ends in its suppression and has for its final result not an act, but a state or condition of training which is no less characteristic. This rhythm in the process of muscular action Dr. Lagrange explained to us very clearly, demonstrating and illustrating it by a series of striking examples. Nothing could be more interesting to us than to see the proper rôle of the will and its indispensable intervention so clearly pointed out by science without any preconceived theory; to see it proved that while "muscles are endowed with a motive force, an exciting agent is necessary to put this force in action," and to learn that "the will has no direct hold on the muscle; it only acts on the gray matter of the cerebral convolutions, where it produces a molecular disturbance which, approaching nearer and nearer to the fibers of the motor nerves, finally communicates itself by their means to the muscular fibers," thus producing that "muscular wave" which M. Marey succeeded in recording. Contemporary physiology has confirmed the doctrine of many psychologists that every voluntary movement is an acquired movement, that every volition presupposes a representation of the movement, and consequently a previous movement already finished, if only once.

Again, physiology has established by scientific methods the relations of the three successive phases of muscular movement—*before, during, and after* effort. Physiology also explains that training consists not in habituating one's self to muscular pain, but in suppressing that pain by causing the muscles to acquire the weight, strength, and rigidity or suppleness which enable them to afford the

same amount of work without appreciable pain which previously caused almost intolerable suffering. From these physiological views pedagogy has derived more than one precept. The law of physical education itself flows from them. This education should adapt itself to the three periods which science has indicated by three different methods of proceeding. In the first period it should allow perfect freedom of action to the growing muscles, which need to extend and relax without any regularity. In the second it should teach effort gradually and cause the will to perform its first miracles at the expense, if necessary, of some pain; while in the third it should effect training with the marvelous results which are thereby rendered possible and even easy.

We studied next with some detail some of the consequences which flow from this progress of physiological phenomena. We endeavored to estimate, from this point of view, the comparative value of the diverse methods of gymnastics used in France, Germany, and Sweden, and we took into account what value athletic sports can add to gymnastics from their greater spontaneity and the more complete and regulated character of their exercise. We even considered the services which manual training can render to the physical education of those whose circumstances do not allow them the luxury of tennis, cricket, or football.

But are the direct applications to physical education the only ones which suggest themselves to us by the scientific work we have cited? Could not the psychophysicologist help us to introduce into psychical education the rôle of the will which the physician helped us to follow so satisfactorily in the "functional education of the organs?" Let us begin by seeking the answer to this question in the domain of sensibility, and, to begin at the beginning, let us take up inferior sensibility or sensation.

## VI.

We found in the life history of sensation the same trilogy which the history of the will played in physical life, a fact which is not surprising, since sensation and physical life are hardly distinguishable. Ribot showed us the first stage of the life history in the "biological property inherent in living matter which is called *irritability*, the two forms of which differentiate themselves later into *sensibility* and *motility*." This instinctive and almost automatic reaction, the first and blind start or spasm of the living being in response to an external stimulus by a rudimentary spontaneous movement, is, indeed, an humble point of departure for the will. In proportion as we rise in the scale of beings, however, this first sign of life accentuates and defines itself, the different organs of sense become distinct and the impressions are divided into as many series as there are senses, there now being special reactions corresponding to the impressions of taste, touch, sound, and light. But herein is the very mystery of life, that while an inanimate mechanical force will repeat the same movement indefinitely without undergoing any change, in the living animal there is something that changes at each repetition. The power or force of the animal increases by exercise. The sensible impression which is repeated is never repeated in identically the same way, and the reaction which follows is also not exactly the same. At each repetition the living force acts a little more and a little better, like a spring which, becoming bent more and more, carries further each time it is released. From its first exercise to the second, the third, the hundredth, the thousandth time, sensibility gains enough to be no longer recognizable as originally manifested, so greatly has it developed from its rudimentary stage. The "will-to-live," at first fluctuating and vague, asserts itself, and becomes conscious of itself. To look is to make the effort to see, to listen is to make the effort to hear, and so on in all parts of organic life. By each of its senses, as we first remarked of each of its muscular organs, the animal tends to preserve and increase its being. To live is to make the effort to live at

every moment. Now, what is the result of this incessant work of life? It increases the sum of life. Sensibility as the motive force is developed, and makes itself capable, through repetition of feeling what it did not feel at first, of classing and graduating the primitive sensations and directing, modifying, attenuating, or amplifying them. Here, too, effort creates training, the innumerable blind efforts to interpret primitive sensations end in the suppression of such gropings in the dark, the two parallel capacities of feeling and perceiving, emotion and consciousness, at first confusedly intermingled with each other, tend to separate; they become divided and each develops in its own way and according to its own law, their constant exercise refining them until they function without effort. Here, then, in the obscure recesses of the merely vegetative and sensitive life, we have three periods of instinct, effort, and training.

Pedagogy likewise passes through three corresponding states. At first it allows nature to act and awaits the result. Weeks and months pass while mothers and nurses, by prodigies of patience, succeed in establishing even in this domain the beginnings of order and regularity. The great care which young mothers take to teach their young children neatness, as they call it, is only the first application of self-control, of the power of inhibition, the outlines of the empire over self, the apprenticeship which begins in the cradle and ends only with life. It would seem as if all the automatic phenomena of the nutritive life, which are unconscious, irregular, and irrepressible in very young children, would remain so indefinitely did not their education begin at the earliest age. This is only too well understood in institutions of charity, where unfortunate children who have been deprived of these elementary attentions during the first months of life are received, and who feel the effects of this neglect for years.

Thus in this lowest and entirely animal degree the first appearance of the will is made under the form of inhibitory effort. It intervenes to check, suspend, and regulate even the reflex movements of the organism, and finally succeeds in governing the ungovernable. Habit once established, the feeling of effort disappears and the child no longer remembers the way in which he acquired control over himself. There are the same phenomena and the same stages for all the other parts of his sensible existence. By utilizing fugitive sensations long repeated at random the child is finally initiated into the art of provoking and coordinating them regularly. He learns to see and then to look. He learns to hear and then to listen. He learns to use his hands, to move his legs, to eat, to walk, and run. He learns to speak. The whole of these acts begin by a series of blind, unguided awkward movements, and then comes the period of work, for it is work, and singularly useful work, too, although we may not suspect it, for the baby to stammer, prattle, utter cries and make gestures, to keep in perpetual movement, and be always striving after change. This is his way of beginning the study of the world.

## VII.

How much more striking is the application of the law we are considering when we pass from sensations to the feelings! The education of the feelings would never pass beyond the stage of animal training were it not for some original material provided by nature for educational discipline to work upon. At the very first there must arise in us a certain number of affective tendencies, the first movements of the heart, emotions which precede all cultivation, sudden and fugitive impulsive feelings, which are nevertheless real and authentic. The child has spontaneous and sincere moments of tenderness and anger, of likes and dislikes, sudden yearnings to love which are causeless, and no less inexplicable movements of ill humor; charming traits of affection, and again the utmost indifference; astonishing intuitions of affection which touch the mother's heart, and soon after

a selfish rejection of affectionate advances which causes tears. All these contradictory emotions are like wild plants springing up confusedly in uncultivated ground, and the first thing to be done in the way of cultivation is to preserve this natural growth, and not destroy it. But presently comes the gardener ready to weed, prune, and clear away this disorderly array. How ought he to set to work? Ought he to impose his will, his choice, his authority upon the nascent growth? No wise mother would think of such a course for an instant. She solicits the growing will of her child adroitly. She aids it to develop a good tendency in opposition to a bad one, a noble instinct to combat a base one. She leads it to exercise its own power of choice and coordination which, we should remark, is as natural to it and as innate as the contrary tendency to be drawn along passively and blindly, with the difference that the former method costs the child effort but renders it happy eventually, while the second will render it ultimately dissatisfied with itself. This is the form that effort takes in the domain of the feelings.

And here, too, effort ceases but habit remains. To the period of excitation, of exhortation and pressure, there succeeds finally the calm possession of the result acquired by the early efforts and the peaceable enjoyment of feelings and sentiments which thenceforth are an integral part of the character. From this point begin again the same work and the same upward progress, but in a higher degree and operating upon feelings which are more delicate, more complex, and more difficult to determine and establish.

#### VIII.

In the domain of the intellect it was easier to recognize the three degrees of the will. With M. Ribot we placed spontaneous attention at the bottom of the whole psychology of the intelligence, and with him, too, we found that spontaneous attention is not an act of pure intellect, but is directed only where some interest or attraction or some desire draws and fixes it. From which observation comes the first and direct application to pedagogy, viz. not to try to be abler than nature, but to commence where she commences and, first of all, to draw, as she does, the spontaneous attention of the child by things suitable to it. We should not try to make the child attend at first to something which does not interest it, but should find something to interest it, because it will then give attention without knowing it, and will listen to the story which is told it, or look at the object which is shown it, or take interest in a game, not from being asked to give attention, but precisely because there is no need to ask it because its curiosity has been excited.

But is this the whole of psychology and pedagogy? By no means. In this department of the intellect still more than in the others, the second phase is not slow to appear. Among the many objects which attract our attention and to whose changing attractions our minds submit listlessly as they present themselves one after the other, we must learn to eliminate a great many voluntarily in order to retain only a few, and these not the most attractive, since they have lost the charm of novelty and variety in proportion as we submitted them to a methodical arrangement. This second and laborious form of attention is an effort of the intellect, doubtless proceeding from the first spontaneous form, but much more under restraint and fixed.

With voluntary and deliberate attention there begins in pedagogy, as in psychology, the long phase of the struggle which constitutes the essential fact of education and of civilization itself. Only here, too, instead of explaining this effort of attention by a kind of permanent miracle of the will, the great object of the teacher should be to do for the artificial attention of the intellect what nature does for spontaneous attention, namely, excite the interest, because that will produce attention. This is M. Ribot's conclusion as regards psychology, and we are willing to accept it for pedagogy, with the proviso that when we speak of "excit-

ing interest" we must not be taken to mean that we effect this only by some attraction acting on the mind from without. The mind is not interested only in what is presented to it, but is also interested in its own representations, in its own work, its play, and its efforts. Effort is sometimes the most exquisite of pleasures. The pedagogue, therefore, who should leave his pupil in ignorance of intellectual effort would be in equal error with Rousseau, who thought to leave *Émile* in ignorance of the existence of God.

In all mental operations we can distinguish a first degree, wherein the mind is almost a passive observer, attracted, amused, and led, and a second, in which it reacts, at first spontaneously and as if by intermittent flashes, and then continuously and methodically. To look involves more mental activity than to see; to observe requires more activity than to look. To recollect and reflect, to abstract and generalize mark still further degrees in the proper work of the mind, while judging and reasoning are its crowning effort. Now, it is this crowning work toward which the mind of the child must be led little by little. It would be impossible to learn to think without first learning to will to think. Reasoning is not only thinking, it involves the will to think. It is thought guided, or rather a series of thoughts which are compelled by an effort of attention, that is to say, of the will, to take a certain logical order. Great reasoning power presupposes great will power applied to directing the intellect. Reflection is attention in the second degree; in other words, it is the will willing to take possession of itself. William James has defined the will as the relation between the mind and its own ideas.

To neglect or diminish the rôle which effort plays in the intellectual life would therefore be to mutilate that life; and to substitute, generally, interest or external attraction in place of effort would be to take from man that which makes him man, namely, the faculty he possesses or acquires of interesting himself in things in which he is not compelled to be interested. He is himself the producer of certain forms of interest, the inventor of certain attractions which do not exist in things themselves. These are, if you wish to call them so, autosuggestions, but they often become the most powerful of all the springs of action. With this reservation, which is only an explanation, we can acquiesce in M. Ribot's rule which makes of the act of volition, even when purely intellectual, a phenomenon which is complex by its definition, being always an ego-affective and an ego-cognitive act. The full result aimed at is not reached until the effort accompanying the act having become insensible (for perhaps we ought not to say unconscious) allows us to repeat incessantly and without trouble what we did at first only by a praiseworthy act of the will. The young scholar who has learned to fix his attention and exercise his memory, who has compelled his mind to represent things to itself without first seeing them and then to perceive the relations of the things and finally the relations of the relations themselves, as Spencer says—that is to say, to conceive abstractions further and further removed from observations of the senses—the scholar who has achieved this mental process already possesses the mental quality of the mature student to whom intellectual effort has become a second nature. The education of the will was, therefore, found to be a normal process, because it began by utilizing a very feeble natural instinct and cultivating it separately, developing it laboriously and artificially and finally making it into a second nature better than the original.

## IX.

We concluded the review of the different domains of the mind by studying that in which all the others meet, and we found that in the domain of moral action or conduct there are also three successive stages. Here we saw that there spring up spontaneously from the depths of human nature not moral ideas or sentiments, to be sure, but certain first feeble desires, which, however unstable and vacillating

they may be, can not be treated with contemptuous disregard. Doubtless the child has no abstract and general idea of justice and injustice, but it feels an injustice very keenly, which is one of the earliest ways of understanding or divining the law of justice. It could not formulate the rule of equality; but its cries, tears, and anger show that it will not endure inequality, at least to its own harm. These are but feeble and doubtful manifestations of the moral sense, it is true, but suppose a child in whom they had never appeared. Would it ever be possible to instill into its mind a notion of good and evil, if it never had experienced this confused and vague anticipation of those abstractions in its own feelings, so that it could reason by analogy or perceive by intuition? The teacher—and in the child's earliest years the teacher is a woman—must endeavor to aid these imperceptible beginnings of an almost instinctive morality. Let this little stem, hardly visible at first, grow and await the result. It is the nascent will, which must not be touched even to help it start out of the earth. Let the sun, the rain, the coolness of night, and the nourishing fluids of the soil and its own sap do the work.

We must not forget that side by side with the instincts which we call good, others which we call bad develop in the child with equal vigor. In reality these instincts are neither good nor bad; they merely exist like all natural things; they *are* and struggle one against the other. It is our work to defend the weaker against the stronger, the superior emotions against the mass of coarser feelings, the more delicate and complex dispositions, the more truly human inclinations, against the simple, gross, and blind appetites of pure animality. Here begins the second stage of moral education, the revelation of effort. To choose is an effort, but to choose the most difficult and least natural of two courses is moral effort which the child must be taught, and which the grown man himself goes on learning and relearning until his last hour.

When does this phase of moral apprenticeship begin? No one can say, for it begins long before the child can suspect it. The mother says, "You must," "You must not," and as if by a miracle makes her child understand this command before it can speak or walk. Its will is not yet in action, notwithstanding that it has been solicited, attracted, and won by a thousand seductive persuasions of speech, of smiles, of plays, of examples to imitate, of caresses and threats, of love and fear, of mechanical imitation, and of excitation of the nerves, without mentioning the secret influences of heredity. But as time goes on and the natural development of its understanding proceeds, the education of the child should make a direct appeal to the effort of the will. Good and evil should be explained and be contrasted with each other. The schoolmaster who has taken the place of the mother represents an authority which exacts obedience imperiously instead of obtaining it by entreaty, surprise, or persuasion. The idea of duty now appears, and with it the notion that where there is a will there is a way. Hence, the necessity of willing. Who is to will, the master or the pupil? Both; but the master's will tends to prod the pupil's into action, an effect which is usually attained in one of two ways. One of these looks for an immediate result which is apparently very satisfactory, and consists in bending the pupil's will in compliance with the authority of the master. The other aims at another end, incomparably more difficult to accomplish, and this is to make the young will comply with a law which it makes itself and yet respects. This constitutes the wide difference between the education based on authority and the liberal education. To act from external compulsion or from inner reason, these are the two opposite systems of the moral government of the child, and later of the man. There is no need to insist upon our choice between these two pedagogies and our reasons for it. But we did endeavor to point out the real character and conditions of that effort to act from inner conviction which we regard, in common with the moralists of the liberal school, as the masterpiece of the education of the character.

The law which we found to prevail in the domain of physiology, also holds good in our psychological history. Effort is an expenditure of energy. Moral or intellectual effort, as well as muscular, is an intermittent phenomenon, a tension of the spring which is followed by a release. It can be renewed, but the renewal can not be continued too long with impunity, for that would injure the machinery and destroy its elasticity. The teacher, therefore, must refrain from keeping up the moral tension of the mind continuously. He should endeavor to remember that the exercise of the will should consist of a long series of short, distinct efforts, and not a long, uniformly sustained one. If this alternation of work and rest, of energetic action and relaxation, is necessary for the adult at all times, how much more necessary is it to insure these intervals of relaxation for the child, without which his good disposition itself will become embittered or even exhausted. To forget that they must stop short of the beginning of fatigue, and so prevent wear and tear of the spring, is the danger to be guarded against by even the best of pedagogues. There is always a considerable difference between our own power of application, intellectual or moral, and that of our children or pupils, which we tend to lessen at their expense through impatience. Let us learn patience and, as Rousseau said, learn to lose time in order to gain it. What will best aid us in this attempt is a knowledge of the real place of effort in the moral life, a knowledge which will teach us not to esteem it too highly or too low. To this end we must familiarize ourselves with the new ideas which biology has revealed to us.

Under the microscope the smallest piece of organic tissue is seen to contain thousands of cells in juxtaposition which are constantly splitting up, ramifying, and intermingling. They are the ultimate particles of living matter. They constitute a world by themselves and yet a world which forms only one living being. This indescribable multiplicity ends in the perfect unity of a living being, and this fact of organic life is an exact image of the life of the mind. It also is composed of an infinite number of infinitely small acts: feeble desires which become volitions, the volitions becoming will; reflex actions which gradually become endowed with consciousness, these conscious movements ending in voluntary movements; impulses and inhibitions whose origin is unknown, but whose free play finally creates a psychical activity which has nothing analogous in the rest of the universe. When we consider all these intermingled series of most diverse phenomena, which, starting from the lowest plane of the vegetative life, reach to the highest summit of the moral life, what imagination can fail to be confounded with a network of such extent, such delicate fragility, such inextricable complication?

Now, just as the life of an animal is no longer for us a simple thing like the word which designates it, but a living unit composed of millions of living cells, each imperceptible to us, so the moral life appears to us as nothing more than the resultant of innumerable acts each of which is insignificant in itself. It is, like the life of the body, a perpetually changing existence, which, in the last analysis, resolves itself into a succession of microscopic elements extending to infinity. And it is precisely and exclusively with these infinitely small elements of action that our work as educators is concerned. To bind the human being and transform him, as it were, by main strength and at once, according to our will, is something we can not do. But to take the young child, a being pliant and plastic, made of fleeting and changing matter which daily and hourly acquires new atoms, grains of sand or rather grains of life, which accumulate and combine with each other in mysterious and unfathomable elaboration, and intervene in the thousands of fleeting minute acts by which he gives us hold upon him, this we can and should do. These are very trifling matters perhaps some one will say, without perhaps sufficiently reflecting upon the important part which contingency plays in human nature and possibly in nature at large.

It is true that each of the little victories over a child may be nothing in itself. Doubtless the inconstancy of the child, his versatility and levity, make it seem as if everything must be begun over and over again. But is not this plasticity of infancy the very reason for its education? The endless series of eddies of the invisible currents that move incessantly in the depths of the child's being, the insignificance of all these movements taken separately, and their incessant repetition in unexpected ways, the impossibility of measuring their immediate effect or of calculating their remote consequences, are not all these considerations the surest guaranty, in the practical field, of our free will and are they not our best reason not to despair of it? Who can say how so feeble a creature as a child will turn out upon whom so many thousands of ideas, sensations, and feelings of attraction or repulsion, of pressure from above and below, must exert their influence and incite to action during years of slow formation?

We must not disdain "the infinitely small" of the details of school life, and ask contemptuously what signifies missing one recitation more or less? What if one lesson be ill learned or one duty be ill done? What effect can merely one expression of encouragement or one example have, or a single word or gesture, or a look? These nothings are the dust from which time makes a solid rock, and they are in the hands of the teacher who thus, by such infinitesimal degrees, influences the pupil. The teacher can never, to be sure, become the master of his pupil's nature irrevocably, but he can have thousands of opportunities of depositing in the young mind, unnoticed, a seed which may possibly remain forever inert but which also may spring up. No one can tell whether a given insignificant resolve taken by the pupil some day about some trifling matter of his infantile life may not be the first term of a series which shall continue beyond all calculation. What is certain is that there is no act which does not leave some trace, not one which may not be the beginning of a habit, not one which does not have an appreciable weight in the balance in which are weighed the imponderable elements of a character and therefore of a destiny. Such considerations are sufficient to impress upon the teacher both the humility and the grandeur of his work. He labors to form a character as nature builds up a coral reef. Molecule by molecule, atom by atom, he elaborates the substance of the moral being. There is nothing grand in this process except the endless addition of little to little. The effort of the will is in the moral life just as much and just as little as the muscular effort is in the physical life. Child or adult, what can man do? It is with his will as with the beatings of his heart. Its rhythm is short. The largest supply of air for respiration lasts but a few seconds, and the greatest provision of virtue hardly suffices us to face the smallest crisis, after which we must take breath and brace ourselves anew for the next struggle, which, too, will not be the last. And the superficial observer cries out: "Poor wrestler, you do not win. Why struggle forever, always getting up merely to fall again?"

But this observer is mistaken, and the proof that we advance a little by each little victory without our knowing it is that after a time the moment comes (when, how, why, no one can tell, either for another or for himself) when effort is found to have ceased. At least it ceases to be effort but is now a condition, and this is the third phase of the evolution of the will. What once cost us so much pain is now ours in peace. There is now no more bitterness of renunciation, no more agony of sacrifice, but peaceful calm, soon to be followed by a sense of deep satisfaction. This condition is like the effect of an acquired velocity whereby an obstacle is overcome almost without noticing it. The first upright act done by a child, the first penny or the first plaything he finds and returns to its owner, the first self-imposed privation for the sake of his fellows, the first spontaneous acknowledgment of a fault which he might have concealed—each of these little efforts is an event in his life, and they must be often repeated in order to become

easy and familiar; but sooner or later they all become so thoroughly a part of him that he will do, offhand and without thinking of it, what at first seemed to him to require great courage.

Can we say that this final condition is morally inferior to the preceding, on the ground that where there is no effort there can be no merit? Such a judgment would betray a very rudimentary conception of merit, a survival unchanged from the recollections of infancy, when the hesitating will to do right is stimulated by maternal ruses. The end of education is good conduct. And good conduct does not consist of one act, but in a series of acts; it is not a fortunate accident, but a permanent condition; not the deeds of a day, but of every day. Do we seek in education a fortunate accident or a permanent equilibrium? We are forced to begin by obtaining this equilibrium once for all at a great price, but the important thing is to give it permanence. We must at all cost remove from it the character of chance, which gives interest to the moral drama as long as the issue is in doubt. When this is no longer the case, then has victory come and there is no more combat. Interest and effort no longer concentrate in one act, but are spread over the whole life, and the whole of life should be our real end. Doubtless the end supposes the means, but how much it surpasses them! The habit of virtue in which the isolated acts of virtue become consolidated is the end we aim at. Morality without effort is doubly virtue, precisely because it raises us to a point where we are no longer tempted to admire ourselves for having merely done our duty. We are nearer the ultimate truth of things and the just evaluation of real merit and the real dignity of humanity when we can say in all sincerity after a good action, "What I have done is the most natural thing in the world," than when we say involuntarily, "I have just done a very fine thing." The proof of this position is that if I were to congratulate one of my hearers for returning an overpayment in change at a shop he would feel very much injured and could never pardon me for doubting him.

## X.

The three great theories of moral education may be reconciled as follows: The optimistic theory of Rousseau, which teaches us to believe in the natural goodness of man and seems to propose to recover the lost paradise of primitive simplicity—the state of nature—we accept by confining it to the first of our three periods, the earliest stage of education. The stoic and Kantian theory, which appeals to effort and liberty, this we accept for our second stage, which is the longest and most laborious of all, and we add to it, besides moral effort properly so called, all the other forms of physiological and psychological effort and the different varieties of intellectual effort. Finally, there is the Christian theory, which lays so much stress upon the effect of habit, of accepted authority, of established practices, and of the external influences which contribute ceaselessly and gently to fashion our will; this we accept also, but only where its domain seems legitimate and without risk, namely, in our third stage of education, in which we have only to maintain through exercise a condition of training already duly established. It should be added that as these three states or conditions exist simultaneously in us, the three methods of education should also be exercised simultaneously within the limits of the respective domains which we have assigned to them.

## XI.

Now to conclude, can we draw any general rules for the pedagogics of the will from our observations on the various chapters we have skimmed over? We can, and the following is a summary of such rules:

- (1) Psychology teaches us that the will is not a special faculty limited to a certain domain and exercising itself in certain determinate forms, but it is spiritual

force in all its plenitude; that is to say, in its variety as well as unity, in the different phases of its development, from the rudimentary spontaneity of instinct up to full and clear self-possession through a conscious activity which is free and guided by reason. From this doctrine pedagogy concludes that there is no special education of the will. All education is an education of the will or is nothing at all. The will is formed while learning to think, to feel, and to act. To will is nothing else than to direct and lead the mind. To direct the intellect is not merely an affair of logic, but is a most complex act involving, even though we are unconscious of it, innumerable elements, affective, representative, and active. To learn to will is to learn to think and look, to act and react, to control for a definite purpose an immense apparatus whose mechanism is unknown to us, but whose movements we call by the different names of instincts, feelings, thoughts, and volitions. If the will is the unifying force which subjects the passions to the reason, the caprices of the imagination to the laws of thought, and these laws themselves to the supreme law of goodness, the teacher does something for the will each time he gives a correct idea, excites a noble sentiment or prompts a good act in the pupil, and each time he contributes to strengthening a good inclination or weakening a bad one, corrects an inexact thought, or helps the pupil to a clearer view of some reality whether external or internal. It is impossible to will correctly without knowing what we will and why. It would be either an empty play of words, or, if attempted seriously, it would be a sad mistake in education to undertake to cultivate the will separately by a kind of artificial selection, and arouse its action alone in a pupil without regard to the intelligence and the heart. We do not determine to will for no reason, but we will because we like and in proportion as we like. It has often been demonstrated that the will can not be reduced to mere desire, but it is nevertheless a superior form of desire, which victoriously opposes lower desires; it is a desire founded in reason—a human desire which silences the merely animal desires. We readily admit that the will is not merely the cold and dry operation of the understanding; but that there can be will without understanding, that we can will without thinking, and will well without thinking well, is what Descartes taught us to deny, and we reflected upon his profound remark that “from very great clearness in the understanding follows a very strong inclination in the will.”

(2) Psychology reveals the will to us under two aspects, sometimes as a force of impulsion and again as an inhibitory force, as if there were two functions, one stimulative and the other repressive, apparently opposed to each other. One has the ardor of desire and the warmth of passion, while the other is the *refo* of wisdom, the resistance of reason to the first impulse that draws us on, and is the result of comparison and selection—a calculation of consequences.

Pedagogy finds two corresponding aspects in the education of the will. It affirms that it is necessary to awaken the living forces one after the other, to arouse the courage and provoke initiative, thus producing a happy and healthy excitation, which becomes transformed into quick, lively, bold, possibly rash, actions, but of the kind of rashness which usually succeeds in youth. And, on the other hand, the young man must learn to retire within himself for examination and reflection, to use all his strength of mind to restrain and contain himself, to be *compos sui*, a process which applies to the feelings, the intellect, and to all forms of activity, both of body and mind.

These two types of the education of the will are nearly the pedagogical translation of the double stoical precept *sustine* and *abstine*, by extending it from the feelings to all the other states of the mind. *Sustine* means: Have courage to suffer pain and endure fatigue, and through this endurance produce and set in motion the forces which are dormant in you. This is active and positive effort. *Abstine*: This denotes the other form of courage which consists in renouncing

pleasure, refusing what we wish, resisting instinct, controlling our passions with their sophisms and seductions. This is privative and negative effort, and is perhaps more difficult than the other, at any rate it is more painful in being prolonged, while the first acts at once, rapidly and decisively.

(3) Psychology shows us the human will passing through three phases or stages. First, there is spontaneous activity, or the first instinctive movements of the new-born child; next is the conscious and reflective activity, which is manifested through effort; and finally there is the habitual activity, which is the synthesis of the two preceding.

A separate pedagogical treatment corresponds to each one of these three psychical states which would not be suitable for the other two. To the earliest, opening, psychical phase of development an expectant policy is adapted, one, so to speak, of voluntary ignorance; a let-alone policy which permits the infant to do and speak as it wills and expand its powers like a young, growing plant and as freely as a bird sings. The sacred stream of life is springing into being and we ought not to confine it and guide it in artificial rills from the start. *Primum vivere, deinde philosophari*. Let the child have pleasure in life, in the life of its senses, of its intelligence, and its will to the fullest extent, and do not rob it of its first and short moments of joy in living. The worst of all educations is the solemn, joyless education. With us in France, notwithstanding that so many controversies exist, there is no question on this point. The maternal method has been a constant tradition in our pedagogy, and has been maintained by all French women who have written on pedagogics from Mme. Guizot and Mme. Necker de Saussure to Mme. Pape-Carpantier and Mme. Kergomard.

But soon comes the next stage, that of conscious effort. It is as long as the preceding is brief, and is the age of ungrateful toil for the teacher. And yet what splendid contests take place in this twilight of transition. It is the period when physical, intellectual, and moral education all concentrate their methods of action. It is the period when the will is forged by the blows of effort. To imagine that this period is a time for easy and pleasant work, for instruction by play, by short methods of study, by recreations, by study without mental effort, for mere moralizing without spiritual struggles, inculcating automatic morality, as it were, would be to abjure the very programme of liberal education and substitute for it some nondescript training. Therefore our pedagogy will never insist too strongly on the gymnastics of the will with which infancy and adolescence are usually filled. I do not need to recall to your minds the fine passage of Prof. William James, the Harvard psychologist, in which he says: "There are many ways of measuring the human will, but the most exact and surest measure is expressed in the question, Of what effort are you capable?" We subscribed to this opinion.

At the same time we took care not to pass in silence or put in the background the third stage, which is the crown of the whole edifice. This is the stage of habit acquired by conscious effort. Thanks to effort itself, there is no further occasion for effort. Habit has engendered aptitude, and it is only necessary to maintain it. It is only a question now of the cultivation of the feelings, of increasing knowledge, of protecting our physical, mental, and moral energies from the decay which comes from want of use. We must take care not to risk incurring the famous reproach: "You know how to conquer, but you do not know how to use victory."

There is only one more remark to make concerning the correct interpretation of the law of the three stages. It would be an unfortunate mistake to suppose that the entire mind passes as a whole from one to the other of these three phases. We must, on the contrary, take each of our sensations separately, each of our feelings, our intellectual faculties, and our moral qualities, and remember that all follow this course, but unequally, each with its own velocity and encountering in

each individual a resistance which varies with that individual's nature. Not only are there differences between man and man, but in the same individual there are the most astonishing inequalities of development between the diverse faculties. A man may reach a high degree of intellectual culture whose feelings and sentiments are still in an embryonic state of development. An artist of genius may be a child in character; a mathematician may be destitute of æsthetic taste; a man capable of heroic self-sacrificing actions may yet be unable to restrain his temper. One man requires strong effort to resist a temptation which would not disturb the equanimity of another. It has been said that there are among our contemporaries people who are still in the thirteenth century, and there are waste places in the depths of the most cultivated minds which form a singular anachronism with the rest. The much spoken of harmonious development of the faculties is only a pious wish, and this is perhaps one of the principal reasons why we should be tolerant, never despair of a person utterly, and never despise or hate. To an eye which could penetrate everything there would be few souls so saintly as not to have some sinful stains, and none so defiled as not to have preserved some spots of divine purity intact. If we can not expect grown men to remember the things they have had no time to hear, let us remember this fact always in our dealings with children, and instead of being vexed at the sudden lapses, want of equilibrium, shocking absence of harmony in the little ones, let us rather study how far each has progressed in the different parts of his development and rely upon the more advanced faculties to stimulate the others.

(4.) Psychology does not stop at demonstrating to us the general fact of a transition from instinct to effort and from effort to habit. It points out the consequences of this transition and shows how this rhythm is the condition of progress. When we have reached the state of habit or training in any of the mental faculties, this higher state becomes the point of departure for a new series. This is because habit has made us masters of one part of the domain to be conquered, which we can make our base for a further effort. If habit had not, as it were, transformed the moving sands of individual efforts into solid ground we could never advance. We can say of these fixations and acquisitions due to exercise what economists say of capital, that it is accumulated labor and is for that reason the means of producing new work. Capital is not created simply for idle enjoyment, but becomes an implement and works in its turn. In the same way the moral or physical qualities which we have acquired are not mere ornaments or a source of satisfaction to us, but they are means for our doing more and better. We understand easily to-day what was unintelligible yesterday and can consequently apply our thoughts to new objects, which, in their turn, seem as difficult now as the others did formerly. Reason triumphs over passion, and conscience, having become more delicate, no longer hesitates at junctures in which it would have been in great straits some time ago. But will there ever be an end to the struggle? No; the strife is only carried a little farther on. Conscience demands more of us because it now sees more clearly and can no longer content itself so easily. When we climb the long sloping terraces of a high mountain we find ourselves higher at every stop, but we also find that we must start again and climb still higher and more vigorously.

If this is the way of life, so ought it to be of education. We must habituate the child to the real view of progress, the real measure of duty; duty increases as we mount upward in life. Progress is not a movement up to a certain point, but is movement itself. When movement ceases, progress ceases. Let the school, then, from its first beginnings, initiate the child to the evolutive and progressive conception of moral life, and not imprison him within a narrow horizon nor atrophy in him the sense of progress which is like that of infinity. Undoubtedly an imme-

diatc object, a clear and near limit which he can attain, must be pointed out to the short sight of the child. But it is not necessary to make him believe that after attaining this first plane all his work will be done. We must not kill in him the instinct for something better, but, on the contrary, we should habituate him to look far ahead, to put his object always higher, and never let him believe that he will ever be able to close his account with his conscience. And in connection with this point of view, let us take care that certain school methods, which are excusable, useful, and even necessary, perhaps, for a time, do not become dangerous from being continued beyond the period of infancy. We must, perhaps, provoke and stimulate effort in very young children by indirect means, by the inducement of a reward or the fear of the punishment conventionally attached to such or such an act. All that should disappear with the toys of infancy. If the pupil should leave the school or lycée with a puerile notion of a very correct set of moral account books, keeping a debit and credit account of so many good marks, so many prizes and occasions of honorable mention, he would have a most wretchedly mean idea of his duty and his destiny. The more good one has done the more remains to do. In this domain there is no end of learning.

And he alone is a man who, not making life a mere close calculation of interests of longer or shorter range, allows himself to be carried away toward an ideal by some inspiration of generosity, without being able to say exactly what he gains by it, who loves the good because it is good, the beautiful because it is beautiful, the true because it is true, without first reckoning what he will make by it. To live as a man ought, his heart should beat with all noble emotions, his thoughts turn to all truths; he should devote his will to all noble causes. As to the rest he should confide in and refer all final results to One who is mightier than we, who has placed all these instincts in our hearts and who beyond doubt knows whither they will tend. And this is the spirit which the liberal education should resolutely oppose to the other.

(5) As to springs of action and rewards and penalties, psychology has some light which pedagogics can profit by. To attempt to direct the will through a single one of its powers, to exclude all incentives and promptings from consideration except rational motives alone, is to take a part for the whole, or, in other words, it is to forget that there are several ages in the will, several degrees of volition, that even the highest degree of the will is not free from all desire, all instinctive impulse, interest, or feeling, or, in a word, from all bond between it and the individual, and that in consequence any one of our determinations, which is in appearance the simplest, is never sufficiently so to exclude an admixture in different proportions of many affective, cognitive, and active elements. To separate these may be an exercise to be recommended to lovers of psychical analysis, but it is the act of the teacher to associate them and make them concur in an intimate and almost indivisible manner in the work of education. We can never tell how many rivulets contribute to make the great river of the moral life.

(6) Finally—and this last remark is of importance, for we must not think that we have nothing to do but to follow the natural inclinations—what is the essential and characteristic fact in the will according to psychology? The answer is quite simple—self-control. It consists in what M. Ribot very happily termed a power of coordination with subordination. Coordination is not possible unless there is a supreme and single principle of action to which all others are subordinate; each domain of activity supposes a central point to which everything is referred, a view of the whole which dominates all details, one end to which everything tends. Now we can not disengage this end, this law, this unity, and isolate it from the chaos of our sensitive life without great difficulty. It requires a strong effort to accomplish this. And herein the Christian doctrine of sin is nearer the truth than all the superficial and indulgent forms of optimism which, by declar-

ing that man *is* good, would save the trouble, it would seem, of trying to make him good. He is not born good. Yet he can become so, but only by continuous effort, which is almost a miracle itself. The mass of our instinctive and animal inclinations is by far the largest and heaviest and the most invasive of all. In order that reason should shed light in this darkness, overcome the beast in human nature, and make mind prevail over matter, man's will must consent to choose, contrary to the natural course of things, what savants call the line of greatest resistance, and choose once, a hundred times, and always, the most difficult course of action. It has been said that the simplest criterion of morality is this: When hesitating between two courses, choose that which costs you the most sacrifice. This is the rôle of the will acting under the reason, that is to say, the action of the will at its highest power. Thus acting, the will converts a mere individual into a real person. Someone has said that only one man in a thousand is a person. And it is the peculiar province of the will to establish this self-mastery, both of mind and body, and in the mind itself the relative mastery of emotion by thought and of thought by action. Relative mastery, we say, and progressive, too, for our entire life is passed in winning from passion, foot by foot, a little ground for reason, little triumphs of duty over interest, and of free will over blind appetite.

This psychological definition inspires, it will be seen, an entirely new pedagogy. Of course the idea of obedience, the pivot of the old education, is not abolished, but except in infancy, when ideas can not be seized unless visibly presented by living beings, what should be taught is the obedience of the will to its own law—moral autonomy. But we ought to have the courage to tell even children themselves the truth while teaching them self-control, which at first is manifested by obedience. Then they will come to obey, little by little, in the same way and for the same reasons that we do. They will learn to obey not force or custom, or the uncomprehended and inexplicable order of external authority, but will bend their will, as we do ours, before the universal will, which announces itself, under various names of nearly the same meaning, as reason, duty, truth, or justice. —

## XII.

In finishing this summary—I must beg your pardon, ladies and gentlemen, for having made it so long and yet so incomplete—I wish to ask you one question: Do you think that the doctrines we have been studying together contain the elements of an education of the will suited to our time and country? For my own part I thoroughly believe so, and I believe further that this pedagogy, adhering to those doctrines in broad lines, lies at the foundation of French State education from the primary school to the lycées and the university faculties. Others have extolled methods of education which are evidently imposed by distrust of human nature; they have required that the child, the woman, and even the man should be intrusted to them as needing tutelage. They have promised to exercise this tutelage for the good of humanity, and they think they are rendering a service to human nature by protecting itself against itself, by constituting themselves, especially through education, the intermediaries between God and man from the cradle to the grave. We do not accept this part of perpetual minor for mankind. We wish to place man as soon as possible in possession of his own will, his own reason, and his own conscience. We do not ignore the difficulties or dangers of the task. But no danger is so great as to surrender one's own self, and to think and will by proxy.

In accepting the mighty burden of liberty for ourselves and our pupils, we believe that we are performing not only a moral and philosophical work, but one profoundly religious as well. As the thinker whom we have so often met in this

course, M. Payot, used to say: "To have respect for human nature in ourselves and others is to realize in ourselves and others the Kingdom of God." We pity those who, being able to see God only through denominational forms and traditional ceremonies, do not see Him in our doctrines, and do not perceive that He is nowhere more present and more profoundly active than in that humble sanctuary of education which they call the school without God. We commiserate them for not perceiving that to bring up children in the constant, careful respect for their own nature, and a constant effort to rise toward the good, is to bring them up in the very atmosphere of the Divine, to make them breathe the gospel air and penetrate them with God. Not, indeed, with the God of images and formulas, but God in spirit and in truth. We have, at any rate, the advantage over our opponents that we take from their creed whatever of the Divine it contains and respect it in the highest degree, while they refuse to do the same with ours.

In all times the reigning religions have spoken of atheism as the religion of the future. Socrates and Jesus Christ were charged with no other crime than atheism. Let us allow ourselves to be called atheists, then, provided that our education, while awakening the sacred spark in the souls of our children, continues to make them adore the things of God instead of the word alone, and to put each one of them all the days of his life, face to face, in the secret places of his heart and conscience, in living contact with the Divine.

## CHAPTER XVII.

### EDUCATION IN ITALY.<sup>a</sup>

- I. Progress of public education in Italy. By Dr. Tullio de Suzzara-Verdi.  
II. The Baccelli bill for the reform of higher education in Italy. By Prof. Alexander Oldrini.
- 

#### I.—PROGRESS OF PUBLIC EDUCATION IN ITALY.

By TULLIO DE SUZZARA-VERDI, M. D., K. C. I.

CONTENTS.—Introduction—Organization—Functions of the ministry of education—Officers acting under the minister of education—Hygienic condition of the school buildings—Infant schools, infant asylums, and kindergartens—Elementary instruction—Effect of compulsory education on illiteracy—Complementary schools for girls—Normal schools—Cost of primary and normal schools—The teachers' pension fund—Physical education; gymnastics—Manual training—Agricultural schools—"Professional" schools—Technical schools—Secondary classical schools (*ginnasii* and *licei*)—Universities—Superior institutes—Convitti (boarding schools)—Colonial schools—Diplomatic colonial school—Other special educational agencies—Public libraries—Philological clubs—The Dante Alighieri Association—Special schools for adults in the agricultural districts—University extension.

In estimating the progress of a nation in education, the true test of intellectual improvement, one should take into consideration its history, political, religious, and economic, especially when that country is Italy, with its history of wars and revolutions, of invasions of barbarous foes, of religious fervor and repression, with its growth and decline of enlightenment; a country scarcely ever united, free, and independent, until King Victor Emmanuel entered Rome and from the terrace of the ancient capitol in 1870 sent forth his stirring message, "*Ci siamo, e ci resteremo.*"

Yet how difficult to eradicate habits and customs which have taken root amid such eventful transitions and have crystallized by time into usages and practices that have almost acquired the attributes and observance of law. A young country like ours can hardly realize the difficulties in the way of the reformer in that old country, and judge of its progress, unless the comparison is made within the sphere of its own life, between periods of its own existence, instead of between it and other nations more or less fortunate. Moreover, progress in education is never by fitful changes, under the impulse of this or that legislator, philosopher, or political economist, but by a gradual and continuous process.

Italy, which in former times attained the highest pinnacle in the world of belles-lettres, science, art, and philosophy, has sunk at other times to the depths of ignorance. Education became then the privilege of the few, an aristocracy of learning, as it were, from which the vulgar were excluded. These periods of obscurity have now passed away. Italy has entered into the ranks of competitors for more knowledge; the proof appears in the feverish desire for education and reform from the moment her unification and independence had been attained. Not one session of its Parliament has since taken place without some progressive

---

<sup>a</sup>For information relating to education in Italy in previous Reports of this Office, see Report of 1890-91, vol. 1, pp. xviii-xxx and 319-339; 1893-94, vol. 1, pp. 325-333; 1894-95, vol. 1, pp. 543-582, and 1898-99, vol. 1, pp. 839-870.

educational measure being submitted to it or voted on. These efforts at improvement are now so frequent that complaints are even made, and not without some justification, that the changes in the curriculum of studies, following one another so rapidly as they do, are embarrassing, if not positively injurious. Inconvenient they often are, both to faculties and students; to the faculties, because they are often ill-timed, considering that the development of studies in the classes requires time and uninterrupted continuance; to the pupils, nay, to the parents and tutors, because they are thus forced into an expense for the changes of text-books, and see the old books, that used to pass from one child to another or be sold for a consideration, go to the wastebasket for kindling purposes.

These changes often cause great discontent and irritation among the students, who rise in protest, and receiving no satisfactory response from the powers that be, break out in riot, requiring the presence of the troops to quell the disturbance.

#### ORGANIZATION.

For administrative purposes the country is divided into communes and provinces. A commune is the smallest division of territory having a local government. A province is a large division of territory containing several communes. A commune is governed by a "sindaco" (mayor) and a communal council (both elective). A province is governed by a "prefetto" (a kind of territorial governor) and a provincial council. The prefetto is appointed by the national Government. The functions of these two orders of governing authorities are distinct, except as to public instruction and police, which they have in common. The population of the country is about 32,000,000. The area is divided into 8,020 communes and 69 provinces.

The education department is organized throughout the Kingdom under one sole head and system, so that the grade of one student corresponds to the grade of another, though instructed in different schools or sections of the country. There is not such a thing as a suspicion that a school or university be not in good standing, or that students coming therefrom may require a special treatment in the examination for fitness. The students are all alike; they have been educated on the same plan, and hence no discrimination in favor of one or another on account of the alma mater being in good or bad repute is necessary or possible.

#### FUNCTIONS OF THE MINISTRY OF EDUCATION.

The minister is a deputy in Parliament temporarily relieved to assume the functions of minister of instruction, and as such he is a cabinet officer. He is the appointed guardian of the primary school system of the Kingdom. For the administration of this system there is established a large department, whose officers are the overseers, the advisers, and the reporters on all matters connected with or pertaining to the primary schools.

The minister, as a cabinet officer, proposes to Parliament such laws or amendments to laws as he deems advisable for the good and advancement of the schools, and he is also the "executive" of all the laws on education enacted by Parliament.

The minister issues rules and regulations for the direction of the schools, and annually announces the programme of studies that is to be carried out by the teachers.

He suggests to the communes the erection of new or the repairing and improving of old school buildings, and wherever the communes are too poor to conform to the recommendations of the minister he is authorized by the provisions of the national law to give such financial assistance, in the form of loans or gratuities, as he may deem proper.

The minister decides upon questions arising in the communes or school boards regarding the administration of the schools.

He deposits in the bank for the pensions of teachers 300,000 lire, which Parliament has appropriated annually for ten years to increase the pension fund and to encourage the communes to do the same, and the teachers to become contributing members. The success of this fund has been unprecedented; in a little over twenty years of its existence its principal has grown to 75,000,000 lire.

The minister has authority to grant special aid to teachers of both sexes who are in need on account of illness or domestic misfortunes; also to bestow premiums of money or honors upon those who distinguish themselves in the performance of their duty.

He is also empowered to assist all corporations or associations who promote night and holiday schools, circulating school libraries, and instruction in manual training.

#### OFFICERS ACTING UNDER THE MINISTER OF EDUCATION.

The "prefetto" (executive officer of the national Government in the provinces) is the general supervisor over all the schools of a province. He presides over the meetings of the provincial school council.

The "provveditore agli studi" is the immediate superintendent of the primary public schools of both grades. He is present at and may take part in the examination of pupils for diplomas, and presides over the provincial school council in absence of the prefect.

The "ispettori" (inspectors) generally, and often by direct order of the minister of instruction, visit the schools of the Kingdom and report whether the rules and regulations of the national Government are observed with fidelity, whether the hygienic conditions of the school buildings are satisfactory, and what changes are required for their amelioration; they see to it that the programme of instruction of the minister of public instruction is faithfully carried out. The "ispettrici" (lady inspectors), chosen for their knowledge of women's work, are employed to visit and preside over the schools for the manual training of women.

#### HYGIENIC CONDITION OF THE SCHOOL BUILDINGS.

The condition of the schools even so late as 1897 was so deplorable that the minister of education issued an order, of which the following is a translation:

*ROME, January 23, 1898.*

The reports of the school inspectors show that in the most of the communes the primary schools [school buildings, of course] are deficient in room, ventilation, lighting, etc. \* \* \* In some localities these inconveniences and lack of sanitary necessities are so great as not to be tolerated a moment longer.

There is no possible excuse for their existence. In those communes where indifference has so far prevailed as to locate schools in abandoned and unhealthy huts, in dark and cold chapels, in old stables, in damp cellars, in smoky kitchens, in attics, lofts, or granaries exposed to the weather, any further tolerance would be a crime, and the school councils or boards should without delay exercise their full authority to abate the nuisances and provide for appropriate localities and buildings.

As soon as proper buildings or rooms are provided where the greatest urgency exists, the officers who preside over primary instruction in the provinces or school districts shall procure all possible information regarding the other schools, and request the administrators of the communes to make such improvements as the hygienic condition of the same requires.

It is to be hoped that the communes thus solicited, with the good will of the teachers, school boards, and citizens in good standing, will not decline to execute the work already adjudged indispensable. Should they refuse, in disregard of those official recommendations, the prefect shall proceed to enforce the laws, either communal, provincial, or governmental, relating to hygiene and public sanitation.

For new constructions the technico-hygienic instructions of the circular of November 11, 1888, should be observed. For repairs and alterations, and where one building is changed for another, the regulations accompanying this circular shall be followed. \* \* \*

Where complications arise in technical or administrative questions, the matter in question shall be referred to this department for advice and counsel. \* \* \*

GALLO, *Minister.*

The regulations referred to in the order as accompanying it are as follows:

First. The building and every part of the same shall be absolutely dry. Humidity is easily detected by observing the damp spots on the walls or on the pavement of the floors. The floors of the room should not be on a level with the ground, and when possible a cellar should be constructed underneath.

Second. The buildings should be located as far as possible from contaminated streams, polluted lands, stagnant waters, collections of manure and offal, stables, markets, military barracks, noisy factories, and factories from which offensive odors or matter emanate.

Third. The ingress for male and female schools should be separate whenever possible, but, on no account, should school rooms or buildings be accessible by or through public offices or private dwellings.

Fourth. The access to the schoolrooms should not be directly from the outside; a vestibule should intervene to prevent sudden drafts of air of unequal temperature; and there should be corridors or rooms for the deposit of outer clothing, often wet, umbrellas, lunch baskets, overshoes, etc.

Fifth. The rooms should be rectangular in shape and allow each pupil 1 square meter of space.

Sixth. The height of the ceiling should be not less than  $4\frac{1}{2}$  meters [ $14\frac{1}{2}$  feet] for new buildings, and not less than 4 [ $13\frac{1}{2}$  feet] in old ones, so as to allow 4 cubic meters of air space to each pupil.

The objections often made that in some regions the rigid climate during the cold season will not permit the proper heating of such large rooms can not be considered, from the fact that there are too many means for protection from the cold known to builders to hesitate a moment to secure to the occupants the necessary amount of air for the preservation of their health.

Seventh. The rooms should be thoroughly lighted, and care should be taken that the light be admitted through one side only of the rooms, the side which admits the rays on the left side of the pupils. The area of the windows should be at least one-eighth the surface of the floor in old buildings and not less than one-sixth in new ones. The windows should be so near each other that no cone can be formed by the shadow of the pilasters or intervening parts of wall upon a pupil. The windows should have sashes sliding up and down, and, whenever possible, they should be on the south side of the room.

Eighth. The size of the rooms should be such that no pupil is placed farther from the window than  $6\frac{1}{2}$  meters.

Ninth. The floors should be on a perfectly horizontal plane, of compact material compactly applied, without grooves or interstices, so that it may be easily washed and scrubbed.

Tenth. All schools should be provided with water-closets exclusively for the use of the pupils, and in two sections, one for the males and one for the females.

Eleventh. Their exposure should be northward of and in continuance with the building, with anterooms to the closets, as far as possible from the schoolrooms, with no direct access from one to the other.

Twelfth. The water-closets, as well as their vestibules or anterooms, should be supplied liberally with light and air, to secure which the building containing them should be exterior to though connected with the school building.

Thirteenth. It is highly important to see to it that all pipes leading from the water-closets to the sewers be properly trapped.

Fourteenth. In localities where sewers can not be laid the best systems known to sanitary engineering for the removal of night soil should be adopted.

Fifteenth. No well or pump for drinking water should be located nearer than 10 meters to any sewer, tank, or cistern holding foul matter.

Sixteenth. Whenever in the opinion of the health officer the water of any well is of a quality that may induce disease, that well should be closed at once.

THE MINISTER.

These regulations have been enforced with great vigor by such enlightened ministers of instruction as Guido Baccelli and Nasi, and have produced a substan-

tial improvement in the hygienic condition of all schools. The discreditable and unwholesome school buildings of old have disappeared, and new, cheery, healthful schools have taken their place.

Whenever and wherever the communes were too poor to make the improvements the National Government, most liberally, has gone to their assistance with loans or subsidies; under such wise policy of the Government the number of schools and the number of pupils have increased beyond precedent, as will be seen further on.

#### INFANT SCHOOLS, INFANT ASYLUMS, AND KINDERGARTENS.

These schools are established by the communes, by religious or lay corporations, by private associations, or by private individuals. The ministry of public instruction supervises them, and even assists them with subsidies whenever deserved. They are the first step in education, the prelude to formal schooling, so that the little pupil who has previously attended them will not start with amazement and fear when he enters the crowded rooms where teaching is systematic and discipline enforced. The Italians regard these infant schools with favor—witness the large number of them throughout the country.

At the end of the year 1898-99 there were in operation 3,205 of these schools, with an attendance of 346,837 pupils—176,545 males and 170,292 females—a gain over 1895-96 of 392 schools and 29,720 pupils. This remarkable gain could not be due to increase of population, which in Italy, in a period of three years, would scarcely be noticeable.

These asylums, however, are not all schools: a few of them are but waiting halls where children above 3 years of age are received and cared for during the hours their parents are at work for their daily bread.

The children are admitted free of charge, except in cases where the parents are known to be quite able to pay fees.

As to the method of instruction, 537 of these institutes follow Froebel's method, 134 Aporti's, and 2,534 a combination of the two.

*Funds.*—The funds for the support of these infant schools, etc., are derived from the State, the provinces, the communes, from private, lay, or religious corporations, individual subscriptions, gifts, bequests, etc.

The income from these sources last year amounted to 2,347,768 lire (\$1,469,553), of which 6,870,803 lire (\$1,374,031) were expended for support.

The average attendance is about 108 pupils to a school, and the annual expense to run the same about 2,491 lire (\$490), or 19.81 lire (\$3.98) for each individual pupil.

*Charitable aid.*—In order to secure the largest attendance in these schools a "patronage association" has been formed for the purpose of assisting the children whose parents are too poor to clothe them properly and supply them with books and food while at school.

Last year the contributions of this benevolent association were as follows:

Four hundred and twenty pupils were assisted with books, copy books, pencils, pens, paper.

One hundred and forty pupils received gratuitously 120 grams of bread each, daily, a soup of vegetables, rice or dumplings, and a glass of ordinary wine diluted with water, now and then even a piece of chicken or beef. The pupils eat their lunch at stated hours under the direct supervision of their teachers.

Sixty-five pupils received necessary articles of clothing.

One hundred and sixty pupils, shoes and stockings, made expressly.

The funds of this association are derived from the subscriptions of members, from private offerings, and from a small subsidy from the minister of public

instruction. The association, in order to further increase its funds, organizes fancy fairs, literary and musical entertainments, etc.

Out of the 8,260 communes, 2,051 have adopted these "scuole d'infanzia" (infant schools), or about 25 per cent of the whole, which is a large proportion when it is considered that in many of the communes the illiteracy previous to the unification and independence of the country in 1870 had reached 95 per cent.

The number of directors and teachers of these schools amounts to 7,370 (108 males, 7,262 females).

#### ELEMENTARY INSTRUCTION.

*Primary schools.*—By "primary school" is meant a school having a five years' course of elementary studies.

The course is divided into two sections. The first, named "inferior," is of three years and is obligatory by law upon every child after becoming 6 years of age.

The second section is named "superior" and occupies two years. It is a progressive and complementary continuation of the former, but not compulsory.

The school programme of the two sections embraces the rudiments of the Italian tongue, practical arithmetic, rudiments of Italian history, geography, reading and writing, first principles of the rights and duties of a citizen, the metric system, and elementary gymnastics.

Since 1898-99 instruction in agriculture has been added to the course of the elementary schools of rural districts, to promote which, through the recommendation of the minister of instruction, many persons generously inclined, and even corporations, have offered small parcels of land for the practical instruction of pupils of these schools. These donations have become very important in the regular instruction in agriculture.

There were in 1898-99 45,745 schools of the "inferior" elementary grade and 6,003 of the "superior," or 51,748 in all, a gain over 1895-96 of 2,222 schools. The total force of teachers and assistants amounted to 52,688.

In 1871-72 the attendance at private primary schools averaged 6.43 per cent of that of public primary schools; in 1898-99 it had risen to 8.33 per cent.

Three years of schooling are compulsory by law. At the end of three years the pupil undergoes an examination, which, if passed successfully, entitles him or her to a certificate which relieves the holder from the obligation of continuing in the school, and admits him or her, if desired, to the superior section.

The pupils of the superior section become candidates for examination in two years more, and if successful are entitled to a certificate which admits them to higher schools, including the ginnasii, the technical schools, and the complementary school which prepares pupils for the normal school.

The percentage of successful pupils at the examinations of the first grade of the primary instruction, viz, the third year and end of the obligatory term, increased from 67 in 1891-92 to 73 in 1898-99.

The proportion as to sex of successful candidates at examination is largely in favor of the female.

In 1894-95 there were examined in the "primary inferior" 270,639 pupils, of whom 181,997 passed.

In 1898-99 there were examined 285,006 of the same class, of whom 201,924 passed successfully.

In 1894-95 there were examined in the superior section 19,048 pupils, of whom 13,736 passed.

In 1898-99 there were examined in the same section 23,284 pupils, of whom 21,883 passed successfully.

*Teaching force of the primary schools.*

Directors .....	588
Teachers (permanent) .....	50,751
Assistant teachers .....	1,937
Special teachers .....	303
Other teachers .....	738
Total .....	54,316

Number of teachers to each 1,000 inhabitants. 1.66.

In the year 1895-96 there were enrolled in these schools 2,379,349 pupils; in the year 1898-99 there were enrolled 2,444,288 pupils, showing a gain in the short period of three years of 68,839 pupils.

The number of primary schools and teachers in 1898-99, including both public and private, was as follows:

Schools .....	60,483
Teachers .....	62,638
Enrollment, both public and private .....	2,636,957

In 1895-96 the total number of schools was 59,526; of teachers. 62,077; of pupils enrolled, 2,589,423, showing a clear gain in three years of 957 schools, 561 teachers, and 45,534 pupils.

*Evening and vacation schools.*—To encourage further school attendance of pupils who have passed successfully the obligatory course of three years, and to provide for those who can no longer attend the day schools on account of being obliged to work for a living, evening and vacation schools have been organized, as provided for by law.

The number of these schools in 1898-99 was 4,245, viz. 2,750 evening and 1,495 vacation schools; in these 138,181 pupils were enrolled (105,856 males and 32,325 females); the teachers numbered 4,446.

It seems as if these schools did not meet with much favor from the people, for from 9,809, opened in 1871-72, they gradually dwindled to 4,245 in 1898-99, at which time the National Government withdrew the annual subsidy of 600,000 lire it had granted before.

## EFFECT OF COMPULSORY EDUCATION ON ILLITERACY.

The Italians call an illiterate person an "analfabeta," i. e., one without alphabet, or one who does not know his alphabet.

In 1871 the "analfabeta" reached, on an average, 73 per cent. Since then no enumeration of illiterates has been made, but their approximate number may be determined by ascertaining the proportion of those who are unable to sign the marriage register. A similar course may be pursued with the annual conscripts of the army and navy.

From these sources are obtained the following proportions:

The percentage of those of both sexes who could not sign their names to the marriage register was 68 in 1871, and only 42 in 1898-99.

The percentage of conscripts who could not sign their names on the army roll was 57 in 1871, while it was only 34 in 1898-99.

The percentage of those who enlisted in the navy and could not sign their names on the navy roll was 66 in 1871 and only 50 in 1898-99.

The average of these three percentages gives 43.92 per cent as the illiteracy of 1898-99, against 73 in 1871.

As the law prescribes that no one can be a voter who can not write his name, it follows that the number of voters has increased in the proportion that illiteracy has decreased.

This illiteracy, however, is not equally distributed over the country: the percentage of illiteracy in the southern regions, and especially in the islands, as Sicily, Calabria, Sardinia, etc., is much higher than in the north. A great difference exists also between the rural and city districts. In Turin 2 per cent could not sign their names to the registers, in Milan 3, in Geneva 8, in Bologna 9, in Florence 11, in Rome 17, etc.

The military schools (regimental schools within the army in time of peace) have also greatly diminished illiteracy in the army, for while in 1894, among the soldiers who had ended their term of enlistment and returned to civil life, 40 per cent were still illiterate, only 23 per cent were illiterate among the same class in 1898-99—a good reduction in three years' time.

*Dialects a cause of illiteracy.*—Dialects are a great stumbling block in the way of teaching and learning in the elementary schools, and particularly in those located in rural districts. These dialects, "brogues," or "patois" not only often differ so radically from the Italian tongue as to seem foreign languages, but they differ from each other from province to province, and even from city to city. This confusion of tongues, for they are tongues rather than languages (if I may be permitted to thus disregard etymology), often compels the teacher to speak in school the dialect of the pupils in order to be understood, and the minister of public instruction finds it a hard task to select teachers for certain schools, for it would never do for a Tuscan to teach in a Neapolitan or Sicilian school nor a Roman in a Genoese, or vice versa. It is an embarrassment indeed that so many dialects, so different in character and expression, are spoken in the country.

"To take a child who knows none other than his vulgar local dialect, and in a few years lead him to express with sufficient clearness his own thoughts, either verbally or by writing, in a language that is more or less different from his own dialect, is a work of which few understand the importance and the difficulty."—(A school inspector.)

These dialects, the origin of which is buried in the darkness of past centuries, can not have even a common root, as they have often been changed and transformed and impregnated with the tongues of foreign foes who invaded and occupied for long periods districts, provinces, sections, or regions of the distracted country. Huns, Goths, Visigoths, Lombards, and similar barbarians from the North, and Gauls, Spaniards, Greeks, Turks, and Arabs, from the South. Moreover, their words and sounds forced into Italian ears were not from the pure languages of their respective countries, but from "patois," so that even a study of their etymology would be useless for deciphering them.

That these dialects are a cause of illiteracy may be proven by the fact that in those regions where the dialects spoken resemble least the Italian language, as in Naples, Sicily, and Calabria, the illiteracy is the greatest; so great, indeed, as to reach 95 per cent.

The use of these dialects is so ingrained in the Italian people that even at court, not many years ago, a dialect was spoken more resembling French than Italian. It is said of King Victor Emmanuel that, when in the heat of battle, to give more emphasis to his words of command, he spoke in Piedmontese; and among the better class of people it was considered an affectation to speak one's own tongue in its purity in society. This unfortunate custom is not totally eradicated even now, for in such large and advanced cities as Milan, Turin, Genoa, etc., dialects are heard in the shops, the cafés, and other public resorts, spoken by people pretentious for their lineage and their fortune.

#### COMPLEMENTARY SCHOOLS FOR GIRLS.

The object of these schools is to furnish to girls a higher degree of culture than they have heretofore obtained from the two sections of the primary schools, and

also to prepare them for entrance into the normal school, or fit them for some occupation such as that of bookkeeper or clerk.

The instruction lasts three years, and is complementary to the course of studies already followed in the superior section of the primary schools, there being added to the latter the elements of drawing, of foreign languages, pedagogy, hygiene, theoretical and practical gymnastics, etc.

At the end of the course they are examined for a certificate of competency to enter the normal school, or to occupy positions in the commercial or industrial world.

In 1881-82 there were but 77 of these schools in operation, with an attendance of 3,569 girls; in 1898-99 the number of these schools had risen to 230, with an attendance of 7,459 pupils.

#### NORMAL SCHOOLS.

These schools might be classified with professional schools, as they are for the purpose of preparing pupils for the pedagogical profession.

In 1898-99 there were in operation 38 normal schools for males and 118 for females, with an attendance of 1,454 males and 20,034 females.

The normal schools for males in Italy are decreasing rapidly. It is generally conceded that in the purely elementary schools the office of teacher is more adapted to women than to men.

The female normal schools, therefore, are flourishing greatly. Besides being institutes for the training of teachers, they are institutes of feminine culture, preparing girls for home and family duties, and also for some industrial pursuit, as the making of artificial flowers, gloves, hats, dresses, etc. Instruction in hygiene and gymnastics (practical and theoretical) has lately been added.

It is also a noticeable fact that in a recent examination for teachers' diplomas 79 per cent of the females succeeded, while only 66 per cent of the males were found competent.

#### *Number of normal schools and students in 1871-72 and 1898-99.*

Years.	Number of schools.	Students.			Per cent of—	
		Males.	Females.	Total.	Males.	Females.
1871-72 .....	115	1,631	4,499	6,130	27	73
1898-99 .....	150	1,454	20,034	21,488	7	93

#### COST OF MAINTENANCE OF THE PUBLIC PRIMARY AND NORMAL SCHOOLS.

*Expenses of the communes.*—The communes are required by law to maintain elementary schools in a certain proportion to the population. They must provide for the construction or renting of school buildings, furnish the same with all the necessary articles of furniture, not neglecting those necessary for the practice of gymnastics, and pay all the "personnel" connected with them, including directors, teachers, ushers, servants, etc.

The minimum salary for teachers is fixed by law, and for that purpose the schools are divided into two classes, viz, urban and rural. These again are divided into three classes, according to the population and the financial condition of the communes.

The salaries of teachers in cities varies from 1,000 to 1,320 lire a year for male schools and from 800 to 1,056 for female schools of the superior grade, and from 900 to 1,000 lire for male and 720 to 800 lire for female schools of the inferior grade.

The salaries of teachers in rural schools are lower, viz, 800 to 900 lire for the

male and 640 to 720 for the female schools of the superior grade, and 700 to 800 lire for the male and 560 to 640 for the female schools of the inferior grade.

These salaries, however, are increased 10 per cent for every six years of continuous service, but only for four consecutive periods.

Besides these expenses for the obligatory term, the communes contribute largely to the maintenance of the infant schools, infant asylums, and kindergartens.

In the aggregate the communes in 1898-99 expended the following sums for elementary, infant, evening, and vacation schools:

Ordinary obligatory expenses:	Lire.
Salary of teachers .....	44,467, 713
Salary for service .....	2, 731, 728
Rent, furniture, lighting, heating, and cleaning .....	5, 785, 051
Gymnastic instruction .....	148, 076
Annual contribution to teachers' pension fund .....	2, 935, 130
Total .....	<u>56, 067, 698</u>
Extraordinary obligatory expenses:	
Construction and adaptation of school buildings .....	5, 244, 917
Furniture, etc .....	542, 734
Gymnastic apparatus .....	28, 201
Total .....	<u>5, 815, 852</u>
Voluntary expenses:	
Infant schools, kindergartens, etc. ....	1, 637, 920
Evening and holiday schools .....	656, 379
Books, paper, and pens for indigent pupils .....	946, 803
Extras .....	1, 178, 314
Total .....	<u>4, 419, 416</u>
Grand total .....	<u>66, 302, 966</u>

According to the above the annual cost of instruction for each pupil in the obligatory primary schools would be 26.21 lire, or 2.09 lire (about 42 cents) for each inhabitant.

To the above should be added the contribution of the provinces, which in 1898-99 was 642,757 lire, and that of the National Government, which was 7,432,906 lire. The total expense of the Kingdom, therefore, for public elementary instruction, independent of private schools, in 1898-99 was 74,398,629 lire, while in 1873 the total expense was 29,039,381 lire. In other words the expenditures for public education were nearly trebled in twenty-five years.

It is, however, estimated that the total annual expense for culture in the Kingdom, combining that of the communes, the provinces, and the states, is about 115,000,000 lire. This is independent of private instruction, which is very prevalent in Italy, on account of an aristocratic love of segregation and the antipathy of the church for the state.

#### THE TEACHERS' PENSION FUND.

This fund has been so ably described by Prof. Alexander Oldrini in his valuable contribution to the Report of the Commissioner of Education for 1898-99 (p. 846), that I deem it unnecessary to treat of it here. I must state, however, that it has met with a success beyond the most sanguine hopes of its founders. From year to year the fund has gone on steadily increasing, until from a deposit of 1,606,384 lire in 1879 it has reached the remarkable sum of 75,774,196 lire in 1899.

This fund has been formed by the obligatory contribution by the communes of a sum equal to 5 per cent of the total amount paid the teachers, the 4 per cent paid by the teachers out of their salaries, and a Government contribution of 3,000,000 lire, paid in installments of 300,000 lire annually for ten years.

The number of communes, schools, and teachers contributing to the teachers' pension fund is as follows:

Year.	Number of communes—		Schools contributing.		Number of teachers contributing.	
	Obliged to contribute.	Not obliged to contribute.	Elementary schools.	Infant asylums and schools.	From the elementary schools.	From infant schools, etc.
1889	8,113	133	59,043	355	37,201	380
1893	8,142	120	40,871	339	40,249	495

Actual receipts and expenses during the year 1893:

Lire.

Receipts	6,603,546.74
Expenses	1,124,160.50
Balance deposited in bank	5,484,446.24

The teacher is entitled to a pension proportional to his salary and the length of time of his service. A pension equal to the full salary at the time of retirement is due to the teacher who has served continuously for twenty-five years or more. In case of death the widow, or the children, if orphans, are entitled to two-thirds of the pension awarded to the husband or father.

#### PHYSICAL EDUCATION—GYMNASTICS.

The history of Italy is full of surprises. While to-day England and the United States of America are looked upon as the exponents of the true system of physical training and challenge the world for supremacy in athletic games, the very games that they play had their origin in Italy as early even as the fifteenth century.

Mafeo Vegio in 1491 wrote: "The youth should be exercised in gymnastics especially, by means of games neither too light nor too hard, but above all not unworthy of a freeman."

Paolo Cortese, in his work *De Cardinalatu* (1510), treats of the exercise of the body in conformity with physiological requirements.

The game of "pallone," a ball inflated with compressed air, which was in vogue at that early period, is played even now in Italy; it may properly be called the Italian national game. It is a game requiring, however, so much dexterity and physical effort that it is played only by professionals.

Scaino in 1555 described a tournament of "palla a maglio" (tennis) in the arena of Padua, at which all the magnates, professors, and scientists of the city were present and speeches were made demonstrating the healthfulness of the game.

Bardi in 1573 described a game of "calcio" (football), at which were present the dukes and princes of Medici, the dukes Gonzaga of Mantua, and all the nobles in Florence, whether native or foreign. Croquet, golf, and quoits were at that time common games, not only in Florence, but throughout Italy.

In 1688 a printing house in Florence published the rules of football, with illustrations, a work dedicated to their highnesses, Ferdinand, prince of Tuscany, and Violante Beatrice of Bavaria.

But Italy had allowed gymnastic games to fall into disuse, and it is only since her unification and independence, proclaimed in 1870, that gymnastics have been revived and placed in the curriculum of all schools except universities. Still,

gymnastics in Italy even now are not taken so seriously or cultivated with the same intensity as in England and the United States. But few professionals are engaged to give practical instruction in gymnastics in the schools, and only a few gymnastic halls are provided for, and those are located principally in the large cities. An error has also been made in adopting the German method, which is peculiarly military, instead of the Swedish, which is in conformity with emotional and physiological requirements. In the normal schools gymnastics are taught with a view to prepare the coming teachers to instruct their pupils in the same when they enter upon active service; but as the pupils of the normal schools are mostly girls, and the instruction is more theoretical than practical, it may be seen that the future of gymnastics in the elementary schools is not very promising in Italy.

In higher schools the number of instructors of gymnastics are as follows: In the technical schools, 276; in the technical institutes, 65; in naval schools, 28; in licei, 135; in ginnasii, 294.

In universities athletics are not highly considered, and one does not hear of "matches" or games between the students of different universities, which are common in England and the United States. Still there is the gymnasium of Turin, which is considered the best equipped and the handsomest in Europe. The Alpine Gymnastic Club, which is not inferior to any club of the same class, has many members, is very rich, and issues important publications. The boat clubs of Turin, Milan, Piacenza, Venice, Rome, Pavia, and Genoa are well known, but only seldom have they had organized races. Lately cycling clubs have been formed.

In late years, however, the Italians seem to have awakened from their lethargy, and organized conventions for the purpose of discussing the methods of gymnastics best adapted to the young and the best manner of teaching them in the schools.

#### MANUAL TRAINING.

This class of instruction, except in infant schools or kindergartens, has not found much favor with teachers, though insisted upon by various ministers of public instruction.

Many deem it absolutely objectionable on account of its tendency to distract the young pupils from their regular course of studies. It is, however, taught with earnestness in the complementary course and normal courses for female teachers. Except for the amusement of very young children, teachers do not think much of cutting paper or pasteboard in geometrical figures, braiding straw, or making mud pies in imitation of some animal, etc., while they take great interest in learning and teaching the rudiments of agriculture, domestic economy, female industries, drawing, etc., as will be shown farther on.

#### AGRICULTURAL SCHOOLS.

The coming into office of Dr. Guido Baccelli as minister of education infused new life into agricultural instruction. It was through his official recommendations that thousands of landed proprietors volunteered to give gratis small parcels of land ("campicelli," so called on account of their small size) for practical instruction in the elements of agriculture. It was through him that this instruction became obligatory in all primary schools, and especially in the normal schools. To fit the public teachers to instruct the pupils in this new study, lecturers versed in the theory and practice of farming and horticulture were sent around by the communes and school boards to instruct the teachers.

These efforts were received with enthusiasm by the people, especially of the rural districts, who now in their turn proceeded to assist to the extent of their ability.

The results of the united efforts of government, school authorities, teachers, and people are shown in the following statistics:

There were 238 lecturers in 1899, who delivered 1,802 lectures, attended by 15,000 teachers, principally of the rural schools.

Among the lecturers were the most noted agronomists, professors of universities and technical institutes, directors of special and practical schools of agriculture, engineers, etc. To these add those teachers who, having been born in the country and raised as farmers, need no instruction, and the new teachers that graduate annually from the normal schools, and it will be seen that the number of teachers competent to teach the rudiments of agriculture has become very large, with the prospect of larger increase.

The curriculum in the elementary schools was limited to the following subjects:

1. Manure and use of chemical fertilizers.
2. Functions of leguminous plants in the rotation of crops.
3. Tilling of the soil; farm tools and machines.
4. Differences occasioned by meteorological conditions.
5. Importance attached to the selection of seeds.
6. Diseases of plants, their treatment and eradication.

The programme of the normal schools in this branch of instruction was more extensive, and was as follows:

1. Arable and nonarable soil; subsoil.
2. Irrigation and drainage.
3. The object of tilling lands; common method and by machine.
4. Construction of stables.
5. Preparation of manure and chemical fertilizers.
6. Instruction on the cultivation of wheat, corn, oats, rye, barley, etc.
7. Horticulture and gardening.
8. Raising textile plants (hemp, flax, cotton, etc.); dyeing plants (madder, reseda, saffron); oleiferous plants (sesame, *ricinus communis*); aromatic plants (anise, hops).
9. Culture of meadows.
10. Cultivation of fruit-bearing plants; their diseases; rules for the preservation of dry and fresh fruits; preserves.
11. Viticulture; selection of soils for planting vineyards; species of vines; propagation of the same; diseases and their remedies.
12. Wine making; wine receptacles, barrels; their defects; vitiations of wine and their remedies, etc.
13. Culture of olive trees; gathering of olives; extraction of the oil and its preservation.
14. Culture of mulberry trees for raising silkworms; varieties preferred, drafting, etc.
15. Raising silkworms; their propagation; diseases they are subject to.
16. Bees and apiaries; production of honey and wax, etc.
17. Animals for work, for butchering; milk and its products; farmyard animals, especially poultry, etc.
18. Elements of rural hygiene; the atmosphere, water, food, clothing; habitations; malaria; domestic toxicology, utensils as a source of poisoning; drinks, condiments, coloring materials, etc.
19. Animals useful and noxious to agriculture.
20. Bookkeeping, etc.

The rural teacher must take his pupils to the small field assigned to the school and there demonstrate practically what he has taught in school. If he is not sat-

ified with his success on the small field, he is to take his pupils to some large farm near by known to be advanced in the practice of farming.

Female pupils are admitted to this practical instruction the same as the males, and the Government especially recommends female teachers to teach their girl pupils to become useful colaborers of the farmer, particularly in all that pertains to housekeeping, the preservation of home goods and wares, the industries of the field, the custody of cattle, the garden, and the orchard.

*Fields for practical instruction.*—The small parcels of land donated by the people for the purpose of enabling teachers of the primary courses to give their pupils some practical ideas of agriculture in 1899 numbered 4,029, of which 2,475 were well equipped and in full operation. No less than 251,488 pupils (200,662 males and about 50,000 females) attended these instructive exercises in the field. The first four months of 1900 the donations of lots were so numerous that it was estimated that the number of "campicelli" would reach 5,000 during the year. The value of these parcels of land is estimated at 1,000,000 lire. This success, due to the suggestion of Minister Baccelli and to the good will of the people, did not involve the Government in one dollar of expense.

Comparing the above statistics with those given by Professor Oldrini in the article referred to above, it can not but be realized that the diffusion of agricultural instruction in Italy in the course of three years has been unprecedented.

Besides the above general elementary instruction in agriculture there are specific agricultural schools, which are classified into "special" and "practical." Under special are the following:

	Schools.	Teachers.	Pupils.
Vine culture and wine making .....	5	52	370
Olive culture and olive-oil making .....	1	3	8
Pomology and horticulture .....	1	8	31
Cattle and cheese making .....	1	7	48
Total of special .....	8	70	457
Practical .....	26	112	1,085
Experimental Agrarian Institute of Perugia .....	1	20	59
Grand total of agricultural schools .....	35	202	1,601

#### "PROFESSIONAL" SCHOOLS.

Under this term, as used in Italy and other European countries, are included schools for instruction in certain trades, industries, and occupations.

These schools are under the charge of the minister of agriculture and commerce, and are supported by the united contributions of the State, the provinces, the communes, chamber of commerce, and association of mechanics.

There are schools of arts and trades in 58 cities. In these are taught the elements of science and technics applied to the trades of masons, blacksmiths, carpenters, builders, gilders, wood carvers, shoemakers, printers, hatters, stonecutters, jewelers, etc. Viniculturists, pomologists, horticulturists, etc., have already been referred to.

Lower commercial schools, 12 in number, are for the purpose of preparing pupils to become commercial clerks, small traders, and for subordinate positions in the railway and telegraph services. In some of these schools foreign languages are taught and pupils prepared to enter the superior schools of commerce.

Schools of art applied to industry, of which there are 103, furnish practical instruction in the trades of blacksmithing, carpentering, stonecutting, wood carving, furniture making, lace making, building (masons), painting on ceramics, etc.

Besides the above there are 15 "professional" and commercial schools distributed in various cities. In these girls are instructed in dressmaking, embroidering, sewing, and in millinery, artificial-flower making, washing and ironing, lace making, mending, etc., also to become clerks, accountants, teachers in designs for embroidering, in ceramic decoration, and in miniature painting, etc.

There were 32,000 pupils in these schools in 1899.

#### TECHNICAL SCHOOLS.

Professor Saverio de Dominicis, in his *Annata Pedagogica* (1900), has classified agricultural schools, "professional" schools, and technical schools proper as "technical schools," and has therefore reported 280 such schools in the Kingdom, with an attendance of 37,733 pupils. Adding to these the communal and the private schools of that class the total number of technical schools, according to Dominicis, would be 483, with an attendance of 49,306 pupils, a gain of 96 such schools since 1895-96.

I have, however, kept the technical schools proper separate in this report for better illustration.

#### *Pupils in the State technical institutes, 1899-1900.*

Course common to all .....	3,221
Physico-mathematical .....	1,392
Commerce and accounts .....	2,337
Surveying .....	1,036
Agriculture .....	25
Industry .....	192
<hr/>	
Aggregates:	
Admitted pupils .....	8,213
Free pupils .....	228
Pupils in evening schools (free) .....	1,851
<hr/>	
Total in State technical institutes .....	10,292

Adding to these 1,600 pupils in private technical institutes, the grand total of all pupils in technical institutes is 11,892, a gain of 2 schools and 2,485 pupils over the year 1895-96.

#### NAUTICAL INSTITUTES.

#### *Number of admissions to the various sections of nautical institutes.*

Scholastic year.	Sea captains.	Naval constructors.	Machinists.	Preparatory course.	Free attendants.	Total.
1896-97 .....	201	33	302	322	53	918
1899-1900 .....	365	44	342	405	63	1,219

A gain of 301 alumni in three years.

*Number of pupils in both Government and private nautical institutes.*

Sections.	Governmental.		Private.		Total.
	Pupils.	Free hearers.	Pupils.	Free hearers.	
Sea captains .....	365	-----	15	-----	380
Naval constructors .....	41	-----	-----	-----	41
Naval machinists .....	342	-----	-----	-----	342
Preparatory course .....	-----	405	-----	18	423
Free attendants .....	-----	63	-----	1	64
Total .....	751	468	15	19	1,233

	Males.	Females.
Summary of all Government technical schools .....	23,570	2,914
Summary of all private technical schools .....	10,060	935
Total .....	34,000	3,800

Making a grand total of 37,900. There was an increase of 1,844 male and 323 female pupils over the attendance in 1898-99.

Apart from their physico-mathematical features the technical institutes are really "professional" schools, excepting those of a manual character. In the special sections of field surveying, agriculture, commerce and accounts, and industry, the technical institutes confer diplomas according to the course pursued.

The nautical institutes confer diplomas of captain for the high seas, seacoast captain, naval constructor, and machinist.

## SECONDARY CLASSICAL SCHOOLS (GINNASII AND LICEI).

The "ginnasio" is not a hall for gymnastic instruction and practice, but a school corresponding to a "college" in England and the United States.

The ginnasio has a five years' course, divided in two sections. The first, or "inferior," covers three years, the curriculum of studies including the Italian language and literature, Latin, history, geography, arithmetic, and gymnastics. The second, or "superior" section, occupies two years; the curriculum continues the above studies and adds Greek, French, and mathematics. Then follows the "liceo" with a two years' course, having a curriculum which completes the gymnasial instruction, and adds German or French, philosophy, physics, and natural history.

This is the routine of studies to be pursued in order to prepare for admission to the university; in the aggregate it embraces a five years' elementary course, a five years' gymnasium course, and a two years' lyceum course—in all twelve years of continued study before a pupil becomes qualified to enter a university; this for every student in the whole Kingdom.

In 1900-1901 there were 269 "ginnasii governativi," so called, with an attendance of 31,668 males and 1,178 females, a total of 32,846. In the same year there were 150 "licei governativi," so called, with an attendance of 12,983 males and 287 females, a total of 13,270.

The above statistics of gymnasiums and lyceums for 1900-1901 are incomplete. The latest figures which give the whole attendance are those of 1895-96, and are as follows:

Total gymnasiums in the Kingdom, 708 in 1895-96, divided into governativi 183, and nongovernativi 525, with an attendance of 59,778 students, 25,444 belonging to the first class and 34,334 to the second.

Total lyceums in the same year 332, governativi 116, nongovernativi 216, with

an attendance of 17,689 students, 10,945 of whom were governativi and 6,744 non-governativi.

The number of female students of the above increased from 1,126 in 1895-96 to 1,465 in 1900-1901.

## UNIVERSITIES.

The term "university" is applied in Italy only to those schools of the highest grade in which the students are instructed in special branches for the profession of their choice, and after a four or five years' course, according to the requirements of the profession selected, they are prepared, graduate, and receive the diplomas of doctor of medicine, doctor of laws, etc.

There are in Italy 21 universities, quite uniformly distributed throughout the Kingdom, 4 of which are independent of Government control. The name and date of foundation of these universities are as follows:

	Year.		Year.
Bologna (about) .....	1200	Turin .....	1404
Padua .....	1222	Catania .....	1434
Macerata .....	1290	Parma .....	1512
Naples .....	1224	Urbino (free) .....	1564
Genoa .....	1243	Messina .....	1549
Perugia (free) .....	1276	Sassari .....	1677
Pavia (about) .....	1300	Cagliari .....	1626
Rome .....	1303	Modena .....	1678
Pisa .....	1338	Camerino (free) .....	1727
Siena .....	1321	Palermo .....	1805
Ferrara (free) .....	1391		

The total number of students admitted to these universities in 1900-1901 was 23,425, divided by faculties as follows:

Jurisprudence .....	6,791
Medicine and surgery .....	6,211
Mathematics only:	
For mathematicians .....	538
For engineering .....	1,071
Physics, mathematics, and sciences in general:	
Physics .....	144
Chemistry .....	280
Natural science .....	473
Engineering school of application .....	200
Letters and philosophy .....	1,144
Pharmacy .....	3,528
Notaries and solicitors .....	803
Obstetrics, for midwives .....	1,202
Veterinary .....	580
Agrarian .....	157
Total, 1900-1901 .....	23,125
Total, 1899-1900 .....	22,774

Besides the above, there are 65 female students receiving instruction in obstetrics for midwives at a special school in Venice, and 140 females in a similar school in Milan. This would make a total of 23,630 students in 1900-1901, as against 22,774 in 1899-1900, a gain of 856 in one year.

## SUPERIOR INSTITUTES.

The schools known as "superior institutes" have the scholastic programme of universities. Though private, they are more or less under the direction of

the Government. They number 20, about uniformly distributed throughout the Kingdom.

The number of students admitted to these institutes in 1900-1901 was 2,621, classified by faculties as follows:

Medicine and surgery .....	261
Mathematics, physics, and natural sciences:	
Engineering .....	215
Physics .....	1
Chemistry .....	34
Natural sciences .....	27
School of application .....	1,079
Letters and philosophy .....	250
Pharmacy .....	44
Obstetrics for midwives .....	70
Veterinary .....	640
<hr/>	
Total, 1900-1901 .....	2,621
Total, 1899-1900 .....	2,892
<hr/>	
Loss .....	181

There are three university schools attached to lyceums, whose students are distributed among the different faculties as follows: Notaries, 31; pharmacists, 175; midwives, 37. Totals: 1900-1901, 259; 1899-1900, 270.

Grand total of students admitted to all the universities:

1900-1901 .....	26,510
1899-1900 .....	25,816
<hr/>	
Gain in one year .....	694

*Female students in universities in 1900-1901.*

Admitted in jurisprudence .....	7
Admitted in medicine and surgery .....	29
Admitted in mathematics, physics, and natural sciences .....	32
Admitted in philosophy and letters .....	89
Admitted in pharmacy .....	11
<hr/>	
Total .....	168
Total, 1895-96 .....	132
<hr/>	
Gain .....	36

The following is a summary of the "superior grade" of instruction in Italy, according to Professor Saverio de Dominicis, 1901:

First. Superior professional military institutes: Military academy, school of war, school of application of military sanitation, school of application of artillery and military engineering, school of infantry target shooting, central school of artillery target shooting, school for candidates for professors of fencing; these have a total of 1,155 military students.

Second. Superior professional civil institutes: Superior royal naval school of Genoa, with 131 students; superior commercial schools of Venice, Genoa, Bari, with an aggregate attendance of 301 students; superior schools of agriculture of Milan, Portici, and Perugia, with an aggregate number of 181 students; the forestry institute of Vallombrosa, with 48 students.

Third. The 21 universities, with 23,125 students.

Fourth. The superior university institutes, viz: Superior finishing school and school of social science at Florence; scientific academy, superior royal technical

institute, and veterinary school at Milan; school of application at Bologna; school of application and veterinary medicine at Naples; school of application and veterinary medicine at Turin; school of application at Rome; and superior normal school at Pisa; these have in all 2,640 students.

Fifth. University schools of Aquila, Bari, Catanzaro, with an aggregate of 229 students.

Sixth. Superior normal schools for women at Rome and Florence, to prepare women to become teachers of the highest grade ("professoresses" so called), with 280 students.

The above aggregate 26,022 students of university grade.

Professor Dominici observes that it is evident that the attendance at the superior institutes of professional character is relatively small, while that at the universities and the institutes of university character exceeds the needs of the country.

This excess of university attendance, with a view to office seeking, the Government has attempted to reduce by rendering the curriculum and the examinations for university degrees more difficult, so as to turn the attention of students more to agriculture.

#### CONVITTI (BOARDING SCHOOLS) FOR GIRLS.

These are schools where girls receive instruction, board, and lodging. They are quite numerous and are largely patronized on account of their privacy and discipline, the students being scarcely ever out of the observation of the teachers. Even in their daily walk for exercise they are marshaled like soldiers under the guidance and supervision of special guardians. In olden times only a few of the young girls escaped from being forced into these institutions of restraint. Parents, and particularly women of fashion, found it very convenient to commit their girls to these institutes and thus be relieved of any responsibility, just about the age when girls become conscious of their own attractions and capable of asserting themselves. This was especially the case with all girls of good birth, under the illusion that they would issue therefrom thoroughly equipped morally, mentally, and practically for the "struggle for existence;" and it is even so now, for annually about 53,000 are educated in these institutes under the tuition of nuns, who, though well-intentioned, are, on account of their seclusion and vocation, least capable of imparting to their students that practical knowledge of the world which they lack themselves.

There are about 1,577 of these convitti, 760 of which are ecclesiastic, 262 part lay and part ecclesiastic, and only 555 subject to Governmental, provincial, or communal control; 479 are free for pupils, 656 receive pay in full, and 443 largely reduced pay.

Of 1,380 instructors 470 were laymen, the remaining 810 were either priests or nuns, largely nuns, however; of the directors of the same, males or females, nearly 1,000 were ecclesiastic and only 465 laymen.

#### CONVITTI FOR BOYS.

In 1900-1901 there were about 860 convitti for boys, with an attendance of 51,227. These were all private except 53, which were governmental, and the directors and teachers were about in the same proportion as to being civil or ecclesiastics as in the female convitti.

#### COLONIAL SCHOOLS.

According to the statistics of 1896-97 there were 52 royal schools in foreign countries, viz, 1 liceo-ginnasiale; 8 technical commercial schools, 2 of which had the ginnasio attached; 23 elementary schools for males and 18 for females; 4 pro-

fessional courses, and 11 kindergartens. These schools had an aggregate attendance of 8,692, at an expense to the Government of 900,000 lire.

Of equal importance, on account of the number of their pupils and the patriotic impulse that led to their organization, are the colonial schools established by Italian subjects abroad. These are all elementary schools, following the programme of instruction adopted for those of the same class in Italy, with the addition of instruction in the language, history, and geography of the country in which they are established. The expenses incurred in the maintenance of these schools are borne by the societies which founded them and by private contributions. There are 100 or more of them, with an attendance of 11,000 pupils, at a cost of 92,000 lire.

Of the colonial schools some of them are of very ancient date. They were first established in various cities of the east as a help to the work of evangelization; they have now extended to the several American republics. These schools are subsidized directly by the Government or through the "Societa Nazionale." There are 30 of these, with 5,926 pupils. The Government subsidy amounts to 51,000 lire.

#### DIPLOMATIC-COLONIAL SCHOOL.

The ministers of public instruction, of foreign affairs, of marine, and of agriculture, industry, and commerce have approved the internal regulations of the diplomatic-colonial school recently established by Minister Nasi. Besides the courses already pursued, viz, diplomatic and consular law, history of political and commercial treaties, tariff legislation compared, political and colonial geography, there will soon be added courses of diplomatic and consular practice and of naval regulations. As this school has only recently been opened, no statistics are available

#### SCHOOLS OF FINE ARTS.

Governmental, 13 schools, with 2,198 pupils; nongovernmental, 13 schools, with 1,688 pupils; total, 3,886.

#### INSTITUTES AND CONSERVATORIES OF MUSIC.

National, 6, with 875 pupils, viz, 555 males, 320 females.

Private, a large number, among which are 5 musical lyceums and 40 private and municipal conservatories; number of pupils unknown.

#### MINERALOGICAL AND MINING SCHOOLS.

Royal school of Caltanissetta, with 7 teachers and 20 pupils.

School for head miners and expert mineralogists at Inglesia, 7 teachers and 42 pupils.

#### SUPERIOR SCHOOLS OF DECORATIVE ART APPLIED TO INDUSTRY.

Rome .....	2 years' course in foreign languages and literature; 2 years' course in history, geology, geography, pedagogy, and sciences.	98
Total .....	-----	2,668

It is the prevailing opinion in Italy that the desire for classic and university instruction is excessive, that is, above the needs of the country, while agricultural and industrial instruction is neglected and needs all the encouragement that the Government and Parliament can give. Italy is par excellence an agricultural country; all her exports are produced in her fields, while the largest part of her

imports are manufactured products, and the balance of trade is consequently against her.

Prof. Carlo F. Ferraris of the University of Padua reproduces the statistics of attendance at the universities and the superior institutes of the Kingdom during the year 1900-1901, with a comparison with the number of those who attended in 1893-94, given by the *Riforma Sociale*. According to this authority the number of students and hearers (the last are allowed to attend lectures, though they are not inscribed on the rolls) who attended the courses of the universities and of the superior institutes, according to faculties, in the scholastic years 1893-94 and 1900-1901, is as follows:

Faculties.	1893-94.	1900-1901.
Jurisprudence (for graduation) .....	5,690	6,792
Notaries and attorneys .....	571	880
Medicine and surgery .....	6,521	6,480
Midwifery .....	1,608	1,538
Mathematical sciences:		
For graduation in mathematics .....	296	537
For engineering .....	1,423	1,285
Physical sciences .....	70	145
Chemical sciences, for graduation in general sciences .....	69	315
Natural sciences .....	226	498
Letters and philosophy .....	1,325	1,695
Chemistry and pharmacy .....	181	477
Engineering, civil, industrial, and architectural .....	1,346	1,188
Pharmacy .....	1,707	3,270
Veterinary medicine .....	536	1,220
Agricultural .....	228	419
Total .....	21,870	28,739

Increase, 5,131.

Professor Ferraris remarks that among the studies leading to the highest academical degree, viz, graduation, there was an increase of attendance in jurisprudence, pure mathematics, letters and philosophy, chemistry and pharmacy, veterinary medicine, and agricultural sciences, but a visible decrease in medicine and surgery. As to engineering sciences, civil engineering decreased conspicuously, while industrial engineering increased largely and architectural engineering remained stationary. Among those who attended for professional diplomas, the candidates for those of notary, attorney, and pharmacist increased in numbers, while those for the diploma of midwife were considerably less.

From the above and the comparative statistics of schools of lower grades given in this statement, it must be concluded that the movement toward a broader culture in Italy has in the last few years received a great impetus, and the hope of its continuance rests on the fact that the movement has been gradual with an uninterrupted progress.

#### PUBLIC LIBRARIES.

As to public libraries, there are no later statistics than these given by Professor Oldrini in his report already referred to, according to which there were 1,831 libraries in 1898, with 1,690,825 books and manuscripts, of which 12,711 were manuscripts.

#### PHILOLOGICAL CLUBS.

There are many institutions of learning in Italy organized by local societies, or associations of learned and professional men, the statistics of which are not obtainable or even collected. It is the same with some schools of trades and industries, as lithography, photography, etc., whose existence is scarcely known except by the persons directly connected with them. There are, however, two

educational agencies which, though private, are of national importance. These two are the "philological clubs" and the "Dante Alighieri Society."

The philological clubs, though independent of Government control, have attained in late years a high degree of influence in the field of higher education.

The professed scope of these institutions is the teaching and perfecting of the Italian tongue and the dissemination of the knowledge of foreign languages; but they go much farther, as will be seen by the published programmes of the courses of studies. These clubs are organized by the literary and social élite. They are institutions not only of learning, but of social intercourse of the highest order. The instruction is by professors of literature, science, and art of the highest standing.

The first organization of this character, the Philological Club of Turin, dates from the time when the unification and independence of the country was effected, namely, thirty years ago; now they are found in every principal city of the country, as Rome, Milan, Florence, etc.

To exhibit their scope and breadth, the programme of the Florence Philological Club, whose president is the distinguished "litterato" and publisher, Piero Barbera, is here appended as being typical of all.

#### PROGRAMME FOR 1891-92 OF THE FLORENCE PHILOLOGICAL CLUB.

First. Instruction in languages: Italian, French, English, German, and Spanish. Lessons in the evening for both sexes.

Second. Special course for ladies in the French, English, German, and Spanish languages during the day.

Third. Finishing courses of the French, English, and German languages and literatures.

Fourth. The Italian course, consisting especially of instruction in Italian phonetics (pronunciation and diction), reading aloud, explanations of subjects read, dictation, orthography, grammar, syntax, correction of written exercises, instruction in the literature and the history of the literature of the country, reading and commenting upon ancient and modern authors, translation exercises, and conversation.

Fifth. "Conversazioni" in the various languages taught in the institute. held on certain evenings of the week from January 1 to May 30.

Sixth. Instruction in drawing and in painting in water colors.

Seventh. Special courses of music for ladies, including singing; a complementary course on the piano. Day lessons.

Eighth. Esthetics and history of art, aided by visits to museums, galleries, and monuments, under the guidance and instruction of competent teachers.

Ninth. Course of stenography.

Tenth. A special course of the Italian language through the medium of French, English, and German.

Eleventh. Courses in other foreign languages and literatures may be given if requested and terms agreed on.

These clubs are generally domiciled in elegant buildings in the most convenient localities. They contain spacious and well lighted and aired reading rooms, furnished with all the important Italian and foreign journals, magazines, and reviews; also very extensive libraries of the noted authors of all countries, with a department of modern literature in the various languages.

The members are allowed to take books home under rules to insure their preservation and safety.

There are special rooms for reading and studying.

Visiting the rooms of the Philological Club of Milan, I was surprised to find in

one spacious reading room 57 daily political and commercial journals, 18 illustrated papers, 14 comic papers, 53 literary periodicals, 4 on geography and travels, 25 technical and scientific, 3 agricultural, 4 legal, 23 on economics and sociology, 4 on medicine, 6 sporting, and 10 miscellaneous; in all, 232 monthly, weekly, and daily publications.

For the convenience of the members there is a room where may be found postal cards, postage stamps, postal and telegraphic tariff, letter scale, telegraph blanks, telephone, etc.

These clubs are equipped with relation to the special needs of the cities where they are located. In Florence, for instance, a city where many thousands of foreign citizens are permanently located, and many thousands more come there for limited periods for the purpose of education, the club is furnished with halls for conversation and recreation. The associates and members may find rest from their studies by playing billiards, chess, dominos, or checkers, provided in the same building.

Scientific or literary lectures are delivered every Monday evening during winter and spring; concerts are also given from time to time for the benefit of the members and their families. Refreshment rooms are provided for the hungry and the thirsty. The rooms are opened from 10 a. m. to midnight.

Admission fee for permanent or active members, 5 lire (\$1); monthly dues, 3.50 lire (70 cents); occasional members, nonactive, monthly, 4 lire (80 cents). Officers of the army and navy, and members of the families of active club members, are allowed a reduction.

The fees for special courses for the scholastic year are: Drawing and water-color painting, 50 lire (\$10); Italian instruction to foreign ladies, 40 lire (\$8); for all other courses, each, 30 lire (\$6). Those who take more than one course pay only one-half for each course after the first.

Nonresidents and foreigners may be admitted as guests by request.

The officers are: One president, one vice-president, a secretary, treasurer, and librarian; there is also a council (executive committee) of 18 members; all serve gratuitously.

The Philological Club of Milan commenced in 1872 with 264 effective members; January 15, 1902, it had 1,306. On the 30th of September, 1901, after paying all expenses, it had a net balance in money of 58,045.72 lire; the value of its library and furniture was 21,368.79 lire, making a total valuation of 79,314.42 lire.

This is a remarkable showing for an educational club, and I am assured, by reliable persons, that the fortunes of the other philological clubs are in a no less, and in some—as that of Florence—in by far a more, flourishing condition.

In cities where large colonies of citizens reside for certain periods of time, special provision is made for them, as in Rome and Florence.

*Extraordinary instruction.*—This is temporary, as current political and economical conditions may require. Thus, when the Italians went to war with African nations, some of the philological clubs immediately established chairs of the Arabian tongue; and when the Italian Government sent a contingent to join other nations in forcing the Chinese to fulfill their international treaties, some of these clubs immediately established chairs of the Chinese language. The State could not provide for such emergencies, any more than it could provide all the assistance the Red Cross gives in labor and material.

#### THE "DANTE ALLIGHIERI."

Another popular instrumentality of learning of national import is the association named in commemoration of Dante Allighieri, the "divino poeta." As it may properly be said that Dante was the master, purifier, and teacher of the Italian idiom, so this association is for the maintenance and diffusion of the same

among the four or more millions of Italians who, through political or economic reasons, remain under the sway of foreign powers or have migrated to other lands to better their condition. Its object is:

First. To foster and diffuse the Italian language and culture in foreign localities containing numerous Italian residents, like Trieste, Malta, and part of the Tyrol, and in the numerous Italian colonies in other parts of the world.

Second. To oppose legitimate resistance to all attempts on the part of foreign states to suppress the Italian language and literature in the colonies or provinces under their dominion.

Third. To establish in the colonies and localities above mentioned Italian schools and libraries by means of local committees and home subsidies, and distribute free national books and publications, and encourage, by every possible means, a constant propaganda for enduring Italianism among the Italians outside of the political confines of the Kingdom.

The patriotic object of this association, organized in 1890, received at once the encomiums and the indorsement of all the most illustrious citizens, from the King and court down to the class of humbler ones who, though possessed of but limited means, could not refrain from joining in assisting the association with all the means in their power. Accordingly this association spread forthwith over the land and to foreign nations. Sixty committees are now organized within the mother country, and 22 out of it, to carry out the programme of the association. Its central committee is in Rome, and through its efforts several congresses have been held: three in Rome (1890, 1891, and 1895), one in Venice (1892), one in Florence (1893), one in Bari (1894), one in Bologna (1896), one in Milan (1897), one in Turin (1898), and one in Messina (1899), with great success, and with great increase of membership and sympathy from the people. Committees are at work in twenty foreign countries, especially in South America, Turkey, Brazil, Chile, Australia, Montevideo, Canada, New York, the Balkan States, Trent, Trieste, and Malta, where large numbers of Italians reside or sojourn.

Italy has great political interest in conserving the sentiment of patriotism among the Italians who are largely colonized all along the coast of the Adriatic, in the Balkans, in Turkey, Egypt, Tunis, and Tripoli. No Italian now, though a resident of foreign lands, need feel abandoned or forsaken, or that the sweet influences of his home do not hover over him in his farthest peregrinations.

The members pay an annual contribution of 6 lire (\$1.20), and by paying 150 lire become perpetual members. The association has expended several hundred thousand dollars in establishing schools, supplying books, and in organizing new sister associations at home and abroad.

This popular movement, with its wonderful success without any material assistance from the National Government, betokens a hopeful future in the self-governing attribute of the Italian people.

#### SPECIAL SCHOOLS FOR ADULTS IN THE AGRICULTURAL DISTRICTS.

The great and difficult problem in the advancement of popular education in Italy has always related to the rural population, that is, the so-called "contadini" (farm hands, field hands), of whom there are about seven millions, or almost one-fourth of the whole population of the country. This class of people work for wages so meagre as to be only too often insufficient to keep a small family from starving. Yet their progenitors were contadini, the present generation is contadini, and the children and grandchildren of these are expected to be contadini. These poor creatures work as no slave ever worked; they have no time for thinking, have no ambition, and take no interest in anything except in what is confined within the narrow space they inhabit under the shadow of their church steeple.

It is among these that the highest degree of illiteracy has been found to exist. These people find no time for learning; nay, learning to them is harder than breaking stone, and considered by them of no utility whatever. Besides, and this is really the main point, they need the labor of their children as soon as these are able to handle a farm implement however small; hence the schools are shunned or avoided when possible in spite of the law requiring that every child from the age of 6 to 9 should be made to attend school, and holding the parents responsible. Those who fear to disregard the law, and consequently send their children to school, withdraw them as soon as they have completed the first elementary course of three years demanded by the law of the land. The parents prefer to have their children back to hoe, to drive cattle, or help in any way they can in tilling land or storing crops. Thus every child in a family becomes a coworker at a very tender age. To break up this custom and overcome the aversion to schooling manifested by these people the Government is all but powerless, its machinery being too cumbersome and too slow to effect the object desired.

The educated class of Italians realize this, and understanding how important it is to overcome this perilous sea of ignorance, and satisfied that the means of the Government are totally inadequate, they have organized popular societies for the instruction of adults among the *contadini*.

This class of people—peasants, countrymen, farm hands, laborers, etc.—has, however, in the last few years become a factor in the economics of the country. They have organized themselves into labor unions, and under the orders of their chiefs have made gigantic strikes at times when their labor was most needed, as harvesting time, compelling the Government to send an army of soldiers to mow and to reap, in order that the crops of grain might not be wasted and the people revolt afterwards for want of food. These movements have further demonstrated the necessity of educating that large class of the population so that it may not be too easily misled by selfish leaders and demagogues; hence the society bearing the title "Society for organizing schools for adults and for small industries in the country." This society was organized in Milan in 1893, but did not become a body with corporate powers till 1899.

Of this society Angelo Crespi, the doctor of laws, says:

This society is one of those institutions which express the modern idea of beneficent social activity independent of the too cumbersome and slow government machine, and though it is still in its embryo state and has but limited resources, still it may be compared with another most worthy institution, the Dante Alighieri. While the latter has for its object the welfare of Italians in foreign parts, the intellectual and moral support of those, young or old, whom want has driven to other countries, the former tends to bring together residents of the same locality and prepare them for that modern life that demands greater strength in the "struggle for existence," and so put an end to that state of things which makes many parts of Italy appear like wastes of ignorance and brutishness, suffering unheeded agonies as by a divine curse.

"No one before," says the secretary of the society, "had thought of taking the youth just at the moment in which he begins to realize himself, at the moment when he begins to appreciate the utility of anything and to recognize all the injury done to himself by remaining ignorant of that which his more careful school-fellows are acquiring, and even forgetting the little he has learned." Taken at that moment the youth readily acquiesces in anything suggested for his improvement, even that which he had before considered as irksome. Offering him the means of instructing himself just at the moment when he most thirsts for knowledge, you gain, with little expense and trouble, an advantage in his favor that you never thought possible before. It is like casting an attractive bait at a fish which has hitherto escaped the net.

This society opened its first school in 1893, entirely supported by voluntary contributions, and its success became at once apparent. The object of the association

met with universal approval, and schools grew in number under its influence, in Milan and out of Milan, until 30 may now be counted in a flourishing condition, with an attendance of 1,600 pupils from 14 to 43 years of age, the largest portion of whom are from 14 to 18, the most propitious age for this moral life-saving effort.

The rules of these schools admit pupils from 12 years of age upward; they are divided in classes according to the degree of education they are found already to possess. There is also a preparatory course for those who have escaped from taking the compulsory three years' elementary course, and for those who are illiterate from other causes.

#### UNIVERSITY EXTENSION.

Following the example of Belgium, popular universities have been lately instituted in Italy. But it is yet too early to determine their degree of success or give an account of them. However, judging from personal observation, the instruction attempted does not seem as yet to fulfill the object of the movement; it is entirely on too high a plane for the class of people for whom it is intended. The free lectures, so far as the writer has heard, are above the comprehension of the audience, when it is considered that it is composed principally of mechanics, artisans, and laborers who never have had that preliminary training that leads to the comprehension and appreciation of lectures on high art, on the most subtle sciences, on the highest culture in belles-lettres, literature, philosophy, etc. The professors who were engaged to lecture seemed to have had their personal reputation for learning far more at heart than the interests of the people who went to hear them. That is a national failing of the learned in Italy, if it is not of the whole continent of Europe. Vanity may destroy the praiseworthy object of the association. Let us hope that they will soon see their error and correct it. The people need such popular instructors as Professor Tyndall, of England.

#### ACKNOWLEDGMENTS.

For documents and statistics the author is indebted to:  
 Comm. Piero Barbera, publisher, president of the Philological Club of Florence, active member of the "Dante Alighieri."  
 Professor Fumagalli, director of Brera Public Library, Milan.  
 Signor Bozzi Carlo, vice-president of the Milan Philological Club.  
 Signor Angelo Crespi, vice-secretary and counselor of the Milan Philological Club.  
 Comm. Luigi Bodio, senator of the kingdom, counselor of state, commissary-general of emigration, director of statistics, Rome.  
 Dr. Egisto Rossi, attached to the ministry of foreign affairs, commissary of emigration, Rome.  
 Prof. G. Marengli, University of Pavia.  
 Prof. Alexander Oldrini, doctor of philology, New York.  
 Dr. M. De Cristoforis, deputy of parliament, assessor of public schools, Milan.

## II.—THE BACCELLI BILL FOR THE REFORM OF SUPERIOR EDUCATION IN ITALY.

PRECEDED BY A BRIEF ACCOUNT OF THE ORIGIN AND DEVELOPMENT OF THE ITALIAN UNIVERSITIES.

By Prof. ALEXANDER OLDRINI.

CONTENTS—I. Early education in Rome.—II. The Middle Ages and higher education.—III. Debates on the reform of superior education.—IV. Text of the Baccelli bill.

### I. EARLY EDUCATION IN ROME.

The superior training that had reached its zenith in republican Rome in the teachings and writings of individual celebrities, was centralized in the first century of the Roman Empire in the rudimentary conception of the later "universitas studiorum," the forgotten traditions of which were developed during the

Middle Ages and in the modern high schools and universities of European countries. The statement that the universities were evolved directly through the intellectual efforts of medieval times, whether from Bologna or from Paris, would do violence to history and lead to a fallacious understanding of the sequence of human intellectual conquests. It would limit the field of investigation necessary even in a cursory survey of the history of Italian universities.<sup>a</sup> The gradual progress of Roman instruction to its highest position may be considered as including three distinct periods:

First. The private teaching of a primitive period in the early days of the city, which was restricted in a general way within the circle of the family (*"suus cuique parens pro magistro"*), while the plebeians scarcely frequented the *"ludi litterarum"* opened near the Forum. This was the period of the Saturnian verse, of the Etruscan fescennine verses, and of the burlesque *"fabulæ Atellanæ."*

Second. The period when instruction, amid the long struggles of the *"Urbs"* for political supremacy in Italy and over Europe, Asia, and Africa, becomes public, but still remains independent of the central power. This is the century of the splendor of Roman letters.

Third. That of state education under imperial Rome, when the cycle of higher studies, the curriculum, is complete in its classical structure, and such that, although modified or enlarged according to the genius, the character, and the aspirations of future nations, it will always remain the standard par excellence. This was the period of grammar, rhetoric, eloquence, philosophy, jurisprudence, medicine, and the natural and mathematical sciences.

This onward triumphal transformation of education, consistent and parallel with the historical evolution of the republican genius of Rome itself toward centralization of power in the Universal Empire (*"regere imperio populos"*), well deserves a concise analysis.

The school, as has been well said, reflects the image of the community which creates it. Roman instruction in the early centuries of the *"Urbs"* was exclusive, as would be logical in a stern aggressive community, unwilling to form alliances, *"imperium cupientibus nihil medium inter summa et præcipitia."* The state being all, no limit could be admitted to the parental authority, since it was understood in early Rome that only by obeying their father's will young Quirites might learn how to obey the state; and no doubt such authority in instruction must have proved absolute with the scions of patrician families.

While there is no written history, except in the form of annals, to prove definitely in what instruction consisted, many historians express the opinion that higher education was imparted from the close of the fifth century, in patrician families, in accordance with their means and position in the state. The instruction bore upon the science of war, of law, and of eloquence, the sons following their fathers in the battlefields, in the forum, and in the senate, there to acquire that practical training that could alone account for the progress of the early Romans in political culture. This progress permitted the gradual accession of persons issued from the people to the ranks of the nobility, to the direction of public affairs. Later on, when the necessity was felt of a still wider range in higher education, the senate, according to Cicero, used to order a number of young patricians to be sent every year to Etruria, there to study the science of religion, which was characteristically considered by the Romans as bearing on human as well as transcendental problems.

Religion, according to the Romans, was the science that assured that moral and intellectual power which opened the way to the highest offices in the state, and gave to the Pontifex his great authority in Roman society in regard to the inter-

<sup>a</sup>P. Rossi: *Istruzione pubblica antica Roma* (Siena University, 1891).

pretation of laws, of formulas, of civil procedure, of measures, of numbers, and in regard to the annual relation of public events.

After the ending of the third Punic war with the destruction of Carthage (146 B. C.) by Scipio, and after the destruction of Corinth by Mummius, new elements, such as Greek influences and customs, brought about a change in the destinies of Rome. The sixth century of the city is the period of the national unification of Italy, and of the replacing of the concept of the "Urbs" by the broader one of the Italian nation with Rome for its capital, ruling over partly conquered Europe, Asia, and Africa. Such an event prepared for the complete transformation of Roman society, altered the ancient rigidity of customs and family ties, and consequently the educational and political institutions.

The necessity was then felt of establishing permanent rules for the Latin language, "*lingua urbana*," now spreading to distant lands, to be used by other peoples, so that there was a great impulse toward the opening of schools of grammar, rhetoric, and philosophy; this was a step toward the passage and transformation from the first period, that of private and home tuition, to that of a public system. This was not done, however, without opposition from the old patrician element, represented by Cato, who might be considered as the highest moral incarnation of the old circumscribed Roman ideas as well as of Roman austerity, virtue, and national pride. He went so far in his bitterness toward the new ideas as to ask the senate to send back to Greece such scholars and thinkers as Carneades the academic, Diogenes the stoic, and Critolaus the peripatetic, on account of the philosophical influence their lessons exercised on the young Roman generation. All this was of no avail, however, as each rich family vied with the other to secure, by the payment of large salaries, the most learned Greeks, whether slaves or free, to teach their sons Hellenic philosophy, sciences, fine arts, and manners. Thus there came about the establishment in Rome of that universal and almost encyclopedic character of studies, which answered theoretically to the ideals of Greece, but was to remain a characteristic prerogative of the most eminent citizens of the Roman Republic.

The fall of Corinth was the sign for legions of vanquished Greeks to invade the country of the victor—philosophers, scientists, rhetoricians, artists. "*Grecia capta ferum victorem cepit et artes intulit agresti Latio*" (Horace). Both the aristocracy and the new popular party took up the new studies in earnest and followed their teachings. Interest, fashion, and pleasure on one side, the acquired wealth and the new enlarged political empire on the other, fostered their rapid development.

The "*schola*" on the Hellenic plan then first appeared in Rome, and a number of high schools were opened in a short time; but they were not considered sufficient, either in number or grade, so that students who wanted to rise to the standard of the new ideas and to be in accord with the international development of the republic, began to go abroad to complete their higher education. They went to Athens for literature and philosophy; to Rhodes, Mitylene, and Apollonia for rhetoric; to Alexandria for the highest scientific training. It is the century of Sylla and Augustus (78 B. C. to 14 A. D.), the second period of free Roman letters and of the perfection of the Latin language; the beginning of the era when the Roman genius developed all the power of its national originality, graced by the Greek influence; when numbers of renowned authors showed that vast erudition which constituted one of the characteristic qualities of Roman superior education. It is the period when higher education assumed regular divisions, and conquered its highest standing in Rome, its effects extending from Rome to the uttermost borders of the empire, to the most distant peoples, to apprise them of her powerful and intellectual civilization.

Higher education, acquired during that period, was in fact such a power in Rome that the destinies of the state appeared to depend upon it more than upon the force of arms and political authority, so that the state gradually assumed the rôle of a protector of education at first, then that of a regulator of it, with the result that, from an independent public status, the whole system became official and was subservient to political power, thus losing the incomparable benefit of that free expansion that self-supporting institutions and unfettered liberty of teaching and learning can assure to a progressive nation.

The personal influence of the emperors since Augustus, then representing the State in its highest capacity, was felt so deeply in the educational field that the most independent and keenest poet of imperial Rome wrote: "*Et spes et ratio studiorum in Cæsare tantum*" (Juvenal). They subsidized the professors of Rome, whether Greek or Latin; they provided for the instruction of the poorer classes, protecting and honoring equally both teachers and students.

Hadrian, a great scholar himself, is reported to have made the first step in the direction of encroaching on the freedom of public teaching by removing from their chairs those professors whom he had honored and enriched when he thought they had fallen from their high standing. He went further in the direction of imperial intervention by erecting a superb building for the debates and lectures of rhetoricians and poets, of professors and pupils alike, at the expense of the State. Hence the first Atheneum of Rome.

His successors extended their activities in the field of public education successively from the chairs at Rome to the high schools throughout the Empire by establishing chairs of rhetoric and philosophy "*per omnes provincias*," as decreed by Antoninus Pius. Marcus Aurelius raised the schools of Athens, then the most renowned, to the rank of true superior institutions, for the teaching of all philosophical doctrines of the period, the stoical, the epicurean, the platonic, and the peripatetic, while Alexander Severus provided by decree for the opening of special schools for the teaching of other sciences besides grammar and rhetoric, such as mechanics, architecture, medicine, and mathematics, and took a characteristic step in the direction of State authority over public education for the first time by granting, at the expense of the treasury of the State, sums of money to meritorious poor pupils that they might complete their higher studies.

All these still semiofficial high schools throughout the Empire, opened in even the most distant important centers of civilization, were not uniformly governed, nor with the same liberality as that of Autun, for instance, where Eumenes, the director, received no less than 600,000 sesterces a year salary, half of which sum was contributed by the State.

It was the Emperor Gratian who took up this subject of salaries in his reform "*de medicis et professoribus*," and Diocletian followed in his steps by fixing the amount of the monthly fees that each student was expected to present to his professors. The minimum was of 50 denarii<sup>a</sup> for the "*magister litterarum*" and the pedagogues; the maximum 200 for the grammarian and geometrician and 250 for the rhetorician and the sophist. To the salaries of the professors were to be added special privileges and liberal immunities from different taxes and obligations which were common to all classes of citizens; these were regulated in accordance with the importance of the town where the professor resided.

The professors of law alone were excluded from all such benefits, at least until the advent of Justinian, on the plea "that the science of law stood so high in its moral character that it would prove a degradation to put it under a money standard."

<sup>a</sup> The denarius was a Roman silver coin equal to \$0.157.

The onward march toward the final type of the State university was greatly accelerated by the constitution of Julian, which on the one side regularly devolved the appointment to the different chairs, and the removal of unworthy professors, upon the college of centurions, subject to the approval of the Emperor himself; while on the other side it subjected the students to special strict by-laws and regulations bearing on their duties and obligations toward the school, as well as toward the city where they studied, and toward the State.

The limit of the discipline and centralization of higher education was finally reached by the State in the year 425 of our era, when Theodosius I and Valentinian III thought of uniting all the special schools of learning, until then independent of each other, in one single body and under one roof, The Institute, or "*Universitas Magistrorum et Scholarium*." This institute was opened in Rome at the capitol and provided with State professors appointed for the culture of the liberal sciences, embracing the following faculties, letters, rhetoric, philosophy, and law, thus giving birth to the first and most ancient type known to history of the "*universitas studiorum*."

## II. THE MIDDLE AGES AND HIGHER EDUCATION.

In the great contest between the overwhelming materiality of paganism and the ardent spiritual tendency of the new Christianity, while the northern invaders were dismembering the Empire, the official system of Roman higher education was lost sight of. The exodus of the imperial authority from Rome to "*Nova Roma*," Byzantium (A. D. 330), hastened the final disorganization of the Roman world, and troubled days awaited Italy. However, amid the ruins of what had been the Roman educational system, toward the sixth century and the beginning of the seventh, in many parts of Italy the traditions and cult of Roman law and jurisprudence and of the liberal arts were still kept in great honor; this not as an exception among privileged classes, "*but among all classes of citizens independently of the church at that period.*" It is stated that in the schools of Italy throughout the Middle Ages education was of a lay character. This was a unique example at a period when elsewhere in Europe theology absorbed most exclusively the attention of the scholar, who, as a rule, belonged to the clergy, while the laical elements of society, bent on conquest and other material pursuits, even if of noble descent or in a station of wealth and power, disdained the benefit of the very first elements of literary culture.<sup>a</sup>

Most fortunately for the renaissance of letters, arts, and sciences between the sixth and twelfth centuries, the Italian cities, as heirs and trustees of Roman civilization, preserved their Roman municipal arrangements and laws, making them acceptable to their semicivilized conquerors, notwithstanding foreign invasions and the continuous upturning of governments and change of rulers. Roman jurisprudence, together with grammar and rhetoric, continued to be cultivated under the Goths also in Rome and during the Byzantine domination in Ravenna. It seems a logical historical conclusion, therefore, that to such a classical superior training thus kept alive Italy owed her escape from total disappearance as a nation after the fall of the Western Empire, while that same training led to her intellectual and national resurrection later on, when better times and more settled conditions existed. Between the eleventh and twelfth centuries, or as soon as the dark ages came to an end and permitted a more civilized social intercourse among European nations, and when a new and powerful spirit of life, enhanced by the commercial activity of the free cities of Milan, Florence, Genoa, Pisa, Amalfi,

<sup>a</sup> William Giesebrecht, of Munich, was the first to point out the fact that literary education had a laical character in Italy at all times.

and Venice, had passed over the unfortunate peninsula, higher education was again revived in Italy. In the thirteenth century the intellect of the whole Latin race became embodied, as a beacon light to humanity, in the grand personality of Dante Alighieri, the universal scholar, "l'altissimo poeta."

Special schools, favored by the cities with all sorts of privileges, and admitting no administrative interference, reappeared where celebrated free scholars taught to free students their doctrine on Roman jurisprudence. The "Glossa," followed by the revival of letters, arts, and other sciences, gradually brought the schools to a standard which crystallized in the superior types of the Medical School of Salerno and of the universities of Bologna, Padua, Pavia, etc.; so that, in the opinion of historians and thinkers of all nations, the glories of the Renaissance in the fifteenth and sixteenth centuries are due to their influence. The Latin genius once more irradiated the path of humanity, and it was represented by such men as Toscanelli, Columbus, and the navigators; Galileo and the scientists: Michael Angelo, Raphael, and the artists; Petrarch and the poets.

The most celebrated mediæval university of Italy, that of Bologna, offered such a characteristic curriculum, from its first appearance as an independent center of higher instruction, that not only the Italian universities of the Middle Ages followed its lead, but its scientific and eclectic influence was also felt throughout learned Europe, and more, perhaps, than the universities of Paris, Montpellier, and Oxford (Berio). The free "Studio" of Bologna, which owed its first renown to the science and commentaries of Irnerius on the Exegesis of Law, was so rapidly brought by the pupils of this unique master (among whom were Bulgarus, Martinus, Jacopus, and Hugues) to such a degree of importance that in the twelfth century, according to the authority of Odofredus, it could boast of 10,000 students. At the request of the university, as early as the date of Roncaglia, Frederic I granted to all foreign pupils coming to Bologna the privilege and protection of the Autentica of "Habita" (1158), putting that body under a special jurisdiction, under which none could disturb them. This was the foundation of that special corporation which developed into the University of Bologna and led to the institution of the rectorate. The Autentica, as far as history can ascertain, is the first official document since the fall of Rome which, by its provisions regarding the "Universitas Scholarium," marks the return of the interposition of the State in matters of education.

In the University of Paris, where theology absorbed their attention, the professors denied to the pupils the right of participating in the government of the university. Bologna, being preeminently a university of law, letters, and arts, and later of medicine, was more faithful to the old Italian tradition of freedom of teaching and of learning. It granted from the earliest period the administration, and a large share of the legal jurisdiction, of the university to corporations made up of the students. The Government and the municipal authorities also granted numerous privileges to the students.

Next in order after that of Bologna, the University of Padua is the one that contributed the most to the increase of free higher culture in the last centuries of the Middle Ages; then followed the "Universitas Scholarium" of Pavia, and those of Siena, Pisa, Ferrara, Perugia, and Urbino. Unlike the alma mater Bologna, however, the University of Padua, and in general all the Italian universities, did not originate through an imperial charter or other government authority, nor did they develop under the French form of "universitas magistrorum," but were the outcome of free private schools which flourished in Italian cities during the eleventh and twelfth centuries, and of the accession of free pupils coming home from the Bologna University (Savigny).

One exception to the Italian tradition of freedom of teaching, of learning, and

of jurisdiction existed. This exception, the University of Naples, was due to the personal initiative of Frederic II, who, in his love for science, established a great "studio" for general and higher culture in the first part of the thirteenth century (1224). His purposes were both liberal and generous, since he had the most celebrated professors appointed, and the students were also granted many privileges, but he never allowed them to form a corporation; he denied them the right of election, the granting of degrees, and that autonomy and that freedom of curriculum which were enjoyed by all other Italian universities. As a result the University of Naples, notwithstanding the protection and the genius of its founder, notwithstanding the culture of its professors and the bright intelligence of the southern Italian population, never rose to the splendor and the influence of the other Italian universities, to which are due the marvels of the Renaissance and the habit of free criticism and free thought in the fields of philosophy, philology, and history.

The progress of the Italian universities, developed in the freedom of the mediæval republican municipalities, naturally met with the fate of higher education in imperial Rome; that is, it came to an end through the interference of the state when the Italian cities came under the rule of national and foreign princes. The theory of G. B. Vico, the creator of the philosophy of history, on the recurrence of the same human events under the same circumstances, was thus practically illustrated.

Under the conceptions of the functions of the State which prevailed between the fifteenth and sixteenth centuries the university ceased to be considered as a free and independent corporation, and the students ceased to enjoy exceptional conditions with regard to the body politic. By arrogating to themselves the protection at first, then the government of the university, the mediæval princes of the different Italian States, following in the steps of the Roman emperors, jeopardized by an undue interference the superior rights of science and learning, so that both professors and students became victims of tyrannical methods.

The process by which the Italian universities fell under the rule of the different princely Mæcenases <sup>a</sup> may thus be summed up: As centers of national culture they are seen to gradually lose their autonomy and individuality by being incorporated with other institutions depending upon the political power. The freedom of teaching, which could not be immediately abolished, was restricted within given limits. Not content with interfering in regard to the by-laws and regulations of the universities of their several principalities, the rulers went further and limited the number of such institutions. In each case the city where the prince and his government were established soon became the only object of favor as a center of scientific activity. These institutions were put under special supervision, however, so that higher instruction should become an ally of the state and be subordinated to the prince at all times.

Since then, and until recently, all power of initiative having been taken away, the universities existed in Italy only as official institutions. They were therefore unable to exert that powerful and popular influence on the nation's welfare which English and German universities exercise as centers of national free culture and education.

This was the condition of superior instruction and of the universities forty years ago in Italy, so that the institutions which had survived so many vicissitudes had become practically without life or usefulness at the commencement of the new régime in Italy.

## III. DEBATES ON THE REFORM OF SUPERIOR EDUCATION.

The smoke of the battlefield of Solferino (June 1859) had hardly disappeared from the blue firmament of Lombardy when the question of popular education began to engage the attention of those who were striving for a free and united Italy. Owing to the condition of the masses, the result of centuries of denationalization and servitude of body and mind, no problem appeared more worthy of immediate study. A general law was voted at once (November 1859), the Casati law, which, although open to amendment, constituted what was justly termed "The educational code of modern Italy."

Soon afterwards (1862) the debates were opened, before the Chamber of Deputies and the Senate, on superior and higher education. They cover a long period of about thirty-five years. Between the Casati law and the latest bill of Minister Baccelli (1898) there is a long list of parliamentary reports on various bills, prepared by most competent commissions and scholars, which give a summary of these debates regarding the historical character and the status of university and higher education. The object of these bills is to infuse new life into the academic institutions by means of modern pedagogical methods; to raise them to the point of leading the freed nation in the path of progress, abreast with modern nations.

The learned debaters appear to have been remarkably unanimous as to views and purposes, although coming from different sections and schools. They showed that intellectual power can enable a minority of men to lead a nation to higher educational destinies, and raise human thoughts to the conception of those laws that gradually solve social problems as well as nature's mysteries.

However, the question as to the most appropriate methods and means for Italy to reach that end found the debaters, whether in Parliament or outside in public press discussion and polemics, divided among themselves into two main groups, one bent on freeing the universities of the country from state control so far as securing for them absolute didactic, disciplinary, and financial autonomy; the other affirmed the necessity of keeping them under governmental control, temporarily at least. The one urged the reduction of their number (21) as in excess of the present needs, the other upheld the historical rights and usefulness of each in the center where located.

There was also lack of harmony in regard to the curriculum, viz: Whether it was advisable to stand by the ancient Italian classical standard, or readjust it fundamentally on the pattern of modern foreign universities, the object being to secure a real and social evolution in Italy through specialization of studies.

The by-laws, attendance, classical books, the progress toward efficient professorship, the college "laurea" and diplomas, were henceforth to be subservient to the state examinations with regard to the real efficiency and qualifications of students who will be called upon to exert high and sometimes unrestricted authority in the practice of their legal or scientific profession. There were many other secondary problems connected with superior education which constituted the platform of the reform movements under discussion.

Since the opening of the debate on superior education Dr. Guido Baccelli, the eminent scientist and statesman, has been conspicuous in the Italian Parliament as a standard bearer of reform. As the Baccelli bill and the three reports of Cremona, Berio, and Fusinato seem to bear upon all features of the debated subject, a résumé of these is here given.

Superior education, as Dr. Baccelli<sup>a</sup> eloquently affirmed, is a weapon of precision in the competition among nations; its machinery must unceasingly undergo modifications and improvements. Liberty is its true basis—that is, freedom of

<sup>a</sup>Dr. Baccelli was minister of public instruction in 1898.

teaching and of studying, which was the foremost cause of the greatness of the ancient Italian universities. "I mean [said Dr. Baccelli] to secure for modern higher education in Italy liberty and academic autonomy considered in its three-fold aspect—the didactic, the financial, and the disciplinary."

Science in Italy, which originates almost entirely in the universities, has showed signs of a steady progress within the last few decades notwithstanding the strained financial conditions of Italy; it has indeed become a redeeming national directive force, from the fact that there has been an admirable work, not only of assimilation of the scientific patrimony of other nations which were once tributary to Italian genius, but also of contribution to the development and progress of science at large. This is observable, namely, with regard to jurisprudence and the application of its highest principles, with the result that Italy, applying the humane teaching of Cesare Beccaria, the eminent author of the treatise "*Dei delitti delle pene*," has alone, among the great nations of the world, abolished capital punishment. The same is also witnessed in the new realm of electricity and in the biological sciences, where the most successful initiative has been taken. Progress in that direction has not, however, brought forth as a logical consequence the reform of higher Italian education so that it will compare favorably with the standard of other nations.

The student does not seem to benefit by the high standard of superior instruction as it is now imparted by celebrated scientific men in most of the Italian universities; not that the Italian youth of to-day feels less like cultivating special and higher studies, but that there are material difficulties which stand in the way of greater results. This is in part because the present Italian scholastic curriculum and by-laws do not foster the earnest activity of professors and students alike, but they even prevent it by their excessive and narrow uniformity. There is, above all, lack of liberty in the choice of subjects of study. Thus handicapped at the start, the student aims more to conquer the obstacle of obligatory examinations, which lead to a profession, rather than to seek the loftier ideal of high culture for its own sake; the professor, on the other hand, moves in a stagnant official atmosphere, which is destructive of the strongest energies. Hence the necessity of a law whose object shall be to rehabilitate the university, to permanently base it on those fundamental principles of free research which will tend toward the development of the special higher aptitudes of youth.

Speaking of the much debated point that in Italy superior education needs more centralization, that twenty-one universities represent a number far in excess of the present potentiality of the new nation, inasmuch as some of the minor ones seem hardly worthy of the sacrifices made annually to keep them alive, Dr. Baccelli expressed himself as against the suppression of the latter. The very uncertainty of late in regard to their suppression or transformation is given by him as a cause of their shortcomings in the exercise of their didactic capacity, and of the check to the enhancement of their scientific importance. Voicing the opinion of many a learned scholar, moreover, he calls to mind that old Italian institutes of superior culture, including some under discussion, have educated for centuries superior minds and most able exponents in the realm of science, thus offering to history the proof of having been worthy centers of intellectual life, of general culture, and of patriotism, when intellectual and national life in Italy seemed otherwise extinct. Thus to destroy one of these sanctuaries of scientific and philosophical activity for the sake of economy would simply prove sacrilegious. The wisest solution offered is to let each university find, in free competition with others, that energy which may secure for it an honorable future in the service of the community and of science; nay, to raise it from its present state to higher ideals. If, after such an attempt, it should be proved that the universities

can not be brought to a new vitality, owing to their location in cities where an active public life is no longer found; if also the individuality of their ancient peculiar political history is no longer observable, then only should the patrimony of bygone institutions be applied to new university corporations; then might this patrimony be used for educational necessities in the centers where the ancient universities exercised a secular authority. Thus one would apply to them the scientific theory of the spontaneous metamorphosis of beings destitute of vitality, in conjunction with the wise law of securing from their elements the nutrition of new bodies.

It is obvious that the above abnormal condition of superior education in Italy has been conducive to a certain distrust since the opening of the debate, so that the authority of the universities has been diminished and their importance in the eyes of the public modified; for the people were not cognizant of the many reasons which caused these very debates on the reform of superior education to appear to the legislators as a guaranty of higher destinies for the newly reconstituted nation. It is certain also that such a state of distrust and such a lack of discipline in the Italian universities has affected the intellectual life of the students. This has led of late to periodical disturbances and actual strikes, in several instances causing the clôtüre of several universities through state intervention. To obviate such conditions Dr. Baccelli suggests, as an outcome of his long experience, that the remedy called for immediately, and the only effective one, is freedom, and he has formulated his bill upon such a fundamental conception. "I ask the Parliament [said he] to vote without hesitation for the complete academic freedom of our universities under the enlightened supervision of the state. Freedom of teaching and of learning, which vanished with the departed greatness of Italy, must again become the 'jus' of our universities." The freedom of academic autonomy should be considered under three different but coordinated aspects, chiefly the didactic, then the administrative, and finally the disciplinary; under the didactic, with the aim of insuring full scope to the academic body, in determining the limits and the object of each faculty, in introducing new courses in existing institutions, and the opening of new ones whenever such an initiative seems to be warranted by the constant development of science and the new conditions created by science among men. Among these might be included a superior faculty of philosophy to link together the exact and the speculative sciences; higher polytechnic faculties, and a superior faculty of agriculture, the conception of which matures every day in the minds of the masses. Dr. Baccelli says that the chief duty of the faculty should consist in organizing its own curriculum, harmonizing the different university regulations, and planning to meet the continuous calls of pure science and the new requirements of higher professional culture. In order to enable the universities, considered as a unit, to gradually adapt themselves to the rapid evolution of science, it should be the right and the constant duty of the faculty to insist upon a careful selection of professors who are in touch with progressive movements, each institution adopting such rigid rules that it may secure the appointment of the most meritorious professors without being affected by local favoritism and outside influences. The authority thus granted to the universities toward appointing professors to the different chairs should not only constitute a safeguard and a spur to emulation among ordinary and extraordinary professors and applicants for positions, but also bring about a rivalry between institutions of the same class in vying with each other for a good name. Only by such a free and unbiased system of selection, and the freedom reserved to students to seek the institutions where professors are held in special consideration on account of their scientific knowledge, will the importance and the influence of the universities be raised to the desired standard.

However, not to radically change the present methods and regulations for the appointment of regular professors, a period of five years is provided in the bill, with a view to giving the faculty ample time to devise the best plans to be adopted for the appointment of ordinary and extraordinary professors, the appointment to be based on their scientific merits. After that period the faculty should be granted, in every instance, the permanent privilege of nominating to the State the candidate for a vacant chair. As regards the professors who, on account of their scientific attainments and didactic aptitude, would thus be appointed to a chair by their colleagues, if sanctioned by the State, they ought to be entitled to the privilege of giving to their lessons the scientific trend which they may deem best; they ought, moreover, to be left absolutely free to expound, upon their own responsibility, those teachings which they consider as the most apt to foster scientific culture.

Among the arguments brought against the present official system of government selection of ordinary professors, two are specially insisted upon, to wit, the influences foreign to science, which come through political channels under ever-changing administrations, and the fact that ordinary professors, realizing that they have a life tenure under the law of the State, are no longer spurred on to compete for reputation and celebrity, and lose their zeal for knowledge; thus their methods of instruction follow a certain routine which is limited to their early knowledge, and they become indifferent to or unaware of the rapid advance of science. The independent professor, asserts Dr. Baccelli, who is known as an accurate and active contributor to the progress of science, and who, working from known problems and truths to the unknown, has made new discoveries and devised practical applications thereof, is the right man. Surely, a man of this type would not allow himself to be bound by official adherence to a given obligatory curriculum; he would court specialization. Trained scientifically, and teaching to youth, in his turn, the conquests and the ideals of science from original sources, he should be free from the narrow control of bureaucratic authorities and left an arbiter of his high ideals. Criticism may annoy him from time to time, but his career will be marked by success. Soon a group of followers would form around the highly trained teacher with a view to coordinate his ideas, to affirm new principles for the immediate benefit of students, who, ennobled by such an example of intellectual freedom and efficiency, would take delight in their chosen studies, and their minds would be lifted to the loftiest comprehension of their duties to science and society.

Having thus stated his views on the basis of the reform of higher education in Italy, Dr. Baccelli explained the new provisions of law for the practical carrying out of the reform.

The examination for the "degree of maturity," after a stated period of instruction, indicates, to the university authorities, the benefit which the student has received from his general scientific training, and the depth of his theoretical knowledge in the fundamental sciences of his course. This examination in the sciences which constitute the basis of the initial instruction of the student, is to be intended as a substitute for all special examinations. It is a decisive trial of his capacity, and imposes upon him the obligation of a general and continuous study of the most important parts of the curriculum, in order to give him a solid theoretical preparation for the practical part of his professional course. Then, at the end of the entire course, the student, conscious of having mastered a vast department of knowledge, requests the university authorities to judge of his scientific preparation for the exercise of his chosen profession, so that he may obtain the title of "doctor." The faculty should reserve the full right of establishing special conditions for obtaining the academic "laurea," which leads to

professorship and opens the way to the highest offices of the State. But since, owing to the phenomenal development in the applications of science in general and the growing requirements of society, the exercise of the different professions acquires every day a greater authority, the State should assume the supreme control of them as a means of public protection. In the same way and on the same principle that the State—the highest authority—is called by common consent to insure protection to life and property in general, it should investigate and judge if the student on whom the university has bestowed its honorable degree of doctor is really prepared to safely exercise among the people the profession to which he holds a title. In other words, while the university, in view especially of his scientific acquirements, grants him the “degree of maturity,” the State alone, on the ground of professional efficiency, should confer the diploma admitting the student to the exercise of his profession, i. e., the “State degree.”

In the exposition of his views on the necessity of a State degree, Dr. Baccelli stated that, among other benefits to be derived from that measure, if adopted, the State examination would be a guarantee against laxity in the examinations for the “degree of maturity,” thereby protecting society, as far as possible, by assuring the real professional efficiency of the one who obtains a degree; while in the competition between the different universities and institutes for fame and scholarship, it would give proof to the nation of the relative thoroughness of the instruction in the different institutions.

Then, passing to the main point regarding the composition of the supreme jury to be called to judge of scholars, already recognized by a university as having gained, through the doctor's degree, the highest right to the exercise of a science or professorship, the learned academician argues that the best-known practitioners and recognized specialists should be appointed. University professors should not be excluded, however, from this jury, as it would be unjust to exclude them from the final judgment to be rendered in regard to what they had taught, and such a course would eventually deprive them of the opportunity of forming rules for their future guidance. The professors of the university attended by the student should nevertheless be excluded, and others appointed, to whom the student is not known, so that there may be no personal prejudices which might mar their judgment.

As for the courses of study leading to the state degree, there ought to be periodical revision, based upon the changeable conditions and exigencies of society, a principal object being to place restrictions upon the accessibility to the professions. The examination for a state degree would thus constitute a very efficacious means of control as regards the increase and progress of the sciences and knowledge that naturally tend to raise the level of professional culture.

In the Baccelli bill, the question of administrative autonomy naturally follows that of didactic autonomy. The university should be granted the privilege of applying to higher education the endowments or subsidies allowed. The juridical personality of the university ought to be acknowledged by law, and every university ought to be entitled to the full control of its own ancient patrimony, as well as to receive all donations, to be applied to the progress of science, without which the right of legal ownership itself would prove vain. The professors of a university themselves are to be considered as the most competent to judge of the needs of the institution as regards the requirements of the sciences; it being reasonably assumed that they, more than anyone, would be actually and logically interested in the right and useful distribution of such resources.

On the subject of finance, however, the cooperation of the municipal and provincial authorities where the university is located would be permissible whenever one or both chose to contribute to the fund of higher education. Such an addi-

tion to the board of directors from outside of the university would be of particular advantage in two respects: It would divert public attention to the institution and to higher education, and thus attract additional means toward its maintenance and development; moreover, while under the sole direction of the academic body, perchance misinformed or distracted by various influences, one faculty or one professor might be more favored than another, the intervention of local trustees, interested only in the public welfare, would offer a considerable guarantee of equitable treatment.

The necessity of, and general principles governing, a didactic and financial autonomy having been thus affirmed, the university is called upon by the new bill to frame regulations for the direction of professors and students alike. In a general way the maintenance of order in the university should be intrusted chiefly to the students themselves, who are assumed to have acquired a sense of their individual responsibility, discarding as obsolete the by-laws still uniformly applied to all the Italian universities, and replacing them by a disciplinary reform of a more modern type, under which the common interests of the students of a university would be put in their own hands, thus compelling them to eventually give to the unruly elements the "*consilium abeundi*." The student corps would then have the responsibility that free men always have when freedom is the basis of their action. The youth would feel it more than the elders, because youth is actuated less by the spur of personal interest and more by the principle of right and the ideal of justice not yet obscured in the battle of life.

As a guarantee of the result expected from this reform, based on the principle of self-discipline, the bill provides for national control, the appointment of a Government representative, to reside within the walls of each university, but dependent upon the minister of public education. His duty would be twofold, to wit, to keep the department posted in regard to the disciplinary conditions of the institution, and to assure the Government that all national subsidies, annually granted by the law to each university, are applied in accordance with the objects for which allowed. The State representative should act as a friendly adviser with regard to the students. He should keep the rector informed and aid him to avoid any friction with them, thus leaving the rector free to carry on his high mission. Through this representative, the minister of public education should, in his turn, be kept informed of the discipline of the university, and, in those cases where the character and the future of the university might, on account of illegal application of public moneys, be in question, he should uphold the supreme right vested with the nation.

These limitations in the interference of the State, until now sole supreme regulator responsible for the discipline and order of the university, find their logical explanation in the principle of freedom pervading the new bill.

In regard to the question touching the contribution of the State to universities and the increase of fees to be paid by students—now 33 per cent and in some cases 50 per cent lower than the fees paid by university students of other European nations—the new bill is based on the following views adopted by the majority of Italian scholars interested in the reform of the national universities: As, owing to the traditions of the universities and the political and financial organization of the country, the State is still called upon to support superior education in a measure, and owing to the fact that only a limited number of students benefit from it, if their number be compared to the total mass of the population, a larger contribution should be secured from those who aspire to secure university degrees. Such an increase would tend also to reduce "the call to professions within the needs of the nation," it having been statistically proved that the numerical proportional attendance in Italian universities is in excess of that of similar foreign institutions,

the universities of Germany, for instance. It is also an ascertained fact that, within the last twenty-five years, the rate of increase of the Italian university graduation has proved to have been seven times as large as that of the population of Italy within the same period. The students now attending the 21 Italian universities are about 23,000 in number, with a yearly increase of over 1,000, and there are 15,000 students in the special superior schools or institutes. During the debate before the Parliament, statistics were produced showing that every year in Italy 1,200 students received from the universities the doctor's degree, admitting them to practice in their chosen professions, "in excess of the number that would correspond to the actual need of the nation"—an abnormal result if considered in comparison with the rational balance of education in its three grades, the primary, the secondary, and the academic or special, to the apparent advantage of the latter; this is an undesirable state of affairs, according to the views of the majority of the debaters, inasmuch as it diverted the Italian youth from applying their energy and spirit of initiative to other aims than to the "liberal professions," such as scientific farming, manufacturing, mechanics, electricity, navigation, national and international commerce, and all those safe channels of personal welfare, "necessary for a nation passing through the difficult period of economic reorganization." Hence the duty of the State to secure as far as possible a sound and useful distribution of academic and higher culture by a timely checking of the entrance to the universities of "unfit elements" that would lower their high standard—a restriction that would, in the meantime, deter coming generations from seeking an academic degree because it assures an easy entrance into different positions.

Summing up the debate on the reform, Dr. Baccelli expressed the belief of the majority that, under the provisions of his bill, intended to free the Italian universities from the fetters that still prevent their responding to the modern requirements of science, the State would not loosen its legal and national control of them. Since, while Parliament would no more be called to fix the number and titles, or regulate the promotion of professors, or to establish an obligatory curriculum for students and prescribe uniform rules and by-laws, such rights to be henceforth vested in each university, all such matters would still be under control by being submitted to the superior council of public education for adoption.

That the battle for the reform of the university system in Italy is won, that its beneficial results are felt throughout the country, is to-day understood. For the practical application of the modern elective system of studies, characterized by a free curriculum and free teaching, has been taken up in earnest by the learned men of all the educational centers, with the result of establishing popular universities in many cities. While this educational movement, which tends toward the free extension of the State universities among the people, can not expect at first to have the benefits of the fruits of which a long academic training is the only possible basis, whether in the classical or in the scientific realm, yet in a country like Italy it will undoubtedly prove a useful agency for disseminating a general free high culture, and it will be a powerful initiative toward the solution of the problem of new methods and of progressive modern standards for the Italian universities, the very glorious historical Roman and medieval traditions of which correspond to the period of "freedom of teaching and of learning."

#### FAILURE OF THE BACCELLI BILL—THE NEW REGULATION OF MINISTER NASI.

Owing to conditions inhering in the political and parliamentary world of Italy and to the divergencies of view existing among Italian scholars with regard to the best and safest methods and measures to be adopted toward reforming superior and university instruction in Italy so as to keep them abreast of the progress of science, the Baccelli bill failed as a whole, like many previous organic projects of reform, to become a law. It failed because it was deemed to involve a too radical reform, for

which "the way should be prepared by gradual approaches;" however, the long and thorough discussion of the subject before the Parliament and in the public press of Italy has itself had a beneficial consequence—that of emphasizing the necessity of a reform, and of paving the way in the direction of freedom of superior teaching and learning in Italy.

The improvements already introduced by the present minister of public instruction of Italy, the Hon. N. Nasi, have been judged rather severely in the press, as having disturbed in many ways the established condition of things without bringing an adequate degree of progress. A summary survey of the views expressed by him on different occasions and in writing will convey to the reader sufficient information to enable him to form an opinion of his personal programme.

At a meeting of the professors of the University of Sicily (1902), where Dr. Baccelli (now minister of agriculture and commerce) introduced him, Minister Nasi said: "It is my aspiration to follow my predecessor's example in the way of reform, and to that end I tried to promote the introduction of all possible improvements that lay within the range of the action of the Government. \* \* \* I hold, however, that the problem to solve is a most difficult one." "*Multa renascentur quae iam cecidere; \* \* \** the old order of things returns amended and increased by all the good ones that are in the new"—thus taking, as it appears, a different, almost opposite, view to that of university reform *ab initio*, on the basis of the absolute autonomy of the university (the aim of Dr. Baccelli and his school). He makes from the start a bold stand for the authority *ante omnia* of the existing law (1859) governing public instruction in Italy, and is convinced that even at this date that law contains all the potentialities of a gradual reform, and that there is no necessity for a new constructive law.

In Italy, the views and the authority of the heads of the different departments may find their application in the promulgation of regulations and decrees approved by the chief of the state and the ministry. In the special case of the department of public instruction the text of a decree is previously submitted by the proposing minister to the consideration of the superior council of public instruction and to the council of state. Minister Nasi accordingly prepared and submitted the new rules and by-laws which form his "*Regolamento generale universitario*" (April 13, 1902). Considered in its general outline, it retains the previous juridical and administrative officials of the university, their number, their chairs, and their divisions into faculties, the changes bearing mostly on the rights and duties of both professors and students, and on the subjects forming the new curriculum. "I am convinced," says the minister, "that with a simple reform of the existing by-laws many important questions can be solved, whether didactic, administrative, or touching the discipline of the university. The dominion of the law must be reaffirmed in all its integrity, particularly of the law of November 13, 1859 (the Casati law), which may still be considered as the basis of our universalist '*jus*,' since all the exigencies of modern science may find in its liberal construction their satisfaction."

With regard to the government of the universities, the new "*regolamento*" aims to draw a clear line between the administrative and the didactic direction, the first being the province of the rector, nay, centered in his personal authority; the second being granted to the "*presidi*" of the different faculties, while the Government reserves the right to keep in touch with both by means of inspection. To the rector is intrusted full power to secure order within the university, and to protect its prestige; for he is vested with authority over "the professors themselves" whenever, "in or even out of the university," by act, speech, or writing, they shall discredit their lofty calling; the academic council being requested to take up the matter whenever his appeal to order, verbally or in writing, may be disregarded by a professor; "since the function of teaching implies a lofty mission, which finds its exercise not only within the university, but likewise in the decorum of public or private life."

As to the academic council, a consultative body, while the law provides that only

the chairmen or presidents of the faculties, and the directors of superior and special schools attached to the university, are called to membership in it, yet, owing to the increasing necessity of outside professors, and in justice to them, the regolamento prescribes that to the general assembly of professors shall henceforth be admitted not only the regular ones (*ordinarii*), but also all others attached, under whatever title, to the university (*straordinarii*). The latter are henceforth admitted to a regular promotion by means of "concours" (competition), and a special commission is appointed for that purpose; but their appointment is vested only in the minister of public instruction, who reserves also the right to see to it that in the addition of new elements to the faculty there shall be "no unjustifiable intrusions in the field of superior teaching;" and in order to avoid most of the difficulties, dissatisfaction, and recriminations that every concours seems to leave behind it, the regolamento returns to the enforcement of the exact text of the Casati law, with the addition of all those guaranties that can secure the object of the concours. The law prescribes that the committee of judges shall be appointed by the minister responsible in re from among persons eminent for their learning and their teaching experience; but, as a new feature, all the regular professors of the faculty are previously invited by him to designate in writing their choice and their motives for same.

The regolamento contains many provisions regarding the rights and the duties of both professors "*straordinarii*" and "*liberi docenti*" and their teaching, based on the principle of an absolute freedom of teaching: "I am decidedly favorable to the principle of academic freedom; \* \* \* but the professor of a university is under duty to freely teach the science he has studied, conceived, or advanced, provided he does so most seriously and with severity of method, while having a great respect for opposing opinions. \* \* \* In the field of science experimental sciences offer no motive to agitation; but in the case of the moral and philosophical sciences, \* \* \* if one tries to impose his own doctrine, the contrary one will command attention and assert its importance." (Speeches, 1901, Congress of the National Teachers' Association.) Such views found their application in the introduction to the regolamento, where he assumes that "no one imparting superior instruction shall be allowed to consider himself independent of all hierarchical ties and due consideration for the political as well as for the university authorities, outside even of the time and of the place where the professor exercises his functions." This limitation was probably occasioned by recent occurrences, such as the free utterances of some university professor in the field of governmental policy, or on social problems agitating the masses, or, maybe, an objectionable private life. It evolved much criticism, appearing to many as not in touch with the requirements of the times, and, *a priori*, severe and unjust toward the professors as a whole.

As to the changes introduced by Minister Nasi with regard to the students of the university, freedom is granted to them of arranging within certain limits their courses, whether obligatory or complementary; also the choice of the professor; but every year the courses must be indicated for which the inscription is requested. The by-laws of the faculty, however, must indicate the minimum of courses necessary for the year. In those faculties which include different grades, the examination for any one of them shall be granted only when the student has passed the examination of the preceding grade; this to prevent the grave inconvenience of tending to accumulate in the last year all the examinations, or the greater number of them. With regard to the application of disciplinary measures, the student is granted the right first to make his own defense. In the case, however, of disorders reaching beyond more than one class, and such as would disturb the regular order of a faculty or of all of them, the rector is vested with the power of closing the university, and, upon the advice of the academic council, he may keep it closed for eight days; to the minister is reserved the right to extend this disciplinary measure to thirty days, after which the annual examinations shall be considered as suppressed for that year.

## DR. BACCELLI'S BILL PROVIDING FOR THE AUTONOMY OF THE ROYAL UNIVERSITIES AND THE TWELVE SUPERIOR SCHOOLS AND INSTITUTES OF ITALY.

## ARTICLE I.

Legal corporate existence with didactical, disciplinary, and administrative autonomy are hereby granted to the royal universities and institutes of superior education under the supervision of the Government.

The Government shall exercise this supervision through officers of the department of public education, one for each institution. He shall report to the minister of public instruction.

The by-laws of each faculty shall be compulsory upon both professors and students.

On the motion of the minister of public instruction and the advice of the superior board of the department of public education and of the council of state, a royal decree shall determine the regulations of the aforesaid triple autonomy.

## ARTICLE II.

The apportionments of each institution shall be determined according to special regulations and shall be inserted in the budget of the department of education. Such apportionments, as well as any other income allowed by this law to each institution, shall be exempted from taxes.

Percentages on salaries on account of income tax and pension funds shall be retained by every institution and deposited in the treasury and be diverted to provide for pensions and increase of salaries occurring, as prescribed by law, every five or six years.

The real property of said institutions not used for any special purpose shall be sold or transferred within ten years from the promulgation of the present law and the amount obtained therefrom invested in Government bonds, unless applied to educational purposes.

Under the same conditions, all gifts and bequests made to any institution shall be converted into Government bonds, unless special dispositions are mentioned in the deed of gift or bequest.

## ARTICLE III.

New universities and schools of superior education, as well as new additions to existing institutions, shall be regulated by law.

## ARTICLE IV.

The executive committee of each institution shall be composed of the rector as president, the representative of the Government, and the elected representatives of the faculties and sections of the institution, according to rules determined in the by-laws.

Persons or corporations contributing to the resources of the institution, for at least as much as one-tenth of the Government allowance, shall be entitled to be represented on the executive committee.

The estimates and apportionments of each institution voted by the executive committee shall be submitted to the approval of the minister of public instruction.

## ARTICLE V.

The faculties of universities and the sections of schools of superior education are granted the right to propose to the minister all appointments of ordinary and extraordinary professors. The minister, on the advice of the superior council of his department, shall make or veto such appointments.

All the appointments shall be made by royal decree.

When competition is proposed, the same shall be regulated and supervised by the department of education.

## ARTICLE VI.

The universities and institutions of superior education so authorized, shall confer upon students the "laurea," or diploma, and the Government shall give the license permitting the exercise of the profession.

Students not graduated from a college shall not be admitted either to the examination for the "laurea" or for the license.

The subjects of examination for college graduates shall be determined by the special regulations of each institution.

The "laurea" is required for teachers desiring to be appointed to superior and secondary schools. Exception is made in cases defined by the law enacted November 13, 1859 (No. 3725).

Present examinations for lawyers, solicitors, and public notaries and the license are abolished by the present law.

The regulations, provided concurrently by the departments of education and of justice, shall determine the special conditions for admission to Government examinations for such students as have been graduated in law.

The board of State examiners, annually appointed by the minister of public instruction, shall be composed of professors other than those of the institution where examination is to take place and of persons eminent in their professions.

#### ARTICLE VII.

The courses held by private teachers, in order to have the same effect as those held by Government teachers, must follow the same programmes and be of the same duration.

Private teachers shall be entitled to sit on the board of examiners for college graduation with the same rights as the Government professors in all matters pertaining to their course.

Under the same conditions, private professors are to be preferred, when in competition for a university chair, to Government professors.

#### ARTICLE VIII.

All fees for superior education are divided as follows:

- (1) Fee for the annual registration.
- (2) Fee for the annual registration in special courses.
- (3) Fee for college graduation.
- (4) Fee for the examination for the "laurea," or diploma.
- (5) Fee for State examination.
- (6) Fee for admission to competitive examinations for ordinary and extraordinary professors.
- (7) Fee for private teaching.

Fees under 1, 5, 6, 7 shall be paid to the treasury.

Fees under 2 shall be divided among official teachers and the private professors for whose courses students have been registered.

One-fifth of the total amount shall be divided among those professors whose particular subject of teaching applies only to a restricted number of students.

Appropriations under 3 and 4 shall be granted to each institution for pedagogical purposes.

Deserving students, who prove their inability to pay university fees, shall be partially or wholly exempted from payment, or they may be permitted to obtain a delay.

For the purpose of obtaining such privilege, in the case of courses given by private teachers, the consent of the professor is required.

#### ARTICLE IX.

The faculties, sections of institutes, and schools of superior education that can not show, during two consecutive years, a total number of legally registered students, which, divided by the years of the courses, may correspond to at least eight students per year, shall be ruled out of existence.

The law of November 13, 1859, provides for the statutory regulations of the faculties, institutes, and schools of superior education, account being kept of their scientific progress.

The apportionments for faculties or sections of institutes which may have been closed shall be handed over to the university or institute.

The Government out of said apportionment shall dispose of such amount as is required for pensions or for fees due to professors and employees.

In case a university or school of superior education ceases to exist, the above expenses being settled, the remainder shall go to the city, provided the city authorities create an educational institution which may be of more value to local interests, or may be an improvement upon existing institutions.

#### ARTICLE X.

All free universities offering sufficient scientific guarantees under the present law shall be entitled by royal decree to the same rights as those of the State universities.

#### ARTICLE XI.

All provisions antedating the present law are hereby repealed. All by-laws shall be approved by royal decree.

## TEMPORARY PROVISIONS.

## ARTICLE XII.

For the five years following the enactment of the present law the appointments of professors shall be made in accordance with the law of November 13, 1859.

## ARTICLE XIII.

The rights of tenure of office and promotion acquired by professors and employees at date of enactment of this law are hereby assured.

Increase of salaries shall be made by the department of public education.

Pensions shall continue to be paid by the national treasury.

## ARTICLE XIV.

The provisions of this law shall not affect those professors who, at the date of its enactment, had already commenced a course of studies in any institution to which the law applies.

The present law shall take effect at the beginning of the academic year.

*Annex A.—Public institutions of superior education to which the present law refers.*

Institution.	Date of foundation.
University of Bologna .....	Eleventh century.
University of Catania .....	1434
University of Cagliari .....	1626
University of Genoa .....	1242
University of Macerata .....	1290
University of Messina .....	1549
University of Modena .....	1678
University of Naples .....	1224
University of Padua .....	1222
University of Palermo .....	1805
University of Parma .....	1512
University of Pavia .....	1300
University of Pisa .....	1338
University of Roma .....	1303
University of Sassari .....	1677
University of Siena .....	Thirteenth century.
University of Turin .....	1404
Institute of Superior Studies in Florence .....	1859
Scientific and Literary Academy of Milan .....	1859
Superior Technical Institute of Milan .....	1859
School for Applied Engineering in Naples (reorganized 1863) .....	1810
School for Applied Engineering in Rome .....	1873
School for Applied Engineering in Turin .....	1859
School for Applied Engineering in Bologna .....	1877
Superior School of Veterinary Medicine in Milan .....	1859
Superior School of Veterinary Medicine in Naples .....	1856
Superior School of Veterinary Medicine in Turin (reorganized in 1860) .....	1796
Superior Institute for Normal Training of Women, Rome .....	
Superior Institute for Normal Training of Women, Florence .....	

*Annex B.*

The appropriation for each institution named in Annex A shall be included in the budget of the department of public education, in accordance with the following regulations:

## EMPLOYEES.

## I.—UNIVERSITIES.

(a) The appropriation shall include the salaries of the ordinary professors to which each university is entitled, in accordance with the number of faculties and courses and in accordance with the law of November 13, 1859, or any other special law established by existing regulations.

In the universities in which the ordinary professors exceed the regular number the apportionment shall be provisionally increased by the required amount as long as the additional professors remain in charge. When they cease to teach, said amount shall be subtracted from the appropriation for the institution when applied to optional courses. Said amount shall be converted, however, into a salary for an extraordinary professor in case the courses are obligatory.

The salary of ordinary professors shall be fixed at 5,000 lire (\$1,000) and 3,000 lire (\$600), according to the rank of the university.

(b) The appropriation shall also include the amount corresponding to the number of extraordinary professors of each university at the date of the enactment of the present law. Such amount, however, shall be curtailed for those universities in which the number of ordinary professors at said date is inferior to the number allotted. That reduction shall correspond to the salaries of as many extraordinary professors as there are ordinary professors who are not fulfilling regular duties.

Salaries of extraordinary professors shall be established on the basis of 3,500 lire (\$700) and 2,100 lire (\$420).

(c) The appropriation shall also include the amount corresponding to the number of additional teachers of each university at the date of the enactment of the present law. The basis shall be that of a salary of 1,200 lire (\$240) and of 1,000 lire (\$200), according to the rank of the university.

(d) The amount entered in the last budget under the following denomination: "Amount destined for new appointments or promotions, and for teachers in special courses," shall be divided among the universities (exception is made of the free University of Macerata), in proportion to their allowances, as stated in paragraphs a, b, and c.

Such amount shall be curtailed to the extent of the expenses resulting from the application of rules stated in paragraphs a, b, and c.

(e) The budget shall also include an amount corresponding to the expenses for salaries of employees of all scientific establishments, according to existing regulations.

(f) It shall also include an amount which corresponds with the salaries of the administrative staff of each university in accordance with the regulations.

(g) The present financial arrangements between the Government and the University of Macerata remain unchanged.

## II. SCHOOLS AND INSTITUTES OF SUPERIOR EDUCATION.

(a) The appropriation shall include the amount required for the salaries of teachers and employees of institutes and schools of superior education, in accordance with the existing regulations for the schools of application of civil engineering of Bologna, Naples, Rome, and Turin; for the Superior Technical Institute of Milan, and the superior schools of veterinary medicine of Milan, Naples, and Turin, and for the higher normal schools for women in Florence and Rome.

(b) The regulations in regard to financial arrangements between the Government and the Superior Institute of Practical Studies in Florence shall remain as provided by law of June 13, 1872 (No. 885).

## III.

The amount included in the last budget under the denomination of "Allowances to extraordinary employees, and indemnities for extraordinary services" shall be divided among all the universities, institutes, and schools of superior education; exception is hereby made of the free University of Macerata, the Institute of Florence, above mentioned, and the Superior Institute for female students, the exception to be in proportion to the appropriation to each of these institutions.

## IV.

Increase of salaries and allowances for residence in Rome shall not be included in the above regulations, and they shall continue to form part of the budget of the department of public instruction in accordance with article 2 of this law.

## FURNITURE.

The budget shall also contain appropriations for scientific laboratories, office expenses, rent of buildings, care of premises, furniture, lighting, heating, and appliances for teaching, and for purchase of laboratory apparatus for the higher normal schools for women in Florence and in Rome.

## I.

Regular appropriations shall be made to each university, institute, and school of superior education to correspond to the apportionment included in the last budget of the department of instruction, with an additional tenth part.

## II.

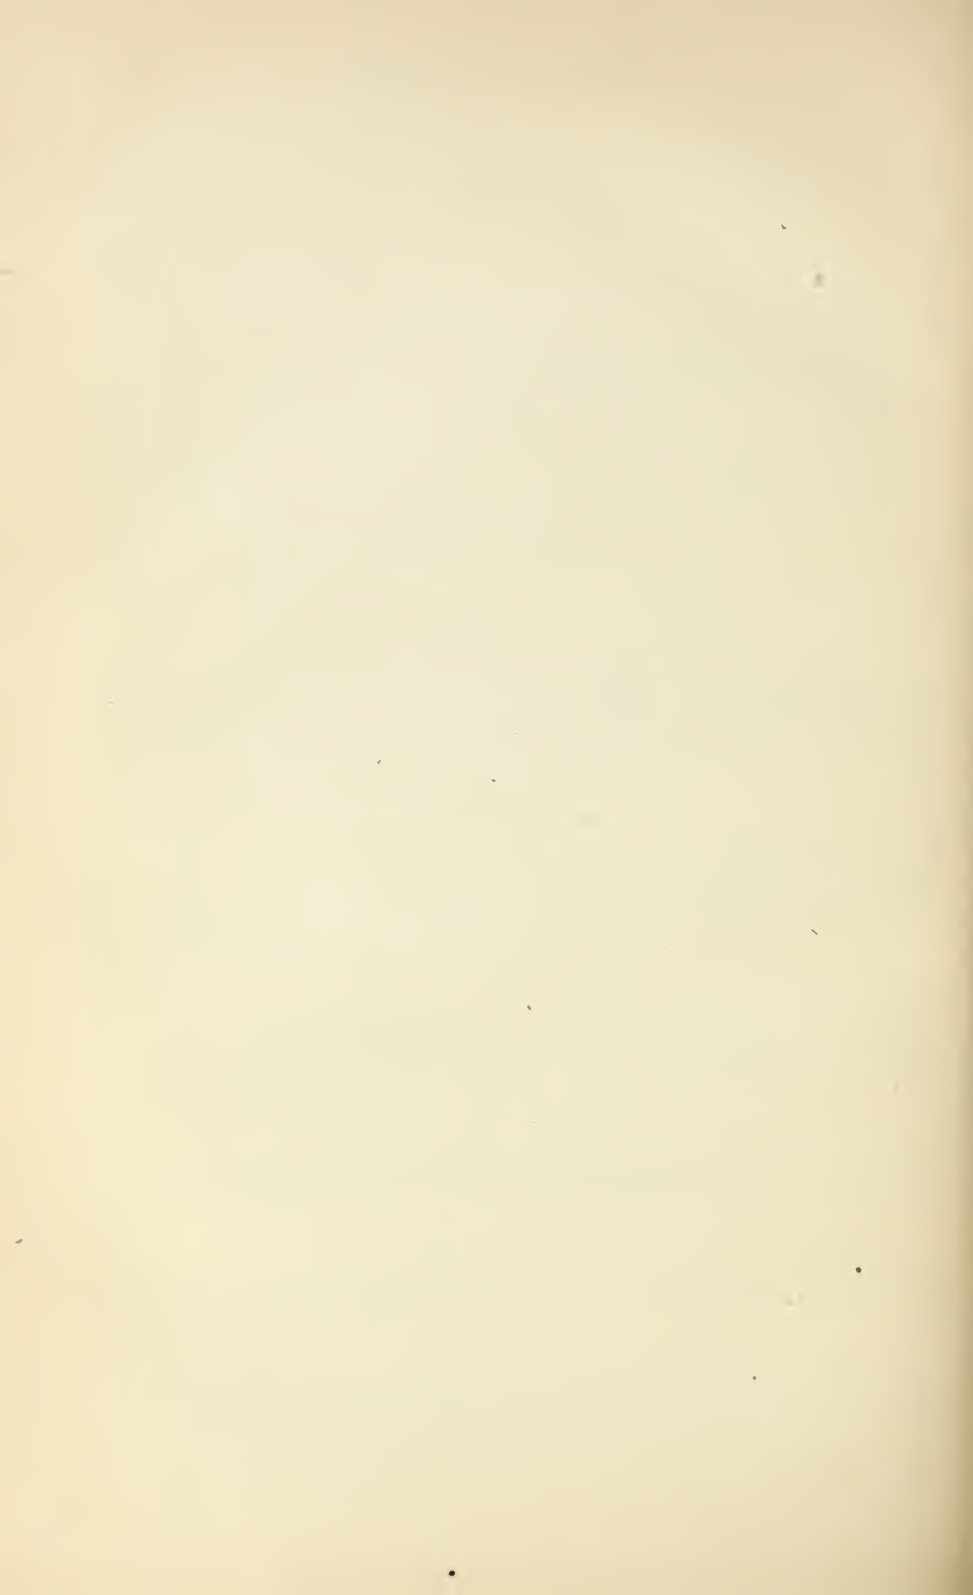

Apportionment shall be made of the amount included as "Fund for supplement to appropriation and increase of expenditure which may occur," in accordance with the last budget, with an additional tenth, to be divided among all universities, institutes, and schools (exception is hereby made of the higher normal schools for women in Rome and Florence) in proportion to the amount allotted to each university or institute.

The part which is actually used for the ordinary expenses of said universities and institutes

shall be deducted from the fund and added to the regular amount allotted to each university and institute.

## FEES.

	Lire.	United States equivalent.
<i>(a) Annual registration.</i>		
Faculty of jurisprudence .....	150	\$30
Faculty of medicine and surgery .....	150	30
Faculty of physics and mathematics .....	100	20
Faculty of higher mathematics and school of application for civil engineers .....	150	30
Faculty of philosophy and literature .....	100	20
Courses for the "laurea" in chemistry and pharmacy .....	150	30
Courses for license in chemistry .....	100	20
Courses for solicitors and notary public .....	150	30
Courses for veterinary medicine .....	100	20
Courses for agricultural science .....	100	20
Courses for gynecology .....	50	10
Higher normal schools for women students .....	50	10
<i>(b) Annual registration for the various courses.</i>		
Course of one hour, weekly .....	5	1
Course of two hours, weekly .....	10	2
Course of three hours, weekly .....	15	3
Course of four hours, weekly .....	20	4
Course of five hours, weekly .....	25	5
Course of six hours, weekly .....	30	6
<i>(c) Examinations.</i>		
For college graduation .....	50	10
For "laurea" or diploma .....	300	60
For license to teach in all the female schools of the Kingdom and in the higher normal schools for women .....	100	20
<i>(d) Government expenses.</i>		
I.		
Jurisprudence .....	500	100
Medicine and surgery .....	500	100
School of application for civil engineer .....	500	100
School of pharmacy for diploma of practice .....	300	60
Solicitors and notary public .....	300	60
Veterinary medicine .....	300	60
Agricultural science .....	300	60
Gynecology .....	200	40
II.		
Fee for admission to competitive examinations for ordinary professors .....	500	100
Fee for admission to competitive examinations for extraordinary professors .....	500	60
III.		
Fee for private teaching .....	300	60

## CHAPTER XVIII.

### ILLITERACY OF THE VOTING POPULATION IN THE UNITED STATES.

PREPARED UNDER THE DIRECTION OF CHARLES W. DABNEY, PRESIDENT OF THE UNIVERSITY OF TENNESSEE, FOR THE SOUTHERN EDUCATION BOARD.

---

The census shows that in June, 1900, there were in the United States 2,326,000 men of voting age, 21 years and upward, who were unable to read and write. This was nearly 11 per cent of the total number, which was 21,330,000.

In a country whose government is determined by popular suffrage, these figures can hardly be regarded with satisfaction. The voter ought to be intelligent. He should have some understanding of the Government whose policy he is to shape, and of the men whom he is to assist in elevating to office. Who will argue that the man who has never read a line of American history or familiarized himself with any great question of statesmanship, or even spelled out the headlines of a newspaper, is competent to cast a ballot? Yet one ballot in every ten is probably cast by such a voter.

At the last Presidential election the total vote was 13,961,566, and the plurality of the successful candidate, 849,790. Suppose in such a case that the ignorant voters should all be on one side; or suppose that the 2,000,000 men of this class should come under the control of unscrupulous leaders who should use them for unworthy purposes. What would become of the stability of the Republic?

Who are these illiterates and where are they? Many are of the negro race, 977,000; but more are white, 1,254,000. In 1870 the greater number were negroes, 833,000 to 748,000 white, an excess of 90,000. Thirty years have changed this and now the white illiterates outnumber the negro by 277,000.

Of the white illiterates a large proportion are foreign born, 565,000, but the number of native born is 688,000, or 113,000 more than the foreign-born illiterates. It appears also that the per cent of illiterates among the native-born sons of native parents is nearly three times as great as among the native born of foreign parents. With the former it is 5.8 per cent, with the latter 2 per cent, indicating that our schools are accomplishing their purpose better for the children of immigrants than for our own American families.

Two sources of danger are often spoken of as threatening our national life—one from the negroes, the other from foreign immigration. But these two are not all. Wherever there is incapacity for the duties of citizenship there is danger, and the illiteracy of 688,000 native-born white Americans of voting age is no more to be disregarded than that of immigrants and negroes.

The tables given at the end of this chapter are designed to show how the people of different races are distributed throughout the country and what are the conditions of illiteracy among them in the several States and Territories.

Table I presents five different race elements of the population in separate columns—1, total white; 2, native white of native parents; 3, white of foreign parents, which includes the native white of foreign parents and the foreign born;

4. negroes; 5. Indians. In each column the State having the smallest per cent of the specified race element stands first, and the other States are arranged in order beneath, with the one having the greatest per cent at the bottom. Thus in column 1, Mississippi stands first, having the smallest per cent of white population, 41.3 per cent of the whole, and New Hampshire is last in the list, having the greatest per cent, 99.8 per cent of the whole.

A study of this table will enable one to see how different are the constituent elements of the population in different States and Territories. In a few the white element is hardly half and the negro element is correspondingly large. In many others the negro element is so small as to be hardly appreciable and the whites constitute almost the whole. So also with reference to the relative proportions of the native and foreign white elements, the latter including the native white of foreign parents. In a number of the Southern States the foreign element is insignificant, the white population being almost entirely native American, while in other States, especially in the North and West, this element is large and sometimes preponderant. In Minnesota and Wisconsin it is nearly three-fourths of the population, while in North Dakota it is even more than this.

The Indian element is small, except in Alaska and Arizona. Mention should be made perhaps of the oriental element from China and Japan, which attracts considerable attention on the Pacific coast; but this is relatively very small and is not treated separately in the Census Bulletins.

Table II shows the proportion of men of voting age who are unable to read and write, by States and Territories. The arrangement is in five columns, giving the per cent of the illiterate—1. in the aggregate number of men of voting age of every race; 2, among the native white of native parents; 3, among the white of foreign parents; 4, among negroes; 5. among Indians. The States having the smallest per cent are first, as in Table I, and the other States are arranged in order beneath, with those having the greatest per cent last.

It will be seen that the illiteracy among the Indians greatly exceeds that among the negroes, and that it varies from 1.3 per cent in Pennsylvania to 91.7 per cent in New Mexico. The variation is also marked among the negroes, though not to the same extent. It seems to be generally true that where there are few they are the most intelligent, and where they are numerous the illiteracy is greatest. Hence the comparatively small per cent in Alaska, Utah, and Minnesota, and the large per cent in the Gulf States.

In the column of aggregates. 1, the region of the Northwest is seen to have fewer illiterates in proportion to population than any other part of the country. Nebraska and Iowa have less than 3 per cent, while the older States of the East, Massachusetts, Rhode Island, Connecticut, New Jersey, and Pennsylvania, have 6, 7, 8, and 9 per cent. The proportion is much the greatest in the South, due in no small degree to the large number of negroes.

In columns 2 and 3 the illiteracy of the white population is shown in the two separate elements, those of native parents and those of foreign parents. The former, column 2, is especially significant, as relates to the South, for only in the Southern States do we find a large proportion of illiterates among the native white people of native parents. This will be considered more in detail when we come to Table V.

Column 3 is especially significant for the North and West, as dealing with the foreign element. A glance will be sufficient to convince one that the foreign element is very different in different parts of the country. In the Northwest the per cent of illiterates is smallest, in the more densely populated States of the East, with their numerous manufactories, it is considerably greater, while the greatest per cent appears in regions as widely separated as Maine, New Hampshire, Texas,

Arizona, New Mexico, and Hawaii. Under such circumstances the foreign illiteracy of any particular State or Territory ought to be considered by itself.

Table III presents a further analysis, with fuller details of the conditions of illiteracy in the white population of voting age. Three elements are given in three separate groups, viz. native white of native parents, native white of foreign parents, and foreign white. In each case the total number of men of voting age is given, with the number of illiterates, and the per cent of the latter to the former.

In this latter table, and in others which follow, States and Territories are arranged by groups as the North Atlantic division, the South Atlantic, the South Central, the North Central, and the Western. Alaska and Hawaii are omitted. It will be interesting to notice first the figures for the United States as a whole, next, those for each division, and, finally, the figures for separate States.

The United States has 10,569,743 white men of voting age of native parentage. Of these 2,760,103 are in the North Atlantic division, 1,466,826 in the South Atlantic, 2,055,858 in the South Central, 3,656,293 in the North Central, and 630,663 in the Western. The number of these who can not read and write is, for the whole country 618,606 or 5.9 per cent, for the North Atlantic division 57,767 or 2.1 per cent, for the South Atlantic 178,564 or 12.2 per cent, for the South Central 237,239 or 11.5 per cent, for the North Central 127,480 or 3.5 per cent, and for the Western 17,556 or 2.8 per cent. If now the two Southern divisions are combined, it will be found that they contain together 3,522,684 men of voting age of the class named, or about one-third of the whole, and 415,803 who can not read and write, which is nearly two thirds of the illiteracy of the whole country. In other words, it will be found that the per cent of such illiterates in the North and West is 2.9, and in the South 11.8, four times as great in the South as in the rest of the country.

The other two columns of this table, however, tell a different story. The foreign element is small in the South and the problem of foreign illiteracy belongs especially to the North and West. Nevertheless, it will be seen farther on that the question of handling our immigrant population has a direct connection with the other question of just treatment for the people of native parentage.

Column 2 shows the number of native white of foreign parentage in the United States to be 3,444,684, of whom 68,975 are unable to read and write. If we combine the two Southern divisions, it appears that the South has 281,170 of this class, of whom 12,501 are illiterate.

Again, column 3 shows the number of foreign white in the United States to be 4,904,270, of whom 562,316 are unable to read and write. Of these the two Southern divisions together contain 282,559 with 45,334 illiterate. Compare this showing with that of some single States in the North. Massachusetts has 343,522 of this foreign element and 47,436 illiterate, more in each particular than the whole 18 States of the two Southern divisions. New York has 829,474 with 100,776 illiterate, more than twice as many in each particular as these 18 States. New York City alone contains 539,746 with 61,086 illiterate.

Now compare the three classes of males of voting age and observe one fact: The per cent of illiterates among the foreign born is large, but among the native born of foreign parents it is much smaller than among those of native parents. This is so in the figures for the United States as a whole and for every one of the divisions. For the whole country the per cent of illiterates among the native born of native parents is 5.85, while among the native born of foreign parents it is only 2.0. In the two southern divisions together the percentages are 11.8 and 4.4, and in the aggregate, North and West, 2.9 and 1.8. This seems to indicate that the nation is doing more for the education of the children of immigrants than for those of its own people.

How is this to be explained? It may be said that the children of immigrants have been readier to learn and that their parents have been more ambitious about them. Few will accept this, probably, as a sufficient explanation. One thing is quite plain: The children of immigrants usually live in the immediate neighborhood of good schools, while a large part of the children of native Americans are not so well situated. Those immigrants in Massachusetts, outnumbering all in the two southern divisions, and those in New York outnumbering them more than twice over, are within reach of good schools for their children and under compulsory laws that require their attendance. But what of the parents of those 415,803 illiterate men of voting age in the Appalachian Mountains and other parts of the South? How many of them are in the neighborhood of good schools or under a compulsory law requiring that their children shall regularly attend?<sup>a</sup>

In every New England State the per cent in column 1 is less than that in column 2. This comes from the prevalence of good schools, as well where the American children live as in communities where most of the foreigners are. But think of a rate of illiteracy that is only 1.3 per cent and compare it with that of Kentucky, which is 15.5, or of North Carolina, which is 19, or of Louisiana, which is 20.3, or of certain neglected counties—not a few—where it runs up to 30, 40, or 50 per cent. This tells what the children of native Americans do when they have a chance and how they fail when no chance is given.

Table IV is designed for a further exposition of this subject. This table presents the illiteracy of the three elements of population we have been considering as existing in cities of 25,000 inhabitants and upward.

There are 160 of these cities, of which 29 are in the two southern divisions and 131 in the North and West.

Comparing this table with the one preceding, it may be seen at a glance that the proportion of illiterates is much less than in the preceding table. We see also, in running the eye over groups 1 and 2, that the illiteracy of the native white, whether of native or foreign parents, does not differ greatly in the cities of the several divisions. In three divisions it is less than 1 per cent for either element, in the others it is less than 2, and only in the single State of Arkansas does it rise as high as 3.

Again, the proportions of the three elements of population in these cities is significant. Of the native white of native parents less than 18 per cent are in these cities; of the native white of foreign parents over 41 per cent are found there, and of the foreign born over 46 per cent. In the two southern divisions the proportion of the first element is less than 10 per cent, of the second it is 45, and of the third 37. This shows to how much greater extent the children of foreign parents are within reach of good schools than those of native parents, for all know that the large cities have greater educational advantages than generally prevail in the country.

For a satisfactory treatment of the subject, however, account should be taken of the cities whose population is less than 25,000, but in which the conditions are very like those of the larger cities. The census gives an enumeration of all the people in cities of 4,000 inhabitants and upward. By applying the proportions that hold in cities of 25,000 and upward, estimates may be obtained for those of 4,000 and upward that are probably near the truth. Such estimates are presented in the next table.

---

<sup>a</sup> The idea seems to be conveyed here, as well as elsewhere in the course of this discussion, that present school conditions are responsible for the degree of illiteracy of the voting population in different localities or sections. It should be borne in mind, however, that persons of voting age are long past their school period, and that the illiteracy of this element of the population is the product of educational conditions that prevailed from seven to seventy and more years ago. Conclusions drawn from a consideration of the present urban and rural or the present geographical distribution of different classes of the population are also open to a like objection.—ED.

Table V offers for comparison five groups of figures relating to the native and foreign population in the North and South. The first group gives the figures for the three white elements as a whole, wherever they live, in city or country. The second does the same for those in cities of 25,000 and upward. The third contains the estimates for places of over 4,000. After this two more groups are seen which were obtained by subtracting the figures in the second and third groups from those in the first, thereby arriving at the numbers in each class living elsewhere than in the larger cities or in any cities of over 4,000.

Looking at the third group for places of 4,000 and upward, it appears that the number of white males of voting age of native parents in the South is about 568,000, of whom about 8,000 are illiterate, about 1.5 per cent. But look now at the fifth group, where it appears that about 2,954,000 are living outside of cities of 4,000 and over, of whom some 407,000 are illiterate, or about 14 per cent. These 407,000 living in the rural parts of the South constitute over two-thirds of all the illiterate of their class in the United States; in those rural parts of the South there are only 114,000 foreign born, of whom less than 30,000 are illiterate.

Look again at the third group and mark the number of foreign born in the 951 cities of the North and West. They are over 3,000,000, and the native born of foreign parents are 1,846,000. Two-thirds of all the foreign born in the North and West are in those cities and enjoying the rare school advantages which are a part of modern city life.

Table VI presents one more phase of this subject. While showing side by side, in groups 1 and 2, the contrast between the educational conditions in the large cities and outside of them, there is a third group depicting the prevalent illiteracy in the more backward rural counties.

The contrast between these counties and the cities is striking in each group and in every State and Territory. But it is most impressive in the South. In the North Atlantic division the per cent of white illiteracy in large cities is greater than in any of the other divisions, but the per cent in the rural counties is less than elsewhere, unless in the North Central. On the other hand, in the two southern divisions the illiteracy of whites in the cities is small, but in the back counties it is especially conspicuous.

This is better seen when the record of the several counties in each State is examined (Table VII). There are counties in the North where the illiteracy is bad. New England has one county, Aroostook, Me., where the proportion of white males of voting age who can not read and write is 23.1. New York has a county, Clinton, where it is 24.6. There are some States in the South which contain no county with so high a rate as these. It is so with Maryland, Mississippi, and Arkansas. But in most of the Southern States the number of counties with a high rate of illiteracy is large. This is naturally so because conditions similar to those of Aroostook and Clinton counties widely prevail.

The list which is given herewith shows the particular counties in the whole country which are conspicuous for illiteracy of the class under consideration. Most of them, it will be seen, are in the South and Southwest. Often these counties are found near to others in the same State where the educational conditions are in strongest contrast. Thus, in North Carolina Stokes County, with an illiteracy of 32.5, is adjacent to Guilford, with a per cent of 10.8; and in Kentucky Estell, with an illiteracy of 26.4, adjoins Clark, where the rate is 7.0, while in Louisiana Jefferson, with an illiteracy of 49.8, is next to Orleans, where it is 5.4.

Generally, however, the more illiterate counties of a State are contiguous. In Virginia, the Carolinas, Kentucky, and Tennessee the mountain regions are in unfavorable contrast with other portions, and in Louisiana the counties along the coast are particularly backward. Texas exhibits the most remarkable extremes. Twenty counties report no white illiterates, and in most of the State

the proportion is small, but in the southwestern counties bordering on Mexico the illiteracy is greater than anywhere else in the United States. The latter unfavorable conditions are met with also to the westward, in New Mexico and Arizona.

The list contains 231 counties in which the proportion of white males of voting age who can not read and write is from 20 to 53 per cent. When it is considered that the per cent for the same class in the 160 large cities of the United States is only 4.5, the conclusions to be drawn are manifest. When it is borne in mind, moreover, that 226 of these counties are in the South and Southwest it hardly needs argument to show in what part of our country is the greatest need of improved schools.

A vital question is that of tendency. Is there progress or retrogression? Is the illiteracy in a particular place or among a certain people increasing or diminishing? For light on this point comparison may be made of the conditions as described in one period with those at other times.

For seven successive decades, beginning with 1840, reports concerning illiteracy have been published by the United States census. An examination of these will convince any scholar of their great value. This is so especially in case of the earlier reports. It is common to think of the science of statistics as belonging to the present and to underestimate the figures of an earlier period: but in the census reports of 1840, 1850, and 1860 will be found an exactness of detail and completeness of enumeration that carry in them the evidence of trustworthiness. The census of 1850 is particularly noticeable for the thoroughness with which it delineates the conditions of illiteracy in each county, and thus enables one to compare the status of the people, within districts of limited area, at the beginning and the end of half a century.

Table VIII presents the figures for white males of voting age, with proportion of illiterates, according to the plan of previous tables, at each decade, from 1840 to 1890.<sup>a</sup>

During the sixty years the white male population of voting age in the United States, excluding Alaska and the insular possessions, appears to have increased from 3,324,115 to 18,918,697; the number unable to read and write, from 204,413 to 1,249,897, and the proportion of illiterate, 6.15 to 6.60. It is especially significant that the proportion unable to read and write is found to be greater now than sixty years ago.

Looking at the several divisions, the North Atlantic States are seen to have increased in their number of illiterate from 39,000 to 402,041, and in per cent from 2.20 to 6.56; the South Atlantic from 69,077 to 192,887, but the per cent is less; the South Central from 55,741 to 280,751, but again with a diminished per cent; the North Central from 40,242 to 319,316, still with a diminished per cent; and the Western from 17,250 (in 1850) to 54,902, also with a less per cent.

The figures indicate that conditions have somewhat improved in all divisions except the North Atlantic, where they are going the other way. In 1840 the States with the least illiteracy among white males of voting age were Connecticut, New Hampshire, and Massachusetts. In 1900 they were the District of Columbia, Oregon, and Washington. In 1840 Connecticut is estimated to have had 219

<sup>a</sup>A considerable portion of these figures have been obtained by estimate. Where this is the case it is indicated by a star at the head of the column. In 1840, 1850, and 1860, the figures are for males 20 years of age and upward. In 1870, 1880, and 1900 they are for males 21 years of age and upward. In 1890, there are statistics of both these classes which show that the former outnumber the latter by about 3.5 per cent, though with slight variations in different States and Territories. These proportions, disclosed in 1890, have been used to reduce the figures for twenty years and upward, so as to conform to the others, and make them all for the voting age, or 21 and upward. The figures of 1840 are for adults, without distinction of sex, necessitating a further modification by division according to the proportions of males and females in 1850.

illiterate white men of voting age, New Hampshire 513, Massachusetts 1,812. Now they have, respectively, 18,265, 10,228, and 51,785. In the 6 New England States the number in 1840 was 5,930, less than 1 per cent of the voting class; now it is 113,675, over 6 per cent. In some counties the change within sixty years is still more marked. York County, Me., shows an increase from 1.6 per cent to 7.8; Barnstable, Mass., from 2.8 to 7.4; Kent, R. I., from 2.5 to 14.3, and Windham, Conn., from 1.8 to 14.6.

These figures tell of a tendency to which attention should be called. Nowhere else in the country is there supposed to be so much done for education as in these North Atlantic States. How is it that here the illiteracy is so much greater than fifty or sixty years ago and how is it that Windham County, lying midway between Boston and New Haven, between Harvard and Yale universities, records an increase from 148 to 2,016 men who can not read and write?

"The inflow of ignorant foreigners" is an easy answer, but Windham has 329 illiterate who are the sons of native parents, over twice as many as the whole number fifty years ago. In all these North Atlantic States there are 57,767 who are sons of native parents, over 18,000 more than all the illiterate of this class in 1840.

The South Atlantic and South Central divisions show a slight decrease in illiteracy since 1840, and for the period since 1870 the decrease is from 16 to 11. The decade from 1860 to 1870 shows in its records the disastrous effects of the war on the schools, for the number of illiterate advanced from 189,434 to 283,715 and the per cent from 12 to 16. That these States should have rallied so quickly and with each subsequent decade recorded a marked reduction of the illiteracy may well be regarded as occasion for congratulation.

It yet remains true, however, that the South has a much larger proportion of illiterate people than the other divisions. Nor is it by any means true that there is a steady improvement in this respect all over the South. Louisiana is a conspicuous exception. The number of her illiterate in 1840 was 4,683, less than 10 per cent, and in 1900 it was 32,039, 18 per cent. It is noticeable, too, that there has been a steady advance in illiteracy with each decade since 1860, when the per cent was only 7.9.

A similar story is recorded of many different counties in the other States. Some counties show remarkable progress; others show a retrograde movement equally remarkable. Thus, in Virginia the per cent of illiterates in Alexandria County in 1850 was 16.6. Now it is 3.7. In Prince George County it was 37.2, and now it is 9.3. Then, in striking contrast, Grayson County in 1850 reported 4.9 per cent. Now there is an advance to 16.4. Washington reported 6.3. It is now 21.2. Stafford reported 10.9. Now it is 24.2.

These figures for the smaller districts are much more significant than those for a whole State. The figures for a State can only express an average. Those for a county or town come nearer to the definite, actual facts that have to be dealt with.

It is especially necessary in the South to avoid the general and get at the particular. In the case of a State like Kentucky, in which several counties have only 4 or 5 per cent of illiterate and a number more have over 30 per cent, or a State like Texas, in which 20 counties have no illiterates at all and several others have over 50 per cent, it will not answer the purpose to strike an average. Each county and, if possible, each community must be faithfully studied by itself. Its particular history must be known. The prevalent tendencies, whether upward or downward, backward or forward, are to be found out. Then it will be clearer what course to take.

The Census reports afford materials for a separate study of the people of negro descent. Table IX is prepared on the plan of Table VIII and covers a period of

fifty years. For the first two decades, 1850 and 1860, the figures are for free colored people in distinction from those in slavery. The age limit for these decades is 20 years and upward, while for the following decades it is 21 and upward.

The lesson of the whole table is one of progress. This appears in the first two decades. The number of free negro males of voting age was not large, little over 100,000 in 1850 and about 115,000 in 1860; but the decline in the proportion of illiterate during those ten years is from 39.5 per cent to 35.8. In a word, there were in 1860 over 74,000 negro males over 20 years of age who were able to read and write. Such a start was of no slight importance for the events that followed.

The most significant figures, however, are those of the later decades. In 1870 the proportion of negro males over 21 years of age who could not read and write was, for the whole country, 83.5 per cent; in 1900, 47.4. At the end of thirty years it is only a little more than half as great as at the beginning. A steady advance is shown in every division and in almost every State.

How much does this mean? It would seem to mean a great deal. But it must not be forgotten what was the purpose to be accomplished. It was intended that the freedmen should be qualified for citizenship. An immense educational system was instituted with a view to presenting opportunities of learning to every colored child. A network of institutions sprang up covering every part of the South—all new where none of the kind existed before. There are no less than 25,000 public schools for elementary learning, with over 27,000 teachers, nearly 100 public high schools, 20 normal schools and colleges maintained by the government, and over 100 universities, colleges, trade schools, and other institutions supported by private beneficence. With such an outlay it was to be supposed that results would appear.

The fair question is, Are the results such as were to be anticipated? There are now 976,000 negro males of voting age unable to read and write, and this is 114,000 more than the number in 1870. The fact that the per cent of illiterate in the whole country has been reduced to 47.4 may be overrated. Account must be taken of particular portions of the country, particular States and counties. In the two southern divisions the proportion of illiterates is still above 50 per cent. In Alabama it is 59.5, in Louisiana 61.3, and in different counties it is as high as 70, 80, and 85 per cent.

Here, too, may be considered the relative progress of people in the centers and in the rural districts. Table X is similar in form to Table VI, showing the proportion of illiterate male negroes of voting age, (1) in large cities, (2) outside of such cities, and (3) in counties where conditions are most backward.

In this table, as in Table VI, it appears that illiteracy is lowest in the cities and highest in sparsely settled regions. The superiority of schools in cities over those in the country naturally tends to such a result. In the 160 cities of 25,000 inhabitants and upward the proportion of illiterates is 24.2 per cent, outside of them 51.9, and in rural counties much higher.

In cities of the North the proportion of negroes who can not read and write is comparatively small. This is shown in Table XI, which gives the figures for 50 large cities having a considerable negro element. In Chicago the per cent is 5.5 (less than that of whites in the cities of the North Atlantic States as given in Table VI), in Boston 5.7, in New York 6.9, in Philadelphia 10.9. In Southern cities the rate is higher, rising from 20 to 46 per cent. But this is moderate compared with conditions in hundreds of rural counties. In Virginia there are 40 counties in which the per cent is 60 and upward; in Alabama there are 28 such counties; in Louisiana 40, in Georgia 58. The proportion in Franklin County, Va., is 72.3, in Macon County, Ga., 72.1, in Morgan County, Tenn., 76.8, in Lafayette, La., 85.6. What a contrast between less than 6 per cent and over 60 per cent.

The general movement of the people from the country to the city is shared by the negroes, as might have been expected. Certain phases of this movement, however, are an interesting study. Table XI shows the total negro population of the 50 cities at the four decades, 1900, 1890, 1880, 1870, with the increase in thirty years. In 1870 the total of all the 50 was 406,238, in 1900 1,053,941, an increase of 647,703. The increase from 1870 to 1880 was 145,863, from 1880 to 1890 234,488, from 1890 to 1900 267,352. Of the 50 cities, 30 are in the North and in the border territory of Maryland, the District of Columbia, Kentucky, and Missouri, while 20 are in the more southern States. In 1870 the 30 northerly cities contained 201,265 and the 20 Southern 204,973, the number in the latter being greater by 3,708. In 1900 the northerly cities have 608,070, and the Southern 455,871, the number in the former being now 153,199 greater than in the latter. From 1870 to 1880 the Southern cities increased in negro population from 204,973 to 251,470—a gain of 46,497. The Northern increased from 201,265 to 300,631—a gain of 99,366. From 1880 to 1890 the Southern cities increased from 251,470 to 375,267—a gain of 123,797. The Northern increased from 300,631 to 411,322—a gain of 110,691. From 1890 to 1900 the Southern cities increased from 375,267 to 455,871—a gain of 80,604, while the Northern increased from 411,322 to 577,870—a gain of 166,548. This shows that, while there has been a movement to both Southern and Northern cities going on constantly during the last thirty years, this movement is turning especially to the North of late and tending to increase in this direction. This is especially true of a few of the larger cities. There are 14 cities, Washington, Baltimore, Philadelphia, New York, St. Louis, Chicago, Pittsburg, Boston, Cleveland, Cincinnati, Columbus, Indianapolis, Louisville, and Kansas City, in which the increase of the negro population during the last ten years has been over 140,000.

Most of the increase in Southern cities during this decade has been in New Orleans, Memphis, Savannah, and Atlanta, aggregating for the four cities 52,700. In Richmond there has been no increase; in Charleston only 552, and in Nashville 662.

Table XII gives the number of negroes in 200 places containing the largest negro population, arranged in the order of their numbers. Of these places 52 are in the North and in the border States, and 148 farther south. The 52 places contain 664,346 negroes, and the 148 contain 915,055. This shows to what an extent, even in the smaller cities, the negroes are finding their homes in the North.

Taking these figures in connection with those of illiteracy, indicating the greater intelligence of negroes in these Northern cities, the evidence seems to prove that the more intelligent and better educated negroes are leaving the South, especially the rural parts, for these cities of the North.

What is the explanation of such a fact as this? It is noticeable that the great schools for the education of negroes which have been built up and maintained since the civil war are most of them in cities. These have continually attracted the more promising and ambitious young negroes from all the country around and habituated them to such a manner of life as prevails in the city. It has been understood, indeed, that their education was designed to prepare them for usefulness in all fields. But the kind of education given, and the tastes cultivated by the predominant influences about them, have been such as to make any thought of return to the plantation and the cabin far from agreeable.

And when there has been a disposition to return, the way has not been made easy. No provision has been found for support in the callings for which they have had their long training. So they have felt obliged to take up such occupations as could be had in the city.

With the passing of time the negro people of Southern cities have come to enjoy many privileges from which those in the country are debarred. Their public

schools, as well as the higher institutions, have improved. Fine church buildings have been erected, and with an educated ministry have greatly increased their attractiveness to persons of intelligence. Societies, lodges, and clubs have multiplied, and to a people naturally gregarious the fondness for social pleasures is gratified in ways without number.

Hence the likelihood of the city trained negroes going into the country to live is growing less. But with increasing numbers of the educated their chances of lucrative employment become few. Then comes the suggestion of going to the Northern cities, and many respond.

The results of this movement can hardly be regarded as satisfactory to those involved. Some few are fairly prosperous, but the condition of the negroes in these Northern cities is generally disappointing. Huddled together in the poorest tenement houses, preyed upon by the vicious and criminal, environed by poverty and disease, they might well envy the pure air, the independence, and the vigorous health of a plantation worker in his isolated cabin.

The saddest aspect of the case, however, is the loss of these educated negroes to their own people, who are in greatest need of their intelligence. The multitudes who have not been admitted to the privileges of good schools require the presence among them of scholars and cultivated men and women. The institutions of education have been maintained with this end in view. There has been the supposition that everyone with a thorough intellectual training would find his most promising field for a life of usefulness and honor among the less fortunate of his own race, and that through the enlightening power of such the wide wastes of ignorance would be reclaimed. It was not dreamed of that the people would be left to their destitution while their expected leaders betook themselves to Chicago, Boston, New York, and Philadelphia. In this manner the scholar's opportunity for himself and for his race alike seems to have been lost.

A mode of education which shows these results must be in some way defective. What is the corrective? It is not easy to say. The suggestion may be ventured that more attention be given directly to the negroes in the country, and that school advantages be provided such as will promote their welfare where they now live. For the negro, as well as for his white neighbor, the problem of the hour seems to be that of the rural school.

## CHAPTER XIX.

### FOREIGN UNIVERSITIES AND OTHER FOREIGN INSTITUTIONS OF HIGHER EDUCATION.

- I. Universities arranged according to date of founding.*
- II. Other seats of learning arranged according to date of founding.*
- III. Universities, etc., arranged according to number of students.*
- IV. The same arranged alphabetically.*
- V. Universities arranged according to countries.*
- VI. Polytechnica arranged alphabetically.*
- VII. Agricultural, forestry, and mining schools arranged alphabetically.*
- VIII. Veterinary schools arranged alphabetically.*

### INTRODUCTION.

The author of "Minerva, Jahrbuch der Universitäten der Welt" (K. Trübner), which is the chief source of information offered in the following lists, says that he has submitted his work at various stages of completion to different professors of the countries mentioned, so that he is assured that his decision as to which of the learned institutions of the world should be regarded as universities is upheld by the most trustworthy authority. He describes his Jahrbuch as a collection of names of teaching bodies, of universities, or similar institutions of the world.

Since Volume 2 of this Report of the Commissioner of Education contains direct information concerning the higher institutions of learning in the United States, they have been omitted from the following lists, which are devoted exclusively to foreign institutions:

#### *I. Foreign universities arranged according to age.*

Date of foundation.	Locality.	Date of foundation.	Locality.
<i>Tenth century.</i>		<i>Fourteenth century—Continued.</i>	
968	Cairo, Egypt.	1243	Valladolid, Spain.
<i>Twelfth century.</i>		1348	Prague, Bohemia, Austria.
1119	Bologna, Italy.	1349	Florence, Italy.
1181	Montpellier, France.	1361	Pavia, Italy.
1200	Paris, France.	1364	Krakow, Galicia, Austria.
1200	Oxford, England.	1365	Vienna, Austria.
<i>Thirteenth century.</i>		1367	Fünfkirchen, Hungary.
1209	Valencia, Spain.	1386	Heidelberg, Baden, Germany.
1222	Padua, Italy.	1391	Ferrara, Italy.
1224	Naples, Italy.	<i>Fifteenth century.</i>	
1233	Toulouse, France.	1402	Würzburg, Bavaria, Germany.
1243	Salamanca, Spain.	1409	Leipzig, Saxony, Germany.
1257	Cambridge, England.	1409	Aix, France.
1266	Perugia, Italy.	1411	St Andrews, Scotland.
1288	Coimbra, Portugal.	1412	Turin, Italy.
<i>Fourteenth century.</i>		1419	Rostock, Mecklenburg, Germany.
1303	Rome, Italy.	1422	Parma, Italy.
1339	Grenoble, France.	1422	Besançon, France.
1343	Pisa, Italy.	1426	Louvain, Belgium.
		1431	Poitiers, France.
		1437	Caen, France.
		1441	Bordeaux, France.
		1444	Catania, Sicily, Italy.

## I. Foreign universities arranged according to age—Continued.

Date of foun- dation.	Locality.	Date of foun- dation.	Locality.
<i>Fifteenth century—Continued.</i>		<i>Eighteenth century—Continued.</i>	
1459	Barcelona, Spain.	1748	Cadiz, Spain.
1451	Glasgow, Scotland.	1755	Moscow, Russia.
1456	Griefswald, Prussia, Germany.	1771	Münster, Prussia, Germany.
1457	Freiburg, Baden, Germany.	1777	Siena, Italy.
1460	Basel, Switzerland.	1779	Palermo, Sicily, Italy.
1463	Nantes, France.	1784	Lemberg, Galicia, Austria.
1465	Budapest, Hungary.	1785	Pressburg, Hungary.
1472	Munich, Bavaria, Germany.	1788	Grosswardein, Hungary.
1474	Saragossa, Spain.	1798	Kazan, Russia, Theological College.
1477	Upsala, Sweden.		
1477	Tübingen, Württemberg, Germany.		<i>Nineteenth century.</i>
1478	Copenhagen, Denmark.		
1494	Aberdeen, Scotland.	1800	Edinburgh, Scotland, Medical Col- lege.
	<i>Sixteenth century.</i>	1804	Kazan, Russia.
1501	Valencia, Spain.	1804	Kharkof, Russia.
1502	Halle-Wittenberg, Prussia, Germany.	1805	Yaroslavl, Russia.
1502	Seville, Spain.	1808	Clermont, France.
1504	Santiago, Spain.	1808	Lille, France.
1506	Breslau, Prussia, Germany (1702).	1808	Lyon, France.
1508	Madrid, Spain.	1808	Rennes, France.
1527	Marburg, Prussia, Germany.	1809	Berlin, Prussia, Germany.
1531	Granada, Spain.	1811	Christiania, Norway.
1531	Sarospatak, Hungary.	1812	Genoa, Italy.
1537	Lausanne, Switzerland.	1815	Moscow, Russia.
1540	Macerata, Italy.	1816	Ghent, Belgium.
1544	Königsberg, Prussia, Germany.	1816	Warsaw, Poland, Russia.
1548	Messina, Sicily, Italy.	1817	Liege (Lüttich), Belgium.
1549	Debreczin, Hungary, Theological Col- lege.	1818	Bonn, Prussia, Germany.
1556	Sassari, Italy.	1819	St. Petersburg, Russia.
1558	Jena, Thuringia, Germany.	1820	Nezin, Russia, Philological School.
1559	Geneva, Switzerland.	1821	Halifax, Canada.
1566	Olmütz, Moravia, Austria.	1821	Montreal, Canada.
1567	Strassburg, Alsace, Germany.	1825	London (University College), Eng- land.
1568	Braunsberg, Prussia, Germany.	1827	Toronto, Canada.
1572	Nancy, France.	1827	Sheffield (Medical College), England.
1575	Leyden, Netherlands.	1828	Lampeter (St. David's College), Wales.
1580	Oviedo, Spain.	1832	Durham, England.
1582	Rome, Italy (Pontif.).	1832	Zurich, Switzerland.
1583	Edinburgh, Scotland.	1832	Kief, Russia.
1586	Graz, Styria, Austria.	1834	Freising, Germany, Theological Ly- ceum.
1591	Dublin, Ireland.	1834	Brussels, Belgium.
1596	Cagliari, Italy.	1834	Berne, Switzerland.
	<i>Seventeenth century.</i>	1836	London (University), England.
1605	Manila, Philippine Islands.	1837	Athens, Greece.
1607	Gießen, Hesse, Germany.	1838	Messina, Italy.
1614	Groningen, Netherlands.	1840	Kingston, Canada.
1632	Salzburg, Austria.	1843	Eichstädt, Germany, Theological Ly- ceum.
1632	Amsterdam, Netherlands.	1845	Cork, Ireland.
1632	Dorpat, Russia.	1845	Belfast, Ireland.
1636	Utrecht, Netherlands.	1845	Galway, Ireland.
1640	Helsingfors, Finland, Russia.	1849	Algiers, Algeria.
1647	Bamberg, Bavaria, Germany.	1850	Sydney, Australia.
1657	Kaschau, Hungary.	1851	Manchester (Victoria University), England.
1665	Kiel, Prussia, Germany.	1851	Newcastle, England.
1666	Lund, Sweden.	1853	Melbourne, Victoria, Australia.
1671	Urbino, Italy.	1857	Calcutta, India.
1673	Innsbruck, Tyrol, Austria.	1857	Madras, India.
1676	Eperies, Hungary.	1857	Bombay, India.
1683	Modena, Italy.	1858	Lisbon, Portugal.
	<i>Eighteenth century.</i>	1860	Jassy, Roumania.
1710	Barbados (Codrington College), West Indies.	1862	Kecskemét, Hungary.
1721	Habana, Cuba.	1864	Bucharest, Roumania.
1722	Dijon, France.	1865	Odessa, Russia.
1727	Camerino, Italy.	1866	Neuchâtel, Switzerland.
1737	Ratisbon, Germany, Theological Ly- ceum.	1868	Tokyo, Japan.
1737	Göttingen, Prussia, Germany.	1870	New Zealand, New Zealand.
1740	Erlau, Hungary.	1872	Aberystwith, Wales.
1743	Erlangen, Bavaria, Germany.	1872	Adelaide, Australia.
1743	Santiago, Chile.	1872	Klausenburg, Hungary.
		1873	Cape Town, South Africa.
		1874	Agram, Croatia, Hungary.
		1875	Angers, France.

NOTE.—The number of students in higher seats of learning not mentioned has not been ascertained.

IV. *Foreign universities, etc., arranged alphabetically, with faculties and number of students.*

1. *Aberdeen, Scotland*: University of Aberdeen, 905 students. Philosophical, theological, law, and medical faculties; library.
2. *Aberystwith, Wales*: Part of University College of Wales, associate colleges at Cardiff and Bangor, 524 students.
3. *Adelaide, Australia*: University of Adelaide, 494 students. Observatory.
4. *Agram, Croatia, Hungary*: Königl. Universität Agram, 908 students. Theological, law, and philosophical faculties; library.
5. *Aix-en-Provence, France*: Université d'Aix, 772 students. Law and philosophical faculties; library.
6. *Algiers, Algeria, Africa*: Académie d'Alger, 786 students. Law, medical, scientific, and philosophical faculties; library, observatory.
7. *Allahabad, India*: University of Allahabad. Examining board, 3,310 candidates.
8. *Amiens, France*: École Prép. de Médecine. Medical school, 100 students.
9. *Amsterdam, Netherlands*: Universiteit te Amsterdam, 1,332 students. Law, medical, scientific, philosophical, and theological faculties; library and several institutes.
10. *Amsterdam, Netherlands*: Free University, 118 students. Theological, law, and philosophical faculties.
11. *St. Andrews, Scotland*: University of St. Andrews, 269 students. St. Salvador, St. Leonard's, and St. Mary's College.
12. *Angers, France*: Université Catholique de L'Ouest, 287 students. Law, scientific, theological, and philosophical faculties; library.
13. *Angers, France*: École Prép. de Médecine. Medical school.
14. *Athens, Greece*: National University, 3,000 students. Theological, law, medical, and philosophical faculties; public library.
15. *Bangor, Wales*: Part of University College of Wales, 325 students.
16. *Bamberg, Bavaria, Germany*: Königl. Bayerisches Lyceum, 71 students. Theological and philosophical faculties.
17. *Barcelona, Spain*: Universidad de Barcelona, 1,887 students. Philosophical, law, scientific, medical, and pharmaceutical faculties; library.
18. *Basel, Switzerland*: Universität Basel, 618 students. Theological, law, medical, and philosophical faculties; public library.
19. *Belfast, Ireland*: Queen's College, 349 students.
20. *Belgrade, Servia*: Serpska Kraljevska Velika Skola, 403 students. Philosophical, law, and technological faculties; library.
21. *Bello Horizonte, Brazil*: Law faculty, formerly in Ouro Preto.
22. *Berlin, Prussia, Germany*: Königl. Friedr.-Wilhelms-Universität, 13,070 students. Theological, law, medical, and philosophical faculties; seminary for oriental languages, and 11 other seminaries, library, and 36 university institutes and museums.
23. *Berne, Switzerland*: Universität Bern, 1,344 students. Catholic and Protestant theology, law, medical, and philosophical faculties; city libraries.
24. *Besançon, France*: Université de Besançon, 295 students. Scientific, philosophical, and medical faculties; library.
25. *Birmingham, England*: Birmingham University, 967 students. Arts and science, medical and commercial faculties; library.
26. *Bologna, Italy*: Regia Università di Bologna, 1,469 students. Philosophical, scientific, law, medical, and pharmaceutical faculties; veterinary and engineers' schools; library.
27. *Bombay, India*: University of Bombay. Examining board, 3,374 candidates; five preparatory colleges.
28. *Bonn, Prussia, Germany*: Rheinische Friedr.-Wilhelms-Universität, 2,557 students. Protestant and Catholic theological, law, medical, and philosophical faculties; library and many institutes.
29. *Bordeaux, France*: Facultés de Bordeaux, 2,042 students. Law, medical, scientific, and philosophical faculties; library.
30. *Braunsberg, Prussia, Germany*: Königl. Lyceum Hosianum, 68 students. Theological and philosophical faculties; library.
31. *Breslau, Prussia, Germany*: Königl. Universität Breslau, 1,813 students. Catholic and Protestant theological, law, medical, and philosophical faculties; library.
32. *Bristol, England*: University College, 567 students (204 women). College faculty and medical school; library.

33. *Brussels, Belgium*: Université libre de Bruxelles, 1,060 students. Philosophical, law, scientific, medical, and pharmaceutical faculties; also polytechnical school; library.
34. *Brussels, Belgium*: School of political and social sciences.
35. *Bucharest, Roumania*: Universitatea din Bucuresti, 4,314 students. Scientific, philosophical, law, medical, and theological faculties; library.
36. *Budapest, Hungary*: Királyi Magyar Tudomány-Egyetem, 5,940 students. Theological, law, medical, and philosophical faculties; library.
37. *Buenos Ayres, Argentina*: Universidad Nacional, 2,665 students. Law, medical, and general faculties.
38. *Cadiz, Spain*: Facultad de Medicina (belonging to Seville). Medical faculty; library.
39. *Caen, France*: Université de Caen, 696 students. Law, scientific, and philosophical faculties; library.
40. *Cagliari, Sardinia, Italy*: Regia Università di Cagliari, 243 students. Law, medical, and scientific faculties; library.
41. *Cairo, Egypt*: Azhar University, about 10,003 students and hearers.
42. *Calcutta, India*: University of Calcutta, 7,210 candidates, of whom 3,475 passed. Examining board; library.
43. *Cambridge, England*: University of Cambridge, 2,985 students. Schools of theology, law, oriental, classical, and modern philology, music, moral science, history and archæology, astronomy, physics, chemistry, mineralogy, biology, geology, and medicine; library.
44. *Camerino, Italy*: Libera Università degli Studi di Camerino, 304 students. Law, medical, and pharmaceutical faculties, and veterinary school: communal library.
45. *Cape Town, South Africa*: University of the Cape of Good Hope.
46. *Cardiff, Wales*: Part of University of Wales, 603 students. Philosophical and scientific faculties and department of engineering; library.
47. *Catania, Sicily, Italy*: Regia Università degli Studi di Catania, 1,027 students. Law, medical, scientific, and philosophical faculties; library.
48. *Christiania, Norway*: Kongelige Frederiks Universitet, 1,400 students. Theological, law, medical, philosophical, and scientific faculties; library.
49. *Clermont-Ferrand, France*: Université de Clermont, 281 students. Scientific and philosophical faculties; library.
50. *Coimbra, Portugal*: Universidade de Coimbra, 1,684 students. Theological, law, and scientific faculties; library.
51. *Cologne, Prussia, Germany*: Municipal Commercial University, 749 students. *Copenhagen.* (See Kjøbenhavn.)
52. *Cordoba, Argentina*: Universidad Nacional. Law, scientific, and medical faculties; observatory.
53. *Cork, Ireland*: Queen's College, 212 students.
54. *Cracow.* (See Krakow.)
55. *Czernowitz, Bukowina, Austria*: K. k. Franz-Josephs-Universität, 543 students. Theological, law, and philosophical faculties; library.
56. *Debreczin, Hungary*: Evangelical Reformed University, 319 students. Law, theological, and philosophical faculties.
57. *Dijon, France*: Faculté de Dijon, 649 students. Law, scientific, and philosophical faculties; library.
58. *Dillingen, Bavaria, Germany*: Theological Lyceum, 129 students.
59. *Dorpat (Jurjew), Russia*: Imperial University, 1,790 students. Law, theological, medical, and philosophical faculties.
60. *Dublin, Ireland*: University of Dublin, 1,047 students.
61. *Dublin, Ireland*: Royal University of Ireland, about 600 candidates. Examining board.
62. *Dundee, Scotland*: University College, 253 students.
63. *Durham, England*: Durham University, 209 students. To this university belong the Codrington College, on the island of Barbados, and the Fourah Bay College, in Sierra Leone; also the College of Science, at Newcastle-on-Tyne, which has an enrollment of 1,500 students.
64. *Edinburgh, Scotland*: University of Edinburgh, 2,920 students. Philosophical, theological, law, and medical faculties; library.
65. *Edinburgh, Scotland*: School of Medicine, 1,200 students.
66. *Eichstätt, Bavaria, Germany*: Bishöfliches Lyceum, 114 students. Theological and philosophical faculties.
67. *Eperies, Hungary*: Evangelische Rechtsakademie, 245 students. Law school.

67. *Erlangen, Bavaria, Germany*: K. Bayerische Friedr.-Alexander-Universität, 1,004 students. Theological, law, medical, and philosophical faculties; library.
68. *Erlau, Hungary*: Erzbischöfliche Rechtsakademie, 108 students. Law school.
69. *Ferrara, Italy*: Libera Università di Ferrara, 128 students. Law, scientific, and medical faculties; library.
70. *Florence, Italy*: R. Istituto di Studi Superiori Pratici e di Perfezionamento, 593 students. Philosophical, scientific, medical, and pharmaceutical faculties; library.
71. *Florence, Italy*: R. Istituto di Magistero Femminile, 152 students. Woman's university.
72. *Frankfort, Prussia, Germany*: Commercial and Social Science Academy.
73. *Freiburg, Baden, Germany*: Badische Albert-Ludwigs-Universität, 1,861 students. Law, theological, medical, and philosophical faculties; library.
74. *Freiburg, Switzerland*: Katholische Universität, 426 students. Theological, law, and philosophical faculties; library.
75. *Freising, Bavaria, Germany*: Königl. Bayerisches Lyceum, 150 students. Theological and philosophical faculties.
76. *Fünfkirchen, Hungary*: Bischöfliche Rechtsakademie. Law school, 140 students.
77. *Galway, Ireland*: Queen's College, 110 students.
78. *Geneva, Switzerland*: Université de Genève, 1,247 students. Theological, law, medical, philosophical, and scientific faculties; five libraries.
79. *Genoa, Italy*: R. Università degli Studi di Genoa, 1,325 students. Law, medical, scientific, and philosophical faculties, and schools of engineering and pharmaceutics; library.
80. *Ghent, Belgium*: Université de Gand, 804 students. Philosophical, law, scientific, and medical faculties; library.
81. *Giessen, Hesse, Germany*: Hessische Ludwigs Universität, 1,016 students. Theological, law, medical, and philosophical faculties; library.
82. *Glasgow, Scotland*: University of Glasgow, 2,059 students (360 women).
83. *Gottenborg, Sweden*: Göteborgs Högskola, 1,116 hearers.
84. *Göttingen, Prussia, Germany*: Georg-Augusts-Universität, 1,456 students. Theological, law, medical, and philosophical faculties; library.
85. *Granada, Spain*: Universidad de Granada. Philosophical, law, scientific, medical, and pharmaceutical faculties; library.
86. *Gratz, Styria, Austria*: K. k. Karl-Franzens Universität, 1,760 students. Theological, law, medical, and philosophical faculties; library.
87. *Greifswald, Prussia, Germany*: Universität, 846 students. Theological, law, medical, and philosophical faculties; library.
88. *Grenoble, France*: Université de Grenoble, 687 students. Law, scientific, and philosophical faculties; library.
89. *Groningen, Netherlands*: Rijks Universiteit te Groningen, 420 students. Theological, law, medical, scientific, and philosophical faculties; library.
90. *Grosswardein, Hungary*: Jógakademia, 222 students. Law school.
91. *Habana, Cuba*: Universidad de la Habana, 633 students. Philosophical, scientific, medical, and law faculties; library.
92. *Halifax, Nova Scotia, Canada*: Dalhousie College and University, 345 students.
93. *Halle, Prussia, Germany*: Friedr.-Universität Halle-Wittenberg, 1,961 students. Theological, law, medical, and philosophical faculties; library.
94. *Heidelberg, Baden, Germany*: Ruprecht-Karls-Universität, 1,823 students. Theological, law, medical, philosophical, and scientific faculties; library.
95. *Helsingfors, Finland*: Keisersliga Alexanders Universitet i Finland, 2,556 students. Theological, law, medical, and philosophical faculties; public library.
96. *Innsbruck, Tyrol, Austria*: K. k. Leopold-Franzens Universität, 1,001 students. Theological, law, medical, and philosophical faculties; library.
97. *Jaroslavl (or Yaroslavl), Russia*: Demidovskij juridiceskij Licej, 456 students. Law school.
98. *Jassy, Roumania*: Universitatea din Jasi, 782 students. Law, philosophical, scientific, and medical faculties; library.
99. *Jena, Thuringia, Germany*: Sächsische Gesamt-Universität, 818 students. Theological, law, medical, and philosophical faculties; library.
100. *Jerusalem, Palestine*: École Pratique d'Étude Bibliques. Theological school, 24 students.

*Jurjew.* (See Dorpat.)

101. *Kazan, Russia*: Imperatorskij Kazanskij Universitet, 873 students. Philosophical, scientific, law, and medical faculties; library.
102. *Kazan, Russia*: Theological academy, 260 students.
103. *Kaschau, Hungary*: Rechts-Akademie, 194 students. Law school.
104. *Keckskemet, Hungary*: Rechts-Akademie, 151 students. Law school.
105. *Kharkof, Russia*: Imperatorskij Charkowskij Universitet, 1,384 students. Philosophical, scientific, law, and medical faculties; library.
106. *Kiel, Prussia, Germany*: K. Christian-Albrechts-Universität, 1,179 students. Theological, law, medical, and philosophical faculties; library.
107. *Kief, Russia*: Imperatorskij Universitet, 2,641 students. Medical, law, and philosophical faculties; institutes and library.
108. *Kief, Russia*: Theological academy, 181 students.
109. *Kingston, Ontario, Canada*: University of Queen's College, 672 students. Theological, arts, law, and medical faculties; museum.
110. *Kjöbenhavn (Copenhagen) Denmark*: Kjöbenhavns Universitet, about 2,000 students. Theological, law, medical, philosophical, and scientific faculties and polytechnic institute; library.
111. *Klausenburg, Siebenbürgen, Hungary*: K. k. Klausenburger Universität, 1,592 students. Law, medical, philosophical, and scientific faculties; library.
112. *Königsberg, Prussia, Germany*: K. Albertus Universität, 968 students. Theological, law, medical, and philosophical faculties; royal and university library.
113. *Krakow, Galicia, Austria*: Jagellonische Universität, 1,711 students. Theological, law, medical, and philosophical faculties; library.
114. *Kyoto, Japan*: Imperial University, 498 students. Law, medical, and scientific faculties.
115. *Lahore, India*: The Punjab University, 2,803 candidates, of whom 1,398 passed. Oriental languages, arts, law, medicine, science, and engineering departments.
116. *Lampeter, Wales*: St. David's College, 130 students.
117. *Lausanne, Switzerland*: Université de Lausanne, 721 students. Theological, law, medical, philosophical, and scientific faculties.
118. *Leeds (see Manchester), England*: Yorkshire College, 1,134 students.
119. *Leipzig, Saxony, Germany*: Universität, 4,220 students. Theological, law, medical, and philosophical faculties; library.
120. *Leyden, Netherlands*: Rijks-Universiteit, 1,027 students. Medical, scientific, philosophical, theological, and law faculties; library.
121. *Lemberg, Galicia, Austria*: K. k. Franzen's Universität in Lemberg, 1,628 students. Theological, law, and philosophical faculties; library.
- Liege. (See Lüttich.)*
122. *Lille, France*: Facultés de Lille, 1,136 students. Law, medical, scientific, and philosophical faculties; library.
123. *Lille, France*: Facultés Libres, 550 students. Theological, law, medical, scientific, and philosophical faculties; library.
124. *Lima, Peru*: Universidad Mayor de San Marcos. Theological, law, medical, and philosophical faculties.
125. *Limoges, France*: École de Médecine et de Pharmacie, 108 students. Medical and pharmaceutical courses.
126. *Lisbon, Portugal*: Curso Superior de Letteras, 111 students.
127. *Lisbon, Portugal*: Escola Medico Cirurgica. Medical college.
128. *Liverpool (see Manchester), England*: University College, 700 students.
129. *London, England*: University of London, about 5,000 candidates. Examining board; library.
- To the university belong:
- (1) University College, with philosophical, law, scientific, and medical faculties; library; about 1,020 students.
- (2) King's College, with theological, philosophical, and medical faculties; library; 1,300 students.
- (3) School of Modern Oriental Languages.
- (4) Ten other colleges with 614 students.
- (5) Eleven medical schools connected with hospitals; about 4,000 students.
130. *Louvain, Belgium*: Université Catholique de Louvain, 1,961 students. Theological, law, medical, philosophical, and scientific faculties; library.
131. *Louvain, Belgium*: Philosophical School of St. Thomas Aquinas.
132. *Lund, Sweden*: Kongl. Universitet i Lund, 693 students. Theological, law, medical, and philosophical faculties; library.

133. *Lüttich (or Liege), Belgium*: Université de Liège, 1,644 students. Philosophical, law, scientific, and medical faculties; library.
134. *Lyon, France*: Facultés Catholiques, about 600 students. Theological, law, scientific, and philosophical faculties.
135. *Lyon, France*: Université de Lyon, 2,602 students. Law, medical, scientific, and philosophical faculties; two libraries.
136. *Macerata, Italy*: Regia Università di Macerata, 210 students. Law faculty.
137. *Madras, India*: University of Madras, about 7,420 candidates. Examining board.
138. *Madras, India*: Medical college, 489 students.
139. *Madrid, Spain*: Universidad Central de España, 5,118 students. Philosophical, law, scientific, medical, and pharmaceutical faculties; libraries.
140. *Manchester, Liverpool, and Leeds, England*: Victoria University, about 3,000 students. This institution consists of:
  - (1) Owens College, Manchester, 1,105 students.
  - (2) University College, Liverpool, about 700 students.
  - (3) Yorkshire College, Leeds, 1,134 students.
141. *Manila, Philippine Islands*: Real y Pontificia Universidad de Santo Tomás de Manila, 1,144 students. Theological, law, medical, and pharmaceutical faculties; library.
142. *Marburg, Hesse, Germany*: Universität Marburg, 1,428 students. Theological, law, medical, philosophical, and scientific faculties; library.
143. *Marseille, France*: Belongs to Facultés d'Aix, 206 students. Scientific, medical, and law faculties; library.
144. *Melbourne, Victoria, Australia*: University of Melbourne, 647 students.
145. *Messina, Italy*: Regia Università degli Studi di Messina, 636 students. Law, medical, scientific, philosophical, and pharmaceutical faculties; library.
146. *Mexico, Mexico*: Instituto Médico Nacional. Medical faculty.
147. *Milan, Italy*: Accademia Scientifico-letteraria, 97 students. Scientific school.
148. *Modena, Italy*: Regia Università degli Studi di Modena, 711 students. Law, medical, scientific, and pharmaceutical faculties; library.
149. *Montauban, France*: Belongs to Facultés de Toulouse, 85 students. Law, medical, scientific, and philosophical faculties; library.
150. *Montevideo, Uruguay*: University, 132 students. Medical, law, and mathematical faculties; library.
151. *Montpellier, France*: Facultés de Montpellier, 1,602 students. Law, medical, scientific, and philosophical faculties; library.
152. *Montreal, Canada*: McGill College and University, 1,111 students.
153. *Montreal, Canada*: Succursale de L'Université Laval de Quebec, 605 students. Theological, medical, and law faculties.
154. *Moscow, Russia*: Imperatorskij Moskovskij Universitet, 4,691 students. Philosophical, scientific, law, and medical faculties; library.
155. *Moscow, Russia*: Duchovnaja Akademija, 218 students. Theological faculty; library.
156. *Moscow, Russia*: Lazarev Institute for oriental languages, 59 students.
157. *Munich, Bavaria, Germany*: K. Bayerische Ludwig-Maximilians-Universität, 4,705 students. Theological, law, medical, and philosophical faculties; library.
158. *Münster, Prussia, Germany*: K. Preussische Universität, 907 students. Theological and philosophical faculties; library.
159. *Nancy, France*: Université Nancy, 1,130 students. Law, medical, scientific, and philosophical faculties, and pharmaceutical school; library.
160. *Nantes, France*: École de Médecine de Nantes, 243 students.
161. *Nantes, France*: Ecole Libre de Droit, 100 students.
162. *Naples, Italy*: Regia Università degli Studi di Napoli, 5,165 students. Philosophical, law, mathematical, scientific, and medical faculties, and pharmaceutical school; library.
163. *Neuchâtel, Switzerland*: Académie de Neuchâtel, 178 students. Philosophical, scientific, theological, and law faculties; library.
164. *Newcastle, England*: The colleges belong to Durham University.
  - (1) College of Medicine, 210 students.
  - (2) Durham College of Science, 1,650 students.
165. *New Zealand*: University, consisting of four colleges, 1,287 students.
166. *Nezin, Russia*: Historical and Philological Institute, 81 students.
167. *Nottingham, England*: University College, 1,902 students. Philology, law, and scientific faculties, and school of engineering; free public libraries.

168. *Odessa, Russia*: Noworossijskij Universitet, 1,116 students. Philosophical, scientific, and law faculties; library.
169. *Olmütz, Moravia, Austria*: Theologische Facultät, 191 students.
170. *Oviedo, Spain*: Universidad Literaria, 234 students. Law faculty; library.
171. *Oxford, England*: University, 3,481 students. Theological, law, medical, scientific, and philosophical faculties; Bodleian library.
172. *Padua, Italy*: Regia Università degli Studi di Padua, 1,450 students. Law, medical, scientific, and philosophical faculties, and schools of engineering and pharmacy; library.
173. *Palermo, Sicily, Italy*: Regia Università degli Studi di Palermo, 1,400 students. Law, medical, scientific, and philosophical faculties, and schools of engineering and pharmacy; library.
174. *Paris, France*: (1) Université de Paris, 12,171 students. Protestant theological, law, medical, scientific, and philosophical faculties, and schools of engineering and pharmacy; libraries.
175. *Paris, France*: (2) Facultés libres, 704 students. Law and philosophical faculties; library.
176. *Paris, France*: (3) Collège de France.
177. *Paris, France*: (4) École Libre des Sciences Politiques, 600 students.
178. *Paris, France*: (5) École Pratique des Hautes Études à la Sorbonne, 233 students. Philosophical and theological faculties; library.
179. *Paris, France*: (6) École Nationale des Beaux-arts, 2,000 students.
180. *Paris, France*: (7) École Nationale de Chartes, 69 students.
181. *Paris, France*: (8) École du Louvre.
182. *Paris, France*: (9) École des Langues Orientales Vivantes, and other special schools, 430 students.
183. *Paris, France*: (10) École Russe des Hautes Études Sociales, 350 students.
184. *Paris, France*: (11) École Normale Supérieure, 110 students.
185. *Parma, Italy*: Regia Università degli Studi di Parma, 621 students. Law, medical, and scientific faculties, and veterinary and pharmaceutical schools.
186. *Passau, Bavaria, Germany*: Theological Lyceum, 97 students.
187. *Pavia, Italy*: Regia Università degli Studi, 1,335 students. Law, medical, scientific, and philosophical faculties; pharmaceutical school and library.
188. *Pernambuco, Brazil*: Faculdade de direito, 237 students. Law faculty.
189. *Perugia, Italy*: Università Libera degli Studi di Perugia, 298 students. Law and medical faculties, and pharmaceutical and veterinary schools; library.
190. *Pisa, Italy*: Regia Università degli Studi di Pisa, 1,074 students. Law, philosophical, medical, and scientific faculties, and engineering, pharmaceutical, veterinary, and agricultural schools; library.
191. *Poitiers, France*: Université de Poitiers, 735 students. Law, scientific, and philosophical faculties; libraries.
192. *Prague, Bohemia, Austria*: K. k. Deutsche Carl-Ferdinands Universität, 1,234 students. Theological, law, medical, and philosophical faculties; library.
193. *Prague, Bohemia, Austria*: C. k. česk Universitet Karlo-Ferdinandovij, 3,459 students. Theological, law, medical, and philosophical faculties; library.
194. *Pressburg, Hungary*: Jógakademia, 246 students. Law and philosophical faculties; library.
195. *Quebec, Canada*: Université Laval, 358 students. Theological, law, medical, and arts faculties; library and museum.
196. *Ratisbon, Bavaria, Germany*: Theological Lyceum, 174 students.
197. *Regensburg, Bavaria, Germany*: Lyceum, 182 students. Theological and philosophical faculties.
198. *Rennes, France*: Université de Rennes, 1,143 students. Law, scientific, and philosophical faculties; library.
199. *Rheims, France*: École Prép. de Médecine, 92 students. Medical school.
200. *Rome, Italy*: Regia Università degli Studi di Roma, 2,348 students. Philosophical, scientific, law, and medical faculties; engineering and pharmaceutical schools; library.
201. *Rome, Italy*: A number of colleges supported by the church, with 1,065 students; also a woman's university with 160 students.
202. *Rome, Italy*: Pontificia Universitas Gregoriana in Collegio Romano, 1,026 students. Theological, law, and philosophical faculties.
203. *Rostock, Mecklenburg, Germany*: Grossherzogliche Universität, 588 students. Theological, law, medical, and philosophical faculties; library.

204. *Rouen, France: École Prép. de Médecine.* Medical school, 157 students.
205. *St. Petersburg, Russia: Imperatorskij Universitet,* 3,775 students. Philosophical, scientific, law, and oriental languages faculties; library.
206. *St. Petersburg, Russia: Imperatorskij Vojenno-Medicineskaja Akademija,* 750 students. Medical faculty; library.
207. *St. Petersburg, Russia: Duchovnaja Akademija.* Theological faculty, 242 students; also a school of military law.
208. *St. Petersburg, Russia: Law Academy,* 330 students, and several other special schools.
209. *St. Petersburg, Russia: Hist. Philological Institute,* 88 students.
210. *St. Petersburg, Russia: Higher Courses for Women,* 1,000 students.
211. *Salamanca, Spain: Universidad de Salamanca,* 1,200 students. Philosophical and law faculties; library.
212. *Salzburg, Austria: Theologische Fakultät,* 60 students.
213. *Santiago, Chile: University with 4 faculties and* 1,000 students; also Institute of Pedagogy, 162 students.
214. *Santiago, Spain: Universidad de Santiago.* Law, medical, and pharmaceutical faculties; library.
215. *Saragossa, Spain: Universidad de Zaragoza,* 966 students. Philosophical, law, medical, and scientific faculties; provincial library.
216. *Sarospatak, Hungary: Theologische und Rechtsschule,* 148 students.
217. *Sassari, Italy: Regia Università degli Studi di Sassari,* 160 students. Law, medical, and scientific faculties; library.
218. *Seville, Spain: Universidad de Sevilla.* Philosophical, law, and scientific faculties; library.
219. *Sheffield, England: University College (belongs to Oxford University),* 450 students; also a medical school.
220. *Siena, Italy: Regia Università degli Studi di Siena,* 228 students. Law and medical faculties and pharmaceutical school; library.
221. *Sophia, Bulgaria: Visse Učilište v Sofija,* 495 students.
222. *Stockholm, Sweden: Stockholms Högskola,* 337 students.
223. *Stockholm, Sweden: Medical Institute,* 327 students.
224. *Strassburg, Alsace, Germany: Kaiser Wilhelms Universität,* 1,250 students. Theological, law, medical, philosophical, and scientific faculties; provincial library.
225. *Sydney, New South Wales, Australia: University of Sydney,* 657 students.
226. *Tokyo, Japan: Teikoku, Daigaku,* 3,213 students. Law, medical, philosophical, and scientific faculties, agriculture and school of engineering; library.
227. *Tomsk, Siberia: Imperatorskij Tomskij Universitet,* 540 students. Theological and medical faculties; library.
228. *Toronto, Canada: University of Toronto,* 1,322 students. Philosophical, law, and medical faculties; library.
229. *Toronto, Canada: Victoria University,* 250 students. Arts and theology; library.
230. *Toronto, Canada: Three medical schools;* 355 students.
231. *Toulouse, France: Université de Toulouse,* 1,955 students. Law, philosophical, scientific, and medical faculties; library.
232. *Toulouse, France: Institut Catholique,* 100 students. Theological and philosophical faculties; library.
233. *Tours, France: École Prép. de Médecine,* 103 students. Medical school.
234. *Tübingen, Württemberg, Germany: K. Eberhard Karls Universität,* 1,524 students. Theological, law, medical, philosophical, and scientific faculties; library.
235. *Turin, Italy: Regia Università degli Studi di Torino,* 2,700 students. Law, medical, philosophical, and scientific faculties and pharmaceutical school; library.
236. *Upsala, Sweden: Kongl. Universitet i Upsala,* 1,388 students. Theological, law, medical, and philosophical faculties; library.
237. *Urbino, Italy: Libera Università degli Studi di Urbino,* 161 students. Law and mathematical faculties and pharmaceutical and surgical schools; library.
238. *Utrecht, Netherlands: Rijks Universiteit te Utrecht,* 1,003 students. Philosophical, medical, theological, law, and scientific faculties; library.
239. *Valencia, Spain: Universidad de Valencia,* 1,728 students. Law, scientific, and medical faculties; library.
240. *Valladolid, Spain: Universidad de Valladolid.* Law and medical faculties; library.

241. *Vienna, Austria*: K. k. Universität, 6,009 students. Law, theological, medical, and philosophical faculties; library and numerous university institutes.
242. *Vienna, Austria*: Protestantische Theologische Fakultät, 31 students.
243. *Vienna, Austria*: Lehraustalt für orientalische Sprachen, 132 students.
244. *Vienna, Austria*: Consular Academy, 33 students.
245. *Warsaw, Poland, Russia*: Imperatorskij Warschawskij Universitet, 1,122 students. Philosophical, scientific, law, and medical faculties; library.
246. *Würzburg, Bavaria, Germany*: K. Julius-Maximilians Universität, 1,254 students. Theological, law, medical, and philosophical faculties; library.
247. *Zürich, Switzerland*: Schweizerische Hochschule, 924 students. Theological, law, medical, and philosophical faculties; cantonal and city libraries.

*V. Foreign universities, arranged according to countries.*

- Argentina*: Cordoba. Buenos Ayres.  
*Australia*: Adelaide, Melbourne, Sydney.  
*Austria*: Czernowitz, Gratz, Innsbruck, Krakow, Lemberg, Olmütz, Prague (German). Prague (Bohemian). Salzburg, Vienna.  
*Belgium*: Brussels, Ghent, Liege, Louvain.  
*Bolivia*: (Universities not mentioned in "Minerva.")  
*Brazil*: Bello Horizonte, Pernambuco.  
*Bulgaria*: Sophia.  
*Canada*: Halifax, Kingston, Montreal, Quebec, Toronto.  
*Cape Colony*: Cape Town.  
*Chile*: Santiago.  
*China*: (College of Foreign Knowledge.)  
*Colombia*: (Universities not mentioned in "Minerva.")  
*Corea*: (None.)  
*Costa Rica*: (None.)  
*Cuba*: Habana.  
*Denmark*: Copenhagen.  
*Ecuador*: Quito.  
*Egypt*: Cairo.  
*England*: (See also Ireland, Scotland, and Wales, below.) Birmingham, Bristol, Cambridge, Durham, Leeds, Liverpool, London, Manchester, Newcastle, Nottingham, Oxford, Sheffield.  
*France*: Aix, Algiers, Angers, Besançon, Bordeaux, Caen, Clermont, Dijon, Grenoble, Lille, Limoges, Lyon, Marseille, Montauban, Montpellier, Nancy, Nantes, Paris, Poitiers, Rennes, Toulouse, and four separate medical schools.  
*Germany*: Bamberg, Berlin, Bonn, Braunsberg, Breslau, Cologne, Dillingen, Eichstätt, Erlangen, Frankfurt, Freiburg, Freising, Giessen, Göttingen, Greifswald, Halle, Heidelberg, Jena, Kiel, Königsberg, Leipzig, Marburg, Munich, Münster, Ratisbon, Rostock, Strassburg, Tübingen, Würzburg.  
*Greece*: Athens.  
*Guatemala*: (None.)  
*Haiti*: (None.)  
*Hawaii*: (None.)  
*Honduras*: (None.)  
*Hungary*: Agram, Budapest, Debreczin, Eperies, Erlau, Fünfkirchen, Grosswardein, Kaschau, Kecskemet, Klausenburg, Pressburg, Sarospatak.  
*India*: Allahabad, Bombay, Calcutta, Lahore, Madras.  
*Ireland*: Belfast, Cork, Dublin, Galway.  
*Italy*: Bologna, Cagliari, Camerino, Catania, Ferrara, Florence, Genoa, Macerata, Messina, Modena, Naples, Padua, Palermo, Parma, Pavia, Perugia, Pisa, Rome, Sassari, Siena, Turin, Urbino, and several colleges.  
*Japan*: Kyoto, Tokyo.  
*Mexico*: (Schools of law, medicine, engineering, etc.)  
*Montenegro*: (Theological seminary, not mentioned in "Minerva.")  
*Morocco*: (None.)  
*Netherlands*: Amsterdam, Groningen, Leyden, Utrecht.  
*New Zealand*: One university.  
*Nicaragua*: (None.)  
*Norway*: Christiania.  
*Orange Free State*: (None.)

*Paraguay:* (National college, not mentioned in "Minerva.")

*Persia:* (Several colleges, not mentioned in "Minerva.")

*Peru:* Lima.

*Palestine:* Jerusalem.

*Philippine Islands:* Manila.

*Portugal:* Coimbra.

*Romania:* Bucharest, Jassy.

*Russia:* Kharkof, Dorpat, Helsingfors, Yaroslavl, Kazan, Kief, Moscow, Nezin, Odessa, St. Petersburg, Warsaw.

*Salvador:* (One university, not mentioned in "Minerva.")

*Santo Domingo:* (None.)

*Scotland:* Aberdeen, St. Andrews, Dundee, Edinburgh, Glasgow.

*Servia:* Belgrade.

*Siam:* (None.)

*Siberia:* Tomsk.

*South African Republic:* (None.)

*Spain:* Barcelona, Cadiz, Granada, Madrid, Oviedo, Salamanca, Santiago, Saragossa, Seville, Valencia, Valladolid.

*Sweden:* Gottenborg, Lund, Stockholm, Upsala.

*Switzerland:* Basel, Berne, Freiburg, Geneva, Lausanne, Neuchatel, Zurich.

*Turkey:* (Several colleges not mentioned in "Minerva.")

*Uruguay:* Montevideo.

*Venezuela:* (Universities not mentioned in "Minerva.")

*Wales:* Aberystwith, Bangor, Cardiff, Lampeter.

## VI. Technological schools.

1. *Aachen (Aix-la-Chapelle), Prussia, Germany,* founded 1870; 714 students.
2. *Berlin, Prussia, Germany,* founded 1779; 4,811 students.
3. *Brunsuick, Germany,* founded 1745; 509 students.
4. *Brünn, Austria,* founded 1850; (German) 403 students.
5. *Brünn, Austria,* founded 1899; (Bohemian) 177 students.
6. *Budapest, Hungary,* founded 1836; 1,780 students.
7. *Copenhagen, Denmark,* founded 1829; 500 students.
8. *Coopers Hill, England,* founded 1885; 131 students.
9. *Darmstadt, Hesse, Germany,* founded 1868; 1,803 students.
10. *Delft, Netherlands,* founded 1864; 875 students.
11. *Dresden, Saxony, Germany,* founded 1828; 1,292 students.
12. *Glasgow, Scotland,* founded 1886; 596 students.
13. *Gratz, Styria, Austria,* founded 1811; 425 students.
14. *Hanover, Prussia, Germany,* founded 1879; 1,729 students.
15. *Helsingfors, Finland, Russia,* founded 1847; 372 students.
16. *Karlsruhe, Baden, Germany,* founded 1825; 1,635 students.
17. *Kharkof, Russia,* founded 1884; 1,000 students.
18. *Kief, Russia,* founded 1898; 846 students.
19. *Lemberg, Galicia, Austria,* founded 1844; 725 students.
20. *Lille, France,* founded 1885; 100 students.
21. *Lisbon, Portugal,* founded 1837; 462 students.
22. *London, England,* 2 institutions, founded 1884; 277 and 187 students.
23. *Lyon, France,* founded 1857; 98 students.
24. *Madrid, Spain,* 2 institutions, founded 1835 and 1844; 223 and 80 students.
25. *Marseille, France,* [1891]; 30 students.
26. *Milan, Italy,* founded 1863; 552 students.
27. *Moscow, Russia,* 2 institutions, founded 1832 and 1896; 1089 and 380 students.
28. *Munich, Bavaria, Germany,* founded 1827; 2,738 students.
29. *Nancy, France,* 2 institutions, founded 1890 and 1900; 96 and 51 students.
30. *Naples, Italy,* founded 1863; 141 students.
31. *Oporto, Portugal,* founded 1877; 200 students.
32. *Paris, France,* founded 1794; five schools, with 1,538 students.
33. *Prague, Bohemia, Austria,* founded 1806 and 1868; 2 schools, with 1,909 students.
34. *Riga, Russia,* founded 1832; 1,701 students.
35. *St. Petersburg, Russia,* founded 1828; 5 schools, with 3,100 students.
36. *São Paulo, Brazil,* founded 1894; 175 students.
37. *Sheffield, England,* founded 1885; 750 students.
38. *Stockholm, Sweden,* founded 1798; 450 students.

39. *Stuttgart, Wurttemberg, Germany*, founded 1829; 1,203 students.
40. *Tomsk, Siberia, Russia*, founded 1896; 100 students.
41. *Turin, Italy*, founded 1858; 497 students.
42. *Vicenna, Austria*, founded 1815; 2,525 students.
43. *Warsaw, Poland, Russia*, founded 1898; 461 students.
44. *Zurich, Switzerland*, founded 1851; 1,511 students.

NOTE.—Several noted technological schools in Italy and in other countries are connected with universities, hence are not mentioned separately in this list.

## VII. Higher agricultural, forestry, and mining schools.

[Figures in brackets signify date of founding.]

1. *Altenburg, Hungary* [1819], Agricultural Academy; 162 students.
2. *Aschaffenburg, Bavaria, Germany*, [1844], Forestry Academy; 58 students.
3. *Beaurais, France* [1854], Agricultural Institute; 104 students.
4. *Berlin, Prussia, Germany* [1806], Agricultural Academy; 684 students.
5. *Berlin, Prussia, Germany* [1860], Mining Academy; 232 students.
6. *Bordeaux, France* [1891], School of Chemistry, Industry, and Agriculture.
7. *Campinas São Paulo, Brazil* [1887], Agricultural Institution.
8. *Clautthal, Prussia, Germany* [1775], Mining Academy; 183 students.
9. *Coopers Hill, England* [1885], Forestry Academy and Engineering College; 131 students.
10. *Copenhagen, Denmark* [1858], Veterinary and Agricultural Academy; 340 students.
11. *Debreezin, Hungary* [1865], Agricultural Academy; 110 students.
12. *Douai, France* [1888], Agricultural College; 30 students.
13. *Eberswalde, Prussia, Germany* [1820], Forestry Academy; 59 students.
14. *Eisenach, Saxe-Weimar, Germany* [1859], Forestry Academy; 38 students.
15. *Evois, Finland, Russia* [1859], Forestry Academy; 22 students.
16. *Freiberg, Saxony, Germany* [1765], Mining Academy; 466 students.
17. *Gembloux, Belgium* [1860], Agricultural Academy; 112 students.
18. *Glasgow, Scotland* [1900], Agricultural School; 110 students.
19. *Grignon, France* [1828], Agricultural Academy; 120 students.
20. *Hohenheim, Wurttemberg, Germany* [1818], Agricultural Academy; 113 students.
21. *Jekaterinoslaw, Russia* [1899], Mining Academy; 128 students.
22. *Kasehan, Hungary* [?], Agricultural Academy; 132 students.
23. *Keszthely, Hungary* [1865], Agricultural Academy; 156 students.
24. *Kingston, Ontario, Canada* [1892], Mining School; 214 students.
25. *Kolozsmonostor, Hungary* [1863], Agricultural Academy; 114 students.
26. *Leoben, Styria, Austria* [1894], Mining Academy; 255 students.
27. *London, England* [?], Agricultural College; 50 students.
28. *Lille, France* [1885], Industrial and Agricultural School.
29. *Madrid, Spain* [?], Schools of Agriculture and Veterinary Science; 200 students.
30. *Milan, Italy* [?], Agricultural Academy; 180 students.
31. *Mons, Belgium* [?], Mining Academy; 325 students.
32. *Montpellier, France* [1872], Agricultural School; 200 students.
33. *Moscow, Russia* [?], Agricultural and Forestry Academy; 235 students.
34. *Münden, Prussia, Germany* [1868], Forestry Academy; 50 students.
35. *Nancy, France* [1824], Forestry Academy; 26 students.
36. *Nowaja-Alexandria, Poland, Russia* [1892], Agricultural and Forestry Academy; 224 students.
37. *Ouro-Preto, Brazil* [1892], Mining Academy.
38. *Paris, France* [?], Mining Academy; 161 students.
39. *Paris, France* [?], Agricultural College; 260 students.
40. *Poppelsdorf, Prussia, Germany* [1846], Agricultural Academy; 391 students.
41. *Portici, Italy*, founded 1872, Agricultural College; 105 students.
42. *Pribram, Bohemia, Austria* [1849], Mining Academy; 135 students.
43. *Rennes, France* [1890], Agricultural College; 120 students.
44. *Schemnitz, Hungary* [?], Forestry and Mining Academy; 263 students.
45. *St. Etienne, France* [1816], Mining Academy; 120 students.
46. *Stockholm, Sweden* [1823], Forestry School; 41 students; also Agricultural Academy [1811]; 30 students.

47. *St. Petersburg, Russia* [1773], Mining Institute; 550 students.
48. *St. Petersburg, Russia* [1880], Forestry Institute; 516 students.
49. *Tharandt, Saxony, Germany* [1811], Forestry Academy; 54 students.
50. *Toronto, Canada* [1888], Agricultural College.
51. *Vienna, Austria* [1872], Agricultural Academy; 366 students.

NOTE.—Other similar higher institutions of learning are connected with universities, hence they are not mentioned in this list of separate institutions.

#### VIII. *Veterinary schools.*

1. *Alford, France* [1766]; 294 students.
2. *Berlin, Germany* [1790], 483 students.
3. *Bucharest, Roumania* [1861]; 95 students.
4. *Budapest, Hungary* [1786]; 318 students.
5. *Cordoba, Spain* [1802]; 74 students.
6. *Copenhagen, Denmark* [1858]; see above in VII, 340 students.
7. *Dorpat, Russia* [?]; 311 students.
8. *Dresden, Germany* [1774]; 174 students.
9. *Hanover, Germany* [?]; 273 students.
10. *Kazan, Russia* [?]; 456 students.
11. *Kharkof, Russia* [1804]; 150 students.
12. *Lemberg, Austria* [1881]; — students.
13. *Leon, Spain* [?]; 99 students.
14. *London, England* [1791]; 230 students.
15. *Lyon, France* [1761]; 180 students.
16. *Madrid, Spain* [1792]; 344 students.
17. *Milan, Italy* [1791]; 157 students.
18. *Munich, Germany* [1790]; 306 students.
19. *Naples, Italy* [?]; 200 students.
20. *Santiago, Spain* [1820]; — students.
21. *Saragossa, Spain* [?]; 276 students.
22. *Stockholm, Sweden* [1821]; 57 students.
23. *Stuttgart, Germany* [1821]; 135 students.
24. *Toulouse, France* [1825]; 164 students.
25. *Turin, Italy* [?]; 91 students.
26. *Utrecht, Netherlands* [?]; 83 students.
27. *Vienna, Austria* [1764]; 258 students.
28. *Warsaw, Russia* [?]; — students.

## CHAPTER XX.

### COMMERCIAL EDUCATION IN SWITZERLAND.<sup>a</sup>

[In the summer of 1901, the "International Union for the Promotion of Commercial Education" met in Zurich, Switzerland. Previous meetings of this union were mentioned in the Annual Report of 1900-1901. For the meeting in Zurich the editor of the Swiss "*Lehrerzeitung*" published July 6, 1901, an account of what the Swiss Confederation does for commercial education. Prof. Theophil Bernet-Hanhart prepared the article, which is here given in English with unimportant omissions.]

#### INTRODUCTORY REMARKS.

During the year 1888, about 125,000 persons were engaged in commercial occupations in Switzerland. The latest census, the details of which have not yet been published, will show a much larger number. In view of the unprecedented development of industry and commerce, the growing diversity of business pursuits, and ever keener competition, all members of the commercial class, especially clerks—except those in the most subordinate positions—require a good education. This conviction is constantly gaining ground. Whoever aims at a better position in business must possess a great deal of technical information and a knowledge of languages. In regard to the latter, far greater demands are made upon merchants in Switzerland than upon those in many parts of Germany, in France, England, and Italy.

That commercial education in Switzerland is on a higher plane than almost anywhere else is, therefore, not a mere accident, but the necessary consequence of the peculiar conditions of its commercial class. Owing to their thorough knowledge, Swiss business men have acquired a high reputation in the world of business; large numbers of Swiss clerks have won prominent positions with foreign firms, and their influence has reacted upon economic conditions in Switzerland with good effect. The greater the efforts to raise the educational standard of the commercial class in neighboring countries, however, the more we must strive not to be thrown into the shade.

The people of Switzerland have other reasons to occupy themselves with the subject. Every year large sums from the Federal treasury are spent on commercial education. In the year 1891 the Federal Government appropriated 41,616 francs for public commercial schools and mercantile associations; in 1900 the appropriations for similar purposes had increased to 300,147 francs (about \$60,000).<sup>b</sup> These figures are taken from official records; the following are based partly upon official reports, partly upon private calculations and estimates. The individual Cantons (States) and communities have appropriated about 720,000 francs for commercial education. Tuition fees and contributions of business firms amounted to about 382,000 francs.

<sup>a</sup> Articles on similar subjects published in previous Reports of the Commissioner of Education:

Commercial education in Europe. An. Rep. of 1896-97, p. 207.

The German commercial clerk. An. Rep. of 1899-1900, p. 835.

Industrial and commercial schools in Hungary. An. Rep. of 1899-1900, p. 865.

Commercial schools and commercial universities in central Europe. An. Rep. of 1900-1901, p. 21.

Consular reports on commercial schools. An. Rep. of 1899-1900, p. 1431 and p. 1440.

<sup>b</sup> However much this subsidy is appreciated, it must be stated that it falls far below that which is offered to industrial and agricultural education on the part of the Federal Government. In the year 1897, 1,908,773 francs (about \$400,000) were appropriated for industrial and agricultural schools, while the commercial schools received only 168,710 francs from the Federal treasury. (Huber, *Swiss Year-book of Education*, 1897.)

In 1900 the total expenditure for commercial education in Switzerland amounted to more than 1,400,000 francs. These are noteworthy sums of money, and it seems worth while to learn to what purposes they were applied.

#### HISTORICAL REVIEW.

Before examining the present conditions of commercial education in Switzerland, we will take a look at the past. A better understanding of the whole is thus gained, and many a peculiarity is easily explained in the light of its historical development.

#### THE EDUCATION OF SWISS MERCHANTS IN FORMER TIMES.

In former centuries, the sons of rich merchants received a good school education, according to the views of their times, and much private instruction. After leaving school they served an apprenticeship of from two to four years, after which they traveled abroad. In other cases, merchants gave their sons direct to foreign business friends for a term of apprenticeship, and took their children into their own business "in exchange." The counting houses of large business firms abroad were the universities for the merchant class, as they afforded the best opportunity for learning foreign languages and for the study of the world's markets.<sup>a</sup> On the other hand, no one paid any attention to the improvement of the "clerks" or "factors," for the obvious reason that their work and positions were subordinate; moreover, their number compared with that of present times was insignificantly small. Dr. Tr. Geering states that in Basel, in the sixteenth century, most business houses were conducted without clerks, and that fourteen large firms collectively employed only nineteen clerks. In Zurich, mostly young men from the country were appointed as commercial clerks, who, with modest means, spent their whole lives in the same office. They were not allowed to establish a business of their own, and even a change of position was often forbidden in their contract of engagement. (New Year's Bulletin of the Zurich Orphan Asylum, 1880.)

In later times, one hundred and fifty years ago and more, those who were intended for business pursuits attended, in common with other children, at least the so-called German schools, likewise known as citizens', secular, or writing schools. Reading, writing, in most cases also arithmetic, and some Latin were taught. Teachers and methods of instruction in these schools were nearly all wretched. Those who desired a better education attended the Latin school, in which not only the greatest attention was given to the Latin language, but that was also the medium of instruction in other branches. It is worthy of notice that the Latin language down to the time of the Reformation, and long afterwards, occupied a more prominent position than any modern language does at the present time. According to the History of Zurich Schools, by Prof. U. Ernst, there was, at that time, no provision in Switzerland or anywhere else for the special education of business men and mechanics. He who had learned to read and write was placed in the highest grade of the German school at the Newmarket (a boys' school established in 1586). There—

Söllend sy lernen eine rechnung usstellen, eine rechte überschrifft machen, den anfang und ussgang eines brieffs uffsetzen, zyt, jar und kalender verstan. (They shall learn to make out a bill, write correct addresses, draw up the beginning and end of a letter, and understand time, year, and the calendar.)

If in the commercial city of Zurich the study of arithmetic, so necessary to a merchant, was among the optional branches, being one of those to be paid for extra, it was looked upon elsewhere as an easily dispensable luxury. As late as the eighteenth century, arithmetic was taught in but one school throughout the Canton of Basel, in that of Liestal. Higher education was likewise in a state of petrification.

<sup>a</sup>This practice was in vogue during the first part of the nineteenth century all over Teutonic Europe. See Freitag's Debit and Credit (Soll und Haben), which contains a vivid description of this practice.—Translator.

It was only during the last decades of the eighteenth century that education began to show signs of progress. Citizens' or burgher schools and higher institutions were reorganized, the classic philological studies became less prominent, and more attention was given to the mother tongue and the exact and historical sciences. In Zurich, in 1765, Heidegger, who in later years became a highly respected burgo-master of the city, presented a well-prepared plan of reform, which was not carried out until about ten years later. New schools were established, as the school of arts (1773) and the girls' high school (1774). We shall have to refer to the first mentioned again, as it was chiefly designed for boys who intended to devote themselves to business. The efforts to improve popular and "higher" schools<sup>a</sup> have never ceased since, though the years of the Revolution did much to retard and injure them. We need not present here the phases of development of education in general. Knowing the opinions expressed by many merchants of Switzerland, we shall merely state that the people's schools, i. e., primary and grammar schools as they are to-day, are satisfactory in point of organization, and in general meet the requirements of the commercial class. However, owing to the great demands which are made of business men at present, all are of opinion that these people's schools require supplementary institutions for special education.

#### ORIGIN OF COMMERCIAL SCHOOLS.

So-called ciphering and bookkeeping schools were the forerunners of our commercial schools. In different cities abroad retired tradesmen, in the capacity of "teachers of bookkeeping, writing, and arithmetic," opened such schools, which usually passed out of existence with the death of their founder and only teacher. Thus Venice (from 1497), Nuremberg, and Leipzig (1680-1723) are reputed to have had schools of this kind. True commercial schools with a comprehensive course of study were first opened in Lisbon (1759), Paris (1767), Hamburg (1768), Vienna (1770), the Imperial Commercial Academy, with a practice department, Mülhausen (1781), etc. The college "La Châtelaine" in Geneva is the only private commercial school in Switzerland that dates its origin back to the eighteenth century (1776).

The oldest public commercial school of Switzerland is the Cantonal Commercial School in Zurich, a department of the industrial school. The present and past history of this, not only the oldest but also the largest commercial school of German Switzerland, has been prepared by loving hands in two supplements to the annual catalogues of the cantonal school: Contributions to the History of the Zurich Cantonal School, Part II, 1883, by Rector F. Hunziker, and The School of Arts in Zurich, the first Industrial School, 1900, by Dr. U. Ernst. From these and other sources at our command we take for our brief account only the following: The efforts toward educational reform in general during the second half of the eighteenth century led, as stated before, to the establishment of the school of arts. This institution opened its doors to students in 1773; it was not a purely commercial school, but was also designed for the education of young men who intended to become artists or skilled mechanics. Nevertheless, it is worthy of notice that repeated attention was drawn to the fact that merchants should know and learn more, and for that purpose required a new and special institution; that the board of trade undertook to contribute a large yearly subsidy; and that, from the very beginning, practical arithmetic, bookkeeping (combined with business correspondence), penmanship, French, and geography (with especial attention to the products which commerce and industry are particularly concerned with and trade routes), besides mathematics, natural history, drawing, and general history, were taught. The teacher of arith-

<sup>a</sup>By this term Swiss, Austrians, and Germans always mean schools higher than elementary.—*Translator*

metic at this school, Jakob Locher, can, therefore, justly be regarded as the first Swiss commercial teacher. Zurich's example was followed by other cities, for instance, Berne. At this period foreign universities, Dutch (Leyden, Utrecht) and German (Göttingen, Halle), were frequently attended by Swiss students. It was not a rare occurrence that even young-established merchants spent two or more terms at a university. (Gerold Meyer von Knonan, *The Canton of Zurich*, II, 1846.)

To afford those young men who desired a higher education after leaving the school of arts, or the corresponding classes of the classical high school, and before entering upon a practical career, the opportunity of obtaining it in Zurich, a private association was formed which founded the Technological Institute January 4, 1827, and continued to manage it until the cantonal school was established. Besides mathematics and the natural sciences, the following languages and commercial studies were included in the course: Commercial arithmetic and bookkeeping, commercial and banking law, German, French, English, and Italian. The State or cantonal school was opened on April 22, 1833, in the industrial department of which commercial arithmetic, bookkeeping, and countinghouse practice were taught. A reorganization, in the year 1839, divided the industrial school into three sharply defined sections: The mechanical technical, the chemical technical, and the mercantile. By a very considerable extension of the time given to commercial studies the mercantile section received more the character of a special school in 1855. Reorganizations of a less radical nature gradually led to a broader plan from the standpoint of a practical business as well as of a general education. The course was lengthened and the mercantile section received a more independent character contrasted with the technical sections. The plan of study approved on February 6, 1901, by the minister of education of the Canton contemplates a course of four and a half years. The higher classes constitute the commercial university. At present the whole institution, which bears the title of "Cantonal Commercial School and Preparatory School for Administrative Service," numbers 150 students in six classes. The example of Zurich was imitated by the following cities, in which have been established commercial secondary schools, some of them being independent cantonal or city schools and others departments of cantonal industrial or high schools: In 1842, St. Gall (mercantile division of the cantonal school); 1853, Frauenfeld; 1856, Berne and Schwyz; 1860, Zug; 1861, Winterthur (mercantile division of the city industrial school); 1865, Chur; 1869, Lausanne; 1874, Winterthur (commercial section of the cantonal technological school); 1882, Basel; 1883, Lucerne and Neuenburg; 1888, Geneva; 1890, Chaux-de-Fonds; 1892, Soleure; 1895, Bellinzona; 1896, Aarau and Locle; 1897, Freiburg, and, finally, 1899, again St. Gall (business academy and school of commerce).

Plans have been made for the establishment of commercial schools in Burgdorf and Biel, and their establishment is now assured. All these institutions are intended, principally, for male students, though Aarau, St. Gall, Soleure, Locle, and Winterthur also admit young women. Other cities have special commercial schools for girls, as Berne, since 1876; Biel, 1881; Zurich, 1884; Neuenburg, 1897; Geneva, 1898 (department of the secondary school), and Geneva, 1899 (department of the school of domestic economy). There are, consequently, 27 public commercial schools in Switzerland with courses from one to five years.<sup>a</sup> To these State and municipal institutions must be added at least 14 private commercial schools and institutes, which enjoy a good attendance. The students are mostly young men from other countries, to whose needs and preparatory education the public schools are not, and are not intended to be, adapted. These private schools afford them the training which they require and value.

<sup>a</sup> It is difficult to classify these schools, some being rather elementary in character, some secondary, and a few aspire to the rank of commercial universities.—*Translator*.

## ORIGIN OF COMMERCIAL SUPPLEMENTARY SCHOOLS.

Whereas the purpose of the schools hitherto mentioned is, without exception, to prepare young persons for a business career before entrance upon its practical duties, and, at the same time, to afford them a higher general education than that given in the elementary schools, the aim of a second and not less important category of mercantile schools is to give apprentices or clerks with some practical experience further theoretical training. The earlier boys leave school, the more insufficient their theoretical knowledge is, and the more necessary it is for them to continue the study of commercial branches and languages in connection with their daily work. Most business clerks have left school after completing the course of the second, a small proportion after attending the third class of a secondary school or the lower classes of a commercial school. For them the supplementary school is a pressing necessity. Formerly, as a usual thing, there was nothing to do but to take private lessons from teachers often incompetent. As, however, private instruction was too expensive for unsalaried apprentices, energetic and ambitious young men conceived the thought of coming together to receive instruction in common. Associations of young men with morning, afternoon, and evening courses of study were formed in Zurich and Berne, 1861; St. Gall, Basel, and Soleure, 1862; Winterthur, 1863, etc. From small beginnings the courses of many of these associations have developed into well-appointed commercial supplementary schools; it may, indeed, be affirmed that the schools maintained by the efforts of the present commercial associations are of the first rank. Many who owe promotion and success in business to these associations have remained true to them; for years, not only young merchants, but also mature men, have formed the membership of these commercial associations. Until the beginning of the nineties, consequently for three full decades, these associations supported their schools by their own efforts and with their own means, and have, therefore, won great merit for the education of the commercial class. Only a few cities, St. Gall and Geneva for female clerks, Zurich and Neuchatel, have public supplementary schools. On the other hand, a number of communities contribute large sums to the support of the courses of the commercial associations. Many Cantons also grant appropriations to commercial supplementary schools, but the most important factor is the powerful financial support which (since 1891) the Federal Government has granted in increasing measure for commercial education. A new and vigorous progress dates from that year.

At present the Federal Government contributes to the support of 60 commercial supplementary courses in 57 different places in Switzerland and 1 school each in Paris and London. Instead of giving an enumeration of these 60 institutions, we have taken the trouble to investigate how many cities in Switzerland have no such schools. The noteworthy fact was disclosed that no community with over 10,000 inhabitants is without a commercial supplementary school. We may except the suburban communities of large cities, as the clerks there resident work mostly in the cities and profit by their centrally located and well-arranged institutions. Of all independent cities with more than 5,000 inhabitants only 7 are without such a school. Besides the 60 receiving support from the Federal Government, there are in a few of the larger cities commercial supplementary courses maintained by communities or associations that have never presented any petition for Federal appropriation.

It would be very interesting to compare the schools of Switzerland with those of other countries. A statistical exhibit of the business schools of all, or even of the principal commercial States, however, would be too great a digression. A few facts must suffice. In his recently published study, *The Commercial School Idea in Saxony, 1900*, Prof. Bruno Zieger, of Dresden, remarks how large the number of commercial schools in Saxony (the "classical country of commercial education") is in comparison with that of other countries. In Prussia, for instance, such educa-

tional facilities are lacking in 110 cities with more than 10,000 inhabitants. Now, it must be pointed out that, with respect to the number of its commercial schools and commercial courses, Switzerland is in advance of Saxony, not only relatively, but also absolutely. Although Saxony has fully half a million more inhabitants, it has only 6 public secondary commercial schools for young men; Switzerland 21. In Switzerland there are 6 such schools for young ladies; Saxony has 5. Switzerland has more than 60 apprentice schools and mercantile courses; Saxony 56. On the other hand, Saxony has a commercial university connected with the old university at Leipzig.

#### EFFORTS TOWARD THE ESTABLISHMENT OF A COMMERCIAL UNIVERSITY IN SWITZERLAND.

A few facts concerning the efforts toward the establishment of a commercial university in Switzerland may be permitted. Many attempts to found such an institution as a department of the Federal polytechnic institute proved futile. In 1891 the Federal Congress considered the question at length on the occasion of a petition presented by the Swiss Commercial Union. The motion was defeated by but a small majority in both houses. It may be considered an accepted fact that the Federal legislative authorities do not want a commercial university connected with the polytechnicum. The departments of education of the two States (or Cantons) of Zurich and Berne have therefore allowed students of their commercial secondary schools who hold a satisfactory certificate of graduation after a four years' course, the privilege of matriculation at their universities. The faculties of the political sciences at both universities are so organized that the lectures on economics and social science, and the seminars on commercial legislation or policy, finance, and commercial law, are combined with those on jurisprudence. He who is preparing himself for the higher positions in commerce or governmental administration, or is educating himself to be a commercial teacher, usually concludes his theoretical training with this university course.<sup>a</sup> Of course this arrangement is only temporary, as the introduction of specifically commercial sciences into the courses of university lectures indicates the need of the establishment of a commercial university. St. Gall endeavored to meet the want of a higher commercial education by the opening of a commercial academy of first rank, and in Basel the authorities are considering a scheme for the establishment of a commercial university with a section devoted to the preparation of teachers.

#### GENERAL REVIEW OF THE PRESENT STATUS OF COMMERCIAL SCHOOLS.

Having traced the development of commercial education in Switzerland, and having shown that with regard to the number of its commercial schools and supplementary courses that country ranks first in order, we shall now endeavor to give a condensed statement of the purpose, condition, and organization of the existing institutions.

#### COMMERCIAL SCHOOLS, THEIR PURPOSE AND CONDITION.

In 1900 the 27 public commercial schools of Switzerland numbered about 1,550 male and 250 female students, besides 300 students of special branches. The city commercial school in Neuchatel had the largest attendance; the cantonal school in Zurich followed next in order, while the commercial department of the girls' high school of that city is the best attended commercial school for girls in Switzerland.

<sup>a</sup> Recently the government council of the Canton of Berne passed an ordinance according to which applicants who have taken a three years' academic course and have had at least one year's experience in business are eligible to examination for the position of commercial teachers of secondary schools. For lower schools the requirements are not so rigid.

Applicants must be 14, for some schools 15, years of age. Before entering, therefore, they will have had at least eight and often nine or more years' general instruction (in primary and grammar schools), and are ready to begin at once with technical branches and foreign languages. According to the purpose of any one institution, students receive a general secondary or a special technical education. All contemplated or proposed changes in recent times, however, tend in the latter direction, for commercial houses are willing to shorten the otherwise strict term of three years' apprenticeship for those only who have received a thorough technically mercantile education. Whether the period of this apprenticeship is abridged or not is a very important question for a young man of 18 years of age. Attendance in the higher classes is essentially influenced by such an abridgment. It is a fact easily confirmed by many proofs that merchants are recognizing to a greater extent every year the value of completing the entire course of a commercial school. Indeed, it often happens now that graduates from such schools receive at once positions as clerks with a suitable salary without any term of apprenticeship.

The commercial schools of Switzerland are, to a greater degree than those of surrounding countries, forced to take the availability of their graduates for immediate practical work into consideration. In Germany, Austria-Hungary, and France, attendance at a public secondary commercial school entitles to the privilege of abridged military service, just as does attendance at any classical high school; the commercial schools which claim this privilege, however, are obliged to give full attention to general education—that is, to culture studies. Attendance does not suffer thereby; on the contrary, the school authorities consider the privilege one of the strongest means to increase the number of students. Any father who destines his son to be a merchant, naturally prefers to send him to a school which allows him the privilege of only one year's military service, and besides gives him a more or less broad technical education. In Switzerland, like considerations carry no weight, as the Swiss army organization grants no favors to the better educated. Parents base their decision as to whether and how long their sons are to attend a commercial school on the extent to which they are fitted for a successful business career by a higher general and technical education.

As has been said, not all Swiss commercial schools follow the same practical plan; nor are their standards equally high. The general rule is a three years' course; Berne, Freiburg, Neuenburg, and Zurich have a four, Bellinzona<sup>a</sup> a five years' course. Most commercial schools for girls, including the mercantile department in Frauenfeld, have only a two years' course; the cantonal school in Trogen and the city school in Winterthur have only a one year's course. Formerly there were more schools with a course of one or two years; but as the federal law lays down the rule that only institutions of at least three grades are able to afford a higher commercial education, and therefore have a claim to federal support, a number of local boards have raised the standard of their commercial schools by extending the course of study.

In strong contrast to the gratifying fact of the improvement of schools are the very numerous instances of students leaving before they have completed the course. It seldom happens that more than half of those admitted take the final examination and graduate. All commercial schools meet with the same experience to a greater or less degree. From the standpoint of both schools and students, this circumstance is to be regretted. An effort, not altogether unsuccessful, has been made to counteract the evil by such means as laying stronger emphasis on the purely commercial branches, giving more attention to actual counting-house practice, placing graduates in desirable positions, and maintaining closer relations between schools and homes.

---

<sup>a</sup> See An. Report of the Commissioner of Education of 1899-1900, Vol. I, p. 843.—Translator.

The condition of affairs can never be brought about that all students will remain to graduate; it must not be forgotten that many mercantile firms, for good reasons, insist upon a three years' apprenticeship beginning with the sixteenth year of age at the latest. Family considerations, health, etc., often require students to leave before completing the course.

Commercial School of the city of Neuenburg, Switzerland.

In view of these conditions, the demand could rather be made of the schools to have the curriculum so arranged as to make leaving a lower grade possible without suddenly breaking off courses hardly begun. The new order of studies for the cantonal commercial school in Zurich has been based on this principle. German, French,

and English grammar, simple bookkeeping, German commercial correspondence, commercial transportation, penmanship, shorthand, and typewriting are taught exclusively in the lower grades of the school, while physics and chemistry, practical exercises in the counting-house department, banking and exchange, political economy, commercial law, Spanish, and Russian are reserved for the upper grades.

#### COMMERCIAL SUPPLEMENTARY SCHOOLS, THEIR ORGANIZATION AND CONDITION.

In the case of supplementary instruction, the effort toward consolidation and systematic development of formerly irregular arbitrary classes is gaining greater and greater recognition. Single courses are developing into apprentice schools with obligatory attendance, detached lectures into a unified series. A young man now does not, as was formerly too frequently the case, begin a new language one year, to take up another the next session, or perhaps not study at all during one term, and the next take up several courses, each claiming two to three hours a week, entirely too much for any one employed in office during the whole day.

We read in the last annual report of the central committee of the Swiss Commercial Union:

The rapid extension of the courses, the steadily increasing number of students and classes, did not allow the sections to give to the internal organization of their special schools all the attention they desired. Introducing new studies and making the classes smaller were the questions first in order. One of the most encouraging results of apprentice examinations is the present conviction, and it has been attained imperceptibly, that a rational programme with obligatory studies is a pressing necessity, if any measure of success at all commensurate with the sacrifices made in behalf of education is to be attained.

Such a programme has been introduced in the supplementary schools conducted by commercial associations in Baden, Berne, Biel, Langenthal, Lucerne, St. Gall, Winterthur, Zofingen, and Zurich. Students who desire to take language or commercial courses must strictly follow the given order, which as a rule extends over six successive semester periods with four obligatory studies each, and eight lessons a week. Supplementary schools thus organized are calculated to furnish apprentices with what is wanting in their "practical experience, which, owing to the rush of present business life and the division of labor in modern industry, is not sufficient for the training of a young man for any branch of business." (This dictum must apply to conditions as they exist here [in Zurich], for it is found in the latest report of the well-informed committee on education of the commercial association of Zurich.) At all the schools mentioned there are free supplementary courses. Older students (clerks, former students) are allowed the privilege of selecting one or more studies from the language, commercial, and art branches of the catalogue. This liberty of choice must be granted to them, as they desire only to fill a gap in their education, or take up those studies which are not admitted into a regular course through lack of time, as shorthand writing in foreign languages, political economy, the Russian and Portuguese languages, etc.

The majority of commercial supplementary schools still follow the principle of a wholly optional course of study. At a conference of representatives of schools of this kind in western Switzerland, which met in Biel in the fall of 1899, a resolution was passed recognizing the advantages of obligatory courses in theory, but declining to decide upon the immediate adoption of them in practice. Most frequently nothing more is done than to advise students more or less strongly to follow a proposed programme. Besides it must not be forgotten that in many places courses are announced in only very few studies; in some places, only in the most important foreign languages. Some schools close altogether during the summer. Of course, these are confined to the smaller towns and cities with a large outside trade.

Although attendance at supplementary schools, or at supplementary courses, is compulsory in but a few Cantons, Aargau and Vaud, for instance, these schools are well patronized. Employers generally favor and facilitate school attendance for their clerks and apprentices. Young men themselves feel the necessity of knowing more, and the desire for knowledge which animates them deserves to be commended.

Commercial Academy in St. Gall, Switzerland.

That there are indifferent and lazy clerks who would apply themselves to study only under compulsion is self-evident, and hence the desirability of compulsory supplementary education is made apparent quite often. It is most gratifying to note that in many towns where all enjoy liberty of choice, far more than half the number of

clerks make use of this opportunity for education. A statistical report which was prepared some years ago, showed that in the city of Zurich 350, nearly 48 per cent of the 734 young male clerks and commercial apprentices, attended the courses of the commercial association. This school numbers [in 1900] 650 students, not only apprentices of business houses, but also clerks, bank and railroad employees, etc. As far as known it is at present the best arranged and largest institution of this kind.

Practice countinghouse of the Cantonal Commercial School at Zürich, Switzerland.

The 59 supplementary schools that received Federal subsidies had last year a winter attendance of 5,244 male and female students. How great the proportion of the latter was could not be ascertained. According to the latest official report 15 schools admit women. In pursuance of a decree dated November 17, 1900, all supplementary schools that receive any support from the Federal treasury are obliged to admit girls if there is no special school for girls in the town.

Usually these supplementary schools, as well as secondary commercial schools, admit students only after they have reached the age of 14 or 15, and it is only after students have attained their twentieth year that they can become voting members of commercial associations; in fact, membership then is required of them. Up to this time the students enjoy no other advantages of the association except the use of the library and reading room and attendance at lectures.

Instruction in most cases must be deferred till after business hours, from 7 to 10 o'clock, a circumstance which is very prejudicial; there is no question but that after a day's work the receptive faculties of a mind not yet matured are less active, and that this system endangers physical well-being through overexertion. Arranging the classes between 1 and 2 p. m., or 6 and 7 a. m., has likewise proved unsatisfactory. A ten years' experience has shown more and more that apprentices should be allowed to attend school during business hours; classes for salaried clerks must, of course, be accommodated to their free time. Independent of the weighty pedagogical and humanitarian reasons for giving instruction during business hours (7-9 a. m.,

Cantonal Commercial Academy at Bellinzona, Switzerland.

2-3 p. m., and 6-8 in the evening), another consideration in its favor is that it is a question of instruction in those matters which students should learn in actual business, but so often fail to. Quite a number of firms allow their employees to attend these day classes. In the summer of 1899 as many as 163 classes with two hours a week were held during business hours; during the winter term the number rose to 206 classes at 24 association schools.

#### DETAILS CONCERNING THE SWISS COMMERCIAL SCHOOLS.

Attention is now drawn to a few matters which admit of uniformity of treatment for both kinds of schools (commercial schools proper and supplementary commercial courses). The following are selected as being of special importance: Courses and branches of study, appliances for teaching, examinations, size of classes, tuition fees and scholarships, officers, principals, and teachers. The comprehensive work, Commercial Schools and Mercantile Supplementary Education in Switzerland, pub-

lished by the Federal department of commerce, 1896, has been a valuable source of information for this article. A very lucid account of commercial supplementary education is also contained in a work entitled *The Commercial Association of Switzerland and its Sections, 1861-1896*, compiled by F. Bodmer-Weber and A. Krähenbühl. Besides these, the latest school programmes and annual reports were consulted, especially those of the Federal commercial department and the commercial teachers' association; for since the appearance of the two works just mentioned many changes have taken place in commercial school matters.

#### COURSES OF STUDY.

The commercial schools of Switzerland present the greatest diversity with regard to their plans of study; no two of the 27 schools have the same plan. The chief reason for this is the difference of purpose of the individual institutions, which has been already referred to. Trade and school conditions of different places, financial reasons, personal views and considerations may all have had a greater or less influence upon the arrangement of the curriculum. Unlimited freedom in the matter of studies is attended with great danger of making higher interests subordinate to less important ones. The attention of the commercial teachers' association of Switzerland has been directed to the fact that the diversity in the courses of study is a disturbing factor in the transfer of students from one school to another. And yet, such changes are very frequent on account of the shifting population in larger cities, and the popular custom of sending boys and girls away from home for one year to a part of the country where another language is spoken, in order to complete their commercial education. The board of directors of the association has been commissioned to call the attention of the conference of the Swiss department of education to this evil. Besides, Prof. W. Flury, of Soleure, under the direction of the association, has prepared a well-arranged compilation of the courses of study of public commercial schools in Switzerland, which has just been published in the third annual report of the commercial teachers' association.

Far from desiring to bring about a deadening uniformity of studies, it is nevertheless advocated that a standard order of studies for Switzerland be adopted, such as reason and experience dictate as proper for a well-organized commercial school. No one intends thereby to apply a strait-jacket. For positive as the disadvantages of absolute liberty may be, it must not be forgotten that it has not only been the source of diversity, but also of the strong development of excellent schools along original lines. Thanks to this liberty, new studies have been introduced in different places and new methods tested. That certain foreign languages and selected auxiliary studies have been taught according to the needs of the prevailing commercial or industrial lines of activity has only contributed toward assuring and increasing the sympathy of merchants for these schools. The Federal commercial department has taken the following attitude on this question:

To a certain degree the diversity of schools—i. e., the decentralization of our mercantile education and the variety of courses of study and methods—can be considered an advantage. In this regard the Government desires no action toward uniformity. The main purpose is a steady effort toward perfection. This effort is manifest, and has developed into a wholesome rivalry among individual schools. The Federal Government needs only concern itself about the proper measure of financial support. In all other matters each school should be permitted to carry out its purpose in whatever way may seem best for its attainment. A standstill is thus most surely avoided.

The following may serve as an example of the course of study of commercial schools of a three years' course, the type most frequently found in Switzerland:

*Course of study of the Superior School of Commerce of the city of Geneva.*

[To be admitted, students must have attended elementary schools for at least eight years.]

Studies.	Hours per week.		
	First year.	Second year.	Third year.
Mother tongue (French).....	3	3	3
Second Swiss language (German).....	4	4	4
English, Italian, or Spanish (optional) each.....	4	4	4
Commercial arithmetic and mathematics.....	5	3	3
Bookkeeping.....	4		
Counting-house practice.....		6	8
Commercial law, political economy.....		5	4
Chemistry, physics, and knowledge of merchandise.....	4	3	5
Geography.....	2	2	2
History.....	2	2	
Penmanship.....	3	2	
Stenography and typewriting.....			2
Drawing.....	2		
Total.....	33	34	55

The courses of other commercial schools are very different from this, yet everywhere great attention is given to languages. German and French are the principal branches in all these schools, and three, four, five, and six hours a week are devoted to each. The following are either optional or obligatory: English, Italian, Spanish, Russian, and in addition to these at the commercial academy of St. Gall, Dutch, Portuguese, Arabic, modern Greek, and Malay are offered. Besides languages, according to the character of the school, either the historical and mathematical-scientific, or the commercial branches receive the most attention, without any one group being altogether neglected. History, geography, physics and chemistry, the latter two mostly combined with technology, and the study of merchandise, algebra, commercial arithmetic, bookkeeping, office work, political economy, commercial law, penmanship, stenography, and typewriting—these branches, under various designations, it is true, and grouped in different ways, with more or less time devoted to each, are included in the curriculum of all the commercial high schools of Switzerland. Some schools include instruction in religion, debating, natural history, geometry, geometrical and free-hand drawing, transportation, civics, weaving, embroidery, gymnastics, military exercises, and singing. The senior students visit buildings of exchange, factories, etc., even though it may not be expressly prescribed in the course.

The branch about which there is the greatest diversity of opinion is the business department or counting-house practice, also known under the terms model office, practice bureau, and model bank. In some schools six to ten hours a week are given to it; others make no mention of it whatever in their study programmes. Whether it be known by one name or another, nearly all schools have a practice department in its simplest form. Students, under a teacher's direction, enter a short series of business transactions in their books, and at the same time make all the necessary calculations and write all the requisite letters. However, there is a great difference between this and the business department in its highest state of development, in which a whole class (or in very large classes a section) represents a commercial house which conducts actual or fictitious business with real business firms and merchants through regular correspondence, and in which each pupil receives his own independent work to do. Teachers, mostly former merchants, give the necessary suggestions and explanations, but otherwise confine themselves to

supervision and control, while the students attend to all the work like clerks in a place of business. The schools of Zurich, Bellinzona, and Aarau have departments of this kind. The "bureaux pratiques" connected with the senior classes of the schools of Geneva, Neuchatel and Chaux-de-Fonds, are similarly organized. At only a few schools students form fictitious firms with one or more members and conduct a regular correspondence. In all instances correspondence is conducted in foreign languages as well as in the vernacular. In some departments books are also kept in foreign languages.

In commercial supplementary schools for apprentices and clerks already employed there are, of course, no practice departments. A number of general studies are also omitted, as the students need all their surplus time and energy for the most necessary branches. Still the number of studies included in the regular course of the larger association schools is quite considerable—French, English, Italian, Spanish, Russian, and German, both as mother tongue and for foreigners; bookkeeping, commercial arithmetic, correspondence, commercial geography and law, law of exchange, penmanship, stenography, and typewriting. Moreover, occasional courses are held, chiefly in form of lectures on selected topics, such as technology, history and art, law and political economy, German and foreign literature. Finally, the departments of music and gymnastics of the cantonal associations, which show good results, are open to those who attend the supplementary courses.

#### TEXT-BOOKS USED.

In both the secondary and supplementary schools the same manuals or text-books and readers are used. Some are published in Switzerland, some abroad. Great liberty of choice prevails. A list of the text-books in use at Swiss commercial schools gives 63 different ones for the French language alone. A number of Swiss authors have written very valuable manuals and text-books. It is impossible to give a complete list, but the works on commercial science of the Swiss authors, Schaer, Hügli, Wick, may be mentioned, as well as the foreign text-books of Baumgartner, Schmidlin, Schilling (Spanish grammar), Graziano, and Kürschner. Nevertheless, the supplementary schools especially are suffering from the lack of condensed cheap guides or manuals adapted to Switzerland. Upon repeated requests, the Swiss commercial association has taken the subject in hand. A large prize was offered for a brief treatise on commercial geography, and the accepted work (in German) is about to be published. This little book is to be followed by others, and by similar ones in French. The better equipped commercial schools possess large collections of charts, pictures, blank forms, and circulars, and also samples of merchandise. Nearly all have libraries for teachers and pupils.

#### EXAMINATIONS AND DIPLOMAS.

An entrance examination is a regular condition of admission at commercial secondary as well as supplementary schools. All applicants are required to show that they possess the knowledge to be acquired by an eight or nine years' attendance at an elementary school. Public examinations or exercises are held at the close of each year; at secondary schools graduation examinations are held. Rules similar to and as strict as those governing the final examinations of other secondary schools apply to the graduation examinations. As a rule, representative merchants are present as experts. Students who pass receive diplomas.

Mercantile apprentice examinations take the place of graduation examinations for those who attend the courses of supplementary schools of commercial associations. These examinations afford an apprentice, or prospective clerk, the opportunity of proving what he has learned at school and during his term of apprenticeship, and

of receiving a diploma. The examination includes bookkeeping, commercial arithmetic, composition, correspondence in the mother tongue and in one foreign language, the fundamental principles of commercial law, practical knowledge (terminology, geography, and transportation), and penmanship as obligatory branches, and a number of optional studies. The necessary uniformity of standards in judging the examinations is assured by definite rules for each study, and by the participation of educational experts, appointed by the Federal Government, who propose themes and give marks. Furthermore, the committees of the different examination districts are invested with ample power to make allowance for special local demands of industry and commerce, so that the desired uniformity does not degenerate into pedantry or narrowness. Apprentice examinations were held for the first time in the spring of 1895, under the auspices of the Swiss Commercial Association. Apprentices are free to decide upon taking them. In 1900 there were 266 applicants in 13 localities; 261 received diplomas. A gratifying result of these examinations is the knowledge that they stimulate the zeal of young men, and that in many places they have been the first vigorous incentive to the introduction of a rational programme of study.

#### SIZE OF CLASSES.

If, in the spirit of strict self-criticism, we must confess that the condition of our commercial schools might be improved, we may also allude to a highly important question which has not been solved anywhere else so satisfactorily as in Switzerland. Dr. Eichmann, the president of the Federal department of commerce, deserves the credit for having exerted all his energies when commercial schools were placed under Federal supervision to the reduction of the number of students in class; whereas in other countries classes frequently have 40, 50, 60, or more students, much too large a number for secondary schools, the department was able to state, in 1896, concerning this question:

Until a short time since the lowest classes or grades of our commercial schools, excepting those of Chaux-de-Fonds and Soleure, were overcrowded, numbering as high as 46 students. With so large a number of students under him the best teacher can not attain satisfactory results. In teaching languages, commercial branches, arithmetic, and bookkeeping, the individuality of students must be taken into consideration. How can it be possible for students to acquire fluency in reading and conversation if each is allowed only an average of one and one-half to two minutes for reading aloud, for translation, and conversation? Or how can anyone inculcate facility in mental arithmetic, the understanding of bookkeeping and complicated commercial calculations, if the hour must be divided among 30 to 40 students, and the value of the lesson depends upon the time which the teacher devotes to each single student? The Federal educational authorities gave this evil their chief attention and required schools to provide for sufficient teachers and make arrangements for dividing the classes into smaller sections. No class (or parallel section) in languages, arithmetic, and bookkeeping was to number over 10 students. This ideal has been reached in most of the supplementary courses of commercial associations. What is possible in these private schools should be, in the course of time, also possible in public schools.

This authoritative declaration has great value for all commercial schools, although experience in different places shows that the time has not arrived for small parallel sections in languages and commercial studies, even in secondary schools. The financial condition of cities or cantons, notwithstanding Federal assistance and the fact that commercial schools should not be considered with greater favor than other secondary schools, must be taken into account. Ideal conditions are not reached at a bound. Even commercial associations under the pressure of cantonal and municipal subsidies have again begun to increase the size of their classes.

The small class system of the commercial associations has been designated an unwarrantable luxury. In our estimation this judgment is unjust, for it does not

keep in view the special character of commercial schools. They aim, more than other schools, at the greatest possible educational product in the shortest space of time. Whoever applies himself strictly ten hours a day to office work must economize his leisure in order to gain a broader education. Unless they are willing to forego a great advantage, commercial associations should not depart from the system of small classes, especially for the language courses attended by older students, apprentices, and clerks. The following example furnishes a proof. Before any Federal appropriations were granted there existed two schools in St. Gall for ten years, a free city supplementary school for clerks with large classes, and the school of the association of young merchants with very small classes and heavy tuition fees. Experience taught that the majority of diligent and ambitious apprentices joined the association.

We have every confidence that the directors of commercial supplementary schools will not yield their standpoint attained by years of effort and sacrifice. What has been defined as an ideal by the highest Federal authority, commercial associations will hold to as such. However, there must not be too much dogmatism in this matter. Whereas for older students small classes of from four to ten members are perfectly justifiable for languages, arithmetic, and bookkeeping, good reasons could be presented for organizing classes twice as large, at least for beginners and in studies taught by lectures, as the principles of commercial law and geography. School authorities will in the end not oppose this concession.

#### TUITION FEES AND SCHOLARSHIPS.

The greatest diversity prevails respecting the demands made upon students or their parents to cover the heavy outlay. The commercial schools of Basel and Soleure are free. Others charge as much as 250 francs a year. At some schools natives and foreigners are treated alike. At others foreigners, and justly so, are required to pay much more than students of Swiss parentage. No school can be supported, even approximately, from tuition fees alone. Cities or Cantons are obliged to grant large annual appropriations, to which, as has been already stated in detail, the Federal Government contributes a noteworthy share.

As a rule mercantile continuation schools require a tuition fee, which differs in amount. Calculated to the single hour, it varies between 5 and 30 centimes (1 and 6 cents in United States money). In a few associations instruction is given free, but, as an official report states, "experience has proved that this leads to indifference in attendance."

On the other hand, the most liberal provisions are made at both secondary and supplementary schools for poor but diligent students. In many places scholarships are granted. The Government likewise offers scholarships. Last year they amounted to 10,000 francs. They are given to needy students of the higher classes of commercial schools partly supported by Federal appropriations; also to candidates for commercial teachers' positions, studying at home or abroad, and finally to active teachers, for the purpose of continuing their education (for traveling expenses and attendance at supplementary courses).

#### PRINCIPALS AND OTHER OFFICIALS.

According as commercial schools have been founded by the State (Canton) or a community, form independent institutions or are departments of other general educational institutions, are they under the supervision of cantonal or municipal school authorities (frequently there is a special committee of supervisors), while the immediate direction is either in charge of a special director or department principal or is in the hands of the rector of the general institution of which the commercial school is a department (cantonal or central high school, technological institution, etc.).

The larger commercial supplementary schools are directed and managed by special committees on instruction composed of merchants and representatives of the State

or city authorities. In smaller associations, whose courses are less extensive, a committee of the association directs affairs. Moreover, Zurich, Berne, St. Gall, Lucerne, and Basel have special salaried rectorships.

The secretaryship for commercial education in the Federal department of commerce is a position of the highest influence. The holder exercises a certain superintendence over all commercial schools that make any claim to Federal support. He determines the proportion of allowance, makes the payment of the amount to the different schools (last year's in sums of from 135 francs to 56,493 francs per school), approves the courses of study of the State-aided schools, and performs other duties. The Federal department is kept acquainted with the standing and progress of the schools by reports and by regular inspection. It watches over and directs the progress of new establishments in a kindly way, and is frequently consulted by directors in the appointment of new teachers. This office was created in 1898 and is at present filled by the former rector of the technological school in Winterthur, Prof. U. Schmidlin, he having been chosen to this position by the Federal Council.

#### TEACHERS.

The corps of teachers of commercial secondary schools, as well as of large mercantile supplementary schools, is composed of principals and assistants. Teachers of German, of foreign languages, history, and the natural sciences must have had the same preparatory education as those of other secondary schools, but teachers of the specifically commercial branches are required to have had several years' practical experience in business.

All schools employ assistants who teach particular studies to which only a few hours a week are devoted. Such teachers are employed exclusively by many supplementary commercial schools, and often fill these subsidiary positions with great zeal and aptitude. A large number of teachers of elementary and grammar schools, special teachers of commercial secondary schools, private teachers and business employees with pronounced aptitude for teaching, are thus engaged in serving the cause of commercial education.

The teaching personnel of the commercial schools of Switzerland numbers about 500 persons.

At the educational conference of the commercial associations of Switzerland held June 13, 1897, in Zurich, the formation of a union of the teachers of all kinds of commercial schools in Switzerland was agitated, and in the following year the Swiss Commercial Teachers' Association was organized. For the first three years its headquarters were at Zurich; since then it has been changed to Geneva. At present the association has 250 members. A supplementary course for teachers of commercial schools has been established, and representative practical men have taken an active part as consulting teachers. The first course, held in Zurich during the spring of 1900, had an attendance of 57; a second course is to be held in Geneva in 1901. Besides, a valuable statistical report on commercial schools in Switzerland has been published, also a bibliography covering the most important subjects of commercial education. For nearly three years there has been a large circulation among the members of reading portfolios, for which a number of technical publications in German and French have been subscribed. The establishment of a central library has been begun. The question of the methods best adapted for the education of commercial teachers has also been minutely discussed by the association.

#### CONCLUSION.

Much remains to be said, and this article makes no pretense to completeness. In treating the whole of commercial education there would be necessary a detailed account of all those agencies which can only be briefly referred to here in closing.

The support which the commercial corporations of Switzerland have given to all efforts in the matter, independent of those having education in the narrower sense of the term for their object, deserves first mention. The large libraries of commercial associations and boards of trade are appreciated and largely made use of by teachers and students. And what a fund of information on technical and economic subjects is contained in the regular annual reports on commerce and industry in Switzerland, published at the headquarters of the Swiss Commercial and Industrial Association; also in reports of its component sections, limited to a less broad territorial and industrial scope; for instance, the publications of the Zurich Chamber of Commerce, the commercial board of directors of St. Gall, the silk industry association of Zurich, and the boards of trade of Basel and Geneva; finally, in the collection of consular reports published annually by the Federal commercial department. Aside from several daily papers, there are special periodical publications devoted to the educational needs of merchants, as the reports of the Geographic Commercial Association of eastern Switzerland, the Swiss commercial "Centralblatt," the bulletin of the board of trade in Geneva, etc. Many lectures and series of lectures on commercial and affiliated subjects are given annually under the auspices of commercial, economic, and geographical societies. The sections of the Swiss Commercial Association alone held 153 during the winter of 1899-1900. The institution of prize compositions on optional or specified subjects by members of the association likewise deserves to be mentioned; the best works received are printed invariably. The museums, with their rich collections of native and foreign objects of commerce and industrial products, must not be omitted, nor the incentives and knowledge which many owe to the different exhibits designed for industrial, technological, and agricultural training. To consider all these is beyond the scope of this sketch. Suffice it to state that numerous forces are everywhere cooperating willingly and with ample means at hand for the fulfillment of the great task of affording the best possible education to the commercial profession. May our country never be wanting in men who, convinced of the great importance of commercial education, will devote themselves to its interests, so that a liberally educated generation of business men may be assured to Switzerland for the future.

#### GERMAN CHAMBERS OF COMMERCE AND COMMERCIAL EDUCATION.

A short time ago, the Zwickau Chamber of Commerce wrote to all the various chambers of commerce and commercial bodies in the German Empire, asking what part was taken by them in supporting commercial education, the sum expended, what supervision of schools was exercised, etc.

The following answers from all parts of the Empire speak for themselves:

*Aix-la-Chapelle.*—The chamber of commerce uses every means in its power to promote commercial education. At the beginning of every school year, the chamber publishes in the press of the city the studies scheduled for that year, and always embodies the school reports in the annual yearbook of the chamber.

*Altona.*—There is one commercial school with indirectly enforced attendance. The chamber of commerce has been instrumental in forming a commercial school in the suburban town of Elmshorn. In Neumünster a similar school is maintained by the merchants' union and town corporation. Through the influence of the chamber of commerce many commercial subjects have been introduced into the public schools of Altona.

*Arnsberg.*—The commercial school was founded by the chamber of commerce. The sum of \$32 is given annually toward its maintenance, and the chamber has full control. Prizes are given to worthy students, and members of the chamber often act as examiners. The commercial school in Neheim also receives \$25 annually from this chamber.

*Barmen.*—The chamber of commerce has founded a commercial school, to which it gives \$285 annually. Four members of the chamber, together with one representative of the city and two members of the merchant union, form the board of trustees. The chamber uses all its influence to promote the interests of the school.

*Baireuth.*—This chamber of commerce is at present using its influence with the Government to secure the teaching of commercial subjects in the public schools of the district. Compulsory attendance has been recommended.

*Berlin.*—The merchants' corporation of Berlin has supervision over six commercial schools, to which it gives a subvention of \$10,000 annually. In addition, the

---

<sup>a</sup>This chapter contains information regarding educational affairs in foreign countries as reported to the Department of State by United States consuls. These reports have been in part transmitted direct to the Bureau of Education by the State Department for publication and in part reprinted from the publications of the State Department.

The technical educational terms used by the consuls in their reports have been in most cases retained, and must be understood to have generally the signification which attaches to them in the countries to which they refer.

corporation gives \$550 to an institute which prepares young girls to fill positions in business houses, \$250 to the Humboldt Academy, and \$1,000 to the city weavers' school. The corporation also gives \$1,250 each semester for the benefit of young men who wish to hear lectures on the science of commerce, etc. The corporation would like to see the attendance of apprentices at these schools made compulsory.

*Bingen.*—In 1888 a course of commercial education was secured to the schools of this city through the initiative of the chamber of commerce. The annual deficit (which amounts to \$100 to \$175) is made good by this chamber. The president and two members serve as directors.

*Bochum.*—There are four commercial schools in this district, to which the chamber of commerce gives \$300 each year. The members of the chamber are now agitating in favor of a fifth, which will in all probability shortly be established.

*Bonn.*—This chamber of commerce has established a commercial school and gives \$75 annually toward its support. In addition, the State, the city, and many business firms give voluntary contributions to its maintenance. Five members of this chamber belong to the school board. Prizes and books are granted diligent students, and any deficit which may occur is paid. Steps have been taken to organize a second commercial school.

*Brandenburg.*—This chamber of commerce has organized three commercial schools in as many suburban towns, and affiliated them with the one in this city. The chamber controls these schools, and contributes one-third of the expense which is not met by tuition. The other two-thirds are raised by the State, private individuals, business firms, etc. Attendance is compulsory for apprentices until they have passed their eighteenth year. The Brandenburg Chamber of Commerce contributes annually the sum of \$40 to each of the commercial schools in Wittenberg and Kyritz, which entitles it to one member on the school board, thus giving it a voice in the arrangement of studies and the disposition of funds.

*Brunswick.*—This chamber of commerce has established ten obligatory commercial schools in the Duchy of Brunswick and has full supervisory control over the same. The chamber makes good one-third of the deficit which may occur in any one school year. In 1901 the sum thus paid out amounted to something more than \$1,000. It has established a free course of study for girls employed in commercial houses; it gives a small sum of money each year for the purpose of enabling the teachers in these schools to travel through the different districts of the duchy, in order to thoroughly study economic conditions. A collection of all the industrial products of Brunswick has been placed on exhibition for the benefit of apprentices. There is a library in German, French, and English literature for teachers and students, and prizes are also granted.

*Breslau.*—The commercial school receives \$250 annually from the chamber of commerce. There is an institute in the city which teaches commercial subjects to young women, and \$100 is given every year toward its support. The chamber of commerce has members among the directors of both these institutions. An industrial school is to be established this year, and the chamber of commerce has agreed to pay all expenses not met by school tax, tuition, etc.

*Cassel.*—The commercial school in this city, which was established twenty-five years ago, has passed entirely under the management of this chamber of commerce, which has erected a building from its own funds as a home for the school.

*Coblenz.*—The chamber of commerce gives \$125 a year toward the support of a commercial school in this city. Members of the body are on the school board.

*Danzig.*—The president of this chamber is one of the directors of the commercial school in this city. The chamber of commerce gives an annual stipend of \$2,000 toward the maintenance of commercial courses in the public schools of St. Petri.

*Dessau.*—The sum of \$250 is given each year toward commercial education. The chamber of commerce further grants a stipend which enables teachers to hear lectures on commercial topics during vacations.

*Dortmund.*—The chamber of commerce gives \$900 annually to the commercial school in this city.

*Dresden.*—The chamber of commerce maintains a commercial school, and the president of the chamber is chairman of the board of trustees.

*Duisburg.*—The commercial school in this city was founded jointly by the chamber of commerce and the city corporation. The chamber gives \$250 yearly toward its support.

*Düsseldorf.*—The commercial school of this city was founded by the chamber of commerce independent of outside assistance. It gives \$400 every year toward its expenses. In addition, a course of lectures on the science of commerce, for the benefit of young business men, has been introduced. Beginning with April 1, 1902, attendance at the industrial school of Düsseldorf will be made obligatory. The

chamber of commerce will so arrange the curriculum of the commercial school as to enable the two schools to work hand in hand.

*Elberfeld.*—This chamber of commerce gives \$300 a year to the commercial school in this city. In addition, the school receives from the chamber the interest on \$700 annually.

*Frankfort-on-the-Main.*—The chamber of commerce gives \$150 yearly toward commercial education in this city.

*Frankfort-on-the-Oder.*—Within the past three years this chamber of commerce has founded five commercial schools, all of which are directly under the management of the chamber, which supplies whatever funds are needed. The deficit made good by this chamber in 1901 amounted to \$175. The secretary of the chamber is chairman of the board of trustees. The secretary also gives lectures throughout the district to business men who may be interested in commercial questions of the day. It is possible that four more commercial schools may be founded in this district during the next two years.

*Freiburg.*—The commercial school was founded by the city corporation. The chamber of commerce gives about \$100 annually, which is used chiefly for prizes. Beginning with April 1, 1902, a course of lectures on commercial subjects will be introduced for the benefit of young women.

*Friedberg.*—The commercial school in this city was founded by the chamber of commerce, and receives \$100 each year toward any deficit which may occur.

*Geestmünde.*—The chamber of commerce founded the commercial school in this city. The sum of \$100 is given each year, as well as prizes to diligent students.

*Giessen.*—The three commercial schools in this city receive \$125 a year from the chamber of commerce.

*Görlitz.*—An annual stipend of \$400 is given by the chamber of commerce to the commercial school in this city. Two of the members belong to the school committee.

*Göttingen.*—The commercial school in Münden receives \$50 a year from this chamber of commerce. One member of this chamber belongs to the board of trustees. It also gives \$50 to the commercial school in Osterode.

*Greiz.*—The commercial school receives \$150 a year from the chamber of commerce.

*Graudenz.*—At the instigation of the chamber of commerce, a commercial school has been founded in this city in connection with the industrial school; \$300 is given each year toward its maintenance. No changes can be made in the course of study without the consent of the chamber of commerce. It is trying to establish other commercial schools in the district.

*Hagen.*—The commercial school in Hagen, together with the one in Gevelsberg, receive conjointly \$150 from the chamber of commerce; \$25 a year is further donated for library purposes.

*Halberstadt.*—Through the instrumentality of this chamber of commerce, ten commercial schools have been established in as many cities in the district. One member of the chamber is on every school board. Lectures are maintained during vacations for the benefit of teachers. The chamber pays \$1,500 annually for the maintenance of these schools.

*Halle.*—Three commercial schools have been founded in this city through the united efforts of the municipal authorities, the merchants' union, and this chamber. Each organization pays \$50 a year on the deficit.

*Hanau.*—The commercial school was established through the efforts of the chamber of commerce. One of the members is on the school board. In addition, the chamber has caused a commercial school to be established in Fulda. A commercial course for young women has also been arranged for in this city.

*Hanover.*—The chamber of commerce has no official connection with the commercial school in this city. School tax, tuition, etc., adequately meet the expenses of the school.

*Heidelberg.*—The commercial school receives \$100 a year from the chamber of commerce. Two of the members are on the school board. An advanced course in modern languages and economics has been arranged for by the chamber.

*Heilbronn.*—This chamber gives \$25 a year to be distributed as prizes to worthy and diligent students, and one of the members is on the commercial school board.

*Hildesheim.*—The commercial school in Hildesheim and Peine receives \$400 a year from the chamber of commerce. A commercial school is shortly to be established in Alfeld.

*Insterburg.*—The commercial organizations of this city, with the assistance of the Government, founded a commercial school here some years ago. Members of the chamber have the right to attend the examinations. They intend shortly to set aside a sum of money for premiums.

*Cologne.*—The chamber of commerce watches with great interest the development

of commercial education in this city. Through its influence, evening courses have been arranged for those who have no time to attend the day courses. The commercial school of Cologne was founded and is supported by the municipal authorities of the city, acting for the people. The chamber used its influence in securing the Commercial University for Cologne in 1901.

*Königsberg.*—Through the initiative of the municipal authorities, a commercial school with twelve classes has been in progress since the beginning of the year. Attendance is compulsory. This commercial organization gives \$225 a year toward its maintenance.

*Constance.*—Two members of this chamber serve on the commercial school board in the city. All the members are permitted to attend the examinations. The chamber of commerce gives \$15 a year for the purchase of prizes.

*Crefeld.*—The commercial school in this city was founded by the chamber of commerce, and receives annually the sum of \$1,500 toward its support. One of the members belongs to the school board. The chamber intends to donate a library to the school in the near future.

*Lahr.*—Two commercial schools were established in Lahr and Offenburg, at the instigation of the chamber of commerce. Attendance is compulsory for apprentices. The president of the chamber is on the board of trustees. Each school receives \$10 a year for the purchase of book prizes. The commercial school in this city has recently passed under the management of the municipal authorities.

*Leipzig.*—This chamber of commerce pays \$4,000 annually for commercial education in this city. This sum is raised by private subscription from the members of the chamber.

*Liegnitz.*—This organization has the management of the commercial school in this city; \$200 is given yearly toward its support. Prizes are granted to ambitious students.

*Limburg.*—This chamber of commerce is at present negotiating with similar organizations in other cities of this district, with a view to establishing a commercial school.

*Lübeck.*—In 1873 a commercial school was founded in this city for the benefit of apprentices, which receives \$250 a year from the chamber of commerce. Another school is being organized by the chamber.

*Mannheim.*—This chamber of commerce gives \$250 annually to the commercial school in this city. It also maintains a lecture course on commerce and economics, the funds for which are raised by the chamber conjointly with the merchants' union and bourse. It is probable that attendance at the commercial school will be made obligatory in the near future.

*Magdeburg.*—The commercial school in this city is maintained equally by the State, municipal government, and the chamber of commerce. The city places a building free of charge at the disposal of the school. The aggregate sum paid for maintenance, in addition to school tax, tuition, etc., amounts to \$5,000 per annum, \$1,500 of which is contributed by the chamber. Special courses have been introduced into this school in foreign languages, rapid calculation, double-entry bookkeeping, stenography, etc. These courses thus far have been self-supporting, but if a deficit should occur it must be made good by the chamber and the merchants' union of this city. In addition, the chamber of commerce has arranged for ten scientific lectures on commerce and economics for the merchants of this city. The expense of these amounts to \$500 a year, which is partly paid from the interest on \$4,000 capital donated for this purpose by one of the citizens, and partly from admission fees. During the past year, however, this chamber made good a deficit of \$250 for these lectures. The total sum expended by this chamber of commerce for commercial education amounts to \$2,000 annually, or fully 15 per cent of the total expenditures.

*Mainz.*—There is a commercial school in this city, which receives \$75 a year from the chamber. There is a movement on foot throughout the Grand Duchy of Hessen to thoroughly reorganize all the commercial schools, beginning with the one in Mainz. On the 1st of April, 1902, the commercial school in this city passed under the management of the chamber of commerce.

*Meiningen.*—In 1834 a commercial school was established by the chamber of commerce. The yearly expenses are paid by school tax and tuition.

*Münden.*—In 1898 the chamber of commerce established an obligatory commercial school, which has an attendance of about 150 pupils, divided into four classes. The secretary of this chamber formerly gave a course of lectures on commerce and economics. The annual deficit, if any, is met by the municipal authorities. The efforts of the chamber of commerce to establish an obligatory commercial school in Bünde have thus far failed, owing to the antagonism of the town council of that place.

*Mühlhausen in Thüringia.*—The city and chamber of commerce founded the commercial school in Mühlhausen. One hundred and twenty-five dollars a year is given

toward its support, this sum being raised by a direct tax on the business firms of the city.

*Mülheim-on-the-Rhine*.—A commercial school was founded in the Mülheim district by the chamber of commerce, which gives \$75 a year toward its support. The president of the chamber is chairman of the board of trustees.

*Mülheim-on-the-Ruhr*.—The commercial school in this city, which was founded by the merchants' union, has passed under the management of this chamber of commerce. Its gifts to the school amount to about \$250 a year. The president of the chamber is chairman of the board of trustees.

*Münster in Westphalia*.—The commercial school in this city will open on the 1st of April, 1902. Attendance is obligatory for apprentices and those holding positions who have not passed the age of 18. The State and municipal government each pay one-third of the expenses that are not met by tax and tuition. The rest is paid by the chamber of commerce and the merchants' union. The board of curators is made up of representatives of the Prussian Government, the city, the chamber of commerce, and merchants' union.

*Nuremberg*.—The chamber of commerce gives an annual stipend to the commercial school in this city.

*Offenbach*.—The commercial school in this city was founded by the chamber of commerce. The yearly deficit, if any, is paid by the members. In addition, the building, heat, light, and \$75 extra each year are furnished by the chamber.

*Oppeln*.—There are 30 commercial schools in the district covered by the work of this chamber of commerce. These schools receive annually about \$4,000 from the Government, the chamber, and the various communities interested. A movement is on foot at present to thoroughly reorganize all these schools. This chamber has offered to pay the salary of a director, who will superintend them.

*Osnabrück*.—The commercial school in this city was founded by the chamber of commerce and the merchants' union. Two of the members are on the school board, and the secretary is director. Steps have been taken by this chamber to organize similar schools in other towns of this district.

*Plauen*.—The chamber of commerce uses every means in its power to promote commercial education in this district.

*Posen*.—This chamber furnishes funds to three different commercial schools. It has a member on each of the school boards.

*Potsdam*.—The commercial school in this city was founded by this chamber. The deficit, if any, is met equally by the Prussian Government, the city, and the chamber of commerce. During 1901 the total amount thus expended was something in excess of \$500. The first vice-president and two members belong to the board of curators.

*Ratisbon*.—The chamber of commerce gives \$250 a year to the commercial school in this city.

*Ruhrort*.—The commercial school was founded by the chamber of commerce, which contributes \$500 a year toward its support. The members of the chamber are on the board of curators. During the winter months some twenty lectures on commerce and industry are given for the benefit of merchants. The expense of this course amounts to about \$200, which is raised by admission fees.

*Saalfeld*.—Three commercial schools receive funds from the chamber of commerce. Several of the members are on the school boards. Lecture courses are also given by the chamber.

*Saarbrücken*.—The chamber of commerce gives \$40 a year to the commercial school.

*Solingen*.—The commercial school was founded by the chamber of commerce conjointly with the city. The chamber gives \$150 and pays one-third of any annual deficit.

*Sonneberg*.—The municipal authorities have charge of the commercial school. The chamber of commerce gives \$75 a year toward its maintenance. The following subjects are obligatory: German, English, French, arithmetic, geography, elementary economics, and penmanship.

*Sorau*.—This chamber and the merchants of the city have established three commercial schools in this district.

*Stettin*.—The merchants' organization gives \$150 toward the maintenance of the commercial school.

*Stralsund*.—There is an evening commercial course in this city which receives \$25 a year from the chamber of commerce.

*Strassburg*.—In common with the city, this chamber of commerce has assisted in establishing a commercial school and gives \$500 annually to its support. Four of the members belong to the board of trustees. In addition, this chamber contributes

to a fund which enables teachers to attend lectures on commerce and industry during their vacations.

*Thorn.*—The chamber of commerce grants \$200 annually to the three commercial schools situated in this district.

*Tilsit.*—There is a commercial school in this city. One-third of the deficit, if any, is defrayed by this commercial organization, the other two-thirds by the city.

*Trier.*—The commercial school was founded by the chamber of commerce, several members of which serve on the board of curators. Prizes, etc., are granted by the chamber.

*Wiesbaden.*—The chamber of commerce has founded two commercial schools in this district. One-third of any deficit is paid by members of this body.

*Würzburg.*—The school for apprentices in this city receives \$25 a year from this chamber. Prizes are granted to two pupils each year.

*Zittau.*—The chamber grants small allowances to several commercial schools in this district. It has also donated books to the different libraries.

#### RÉSUMÉ.

There are 145 chambers of commerce, or similar organizations, in the German Empire. Of this number, 112 are actively engaged in promoting commercial education. The inactivity of the others, for the most part, is owing to the fact that they have only been recently established, or that commercial education in their districts is maintained by the merchant unions or by municipal governments. The following résumé will give a very clear idea what commercial education in Germany owes to the Empire's highly organized and powerful chambers of commerce:

I. The statistics for 1901<sup>a</sup> show that 22 chambers of commerce gave \$15,652 in cash to 44 commercial schools, which work entirely under their own management. Six chambers paid one-third of the deficits in 12 commercial schools with independent management; the amount is not stated. Forty-eight chambers of commerce voted the sum of \$13,030 to 102 commercial schools, which were more or less controlled by these chambers. Eight chambers of commerce paid part of the deficits of 18 commercial schools, which were partially under their management. Twenty-four chambers of commerce gave small sums to 31 commercial schools for the purpose of buying prizes, books, etc. Four chambers devoted \$1,697 to independent lectures on commerce and industry.

II. Twelve chambers of commerce give prizes in the shape of books, money, stipends, etc.; in 24, the members take part in the examinations; in 6 chambers of commerce districts the secretary of the chamber makes tours of inspection among the schools; 63 chambers have members on the school board of directors; 8 have arranged lectures for clerks and others holding minor positions in business houses; 3 have arranged for teachers' conferences; 1 has appointed a commission to examine all important school subjects, and another has established an industrial exhibition.

The above sketch of the work of German chambers of commerce along the line of commercial education can not be looked upon as exhausting the subject. German merchants and manufacturers tell me that they are just beginning to take an interest in the matter of education. For example, 8 chambers of commerce are at present busy with reorganizing and extending the commercial schools in their districts; 13 are agitating in favor of such schools; 7 are working to secure obligatory attendance for their schools; 6 have declared their willingness to give pecuniary assistance to the schools in their districts, if certain conditions are complied with; 6 are contemplating assuming the management of the schools in their districts, and several wish to appoint directors at the chamber's expense, introduce lectures, establish libraries, and grant prizes.

In a former report to the Department,<sup>b</sup> I described in detail what is being done for commercial education in Saxony. In order to prevent confusion, however, it

<sup>a</sup> From volume 20 des Deutschen Verbands für das Kaufmännische Unterrichtswesen, Leipzig, Verlag von B. G. Teubner.

<sup>b</sup> See Annual Report of 1899-1900, chapter XXVII, p. 1435.

would be well to look at the German Empire as a whole, and divide commercial education into five distinct grades:

- I.—Primary commercial schools (Kaufmännische Fortbildungsschulen).
- II.—Commercial schools (Handelsschulen).
- III.—Advanced commercial schools (Höhere Handelsschulen).
- IV.—Classified commercial courses (Handelsfachklassen).
- V.—Commercial universities (Leipzig and Cologne).

It is to the primary commercial schools that German chambers of commerce give financial assistance, and it is only these schools which I have had in mind in the above report.

It will be seen, therefore, that Germany pays almost as much attention to trade education as she does to any other branch of instruction, and the methods adopted might be taken up with advantage in the United States by our chambers of commerce and other commercial organizations. What the different nations produce, what they import and export, political economy, German, Spanish, French, and the details of commerce and industry should be known to every progressive manufacturer, merchant, and business man.

ERNEST L. HARRIS, *Consular Agent.*

EIBENSTOCK, GERMANY, May 20, 1902.

#### ANTWERP GEOGRAPHICAL EXHIBITION.

The Cartographic, Ethnographic and Maritime Exposition was opened to the public on May 22. The Royal Geographical Society of Belgium has obtained for the purposes of this exhibition the assistance of the French, Dutch, Spanish, Italian, and Mexican Governments, and in addition the Queen has sent many interesting objects from her private collections.

The exhibition of ancient and modern charts, atlases, maps, globes, and projections is perhaps the most interesting that has ever been brought together, and is particularly notable for its fine specimens of the works of Mercator, Ortelius, Blaeu, Hondius, and the valuable display of those of Elisée Reclus, the great geographer of modern times.

The charts of the Ka-Tanga scientific expedition here find a place, as well as the various scientific apparatus used by the members of the mission. There is a fine map of the Lower Kongo and some remarkable relief maps of the Suez and Panama canals, the districts of Lake Geneva and the Matterhorn, as well as a large one of the surface of the moon.

The ethnographical section comprises photographs, weapons, household utensils, religious objects, articles of wearing apparel, etc., from the Kongo Museum at Tervuren, from missions in the Kongo, China, Java, and South America, besides a brilliant display of gods and goddesses from the Dutch East Indies and beautiful tapestries from the royal palace at Pekin.

In the maritime section are models of the newest types of ocean liners, furnished by the principal steam navigation lines; models of old Dutch craft and men-of-war, and of the proposed ports of Ghent, Brussels, and Heyst; souvenirs of the explorations of the Duke of Abruzzi, of the Belgian Antarctic expedition, etc.

A number of improved instruments for studying the depths of the sea, life-saving apparatus, and instruments of precision for exploring, prospecting, and surveying purposes, besides astronomical instruments, complete an exhibition that is highly interesting from both an educational and scientific point of view.

GEO. F. LINCOLN, *Consul-General.*

ANTWERP, BELGIUM, June 9, 1902.

## ADMISSION TO ITALIAN ART GALLERIES.

The Department has received from Mr. L. M. Iddings, secretary of the embassy at Rome, under date of June 18, 1902, copies of the new regulations issued by the Royal Department of Public Instruction in Italy in regard to the free use of galleries, museums, national monuments, etc., throughout the Kingdom.

The regulations read:

ARTICLE 1. The following persons shall be exempted from paying entrance fees at the museums of antiquity, galleries of fine arts, picture galleries, archæological excavations and monuments: (a) National and foreign artists; (b) students of the history of the arts and of artistic criticism—Italian and foreign—who have published remarkable works; (c) soldiers and sailors; (d) professors, national and foreign, of archæological, historical, literary, and artistic instruction; (e) professors of universities, of preparatory schools, classical, technical, and governmental, and normal schools; (f) alumni of archæological institutes, historical and artistic, both national and foreign, of the faculty of letters and philosophy, and of the schools for engineers; (g) officials charged with the administration of antiquities and of fine arts; (h) artisans belonging to industries analogous to the arts of design; (i) guides who shall have obtained, after examination, a certificate proving their proficiency in archæologic and artistic knowledge.

ART. 2. Persons fulfilling the conditions of article 1, who may desire to obtain a permit for free entrance to the archæological and artistic institutes of the Kingdom, must be furnished, (a) for Italian artists, with an academic document attesting their identity, excepting in case of persons known for eminent merit; (b) for foreign artists and for foreign professors of archæological, historical, literary, and artistic instruction, with an academic document visaed by the diplomatic representative or by the Italian consul in the nation to which the artist or professor belongs, or by their ambassador or minister at Rome; (c) for students of history and of artistic criticism, with some one of the works they have published; (d) for professors of universities and of national, archæological, and art schools, and for professors of classical, technical, and governmental or normal schools, with a document proving their identity when recognition may be necessary; (e) for alumni of archæological and national artistic institutes, for those of the faculty of letters and philosophy, and of the schools for engineers, with an official document showing their registration in the above-mentioned schools in the year in which they ask the permit; (f) for foreign alumni, such documents must be visaed in the prescribed manner by foreign artists and professors; (g) for artisans belonging to industries related to the arts of design, the demand should be accompanied with a certificate proving their identity and coming from the director of an institute of fine arts or some other public authority.

ART. 3. The professors and students of foreign archæological and artistic institutes established in Italy may obtain the permit for free entrance through the principal of the institute.

ART. 4. Pupils of national schools and institutes of education and instruction may, accompanied by their teachers, visit gratuitously the museums, galleries, excavations, and monuments, a previous arrangement having been made between the director of the school and the director of the museum, gallery, etc., to be visited. Soldiers must be in uniform.

ART. 5. Persons desiring a general permit for free admission to all the museums, galleries, excavations, and monuments of the Kingdom shall make a request to the minister of public instruction on stamped paper of 1.20 lire (23 cents), accompanied by the documents required by articles 2 and 3, and an unmounted photograph of themselves, of dimensions not greater than 5 by 8 centimeters (1.9 by 3.1 inches).

ART. 6. Persons desiring free admission to the archæological and artistic institutes of a single city will make their request on stamped paper of 0.60 lira (12 cents) to one of the heads of said institutes, accompanying it with the documents required in articles 2 and 3, and if the permit is asked for more than a month, with the portrait according to the preceding article.

ART. 7. The examination of the certificates for guides must be effected before a commission in each city where there are archæological or artistic institutes or officers of the State, according to the measures which shall be prescribed by the minister of public instruction. The permit to guides is restricted to the institutes and places for which they shall have been recognized as fitted.

ART. 8. Tickets for free entrance, issued before the date of the present decree, shall be valid to the end of the time for which they shall have been granted.

ART. 9. The provisions contained in articles 9 and 12 of the regulation for the collection of the entrance fee into national museums, galleries, excavations, and monuments, approved by royal decree June 11, 1885, are abrogated.

## THE CHINESE LANGUAGE.

While China is considered the land of promise for our manufacturers and farmers, the importance of the knowledge of the Chinese language is greatly undervalued. I submit the details of a recent interview with a linguist who has given special attention to this subject.

It is well understood that in order to enter into permanent commercial relations with a foreign country it is indispensable to know its language. When Russian industries began to develop, the Germans recognized that in order to engage in profitable trade in that country it was necessary to learn Russian, and there is now no country where the Russian language is so much taught as in Germany.

The Chinese language is ideographic. It conveys the idea and not the word for a thing, as the figure "8" represents the idea and not the word. The Chinese have invented more than 40,000 marks for their writing. In the opinion of my informant, it will require only about 3,000 marks for mercantile correspondence, and it will be easier to learn them than the words of an ordinary foreign language.

Russian is more difficult for Americans than Chinese. It takes much longer to learn the spoken language because of the variety of dialects; but anyone can learn enough of the writings to answer ordinary purposes in a few months and have his knowledge perfected by a linguist within about a year. An exact instruction in one of the Chinese languages can only be given by a Chinaman.

This method has been adopted in Germany. Besides the professor for the theory of language, there are four Chinese linguists in the Oriental Seminary of Berlin teaching the business style and the languages of Peking, Shanghai, and Canton. It is not intended to fit pupils for the diplomatic service, but for commercial work.

CHARLES NEUER, *Consular Agent*.

GERA, GERMANY, *July 12, 1902.*

## EDUCATIONAL MOVEMENTS IN CHINA.

Educational movements in the province of Kwangtung are progressing favorably and satisfactorily. A new center of learning has been established in Canton—the Kwong Nga Shu Un, or Provincial College, which is hereafter to be known and styled the College of the Two Kwangs. All students who pass the entrance examination must find their own expenses, the teaching being free. They have also to answer the following questions affirmatively:

Question 1. In the event of your being admitted to this college, do you agree to give yourself wholly to your studies and not to attend any of the degree examinations in other places?

Question 2. After your entrance, a period of seven or eight years must elapse before you proceed to Peking for the second degree; do you consider your patience and perseverance equal to that?

Question 3. Students who have studied English and mathematics previous to entrance must pass through all the classes—no distinctions can be made; do you agree to this?

Question 4. As no allowances will be made and you will have to buy all your books and find all of your expenses during the seven or eight years you are in residence, do you believe your own resources or those of your friends are equal to this demand?

The examinations are competitive, and are held continuously. That the syllabus is an ambitious one can be judged from the following list of subjects: (1) Chief (social) duties and great proprieties, (2) government (methods of), (3) history, (4) geography, (6) Chinese language, (7) mathematics (elementary), (8) physics.

(9) agriculture and mining, (10) map drawing, (11) music (poetry), (12) physical drill.

The following report has just been made to me by Professor Mou Lien, a Manchu, who is one of the faculty:

CANTON, *July 16, 1902.*

HON. ROBERT MCWADE, *U. S. Consul.*

DEAR MR. MCWADE: I am very glad to make to your honor a report of the different branches of science learned by the scholars of the newly established university in Canton, namely: The study of Chinese, English, physics, geography, mathematics, chemistry, politics, bodily exercise, and mandarin language.

Teachers, 16; 6 teach Chinese, 4 English, 1 physics, 1 geography, 1 chemistry, 1 mathematics, 1 politics, 1 bodily exercise. Chief manager, 1; assistant manager, 1; managers of the 3d class, 4. All are Chinamen.

Scholars 160, who have no pay, but those who pass the examination held once every month will get some money as a reward. The school time begins from 1 [7?] o'clock a. m. to 12, and begins again from 1.30 to 4.30 p. m. I am one of the four English professors, and I teach the mandarin language, too.

With best compliments, I am, yours, very sincerely,

MOU LIEN.

His honor Kung Nsin Chan, the prefect of Kwong Chau Fu, told me yesterday that he had purchased over 17 acres of land near the White Cloud Mountains, whereon he proposes to erect a "college for western learning," in which about 200 students can be boarded and educated. He asked me to aid him, not alone in the preparation of plans for the construction of the building, but also in drawing up a scheme of the course of studies to be pursued in the proposed institution. I agreed to do so on the condition that a number of Americans shall be included on its staff. This he agreed to.

There is also a scheme on foot looking to the establishment of a great military college, where 180 students will be taught mathematics, history, geography, botany, geology, hygiene, mandarin, German, and English. They will be divided into three classes, the lowest or first consisting of men intended for subordinate positions, the second a higher grade of official rank, and the third for those who will command armies or divisions. Two years is the limit for the first two classes, and, strange to say, one year for the highest or third class, i. e., intended generals of division. It is quite possible that this classification, as well as the time limit of studies, will be rearranged before the opening of the college. Candidates presenting themselves for the entrance examinations must be able to read the ordinary Chinese text-books with facility, and the age limit is from 17 to 23 years.

I am, sir, your obedient servant,

ROBERT M. MCWADE, *Consul.*

CANTON, CHINA, *July 16, 1902.*"

---

### NEW NATIONAL SCHOOL IN GERMANY.

On the 10th of May, 1902, some of the most prominent citizens of Baden met in conference in Karlsruhe to discuss the founding of a German national school. At the close of the session an appeal was issued to the German people, the contents of which may be summarized as follows:

The efforts to infuse into our national system of education all the necessities of the age have thus far been applied almost exclusively toward strengthening the internal needs of our race, without taking into consideration the wants of our people located in foreign countries. Other nations which have vast interests in every part of the world have long since established schools which prepare young men to take up lucrative and responsible positions in their colonies. This is especially true of England, where education may be termed one-sided in favor of the colonial service.

As time passes, two things become more and more prominent as necessary to the future of the German Empire:

I. Our ability to compete in the world's markets.

II. The preservation of the German element in foreign countries, and the fostering of mutual ties with the mother country.

Upon these two conditions may be said to rest the commercial future of the German Empire. This is especially the case when we consider that the German colonies will never be capable of receiving, to any great extent, the thousands of Germans who emigrate every year. There are to-day some 13,000,000 German-speaking people in foreign countries, who for the most part have renounced allegiance to the land of their birth and enrolled themselves under other flags. To prevent a continuance of this state of affairs will be one of the primary duties of the national school. As a means to accomplish this, we announce the following programme for the young men placed in this school:

(1) A thorough course in economics.

(2) The infusion of German character and civilization, so that the same will remain uninfluenced by the habits and customs existing in other countries in which these young men may locate.

(3) A practical and theoretical course in agriculture, horticulture, and different trades.

(4) To establish boys between the ages of 9 and 15 years in good families for the purpose of better instruction and discipline, where they may at the same time attend the public schools.

(5) Three years' preparation for the national school, between the ages of 15 and 18, in commercial, technical, and agricultural subjects.

From the latest newspaper reports, this school has been established in Wertheim on the Main. It will be formally opened this fall.

ERNEST L. HARRIS, *Consular Agent*.

EIBENSTOCK, GERMANY, *July 19, 1902*.

## INDUSTRIAL SCHOOL AT TOURCOING, FRANCE.

Under date of September 24, 1902, Consul W. P. Atwell, of Roubaix, France, writes as follows:

The industrial school at Tourcoing is under the patronage of the chamber of commerce. Its object is to give a degree of technical instruction to the sons of manufacturers and merchants that will enable them to aid in the management of the business and in time to assume the entire direction, and also to give theoretical and practical instruction to workmen which will fit them to be foremen, head mechanics, overseers of spinning and weaving mills, accountants, and correspondents. The course of instruction, which is given to both day and evening classes includes:

Theory and practical work of spinning; weaving and pattern drawing (sketching and putting on cards); study of threads (distinctive character of textiles) and practical work; applied mechanics (technical working of metals, machinery); industrial physics; electro-technics; geometrical drawing applied to machines; commercial and bank accounts; commercial and industrial law; commerce and merchandise; stenography and typewriting. The studies in each branch extend over one year, except in weaving and pattern drawing; in these classes a special course in decorative composition and creation of fabrics is given, occupying a second year. This course includes drawing from living plants, elements of water coloring, study of decoration in every century, character of styles, creation of designs applied to tissues, with preparation for examination as art workmen. The annual cost of the day course for French students is 300 francs (\$57.90) for the spinning and commercial course, and 400 francs (\$77.20) for weaving. Foreigners pay double, and a reduction of 100 francs (\$19.30) is made for pupils taking a double course, and 200 francs (\$38.60) for those taking three courses. The night classes are organized for pupils living or working in one of the Tourcoing districts. A registration tax of 2 francs (39 cents) is required for the first year, 5 francs (97 cents) for the second, with an additional payment of 3 francs (58 cents) for samples and sundries the first year in the theory class, 4 francs (77 cents) the second year, and 5 francs (97 cents) for the third. The registration tax for the course in electricity is 3 francs (58 cents) the first year and 5 francs (97

cents) the second. The course in conducting steam heaters is 2 francs (39 cents) registration tax and 1 franc (19.3 cents) for the course in machine drawing. The registration tax is required of pupils in the commerce classes independent of any other course they may take, which is 3 francs (58 cents) for stenography. Pupils not residing within the limits of Tourcoing pay a tax of 10 francs (\$1.93) per month, in addition to the cost of samples and sundries, for the privilege of attending the night classes. Application for admission may be made to the director of the school, 66 rue de Casino, Tourcoing. Classes begin October 1.

In addition to the Tourcoing school, there are two superior technical schools in Roubaix and one in Lille.

---

#### CHANGES IN REGULATION REGARDING THE ADMISSION OF STUDENTS TO TECHNICAL SCHOOLS.

The Official Messenger publishes a detailed circular, which has been sent to the curators of the educational districts, and contains a number of new regulations regarding the admission of students to technical schools. Among the changes effected by the new regulations is the abolition of reports on the personal character and habits of the matriculated students which the heads of the intermediate schools have hitherto been obliged to draw up and forward to the technical schools to which the students proceeded. Instead of this the entries in the "behavior list" of the last three years are to be sent in along with applications for admission to the technical schools.

W. R. HOLLOWAY, *Consul-General.*

ST. PETERSBURG, RUSSIA, *September 20, 1902.*

---

#### THE MEDICAL INSTITUTE FOR WOMEN AT ST. PETERSBURG.

R. T. Greener, commercial agent, Vladivostock, Siberia, writes under date of September 20, 1902:

"The new medical college for women opened lately with 300 new students. Nearly all of them had finished the grammar-grade schools with the gold medal for excellence in the course. A few were received who had only silver medals, and a still smaller number who had completed the course, but if compelled to wait four or five years would have been debarred by age from entering upon the study of medicine.

"The whole number of students now in attendance is 1,430. The curriculum is very thorough. The women are apt students."

---

#### GLAUCHAU WEAVING SCHOOL.

Having had a number of inquiries regarding the Glauchau technical school for weaving and designing of textiles, I wish to report the following:

There were formerly two technical schools here, both founded in 1858. The purposes were the same, although one was somewhat exclusive, giving instruction to the sons of manufacturers and merchants only. About 1868 both applied to the Government for financial assistance, which was granted on condition that they unite. This was soon brought about, and the Government appropriated the sum of 5,000 marks (\$1,190), promising to give this amount each year if the city of Glauchau would appropriate 2,000 marks (\$476), which was agreed to, and since that time the school has received 7,000 marks (\$1,666) yearly. This amount, together with the small sum received for tuition, has enabled them to build a large and commodious building and maintain a corps of teachers. Instruction is given in both day and evening classes in the theory and practical work of weaving and pattern drawing,

the creation of designs as applied to textiles, the making and calculating of Jacquard cards, drawing and coloring from nature. The course takes usually about three years and costs natives of Saxony 40 pfennigs (9½ cents) a week.

It has been erroneously stated that this school and a like institution at Meerane are closed to others than natives of Saxony. Foreigners from any country will be admitted upon the payment of a fee of 100 marks (\$23.80) a year.

Owing to the industrial depression existing throughout this entire district for the last five years, the attendance has steadily fallen off, until now there are only 48 pupils, and the city authorities are considering the advisability of closing the school temporarily.

When it is remembered that the population of Glauchau is to-day about 5,000 less than it was six years ago, this situation can be readily understood.

E. A. CREEVEY, *Consul*.

GLAUCHAU, GERMANY, *November 10, 1902.*

### PRIVATE SCHOOLS IN RUSSIA.

According to statistics of the Department of Finance during the last five years, 42 commercial schools, 30 trading schools, 26 trading classes, and 21 courses on commercial knowledge were established and operated by private means. The cost of maintaining these schools and courses was 2,500,000 rubles, or \$1,250,000, and 20,264 pupils are educated in them.

SAMUEL SMITH, *Consul*.

MOSCOW, RUSSIA, *November 17, 1902.*

### THE COMMERCIAL SCHOOL AT TIFLIS.

In compliance with a request from a former university president in the United States for information in regard to the commercial school at Tiflis, Russian trans-Caucasia, I put myself into communication with the director of the school, and with the German consul at Tiflis, who very kindly sent me the following letters. The German consul said:

The commercial school at Tiflis was founded by the merchants of this city and formally opened on the 17th of September, 1900. The school building cost \$107,940. The expenses of the institution are paid by tuition and by an annual subsidy of \$5,140 granted by the merchants of Tiflis. When absolutely necessary, the State also gives some support. The State pays the teachers' pensions, which are earned in Caucasia after twenty years' active service. Throughout the rest of the Russian Empire, such pensions are granted after twenty-five years' teaching.

The director of the Tiflis commercial school wrote:

Our commercial school stands immediately under the administration of the Russian Minister of Finance. There are three elementary classes and five general classes, as well as two classes for special study. Thus far, only the three elementary and three of the five general classes have been organized. A new class will be organized each year until all are complete. The first graduating class will go out in 1907. There are 694 students at present, composed of the following nationalities:

Nationality.	Number.	Nationality.	Number.
Russians .....	48	Greeks .....	5
Georgians .....	89	Jews .....	24
Armenians .....	480	Tartars .....	23
Poles .....	2	Persians .....	5
Slovaks .....	1	Assyrians .....	1
Germans .....	10	Ossedes .....	6

## CONDITION OF ADMISSION.

Children between the ages of 7 and 9 years are admitted without examination. Children coming from the public schools are usually admitted to the first division of the general class.

*Curriculum.*

Russian.  
German.  
French.  
Commercial arithmetic.  
Geometry.  
Geography.  
History of commerce.  
Natural sciences.  
Chemistry.  
Materials of commerce.  
Political economy.  
Religion.

Russian commercial correspondence.  
German commercial correspondence.  
French commercial correspondence.  
Algebra.  
Trigonometry.  
Commercial geography.  
History.  
Physics.  
Physiology.  
Bookkeeping.  
Commercial law.  
Elementary branches.

In addition to this course some of the languages of Caucasia are taught.

One should not lose sight of the fact that the 10,000,000 inhabitants of Caucasia are made up of the remnants of many ancient nomadic tribes. According to Russian statistics, only 2,500,000 are Russians, 1,000,000 are Armenians, 1,500,000 Tartars and Georgians, while the rest are principally Mohammedan tribes. It is claimed that there are 30 different languages and dialects spoken in Caucasia. Tiflis is an Asiatic city. It is connected by overland caravan routes with Persia, Turkistan, Afghanistan, India, and even China. Camel trains from Damascus, Bagdad, and Arabia reach the city from the south. It is the object of the Tiflis commercial school to draw its recruits from all these adjoining countries; to infuse into them Russian customs and business methods, at the same time giving them instruction in their own language, religion, and traditions. Such methods will have a powerful effect upon the destinies of southern Asia. It is the hope of those personally interested in the Tiflis commercial school that by the time it is completely established, the number of pupils will have increased to 1,200.

From a German gentleman of Mittweida, Saxony, who visited Tiflis in August, 1902, and from other sources, I have learned the following additional facts:

The teachers are regarded as being in the service of the State, enjoy certain rights as State officers, wear uniforms, and are appointed by the Minister of Finance. The school is divided into two sections, namely, a preparatory school and an advanced commercial school. In all Russian commercial schools the preparatory department is divided into four classes and the advanced school into seven classes. In Tiflis the preparatory school is complete, but in the advanced school only two of the seven classes have thus far been established. This is owing to the fact that the school was first opened in 1900. The remaining five classes in the advanced school will therefore be organized as soon as the demands for the same are urgent. One year is devoted to every class, making in all four years for the preparatory and seven years for the advanced courses.

Apprentices and others who wish to attend Russian commercial schools have the option of preparing themselves in whatever school they choose. For example, pupils may be admitted to the advanced section of the Tiflis commercial school without having attended the preparatory department of this or any other commercial school. Such preparation may be obtained in any of the public schools.

There are 48 teachers employed at present in the Tiflis commercial school. A large number of these, however, are also employed in other schools of the city. A definite salary is not paid these teachers; only the director and inspector receive fixed salaries. The former receives 4,200 rubles (\$2,158.80) and the latter 3,200 rubles (\$1,644.80) per annum. Each class teacher receives on an average 720 rubles (\$370.08) and has the privilege of giving as many extra hours as the time at his disposal will permit. In the preparatory department each of these teachers receives 50 rubles (\$25.70) for every extra course of two to three hours a week during a semester. Every class teacher is guaranteed a sufficient number of extra hours in

order to make good any deficiency in salary. It might be stated here that the school year is divided into two half years, or semesters. The average income of each teacher is thereby increased so that it amounts to about 2,000 rubles (\$1,028) annually.

There is one subject taught in the above-mentioned curriculum which is especially worthy of note, namely, materials of commerce. In the Tiflis school this subject is divided into four parts and taught with special reference to the commercial conditions existing in Caucasia. These divisions are as follows: Agriculture, stock raising, mineralogy, and manufacture.

Transcaucasia grows almost every known grain in the world. The forests of the Caucasian Mountain Range produce saffron, madder, oak, walnut, and boxwood lumber, while apples, pears, and grapes grow wild in these forests to such an extent that they are exported in large quantities. The wine of Caucasia is also exported, and the cotton of the country is second only to that of Egypt. Stock raising is of more importance to the welfare of the inhabitants than agriculture. The animal products of the country are horses, cattle, sheep, camels, honey, and silk. The fishing industry is well developed and furnishes a livelihood to many thousand people. Caucasia is rich in silver, iron, copper, coal, salt, and especially manganese. The petroleum or naphtha wells of Baku produce 8,000,000 tons, or fully 50 per cent of the world's annual supply. The industries of Caucasia are in their infancy. The articles of manufacture thus far are firearms, woven goods, and carpets.

I have mentioned the resources of Caucasia simply to show what subjects are especially taught in connection with materials of commerce in the commercial school. Samples of plants and minerals have been collected which are used by the teachers as illustrations. No student leaves the school without acquiring a thorough knowledge of all the products of Caucasia and adjoining countries, a knowledge which will inevitably be of great service to him in after years, either as a merchant or manufacturer.

Those who graduate from the Tiflis commercial school may be admitted to any of the technical universities without further examination and (with the exception of the so-called "classical four-faculty universities") to any other institution of learning in the Empire. The student is also fitted to obtain Government employment and has the further advantage of having to serve only one year in the army. The student who is fortunate enough to win the gold-medal prize—only one being granted each semester—secures pecuniary benefits and receives a special title which raises him for life to a rank about halfway between that of citizen and noble. One of the advantages thus acquired is exemption from taxation.

In Caucasia the pensions of the teachers are the same as those all over the Russian Empire. In Tiflis the pensions are better on account of the higher cost of living. These pensions are regulated in the following manner: Each teacher, as well as the director and inspector, pays into the treasury every year 2 per cent of his salary. After twenty years of service, he receives a pension of 900 rubles (\$462.60) annually. The director receives a pension of 1,600 rubles (\$822.40) and the inspector 1,200 rubles (\$616.80) annually. The Government makes a distinction in regard to pensions between those who have especially trained themselves for commercial school work and those who have not. Those teachers who are not graduates of high-class schools receive a pension of only 600 rubles (\$308.40) annually.

The school tax in the first class of the preparatory department is 80 rubles (\$41.12) for each student annually. In the other three classes of the preparatory department the tuition is 100 rubles (\$51.40). In all the classes of the advanced department the tuition is 120 rubles (\$61.68) annually.

Commercial schools in Russia are founded by the State wherever they are thought to be necessary. The initiative is always taken by commercial organizations—that is, chambers of commerce and similar bodies—the members of which have previously appointed a committee which has thoroughly examined the question. After

definite information has been obtained in regard to the demand for a school, the number of prospective students, financial contributions, etc., the Government is petitioned to grant a license and to make good any annual deficit which may occur. The Government, however, never goes beyond granting 25 per cent of the actual expenses of any commercial school. The funds for maintaining these schools must come, in the first instance, from the merchants and commercial bodies in the city where the school is located. Russian commercial schools are State institutions and are under the control of the minister of finance. The Empire is divided into districts, each of which has an inspector who works hand in hand with the director of each school. There are 43 commercial schools in the Russian Empire under the control of the State, and 20 private schools, similarly organized, with State supervision.

The commercial school at Tiflis is a very good example of the schools in the Russian Empire. Russian merchants and manufacturers are alive to the fact that these institutions will be of incalculable value in the development of the enormous material resources of their country. The Russian chambers of commerce are following the example of Germany, and are establishing these useful institutions wherever the needs and resources of a community will admit of it. The signs of the times are distinctly in favor of commercial education, and the extension of these schools throughout Russia will give many object lessons to other nations which are interested in this kind of education.

ERNEST L. HARRIS, *Commercial Agent.*

EIBENSTOCK, GERMANY, *January 9, 1903.*

#### GERMAN PROFESSORSHIP OF RAILROADS.

Consul-General Richard Guenther reports from Frankfort, January 22, 1903:

"A regular professorship of railroading is to be created at the Technological University of Berlin. Since 1901 a course of six lectures on railroading has been delivered at this school; but as this limited course was not sufficient for the important branch (for which a programme of instruction had been agreed upon in conjunction with the management of the State railroads), it is now proposed to establish a full professorship. Much more attention has recently been paid in the school to the construction of locomotives and to signaling."

---

#### ALCOHOLISM IN FRANCE.

Alcoholism in its more deplorable form is not common in France, although without doubt the disease in its milder stages is more prevalent than it was years ago. Excesses in this direction are popularly supposed to be attributable to the failure of the wine crops during the years before and after 1890, with the result that the cheap wine of the people became temporarily expensive, and led to the diffusion of strong alcoholic beverages, commonly denominated "apéritifs." Within more recent years the French wine crop has increased enormously, and the ordinary red wine has become cheaper than ever before. The use of these light wines is recommended by persons interested in the general fight against alcoholism, and it is easily observable, without recourse to statistics, that intoxication is relatively uncommon in the regions where the red wine is produced, and consequently sold upon the easiest terms.

As illustrating what is being done in France to counteract alcoholism, I supply

herewith a translation of a placard which is widely distributed by the public powers and posted conspicuously in the public hospitals:

## GOOD ADVICE.

The majority of maladies treated in the hospitals are caused, or aggravated, by the abuse, and even by the simple use, of liquids containing alcohol; all of these liquids, however denominated, are dangerous. We direct especial attention to the so-called "apéritifs," such as absinthe and bitters.

The brandies and liquors are also very destructive, and likewise wine in large quantities. More than one liter per day of wine represents a dangerous quantity. Taken before eating, these liquids depress the appetite, whatever advertisers may say to the contrary; they burn the stomach, the liver, and the arteries. After eating, alcohol in whatever form served troubles the digestion, and at the end of some time it is impossible to do without drinking, and from this moment the victim is alcoholic.

It is possible to become alcoholic in drinking regularly the liquids indicated above, and that also without entering into a state of intoxication.

The working classes labor under the greatest error in believing that alcohol gives strength. Those who are addicted to its use realize merely an artificial excitement, which lasts but a short time, and leaves them soon more fatigued than before. They then desire to cure this fatigue by again consuming alcohol, and they thus become alcoholic.

Alcoholics become insane easily, and are liable to very painful forms of paralysis. We often treat workmen who have been very robust and who have become rapidly consumptive because they have regularly taken before each meal their "apéritifs."

The children of alcoholic parents are almost always badly formed, weak-minded, insane, scrofulous, or epileptic. They die often in convulsions.

Criminals are in large part alcoholics or the children of alcoholics.

## THE PHYSICIANS AND SURGEONS OF THE HOSPITALS.

No doubt some of the remedies offered for sale in the United States for alcoholism could be sold similarly in France by adopting vigorous methods, but the field in this country is certainly limited as contrasted with that offered in the more northern regions of Europe. France, Italy, Spain, and Portugal are least of all European countries afflicted with alcoholism. There are comparatively few institutions for the special treatment of this disease in France, and I have only been able to secure the following addresses: Maison de Santé d'Epinay, 6-8 Avenue de Paris, Epinay sur Seine; Maison de Santé Esquirol, 23 Rue de la Mairie, Ivry sur Seine; Établissement Hydrothérapique d'Auteuil, Rue Boileau 10-16, Paris; Maison de Santé de Picpus, 8-10 Rue des Picpus, Paris.

ROBERT P. SKINNER, *Consul-General.*

MARSEILLE, FRANCE, *March 19, 1903.*

## AMERICAN COLLEGE IN STRASSBURG, GERMANY.

Consul J. I. Brittain writes from Strassburg, February 18, 1903:

The average American is beginning to learn that if we are to continue our advancement along commercial lines we must give our boys a better knowledge of the modern languages. An American college has been established in Strassburg (the educational and commercial center of this consular district), the object of which, as set forth in a circular, is "to fit American boys for American universities in the actual European environments of spoken German and French." The number of pupils admitted to the school is limited to 20. "Classes" and "forms" do not exist, nor under any circumstances do more than 4 boys hear the same recitation at the same time. The modern languages are taught by native teachers, resident at the school. Science and the English subjects are in charge of experienced American instructors. The school occupies a building of 40 rooms, situated in the best part of the city, and has modern sanitary arrangements. A large playground and a boathouse, well supplied with training and racing boats, are near the building, thus affording ample facilities for athletic exercise. The principal of the school is David K. Goss, formerly superintendent of schools in Indianapolis.

## PROPOSED UNIVERSITY FOR HAMBURG.

A general meeting of the most prominent citizens of Hamburg took place recently to discuss ways and means of establishing a university in that city. This will make the twenty-second or twenty-third university in the German Empire. A gentleman in Hamburg, to whom I wrote for information on the subject, says that the chief argument in favor of the scheme is that Hamburg has already such a well-developed system of lectures that a comparatively small enlargement of the present course would bring it up to the standard of a university.

The lectures referred to have been given under the auspices of the "Oberschulbehörde," or higher school authorities, of Hamburg, and embrace the following branches of learning: Theology, law, medicine, philosophy, geography, history, literature, music, art, architecture, mathematics, astronomy, physics, chemistry, mineralogy, zoology, botany, and pharmacy.

The lecturers thus far have been chosen from the most prominent citizens of Hamburg who have distinguished themselves in their respective professions. Many professors from different German universities have also been engaged to give courses on special subjects. It has always been the practice to give the lecture courses gratuitously. Anyone in America desiring further information on the subject should address Die Vorlesungs-Commission der Oberschulbehörde, Hamburg, Germany.

ERNEST L. HARRIS, *Commercial Agent.*

EIBENSTOCK, GERMANY, *March 7, 1903.*

## PRIMARY COMMERCIAL EDUCATION IN GERMANY.

In a former report <sup>a</sup> to the Department of State, I described in detail what German chambers of commerce are doing for commercial education in this Empire. In order to give a comprehensive view of the subject I divided commercial education in that report into five distinct grades, as follows:

- I.—Primary commercial schools (Kaufmännische Fortbildungsschulen)
- II.—Commercial schools (Handelsschulen).
- III.—Advanced commercial schools (Höhere Handelsschulen).
- IV.—Classified commercial courses (Handelsfachklassen).
- V.—Commercial universities (Leipzig and Cologne).

This report brought a great many letters of inquiry to this office. I have been requested by a number of persons in America, who are interested in this subject, to give a detailed report on the first of the above-named divisions, or primary commercial education as it exists in Germany to-day.

The subject is a vast one. In 1895 the chamber of commerce in Brunswick attempted, through a series of circular letters, to get all the information possible about these schools or classes in Germany. The attempt proved a failure; in many cases the letters of inquiry remained unanswered. Finally, a few persons interested in the subject consented to study up the matter in various localities. In 1896 the Brunswick Chamber of Commerce published the results <sup>b</sup> of its investigations. I have used this publication in connection with my own inquiries on the subject.

## PRUSSIA.

## (a) THE RHINE PROVINCE.

*Reasons for establishing primary commercial schools.*—It was after the creation of the German Empire in 1871 that the need of elementary commercial education took

<sup>a</sup> See article 1 of this chapter.

<sup>b</sup> Kaufmännisches Fortbildungs-Schulwesen, von Dr. Stegemann. Verlag Albert Limbach, Brunswick.

firm foothold in the Rhine province. The war with France gave an irresistible impulse to commerce and industry. Competition for markets became sharper year after year, and the increase of population soon made it apparent to merchants and manufacturers that the training of apprentices was an indispensable necessity in the search for markets. In Germany the conviction is everywhere manifest that the manufacturers of the Empire would play a losing game unless the supporting factor of commercial education be maintained at the highest pitch of skill and perfection.

The following table will show the number of primary commercial schools at present in the Rhine province:

Location.	Date of founding.	Number of pupils.	Number of pupils per 1,000 inhabitants.
Rheydt.....	1874	25	0.83
Wetzlar.....	1874	40	4.91
Duisburg.....	1880	28	.4
Aix-la-Chapelle.....	1883	196	1.72
Cologne.....	1885	230	.....
Elberfeld.....	1886	130	.93
Coblenz.....	1887	102	2.95
Essen.....	1887	122	1.23
Crefeld.....	1887	173	1.02
Düsseldorf.....	1888	250	2.33
Barmen.....	1889	132	1.06
Mülheim.....	1889	40	1.08
Trier.....	1889	65	1.8
Remscheid.....	1889	78	1.63
Gummersbach.....	1892	31	2.82
Bonn.....	1893	156	4.19
Saarbrücken.....	1893	51	1.55
Geldern.....	.....	8	.8
Total.....	.....	2,114	.....

It should be stated that the school in Gummersbach was founded by the Prussian State. The schools in Trier, Mülheim, Düsseldorf, Crefeld, Bonn, and Barmen were founded by the chambers of commerce in those cities. Those in Aix-la-Chapelle, Cologne, Elberfeld, Saarbrücken, Wetzlar, and Remscheid were founded by the merchant unions. In Coblenz, Rheydt, Geldern, and Duisburg the schools were established by the merchant unions and private individuals. The school at Rheydt is exclusively for girls, while those in Bonn, Coblenz, and Cologne are coeducational.

*Compulsory attendance.*—There is a general law in the Rhine province which compels all apprentices under 18 years of age to attend either the primary commercial schools or other schools of similar character. It would seem that the application of this law is left chiefly to local option, as only Trier and Wetzlar have thus far made use of it. The other schools accomplish as good results without resorting to this compulsory law.

*Conditions of admission.*—The conditions of admission are, for the most part, different in each school. In many the sons of the municipal authorities, lawyers, etc., are admitted on an equal footing. The majority, however, admit only the sons of tradesmen.

*Curriculum.*<sup>a</sup>—French, English, Spanish, Italian, bookkeeping, arithmetic, correspondence, stenography, and drawing are taught for the most part in the 18 primary schools of the Rhine province.

*Inspection.*—The board of directors of these schools consists usually of a committee chosen from the municipal authorities of the city in which such school is located. This board selects the curriculum, attends examinations, solicits funds, chooses

<sup>a</sup> For information in regard to text-books used in every branch taught, I would advise those interested to write to Bernhard Liebisch, Kurminz street, 6, Leipzig.

teachers, and makes all necessary recommendations to the minister of education. The mayor of the city is usually chairman of the board.

*Vacations.*—In most German primary commercial schools the vacations come at the same time as those in other public schools of the Empire.

*Financial aid.*—The following tables will show to what extent these schools or classes in the Rhine province are supported by the State, cities, and chambers of commerce. The money is given only for the purpose of making good yearly deficits.

The Kingdom of Prussia gives support to schools in the following cities:

	Amount.
Aix-la-Chapelle .....	\$200. 00
Crefeld .....	452. 20
Cologne .....	428. 40
Trier .....	100. 00

The following schools receive support from the cities in which they are located:

	Amount.
Barmen .....	\$250
Bonn .....	240
Coblenz .....	75
Crefeld .....	75
Gummersbach .....	300
Saarbrücken .....	75

(b) BRANDENBURG.

In the province of Brandenburg there are at present primary commercial schools in the following cities: Berlin, Brandenburg, Cottbus, Potsdam, Spremberg, Cüstrin, Forst, Frankfort-on-the-Oder, Rathenow, Guben, Havelberg, Landsberg, and Sorau.

There are four such schools in Berlin and two in Frankfort-on-the-Oder, while the other cities have but one each. There is also a primary commercial school for girls in Berlin.

(c) PROVINCE OF SAXONY.

There are 40 cities which have a population of more than 5,000; only 14 have primary commercial schools. Twenty-four of these 40 cities have more than 10,000 inhabitants, and 12 of these have such schools. It will be seen, therefore, that the number of schools is insignificant compared with the material wealth and development of this part of Germany.

These schools are in the following cities: Halle, Erfurt, Marseburg, Weissenfels, Eisleben, Magdeburg, Burg, Zeitz, Aschersleben, Neuahaldensleben, Wernigrode, Gardelegen, and Mühlhausen.

Magdeburg has two primary commercial schools, one founded in 1886 and the other in 1888. In Eisleben and Zeitz school attendance is compulsory. This applies to all apprentices under 18 years of age, with the exception of those who have passed the prescribed examination which admits them to one year's service in the army. Girls are admitted to the school at Eisleben, although attendance is not compulsory.

(d) HANOVER.

The primary commercial schools of Hanover are among the best organized schools of this class in Germany. They are: Hanover, Peine, Emden, Goslar, Göttingen, Lüneburg, Celle, Leer, Osnabrück, Harburg, and Hildesheim.

(e) SCHLESWIG-HOLSTEIN.

In Schleswig-Holstein, commercial primary schools have as yet been but little developed. This is perhaps due to the fact that these schools are, for the most part, private enterprises. No compulsory laws being in force, the attendance is poor. There are only four such schools in Schleswig-Holstein, namely, Kiel, Altona, Flensburg, and Schleswig.

## (f) WESTPHALIA.

Westphalia was the last of the Prussian provinces to introduce primary commercial classes. With the exception of the school at Iserlohn, the ten schools in Westphalia were all established between the years 1888 and 1895. These schools are the following:

Located in—	Founded by—
Arnsberg .....	Chamber of commerce.
Bielefeld .....	City.
Bochum .....	Merchant union.
Dortmund .....	Chamber of commerce and city.
Gelsenkirchen .....	Merchant union.
Hagen .....	Do.
Herford .....	Do.
Iserlohn .....	Do.
Minden .....	Do.
Witten .....	Do.

The above schools receive assistance each year over and above tuition collected as follows:

School.	From State.	From city.	From chamber of commerce, etc.
Bochum .....	\$357	-----	\$25
Hagen .....	250	-----	175
Iserlohn .....	125	\$175	-----
Herford .....	75	75	75
Minden .....	75	50	-----
Dortmund .....	-----	250	125
Witten .....	-----	(a)	25
Arnsberg .....	-----	(a)	(a)
Bielefeld .....	(a)	(a)	(a)
Gelsenkirchen .....	(a)	(a)	(a)

<sup>a</sup> These schools receive assistance from private individuals, it having been impossible to learn the amount.

The building, light, and heat are usually furnished by the municipal authorities of each city. It costs each student on an average \$5 to \$7 annually for each subject taught. Compulsory attendance is in force only at Bielefeld and Herford.

## (g) SILESIA.

There are about twenty-five primary commercial schools in Silesia.<sup>a</sup> On the whole these schools do not play an important part in the educational system. The curriculum, however, in most cases is extensive, even more so than in other provinces of Prussia, where education of this nature is further developed. The subjects taught in the Silesian primary commercial classes are: German, English, French, bookkeeping, commercial law, transportation, geography, materials of commerce, history, arithmetic, correspondence, stenography, and political economy.

The schools are supported chiefly from tuition fees, but many commercial organizations give assistance when necessary. It is claimed by those who are posted on the subject that the schools suffer from a want of preparation on the part of the pupils. Attendance is not compulsory.

## (h) NASSAU.

The primary commercial schools in the province of Nassau were founded chiefly by the merchant unions. This was the case in Frankfurt on the Main, Hanau, Eschwege, Wiesbaden, and Marburg. In addition to these schools, one was founded in Hersfeld in 1893, through the instrumentality of a bookkeeper and a teacher in that city.

<sup>a</sup> I have been unable to secure a list of the cities in which these schools are located.

*(i) EAST AND WEST PRUSSIA.*

The primary commercial schools of these provinces are located in Königsberg, Danzig, Elbing, and Thorn. In Königsberg school attendance is not compulsory. The pupils number about fifty. The board of directors is made up entirely of merchants and manufacturers, with the director of the school as chairman. The school funds are raised through tuition, voluntary contributions, etc. The pupils are recruited entirely from apprentices in the city. Instruction is given only from 7 to 9 o'clock on Monday and Friday evenings.

The school in Danzig was founded about forty years ago by the merchants of the city and receives its funds chiefly through tuition and voluntary contributions. The hours of instruction are the same as those in Königsberg. The classes are attended by about fifty pupils.

The Elbing primary commercial school was founded in 1869. It is attended by about 50 pupils, although attendance is not compulsory. There are two classes, the subjects being the same as those usually taught in such schools.

The school in Thorn consists of four classes with two teachers.

*(k) POMERANIA.*

The development of primary commercial schools in Pomerania has been greatly retarded because no compulsory-attendance laws exist. In addition to this, the schools are all private enterprises, without any State supervision. The schools are located in Stralsund, Stolpe, Colberg, and Lauenburg. The classes are not well attended. On the whole, the merchants of Pomerania do not seem to interest themselves much in these schools.

*(l) POSEN.*

There are only three primary commercial schools in the whole province of Posen, and these are all located in the city of Posen. They were founded by the merchant organizations of the city, the State having no supervisory control. The class hours are from 8 to 10 every evening in the week, and the schools were attended during the past year by about 150 apprentices. There is no compulsory attendance, and the examinations are held very irregularly.

## BAVARIA.

The primary commercial schools in Bavaria to-day are the following: Ansbach, Bayreuth, Gunzenhausen, Ludwigshafen, Nuremberg, Würzburg, Augsburg, Fürth, Kempten, Amberg, Ratisbon, Zweibrücken, Bamberg, Landshut, Munich, and Schweinfurt.

These schools are attended by 3,130 pupils. In comparison with the number of inhabitants, however, the attendance is not large.

## SAXONY.

There are more than 50 commercial schools in the Kingdom of Saxony. They are so efficient and widespread that primary commercial classes, for the most part, have been found to be unnecessary. In 1896 there were only three primary commercial schools in Saxony, namely, Leipzig, Oelsnitz, and Waldheim, and a very limited number has since then been established in some of the smaller towns.

## WURTEMBERG.

As long ago as 1825 a movement was started in Wurttemberg to further primary commercial education. Instruction was given in many places on Sunday. In 1854 the plan of giving instruction of evenings instead of on Sunday was introduced. The primary commercial schools in Wurttemberg to-day are the following: Stuttgart, Ulm, Gmünd, Heilbronn, Esslingen, Ravensburg, Reutlingen, Göppingen, and Biberäch.

The school in Stuttgart is independent of any other institution. All the others are connected either with the public schools or with some other institution of learning. Compulsory attendance does not exist, and the apprentices are permitted to attend only before or after business hours. In Stuttgart the hours are from 7 to 9 in the morning in winter and from 6 to 8 in summer; evenings, from 8 to 10 o'clock.

## BADEN.

In 1895 there were 13 primary commercial schools with 1,000 pupils in Baden. I have been unable to get a list of these schools. Presumably, however, they are located in Karlsruhe, Heidelberg, Weinheim, Bruchsal, Mannheim, Baden-Baden, Freiburg, Rastatt, Offenburg, etc. Undoubtedly, the number has been increased since that date.

## HESSE.

The primary commercial schools of Hesse were established under very favorable conditions. The law compels every young apprentice, after leaving the public school, to attend a primary commercial school until his seventeenth year, provided it is his intention to become a merchant or manufacturer. There are at present six such schools in Hesse, located in the six cities which possess chambers of commerce. In other words, these schools are situated only in those cities that have flourishing industries, in which a large number of apprentices are being trained. These schools were founded by the chambers of commerce, and are in Bingen, Darmstadt, Giessen, Mainz, Offenbach, and Worms.

## MECKLENBURG.

In 1891 the merchants of Güstrow held a meeting for the purpose of discussing ways and means to give their apprentices, especially in retail establishments, a better training in commercial subjects. A primary commercial school was finally established, and other cities of Mecklenburg soon followed suit. These schools are Güstrow, Wismar, Neubrandenburg, Plau, Rostock, Bützow, Malchin, Neukloster, Schwerin, Waren, and Hagenow.

## WEIMAR-EISENACH.

In Weimar-Eisenach there are five primary commercial schools, located in Apolda, Weimar, Jena, Ruhla, and Eisenach.

With the exception of the school in Ruhla, they are all private enterprises. Attendance, therefore, is not compulsory.

## OLDENBURG.

Oldenburg has but one institution which may be called a primary commercial school. This school is located in Varel, and has but 14 pupils.

## BRUNSWICK.

There are 10 primary commercial schools in Brunswick, all of which were founded by merchants and manufacturers interested in giving their apprentices the rudiments of a commercial education. They are located in Brunswick, Königslutter, Schöningen, Schöppenstedt, Blankenburg, Wolfenbüttel, Gandersheim, Holzminden, Helmstedt, and Seesen.

The chamber of commerce in Brunswick was particularly active in the work of organizing these schools.

## MEININGEN.

The primary commercial schools of Meiningen are in Meiningen, Poessneck, Sonneberg, Hildburghausen, Saalfeld, and Salzungen. The tuition of the school in Meiningen costs about \$25 a year. The city pays the expense of rent of building,

heat, and light. Teachers receive their pay from the tuition collected, as far as it goes. In Saalfeld each pupil must contribute 75 cents, upon his admission, for the benefit of the teachers. A citizen of Saalfeld gives the interest on \$250 for the school library, which is a growing one. When the school was founded the merchants' union of Saalfeld gave \$80 a year to its support, but as the attendance now is sufficient to meet expenses this stipend has been dropped.

#### ALTENBURG.

As far as I have been able to learn, there is only one primary commercial school in this little State, and that is in the city of Altenburg. It was founded in 1865 by the merchant organizations of the city. The yearly attendance averages 75 pupils. Expenses are defrayed from tuition, but deficits are made good by merchants and others who are interested in the school. One especially interesting feature of this school is the discipline which governs the apprentices. Some of the laws read thus:

It is expected that every pupil will behave himself properly while in school. The wishes of the director and teachers amount to a command and must be promptly obeyed.

Pupils are not expected to reach the schoolroom earlier than a quarter of an hour before class exercises begin. They must be provided with books and writing material, and must take their seats quietly. Tardiness, unless a good excuse is given, will be punished by extra work. When the teacher enters and leaves the schoolroom, the pupils should rise in token of respect.

Whispering is strictly forbidden.

Pupils must be orderly during the recesses. All noise, yelling and calling, the slamming of doors, and running through the rooms and halls, each and all, are decidedly against the rules. If the school property should be damaged and the offender can not be detected, the whole class will be held responsible.

If a pupil is prevented by illness from attending school, it is the duty of the parents or principal to send in a written excuse to the director some time during the day.

It is expected that every apprentice will carefully observe the time set apart for study at home.

Apprentices are absolutely forbidden to attend dances or to take dancing lessons.

The punishments usually consist of extra work, report of misconduct to principal, public reprimand, and finally expulsion.

#### COBURG-GOTHA.

The primary commercial schools of this principality are located in Coburg and Gotha. They are thriving institutions and enjoy the protection of the merchant organizations.

#### ANHALT.

The primary commercial schools of Anhalt are located in Dessau, Cöthen, and Bernsburg.

#### SCHWARZBURG-SONDRERSHAUSEN.

The primary commercial school in Arnstadt was founded in 1882 by the merchant union of the city. About 30 apprentices attend it. The school is a private enterprise without State supervision. Instruction is given by a teacher in the public school and by a merchant in the city. The hours of instruction are, on Mondays, from 7 to 9 o'clock in the evenings; Wednesdays, from 1 to 2 o'clock midday and from 7 to 8 in the evenings; Fridays, from 7 to 9 in the evening.

#### ALSACE-LORRAINE.

When Alsace-Lorraine belonged to France no commercial schools of any character existed. In 1875, Professor Bartholdy<sup>a</sup> founded a primary commercial school in

<sup>a</sup> This veteran commercial educator has done much toward furthering the founding of commercial schools in Alsace. In 1891, the writer had the pleasure of inspecting his school in Strassburg.

Strassburg. In the beginning, instruction was only given in the evenings, and, as attendance was not compulsory, the success of the institution was for a long time in doubt. Considerable stress was laid on the French language, and this soon led many of the soldiers of the Strassburg garrison, who were on the lookout for positions in the newly acquired provinces, to attend the evening classes. The result was that apprentices soon stayed away entirely, and the institution to-day has lost its character as a primary commercial school.

The primary commercial schools of Alsace-Lorraine consist of one in Mülhausen and four small ones in Strassburg. They are all under private management.

#### THE FREE CITIES.

The cities of Hamburg, Bremen, and Lübeck are the gateways through which pass \$2,400,000,000 worth of commerce every year. Naturally, these cities give a great deal of attention to commercial education. Since 1874, the commercial schools of Hamburg have prepared for actual business life 10,150 clerks and apprentices. During the past twenty-five years, Bremen and Lübeck have sent out almost an equal number. The subjects which receive the greatest attention in these schools are: English, French, Spanish, Italian, Danish, Swedish, bookkeeping, stenography, correspondence, commercial arithmetic, and commercial geography. Fully 80 per cent of the pupils study the English language.

#### NOTES.

A Fortbildungsschule, in the true sense of the term, is a primary commercial school which consists of classes where instruction is given, for the most part, by teachers who are employed at other schools. These teachers receive on an average about \$1 an hour for their services.

ERNEST L. HARRIS, *Commercial Agent*.

EIBENSTOCK, GERMANY, *March 21, 1903.*

---

#### EDUCATIONAL NOTES FROM SIBERIA.

Richard T. Greener, commercial agent at Vladivostok, Siberia, sends additional notes on education in Siberia. (See An. Rep. of 1899-1900, vol. 2, p. 1427.)

Prof. J. E. Lugebil, an American citizen, retires from active duty as instructor in the English language and literature, with the opening of the Institute for Eastern Languages, on account of the age limit. He is to be succeeded by an Englishman, Professor Boyle, for fourteen years teacher of English at St. Petersburg. There are 11 classes or English lectures in the new curriculum, making 40 lessons per week, as against 30 per week last year.

The new minister of education, a university man, has restored the study of the ancient classics to its old place in the curriculum, and makes the study of French and English elective, instead of obligatory, as before. Latin and Greek are compulsory from the third and fourth grades or classes.

The Technological Institute at Tomsk is authorized to spend 300,000 rubles in addition to the 600,000 already expended since January 1, 1902. The total amount spent on buildings in previous years is 3,000,000 rubles.

Vladivostok is to have a second girls' grammar school. It will occupy the house of the old gymnasium for girls when the new building now approaching completion is finished and dedicated, in November. The new building is spacious, roomy, four stories, conspicuously situated, and will be one of the ornaments as well as utilities of the city.

By a new order, issued by the colonels of their respective regiments, all officers studying in the Institute for Eastern Languages must hereafter attend divine service, not only mornings, but also on Saturday evenings and Sunday mornings, under penalty of being marked "under suspicion."

Morning and evening prayers are also compulsory on all pupils of the girls' and boys' gymnasiums.

By a recent order no foreigner is allowed to maintain a private school in Russia. Of course they may be employed as individual professors.

Many Russian military officers, besides their daily routine of duty, teach elementary and often special subjects to their privates. This holds true of the navy, and the daily school for soldiers and sailors is an established institution. A small daily allowance, some 30 kopecks, is granted for this work. The officers engaged are conscientious and enthusiastic, and excellent results are reported.

The subjects for study are mainly elementary, though at times they are of a technical character—telegraphy, electricity, botany, etc. At a recent lecture in the museum on the Roentgen rays, three privates manipulated all the apparatus in an intelligent and careful manner, showing complete knowledge of theory and practice. Many privates turn a penny by putting in electric batteries.

In the navy the studies vary, if at sea or in port. Russia is fully conscious of the vast illiteracy, and these notes are written to show that much is doing to overcome it in public schools, gymnasiums, technical and commercial schools, etc.

Some late statistics give 54 high schools, 16,510 pupils; 880 middle schools, 162,000 pupils; 79,000 primary schools, governmental and private, with an attendance of 4,204,000 in the whole Empire.

At St. Petersburg there is a school for teaching watch-making as an employment suitable for women. The course covers three years. It opened last autumn. Only graduates of the fourth-class girls' gymnasium are eligible.

The Government council has granted 200,000 rubles for a girls' gymnasium at Blagoveschensk.

Even at Sakhalin the children of the convicts are not left in absolute ignorance. Seven thousand six hundred and seventy-three rubles were voted by the council for nine schools at Sakhalin for the children, 17,002.50 rubles to open a grammar school, 5,000 yearly for maintenance from 1902 to 1904, and from 1909, 21,612 rubles yearly.

One hundred and sixty thousand rubles are assigned to build a mechanical school at Nikolsk-Ussurisk, 54,760 rubles for a lower-grade school at Nikolaefsk. From July 1, 1902, 8,300 rubles are allowed for maintenance of the Nikolsk school; from 1904, 16,000 rubles yearly. For the Nikolaefsk school, 1903, 3,362.50 rubles; from 1904, 6,075 rubles yearly. In addition, 108,000 rubles were assigned for an industrial school at Nikolsk, and work upon it began in June last.

While an imperial sanction of the state council decrees these sums from the imperial treasury, something is required from the towns benefited. Nikolsk is assessed 1,500 rubles in 1903; after 1904, 300 rubles yearly, toward support of schools.

Nikolaefsk pays 500 rubles until 1903; after 1904, 1,000 rubles yearly.

With the formation of a new school of mines, a new commercial school, and a new industrial and trade school at Vladivostok, all of which are in various stages of evolution at present, one of the projects of the minister of finance will be in way of accomplishment. About 300,000 rubles are estimated for buildings for the trade and industrial school. The city is willing to assume one-third of this expense, as it has in hand 91,500 rubles for school uses, and has granted an eligible site near the Sharikoff Ravine as evidence of its earnestness in the matter.

If there are not many Carnegies in Russia, there are some Pearsons. A peasant from the village of Aleseevka, Briuchkovsky district, Smolensk Province, by name Anisim Andreavitch Samoileuko, left 350,000 rubles for a mechanical school to be established in his native village and bear his name, 50,000 rubles for the building

and 300,000 rubles in the Government bank, the interest of which is to support the school.

The increase in the educational fund throughout the Empire for 1902 is noticeable, being 4,000,000 rubles, making a total of 37,000,000 rubles.

The universities will receive some 500,000 rubles, primary and grammar schools 1,700,000 rubles, and 1,000,000 rubles will be expended for new buildings.

Free lectures on natural history, geology, law, physics, etc. (seven lectures), began at Tomsk late in October, on the university extension plan, and have proved very attractive.

At Blagovestchensk about 600 girls are without the primary instruction. Hence the necessity of opening at once the two proposed schools in that city—the Pooshkin and the Lermonteff.

A. M. Pozdnieff, director of the Oriental Institute in Vladivostok, has issued an order that no teacher in the boys' grammar school, attached to the institute, shall give private lessons unless by the director's express permission. His theory is outside work detracts from the instructor's effectiveness in the class room.

*Schools for deep-sea navigation.*—By imperial order of May 6-19, 1902, five schools for deep-sea navigation are to be established in Russia. One in St. Petersburg, another at Vladivostok, a third at Rostoff on the Don, a fourth at Bakoo City, and a fifth at the settlement Magnushoff.

The yearly appropriation for all of these schools amounts to 95,822 rubles.

The three years' studies will consist of: (1) Religion, (2) Russian language, (3) algebra, (4) geometry, (5) trigonometry, (6) navigation, (7) nautical astronomy, (8) sea practice, (9) arrangement and theory of vessels, (10) steam engineering, (11) meteorology applied to weather forecasts, (12) geography of the sea and the main points of commercial geography, (13) marine law, (14) marine bookkeeping and commercial correspondence, (15) marine hygiene, and (16) English language.

The school year commences in November, and the examinations take place in April.

*Improving the health of school children.*—During the last session of the directors of the middle schools of St. Petersburg, the application of the recommendations of the minister of public instruction with regard to the improvement in health of school children was a subject of debate.

It was stated at the meeting that several middle schools have introduced one free day on weeks that contain no legal holiday. Others, again, introduced such extra holidays after the first and the third quarters of the school year, when the children habitually show signs of lassitude. The taking part in the proposed excursions is not to be made obligatory, as it may come to be considered a hardship.

The conclusion has been reached that the time of recess should be made longer; after the first lesson, ten minutes, instead of five; after the second, twenty minutes, instead of ten, and after the third, forty minutes instead of thirty.

*Labor legislation.*—A recent circular comes from the ministry of finance, addressed to the inspectors of textile fabrics. Every industrial enterprise depends primarily on the workingman. The general condition or state of each nation's industry, when in competition with the world's industry in open market, is undoubtedly measured by the spiritual level or progress of the mass of workingmen and their technical ability. To raise this level is an affair of greatest importance. The ministry of finance has, therefore, outlined a scheme for promoting technical schools and general lectures, which have met the approval of the government council, and have the imperial sanction. The main outline of the scheme is purely practical, relating to the study of the variety and flexibility of all forms of industry and their connection with material and shop activity. The introduction of these technical schools of fabrics and methods is designed to strengthen the amicable relations between the pupils, the workmen, and the proprietors. Such schools can only teach properly when

they furnish correct views of factory life, of materials, all conditions of factory organization, and knowledge of all the Government regulations and legislation relating to industry. These elementary notions can best be inculcated by the Government officials of labor inspection, who stand nearest to all industrial work, who have received the higher technical training, and are competent in all lines of technical study.

On these grounds the new regulations, by imperial sanction, place the new technical workshops, schools, and lectures intimately in relationship with the rigid inspection of factories and workingmen, charging such inspectors with the guardianship of these workshops and lectures and the soundness of the educational system. With this preliminary, the minister of finance urges the inspectors to use every possible means to encourage the opening and advancement of these schools.

*Table of lectures in the Oriental Institute at Vladivostok, academic year 1901-2.*

	First course.	Second course.	Third course.	Total during the week.

a Either five.

Number of scholars..... 284  
 Number of teachers..... 18

*Remarks.*—Gymnastics and choral singing, each three times a week, during recess.

Either French or English is obligatory in the first and second classes, but both modern languages are obligatory studies in the higher classes.

The study of German will cease in 1903 and French be substituted.

After 1904 <sup>a</sup> no more Greek will be studied, and Latin will become optional. Instead of Greek a more extensive study of natural history will be introduced, as well as chemistry, hygiene, and law.

<sup>a</sup> The rule of the new minister of education (see p. 881) would seem to retain Latin and Greek in the gymnasium.

#### I.—HENRY BARNARD'S SERVICES TO EDUCATION IN CONNECTICUT.

REMARKS AT THE CELEBRATION OF HENRY BARNARD'S BIRTHDAY IN HARTFORD,  
MONDAY, JANUARY 25, 1897.

BY W. T. HARRIS.

It is deemed a piece of good fortune that we are able to recognize and acknowledge the services of a public benefactor while he is yet living in our midst. Most recognition comes too tardy for the purposes of comfort and consolation of the hero himself. We build high the monument and place the portrait statue in our public square, not only to commemorate the patriotic citizen who has benefited us by his life, but also to confess our churlish neglect of his services while he lived. It is therefore doubly a cause of rejoicing with us to-day that we are assembled here to celebrate the birthday of a public benefactor who still lives to receive our tribute of respect and mingle his joy with our own. For it is even a greater pleasure to him than to us to see the cause that he advocated with sacrifices of labor and money under circumstances of apathy and neglect, or even of active opposition and some opprobrium, now become everywhere a triumphant cause throughout the entire nation.

The State which furnished the smallest amount of schooling to its people in 1895 gave an average quite equal to that offered by Connecticut in 1839. It may be doubted whether Connecticut or Massachusetts gave an average of more than two full years of two hundred days each to every inhabitant in 1830. Now Connecticut is giving nearly seven years as the average quota that every child receives before manhood and womanhood. In fact, the average schooling of the nation at large is four and one-half years, or double the amount received in Connecticut and Massachusetts at the beginning of the great revival in public education, sixty years ago, in New England.

It was only last year that the centennial anniversary of the birth of Horace Mann was commemorated throughout the nation. We are all fresh from the reading which we undertook anew for the purpose of understanding that remarkable epoch, and to-day we recall again the same historical data, because Henry Barnard was for us, the people of Connecticut and Rhode Island, the initiator of an educational revival corresponding to that of Horace Mann in Massachusetts. By common consent public opinion has placed Henry Barnard side by side with Horace Mann as his great coadjutor, for he has supplemented the work and universalized it by collecting in one great body the written records, not only of this movement, but of all similar

movements in the history of mankind. He has made accessible the wisest and best things that have come from the experience of the race in the matter of founding and conducting schools.

To see the significance of both phases of this movement it is necessary to consider the original status of these colonies and the necessary steps of their progress into membership within a great nation. All the colonies of New England owe their beginning to migration for religious purposes. Their first institutions were church societies, in which a very radical form of democracy was united with an intensely exclusive form of ecclesiasticism. The earliest proceedings of their governing bodies are forever memorable for the adoption of measures to secure the school instruction of all the inhabitants. But the civil community had not yet separated and become independent of the ecclesiastical. A struggle began soon after the restoration of the Stuarts to the throne of England—as early as 1665—to widen the civil functions and extend civil rights beyond the limits of the church organizations. This movement made great progress after the revolution of 1689 and on through the following century. The school was the chief agency through which the separation of the church and state was accomplished.

In Connecticut at first the town was one with the church society; but in time new branch societies were formed in the same town, and the civil interests began to have a wider scope of application than the ecclesiastical. But the school affairs were administered by the church societies until 1798, when the moneys came in from the sale of the Western reserve lands in Ohio. The State refused to give to the churches a share of this fund, but devoted it all to schools. Then new corporations (named in the law school societies) were formed to receive and distribute the school funds to the several districts and exercise supervisory functions so far as to examine teachers and occasionally inspect their schools, the district committeemen employing the teachers and fixing their terms of service. These school societies were coterminous with the religious societies, which they superseded in the control of schools.

The great fund derived from the sales of its Western land amounted by 1810 to \$1,200,000, and by 1825 to one and three-quarter millions, its annual interest being nearly \$150,000 for the support of schools. For a century previous there had been a compulsory tax of one-fifth of a cent on each dollar of property set apart for the support of schools, being in 1810, 45,000; 1825, 72,000; 1840, 103,000. Possibly this may have yielded as much as \$20,000 by the year 1800, when the total valuation of the State may have been about \$10,000,000.

A general State tax is not felt by the school committeeman ever so miserly inclined. He can not relieve his district financially by administering his schools on a basis of rigid economy so far as concerns the expenditure of what he receives from the State as a whole.

But he may limit the school expenditures of his district or his town to the smallest possible outlay beyond these revenues, as this surplus will fall as a special burden on himself and the other people of his district. There must have been a considerable contribution to the school fund on the part of towns and districts before the year 1800, perhaps the bulk of it being in the form of rate bills or tuition fees paid by the parents of the children in actual attendance on the schools. But such contribution must have nearly ceased after the distribution of the annual income from the school fund began. The revenue per child of school age was increased threefold. The results were so stimulating to the schools that Connecticut became famous for its public education, and doubtless it received large accessions of immigrants for this cause alone from the neighboring border populations of Rhode Island and Massachusetts.

The fund being a fixed quantity and the increase of school children a progressive one, the annual quota per child constantly grew less, and the schools ceased to improve. The people had become unused to tax themselves for school purposes;

they disliked rate bills and preferred to shorten the school session or employ cheaper teachers, so that the schools might involve no burden of local expense. The prestige of Connecticut schools began to wane, and the fact that the church lost some of its interest in the schools after the direct responsibility was transferred from the ecclesiastical society to the secular corporation called the school society added very much to the decadence of the standard excellence of the instruction.

The trumpets of alarm were first sounded in and about Boston, where the urban growth had made possible a better type of schools, and a large body of highly enlightened men began to feel sensibly the need for higher ideals in the education of the people. It can not be supposed that Connecticut was at so low a status as Massachusetts in its public schools, even as late as 1835, but three or four years of Horace Mann's administration easily left the boasted prestige of this State behind.

The epoch from 1820 to 1850 is remarkable in the history of the Northeastern States for the introduction of two great instruments of modern civilization—first, machinery in the manufactures, such as the power loom, spinning machines, and the like; next, the railroad locomotive and the stationary engine for the use of the mill. A new era of productive industry was ushered in. Perhaps the total product of all the industries of the United States in 1800 did not exceed 10 cents per day for each inhabitant. That of Russia at present does not exceed 15 cents per capita. But by 1850 the quota had risen to 25 cents, and in 1890 it was nearly or quite 50 cents as the average for the entire nation, while Massachusetts, Rhode Island, and Connecticut, thoroughly equipped with machinery, the railroad, and the common school, produced nearly \$1 per day for each inhabitant.

The common school, by teaching reading, writing, arithmetic, and geography to the child takes him forever out of the fixed and immovable status of soul that belongs to lower civilizations, and by placing each individual into relation with his fellow-men by the agency of the printed page, sets him on the road of continued education, for he enters the spiritual process which goes on in the formation of public opinion. Each individual gives and takes—molding this opinion and being molded by it, but always in a state of continual education, never any longer to be classed with the people in a state of arrested development.

This urban epoch, ushered in by the power loom, the railway car, and the daily newspaper, must have as its concomitants the graded school, the professional teacher, and the expert supervisor of schools, for the village grows into a city and the district school of 1 teacher and 20 pupils of all ages and grades of advancement yields place to the union school, with its clustered group of primary rooms and grammar rooms all arranged in an ascending hierarchy, with small intervals between the classes and each class containing pupils of the same degree of advancement. The old process of recitation, in which the teacher heard the pupil say the words of the book with little or no explanation of the ideas in his own language and with no probing questions on his (the teacher's) part—for there were only five or six minutes available of the teacher's time for the whole recitation—has given place to class recitations of twenty to thirty minutes each, and the contents of the lesson are probed to the bottom, so that each pupil goes to the work of preparation of his new lesson with some new glimpses of the true method of study. He has learned through the well-conducted recitation of some defects of his habits of study, some lack of alertness which allowed critical points to escape him before, but he will not fail again to-day in those particulars. The graded city school, besides this training of the pupil in methods of study, also gives him a will training in the moral habits of regularity, punctuality, silence, and self-restraint, giving him a sense of his responsibility to so act that his deeds may not hinder others, but help them to help themselves.

With the great revival of education led in by Horace Mann, Henry Barnard, and their coadjutors, the school session was lengthened from three or four months to ten or eleven months, and the makeshift teacher, who worked on the farm in the sum-

mer and "kept" (not taught) school in the winter, gave place to the professionally trained teacher, who made a business of school-teaching.

The era of normal schools began with that at Lexington in 1839, and was followed by those at Barre and Bridgewater and the New York school at Albany, and next by the honored institution at New Britain, in this State. In 1896 there had come to be 161 public normal schools and 165 private ones, 326 in the aggregate for the United States.

The graded schools improved rapidly in the new epoch, and in 1847 the justly celebrated Quincy School in Boston was opened under John D. Philbrick (well known to our Connecticut State normal school alumni), and each teacher was assigned 40 pupils for exclusive supervision and the conduct of studies. A new epoch began in discipline from this date with the adoption in cities of the Quincy-School plan, and a better school discipline was secured with a minimum of corporal punishment.

The experience of Massachusetts, Rhode Island, and Connecticut with supervision under Horace Mann and Henry Barnard led to the adoption of school superintendents in one State after another, until all the States have secured supervision by experts.

We have seen that the era beginning with the independence of the colonies from Great Britain in the year 1790 is an era of transition from ecclesiastical authority to civil authority, and that during this period the schools suffered from the change of basis. The ecclesiastical leaders were supplanted by secular leaders, but not for some time by leaders equally competent. Moreover, the great school fund which stimulated the school system in the highest degree up to the year 1820 afterwards furnished a continually decreasing amount for each child of school age, and the deficiencies were not met by local taxation. The school system declined in efficiency, and the rising consciousness of the defects of that system produced the reformers of the epoch from 1820 to 1840. The reform movement meant the better provision for schools on the part of the States and especially a provision for the better education of teachers in the theory and practice of their art. Certainly one of the two greatest movements in this reform was the measure inaugurated by our Connecticut hero, Henry Barnard, to provide for an educational literature, giving the history of all educational movements, and, besides this, containing translations or the original English of the great writings of pedagogy since the beginning. This movement is justly called one of the two greatest, because its usefulness can not be limited by State boundaries. The *American Journal of Education*, with its 31 volumes, is just as useful reading in California, Texas, North Dakota, Canada, Australia, England, and Scotland as it is in Connecticut, and Dr. Barnard has won the thankful recognition of professional teachers in all these places for his great work.

We celebrate here to-day, therefore, the person who in his early manhood consecrated his life to education. Here are his words uttered at the beginning of his career, words which ought to be printed in gold letters in a conspicuous place in the capitol of this flourishing Commonwealth:

So far back as I have any recollection the cause of true education, of the complete education of every human being without regard to the incidents of birth or fortune, seemed most worthy of the consecration of all my powers and, if need be, of any sacrifice of time, money, and labor which I might be called upon to make in its behalf.

This declaration sounds like a prophecy, for our honored citizen has devoted all his time and all of a considerable inherited fortune in making accessible in the form of books what is recorded of the wisdom of the race as relates to the instruction of children.

The nation rejoices with Connecticut to-day in paying this tribute of respect to the great educational counselor of the past fifty years, for Dr. Barnard has been always retained as a counselor on all difficult educational questions by State legislatures,

municipal governments, and the founders of new institutions of learning. The nation assists you to-day in this celebration of the man who has expended his time and fortune to print and circulate an educational course of reading of 24,000 pages and 12,000,000 words. It assists you in bearing testimony to Henry Barnard as the missionary of improved educational methods for the schools of the people, the schools which stand before all other philanthropic devices because they alone never demoralize by giving help—they always help the individual to help himself.

---

## II.—HENRY BARNARD AS FIRST U. S. COMMISSIONER OF EDUCATION.

BY REV. A. D. MAYO, A. M., LL. D.

In a biographical sketch of Dr. Henry Barnard by the writer (chapter 16 of the Report of the U. S. Commissioner of Education for 1896-97) is found the following estimate of this man, rightly named by one of his German admirers, Dr. Wimmer, "The veritable reformer of popular education," and by another foreign writer, "The world's educational orator:"

The time [1830-1850, the period of the first great revival of the common school] was ripe in our country for the appearance of a great national representative of the literary side of popular education. There was an imperative need of a man of large native capacity, broad culture, and catholic temperament, competent to gather into his capacious mind the entire condition of educational affairs in all civilized lands; a man by birth, education, and social connections commended to the educated class of the whole country, yet of a patriotism so intelligent and intense that he should be found ready to cast in his lot as a day laborer, and, if need be, a martyr, in the supreme cause of the uplifting of the masses of this Republic. He should be one who could set before every class of earnest and active teachers and educational workers the best results of educational thought and activity through Christendom in a form that would strongly commend itself to the foremost minds at home and abroad. Such a man was Henry Barnard, of Connecticut, the great colaborer and complement of Horace Mann.

Henry Barnard was born in Hartford, Conn., in 1811, and died in 1900, in the ninetieth year of his age, in the room in the house where he was born. He entered Yale College when only 15 years old, and graduated in 1830, at the age of 19. In 1835, at 24, he was admitted to the bar as a lawyer. His training in the common schools, a celebrated private academy, and Yale College was supplemented by two years of travel in the United States and Europe as a further preparation for the profession which he regarded the occupation of his life. In these journeys he formed the acquaintance of many of the most distinguished men in America and other countries. In 1837 he returned to Hartford, and at the age of 26 was elected a member of the general assembly of Connecticut.

From the year 1837, to the day of his death in 1900, the most remarkable sixty-three years in American educational history, he was always recognized as among the foremost educators of his own country, and especially conspicuous as for many years the medium by which the history and condition of education in Europe was transmitted to the United States.

During the twenty-five years from his first appearance as an educational reformer in Connecticut in 1837 to the outbreak of the civil war in 1861-62 he was engaged at different times in the State superintendency of common schools in Connecticut and Rhode Island and as chancellor of the University of Wisconsin. In the administration of the affairs of every local position he kept in view the larger interests of national education. All his reports, even the first concerning the public schools of Connecticut, praised by Chancellor Kent of New York as a classic in popular education, were uniformly in view of a national audience.

It was a significant fact that despite the powerful physical constitution of Dr. Barnard, which carried him through a working period of nearly seventy years, his health always failed in every post of school administration. He was reluctant at first to undertake the severe task of reforming the common-school system of Connecticut in 1837, and never felt quite at home in any executive position. He declined the invitation to become chancellor of two State universities, Indiana and Michigan, and retired from the two university positions he did accept, the State colleges of Wisconsin and Maryland, after a brief term of service. He never felt so really himself as when through his tireless pen or eloquent voice he was dealing with a national audience. His great work, the *American Journal of Education*, after the prodigious literary fertility of the nineteenth century in educational material of permanent value still acknowledged as the best encyclopedia of popular education, was the best expression of himself. Its collection of useful information, doubly important during the period of the two great revivals of the people's common school, from 1830 to 1850 and 1870 to the close of the century; its fertility in the details of home schooling, which makes it in many cases the only reliable authority in American educational history; its judicial impartiality in the treatment of all sorts and types of educational institutions, ignoring both sectarian religious and partisan political prejudice; its characteristic spirit of optimistic estimate of educational systems and methods in advance of the time, which in one or another shape have become incorporated with the various school organizations of the country; in these and other ways we note the vast field in which he was most content to abide. He was, perhaps, the first of our eminent Northern educators of the many who were called to the management of Southern educational foundations to visit that section of the Union as an advocate of what has since become in fact, though not in legal form, our American system of common schools for all classes and conditions of the people. He was all his life the friend and adviser of the leaders of every important movement for educational reform in every State, from Horace Mann and his colleagues in Massachusetts to the men who shaped the educational systems of the new States of the West. He always worked with enthusiasm in the teachers' institutes, the American normal school on wheels, which at the beginning of the common-school movement comes to every rural locality like a big omnibus, crowded with the best school men and women of the country, for a brief time holding the educational public of the place under the spell of its high thinking and friendly, familiar speaking. And nobody has published more in explanation of the normal school. One of his first college essays was a defense of the higher education of young women, and he was the fast friend of, and at one time the coworker with, Mrs. Emma Willard, the distinguished principal of the seminary at Troy, N. Y., for the secondary and superior training of girls.

Indeed, it would be difficult to name the department of educational activity in the century in which Henry Barnard did not appear as a most welcome, suggestive, and inspiring worker. His great success was not as an administrator of school systems or an author of special treatises, but as in himself a great personal magazine of valuable information; and it may be said that while our own country, especially in the persons of its leading presidents of colleges and academies and State and city superintendents of instruction, has produced a body of literature and a record of effective service that may challenge respect everywhere, no man has yet appeared to fill the peculiar place of Henry Barnard.

His labors in Connecticut and Rhode Island in reorganizing an antiquated and crude arrangement for popular schooling into the American system as outlined by the great reformers of the period between 1830 and 1850, had favored his application of general principles to the social conditions then existing. His early excursions through the Western States, then experimenting on their present systems of public

instruction, had enlarged his ideas of the possibilities of the common school, the most original of our American new departures. His fine catholicity and aloofness from bondage to religious, political, and social prejudice commended him to two cultivated cities of the South, New Orleans and Charleston, which were encouraged and aided by his visits to begin the work of the general free schooling of their white children and youth. His wide acquaintance with the best that was going on in Europe qualified him to publish the results there obtained, with thorough understanding of the conditions under which this information could be accepted and used in the United States.

It was inevitable that the broad interest in what he regarded in fact, if not in name, the American common-school system, should at an early period have directed his mind to the importance of some form of national indorsement, if not of national control, of the people's university by the General Government. The same idea has been ascribed to Horace Mann, and there can be no doubt, even if the proposition does not appear in his published writings or correspondence, that the logic of the great educational movement that dates from his appearance implied what is now the established policy in the support of the National Bureau of Education. Dr. Barnard was never far behind his great chief and associate. In a written statement made to the author of this essay a few months before his death Dr. Barnard speaks of his connection with the introduction of education into the national census in 1838-1840. In 1838, when secretary of the Connecticut State board of education, Dr. Barnard visited Washington to ascertain what school statistics and educational documents existed in the Library of Congress and pigeonholes of any department of the Government. After consultation with Dr. Lieber, F. A. Packard, and others, who had previously issued a pamphlet on census returns, he was referred by Mr. Forsyth, of Georgia, then Secretary of State in charge of the census, to Mr. Hunter, chief clerk, who had the schedules for 1840 in hand, and who informed him that up to that time nothing on this point had been done. After consultation, a memorandum was placed in Mr. Hunter's hands of the points thought desirable to be included; the schedules, as issued, included its main features, and returns were subsequently obtained, tabulated, and published. The returns, by order of Congress, were communicated to Dr. Barnard and Mr. Mann in advance of their official publication, and were used by them after their accustomed fashion.

Ten years later Dr. Barnard, in an address before the American Institute of Instruction, held at Northampton, Mass., in August, 1850, called the attention of the institute to the importance of a central agent, and urged the institute to broaden the field of its action and include such an officer for New England at least. The subject was discussed and Dr. Barnard thanked for his address; and it was voted to refer to the government of the institute a resolution by him covering the following points: To make application to the legislature of each New England State for a pecuniary grant to enable the institute to appoint an agent or secretary devoting his whole time to advancing its objects; the enlargement of the library of the association or proposed depository in connection with the Massachusetts board of education; the publication of a New England Journal of Education under the cooperation of the State teachers' association and State educational authority of each State; a series of educational tracts or essays for popular circulation; an annual report of the condition of the common schools in each of the New England States; and a sketch of the progress of education in other States.

Four years later, in 1854, the idea first suggested by Dr. Barnard in this address, of an agent concerned with the educational affairs of the whole country, was again presented by Dr. Barnard before another association, as will be narrated further on.

Among the numerous movements in behalf of universal education directly and indirectly connected with the great revival of the people's common school, covering

the thirty years from 1830 to 1860, one especially should be noted, both from its breadth of interest as a national organization of several hundred of the most eminent educators of the country and from the relation sustained to it by Dr. Barnard.

In response to a call for a "national convention of the friends of common schools," signed by Bishop Alonzo Potter, of Pennsylvania, and 36 others, including Horace Mann and Henry Barnard, a convention assembled in Philadelphia on October 17, 1849, consisting of some 200 men fairly representing the leading educational body of the country, presided over by Horace Mann, and including in its board of officers Joseph Henry and Samuel Lewis. The meeting, which remained in session three days, was opened by an inspiring address from the president, Horace Mann, to an audience representing 15 States of the Union, all its members well known, and many of national reputation. The address was an eloquent plea for "a national organization of teachers," by which "great and comprehensive plans may be devised, to whose standard each State may be gradually brought into conformity." "Let us devise systems of education," said the president, "that shall reach every child that is born in the land."

On motion of Mr. Henry Barnard, of Connecticut, it was

"*Resolved*, That a committee of five, to be called the 'business committee,' be appointed by the chair to prepare business for the convention."

The president appointed to be this committee Henry Barnard, of Connecticut; John S. Hart, of Pennsylvania; Nathan Bishop, of Rhode Island; H. H. Barney, of Ohio; Thomas H. Benton, jr., of Iowa.<sup>a</sup>

The next day the business committee reported three resolutions, of which the second was as follows:

"*Resolved*, That a committee of five be appointed to prepare a memorial to Congress, asking the establishment of a bureau in the home department for obtaining and publishing annually statistical information in regard to public education in the United States."

Made the special order for to-morrow at 12 o'clock m.<sup>b</sup>

The following day "The second resolution was adopted as reported by the committee."<sup>c</sup>

Dr. Barnard, from the business committee, proposed ten topics for consideration "relating to the organization and administration of a system of public instruction, adapted to different sections of the United States."

Another committee of five, of which Dr. Barnard was chairman, proposed to define and recommend some "rules which ought to regulate the future legislation of States and towns" concerning the formation of school districts throughout the country. Also a committee of three, Henry Barnard, chairman, was appointed to "prepare a digest of the school systems and educational statistics of the several States, and report to the next convention."

The discussions on these topics included almost every subject, and probably no previous meeting of educators in the country had ever included so large a number of men vitally connected with the common-school system as the two hundred and more whose names appear in the list of delegates.

That the suggestion of Dr. Barnard concerning the establishment of a bureau in the home department of the National Government had touched a vital chord in the thinking of the higher educational public is evidenced by the fact that, two years later, a committee was appointed at a meeting of the officers of the American Institute, held at Lynn, Mass., January 4, 1851, of which Mr. John D. Philbrick was chairman, "to consider the expediency of petitioning Congress with reference to the establishment of an educational department at Washington."

<sup>a</sup> See p. 14 of Proceedings of the National Convention of the Friends of Public Education, held in Philadelphia October 17, 18, and 19, 1849. Philadelphia: E. C. & J. Biddle, 6 South Fifth street, 1849.

<sup>b</sup> *Ibid.*, p. 16.

<sup>c</sup> *Ibid.*, p. 19.

The second meeting of the National Convention of the Friends of Education was held in Philadelphia August 28-30, 1850; Rev. Eliphalet Nott, president of Union College, New York, temporary president, Henry Barnard, a member of the business committee. The President of the United States had been invited to be present. A strong resolution was adopted urging upon every State the "political and Christian duty," of providing a system of free schools. An organization was effected under the general title, "The American Association for the Advancement of Education," whose object should be "to promote intercourse among those who are actively engaged in promoting education throughout the United States; to secure the cooperation of individuals, associations, and legislatures in measures calculated to improve education, and to give to such measures a more systematic direction and a more powerful impulse." All members of the two conventions could become members of the association by paying an admission fee of \$2; also delegates from colleges, universities, incorporated academies, normal and high schools, from State, county, or other educational associations, to the extent of three from each, besides such distinguished educators and friends of education in other countries as might be elected by the association. Life members paid \$25. Philadelphia was selected as a permanent place for the reception of all literary material connected with the association.

At this meeting, which continued three days, Dr. Barnard reported as chairman of the committee "to prepare a digest of school systems and educational statistics of the several States," that during the past ten years he had collected more than 1,000 documents for the purpose of preparing the history of education in the United States, from which he would present a report later, including among other topics "the action of the General Government in reference to education and science, grants of land, the Smithsonian Institute, professional schools, normal schools." In connection with the report of this convention is printed the well-known document on "Principles of school architecture," by Dr. Barnard.

The third convention and first session of the American Association for the Advancement of Education was held in Cleveland, Ohio, in August, 1851, Bishop Alonzo Potter, of Pennsylvania, president. The burden of the president's eloquent opening address was that the new association was not merely national but continental, an American association, knowing no dividing lines between East and West, North and South. He emphasizes "the comprehensive and catholic character of our principles." At this meeting Dr. Barnard reported in part on educational systems, and was appointed a member of the standing committee. A communication from Rev. A. A. Livermore, of Cincinnati, on the subject of a national educational bureau at Washington, was referred to a committee of three: Hon. Bellamy Storer, Rufus King, of Cincinnati, and Horace Mann, of Massachusetts. Dr. Barnard was requested to append to the published proceedings a "condensed form of the statistics which he has collected in regard to systems of education in different States." He was also made chairman of a committee of three to report upon the "value of education to all the industrial interests of the country."

In August, 1853, the association assembled for four days in Pittsburg, Pa., Prof. J. Henry, of Washington, president. The retiring president, Bishop Potter, again dwells with great earnestness upon the necessity of the union of the educators of the country for the common purpose, and urges that a premium be offered to the author of the best book on "Education for the times." Among the resolutions offered was one advocating "one great institution of a national character," including a general museum of natural history and botany. An attempt was made to raise the sum of \$5,000, to be used as premiums for educational treatises. Prof. Alexander Dallas Bache, of Washington, D. C., was elected president. Dr. Barnard was detained by sickness in his family. Delegates from abroad addressed the meeting.

The fourth session of the association, held at Washington, D. C., December, 1854, was remarkable for the introduction, by Dr. Barnard, of the subject of appointing a

general agent to devote his whole time and energies to the advancement of the purposes of the association. Bishop Potter offered a resolve bearing on this subject, in which reference is made to "the results of the inquiries some time since instituted by a member of this association, at the instance of one department of the General Government, in regard to the present state and past history of education in the United States." The standing committee was instructed to consider and report specifically at the next meeting on the plan for the employment of a permanent agent by the association proposed by Dr. Barnard.

This plan provided for the appointment of a secretary or agent, with permanent headquarters as a depository of official documents and apparatus. This official, appointed by the association or the Smithsonian Institution, should "devote himself exclusively to the increase and diffusion of knowledge on the subject of education, especially of the conditions and means of improving popular education;" also "answer all personal and written inquiries on the subject, and collect and make available for use information as to all advances made in the theory and practice of education in any one State or country." He should attend educational conventions, national or State. He should edit a publication to be entitled, "The American Journal and Library of Education," on a plan set forth in an accompanying paper. He should "collect plans and models of schoolhouses and furniture, specimens of maps and other material aids of education, and educational reports and documents from other States and countries." He should institute a system of educational exchanges between literary institutions at home and abroad. He should submit annually a report containing a "summary of the progress of education in each State and, as far as practicable, in every country."

In connection with this document, Dr. Barnard placed before the association an elaborate "Plan of publication—A quarterly or monthly issue under the general title of The American Journal and Library of Education." This included: (1) A quarterly or monthly journal of education, making an octavo volume annually of at least 600 pages; (2) a library of education, to consist of a series of independent treatises, to be forwarded to the subscribers of the journal to the extent of another volume of equal size. He includes the topics of these treatises under 32 heads, "constituting when complete an encyclopedia of education." A third annex to the plan is a history of education in the United States, for which large amounts of material had already been collected, although the progress of the work had been interrupted by the service of Dr. Barnard as superintendent of public education in Rhode Island from 1843 to 1849, and by a recall in 1851 for a second term as State superintendent in Connecticut, from which he retired in 1855.

It is evident that during the entire existence of the American Association for the Advancement of Education the mind of Dr. Barnard was laboring with the idea of the nationalizing of the American common school by every practicable method. Indeed, the association itself seemed to exist chiefly to that end. It is not unlikely that this remarkable representative body of educators from every section were moved with the idea of bringing this fundamental obligation of the people to the front as perhaps a breakwater against the political agitation that, during the entire decade from 1850 to 1860, is now seen to have been in fact the preliminary skirmish of the civil war. It was when the halls of Congress were ringing with the loud debates inaugurated by the presentation of the Nebraska bill, every year more exasperated by the disorders that involved the border land of Kansas and Missouri in an actual state of warfare. All the proceedings of this body of educators, which only dissolved on the organization of the National Teachers' Association in 1856-1858, had but one logical tendency—that in some way the National Government should interest itself again in the education of the whole people. The original act of the appropriation of the public lands to the new States by the Congress of the Confederation had

been at once ratified by the new republic. At a later period the movement by the legislature of Maryland for including the original 13 States in this distribution had excited great attention. Of course such a thought as was expressed in 1849 in the resolution of the committee of which Dr. Barnard was chairman for a memorial to Congress in behalf of a "bureau of the home department" for the distribution of statistical information, and in the communication presented in 1851 by Dr. A. A. Livermore, of Cincinnati, and referred to a committee consisting of Judge Bellamy Storer and Rufus King, of that city, and Horace Mann, was not the private property of any one man, however eminent. Dr. Barnard simply looked farther or was more optimistic than his associates in presenting this topic as practically the first in importance for the consideration of the first Philadelphia convention. It is to be observed that to no man in that body of remarkable men was assigned the chairmanship of so many committees dealing with every phase of popular education now represented by the national bureau.

At the last meeting of the American Association, in 1855, the standing committee reported that they had taken into consideration the entire plan of Dr. Barnard, but "from want of funds had been able to take no definite action in regard to the matter." This included the appointment of a general agent and the publication of a national journal of education, for which the association was "not authorized or prepared to assume the responsibility." Dr. Barnard then proposed to undertake the publication of such a journal, the first number to consist of the proceedings of that body. His proposition was assented to, with the distinct understanding that the association should in no way be responsible for the conduct of the journal or pecuniarily liable. It is evident that the association, apart from its very small entrance fee of membership, had little control of funds, there being no report of the collection of the proposed \$5,000 for offering premiums for educational authorship. It was evidently vain to suppose that Congress, on the eve of a war for the preservation of the Union itself, could be persuaded even to look at a proposition to make common-school education a national interest. Thus, while the Association for the Advancement of Education was willing to give a perfunctory indorsement to a scheme so vast and comprehensive as that of Dr. Barnard, the plan itself died in the hands of the standing committee to which it was referred. The notion of any union between States so wedded to their own convictions of popular education as those of the old North and new West; the vain hope of bringing the positive and aggressive representatives of the great religious bodies into any hearty approval of anything above the common district elementary school; the absolute impossibility of moving a single Southern State to unite with Northern educators in behalf of an educational system so closely identified with the entire industrial, civic, and social status of that section; these and other reasons were all sufficient to dissuade that association from any serious attempt to give bodily shape to the elaborate plan of Dr. Barnard.

After a year's waiting on his colleagues, he declares:

In the absence of any funds belonging to the association and of any pledge of pecuniary cooperation on the part of individuals the committee have not taken any steps to establish a central agency for the advancement of the objects for which the association was instituted, or felt authorized to provide for any publication beyond the proceedings of its last annual meeting. Under these circumstances the undersigned has undertaken, on his own responsibility, to carry out the original plan submitted by him so far as relates to the publication both of the journal and the library, relying on the annual subscriptions of individuals in different States, and interested in different allotments of the great field, who desire to be posted up in the current intelligence and discussion of schools and education, to meet the current expenses of the former.<sup>a</sup>

<sup>a</sup> Barnard's Journal, Vol. I, pp. 1-2.

In fact, during the remaining years preceding the war the subject of a national bureau of education rarely appears in the proceedings of the National Teachers' Association, by which it was finally forced on the attention of Congress in 1866. A few speeches and resolutions in 1858, 1859, and 1860 are all that appear in the document relating to the establishment of the office of commissioner of education read before the National Educational Association in 1901, by the present U. S. Commissioner of Education. During that period Dr. Barnard seems to have made no special point of the subject. In fact, during the existence of the American Association, he was engrossed in the duties of his second State superintendency in Connecticut from 1851 to 1855, then again broken down by the habit of his life of repeated prostrations of health. But during these four years he had done invaluable service to the State in the establishment of the first State normal school, in drawing up a revised code of school laws, and especially in publishing "A History of the legislation of Connecticut respecting common schools up to 1838." After a visit to Europe, and the establishment of the American Journal of Education, he was again enlisted in public administration by a call in 1857 to the chancellorship of the university and agency of the board of regents of the normal-school fund of the State of Wisconsin, an invitation which he accepted in 1859 and held until 1861. Immediately at the close of the war, we find him again engaged in administrative duties, in 1866, as president of St. John's College in Maryland, from which he was called March 14, 1867, to the position of first Commissioner of Education in the newly established Department of Education, a position held for three years until March 15, 1870.

The subject of a national bureau of education appears during the progress of the civil war and immediately on its close in connection with the proceedings of the National Teachers' Association. It is not remarkable that the movement at that time should have been largely in the hands of the leading educators of the Northwest. Indeed, the first uprising of common-school interest at the close of the war was in the State of New York, the five original Western States, and the few States beyond the Mississippi, including Missouri. A large proportion of the most distinguished common-school and university men and women of that section had been called from the New England and the Middle States. Before the outbreak of hostilities Horace Mann had been called to his final work at Antioch College, Ohio, Henry Barnard to Wisconsin, Chancellor Tappan to Michigan, Dr. W. G. Eliot and Dr. Harris to Missouri, while the colleges and normal schools of the East were sending forth large numbers of workers in every department of western education. At the meeting of the National Association of Superintendents in Washington in 1866 Dr. E. E. White, then president of the Agricultural and Mechanical College of Indiana, delivered an address advocating the establishment of a national bureau of education, and he was appointed chairman of a committee of five to present the subject to Congress. The bill was carried through the House of Representatives largely by the influence of James A. Garfield, afterwards President of the United States. But it was a fit recognition, not only of the great general services rendered to education by Dr. Barnard in the past in all sections of the country, but also of his early conception of what afterwards became, first the "Department," and then the "Bureau" of Education, that he should be selected by President Andrew Johnson as the first occupant of the office of United States Commissioner.

The new bureau simply appeared in the statutes as a "department" for "the purpose of collecting such statistics and facts as shall show the condition and progress of education in the several States and Territories, and of diffusing such information \* \* \* as shall aid the people of the United States in the establishment and maintenance of efficient school systems, and otherwise promote the cause of education throughout the country." The appropriation for the support of the commissioner and three assistants, at salaries of \$4,000, \$2,000, \$1,800, and \$1,600, amounted in all

to \$9,400. The work of publication under Dr. Barnard included only an annual report with circulars, containing the investigations and recommendations of the commissioner. The commissioner of public buildings was authorized to find office room for this, then the smallest, "department" connected with the National Government.

No special charge of indifference to education in the abstract or personal narrowness need be imputed to Congress in thus fixing these limits. It would have been impossible then, as now, to have carried through either House of Congress a bill to charter even a bureau with four officials, and an annual income of less than \$10,000, with any additional authority over education, or even with such as constitutionally inhered in the law-making power.

The first obstacle appeared in the attempt to do what was ordered in the statute and in a subsequent joint resolution, namely, to report accurately concerning the use made by the States of the school land grants of Congress, and to give a reliable account of the condition of education in the District of Columbia.

In the face of existing embarrassments it was evident that the "one thing needful" to be done at the beginning was to set the educational pitch of the little "department" after a fashion that would of itself challenge the attention of the school public at home and abroad, and especially awaken such an interest among the friends of the common school as would make it dangerous even to meddle with, and impossible to repeal, the statute establishing it.

There was one man in the United States who was peculiarly adapted to this grand work of public inspiration in a decisive and inviting way. That man, as has been stated, was the educator who, in a career of thirty years, had achieved a national and international reputation by the habit of fashioning everything connected with education into a grand and attractive shape. The greatest praise that could be given to the first U. S. Commissioner of Education was that he so magnified what could easily have been considered the most insignificant portion of the National Government in the view of educators at home and abroad as to make possible the work of his successors. This work was most effectually done by Dr. Barnard in his first report to Congress, covering the year 1867-68, a document of 856 closely printed pages.

The attempt to comply with the requirement to give an account of the disposition of the educational land grants made by Congress only revealed the fact of the impossibility of any immediate success. It was like a call to survey a highway through a wilderness, so dense that even the practiced woodsman would be hopelessly confused in groping after the tracks "blazed" by the first explorers. Some information concerning the original grants, and a tolerably correct account of the action of a portion of the States in accepting the latest of these grants (for agricultural and mechanical colleges in 1862), was all that could be reasonably expected at that time.

The Commissioner presented to Congress on the same date, viz, May 30, 1868, a special report on educational affairs in the District of Columbia, in compliance with a joint resolution dated March 29, 1867. In gathering data for this report he had called Mr. Franklin Hough, of New York, one of the best statistical experts of the time, to take a new census of the shifting crowd that the civil-war period had drifted into the capital city of the nation. Mr. Goodwin was invited to work out the most original and, perhaps, then the most important subject, the history of the schooling of the free colored people in the District of Columbia and of the new schools being established in the former slave States for the negroes.

In an extended supplementary report, prepared after Dr. Barnard's connection with the Bureau of Education ceased, this work was further carried out, in a volume concerning agricultural and technical education abroad. The important documents composing this report, which opened new prospects to the educational public

of the period, were printed as a separate volume of Dr. Barnard's American, now rechristened National, Journal of Education, at the author's expense, under a pledge that their publication should not involve the Government in additional expense.

The original report, in its attempt to cover the ground laid out by the statute, presented a great variety of interesting and valuable information, which even now makes this volume a standard work of historical importance. In its opening 25 pages the commissioner outlines his policy for the new bureau. Then follows a collection of circulars and documents issued by the commissioner, containing the history of the legislation establishing the Bureau of Education; farther on come several pages of information less known forty years ago than now, concerning the interest in public education by the fathers of the Republic. The original speech of the schoolmaster President, James A. Garfield, which carried the bill through the House of Representatives, finds a conspicuous place in this connection. All that could then be ascertained concerning the disposition of the educational land grants made by Congress was published; one new State, Minnesota, being selected as an object lesson of the most successful administration of this trust. Fifty pages are filled with a record of the constitutional provisions of the several States of the Union concerning public education, and nearly 200 pages with information concerning national and State legislation respecting colleges of agriculture and the mechanic arts; this section concluding with an account of certain of the institutions which became beneficiaries of the agricultural college land grant. Under the head "The State and Education" is republished the admirable address of Bishop George W. Doane, of New Jersey, to the people of that State in 1838, on the importance of universal education, supported by numerous quotations from eminent civic and educational authorities at home and abroad on the same topic. Then follows an extended republication of the facts and statistics of education in foreign countries, a subject at that time recently brought before the educational public of the country from observations by Stowe, Mann, Bache, Barnard, and many others. School architecture, a matter of first importance, especially to the new Western and Southern States, is treated with illustrative plans and cuts. A valuable essay on the normal school question, State and city, fills 200 additional pages of this crowded public document. The report is fitly closed by numerous quotations from the highest authorities in answer to the question, "What is education?"

As we become acquainted with the actual status of American educational affairs in the decade from 1860 to 1870, especially the comparatively demoralized condition of the common school in the Northern States from the strain of the civil war; its complication with partisan politics, sectarian religion, and the transformation of social conditions in the new West; the fact that no science of educational statistics then existed outside the theories of a few superior educators; that the sixteen Southern States were standing amid the ruins of all that had existed among them under the name of educational foundations; the violence of political parties, which virtually prolonged the war for ten years after the surrender of Lee at Appomattox; the meager income of the little department, working in narrow quarters and really not known at all to the majority of Congressmen—we can somewhat apprehend, but never quite understand, the obstacles to doing anything that beset the first Commissioner of Education. There was simply nothing to be done save to give the new Department of Education a place and a record as the one central agency of education endowed by the National Government.

Happily, a man who by the experience of a generation of illustrious labors was eminently qualified to do this work, at whatever sacrifice to himself, sat in the lonely chair of the U. S. Commissioner of Education. His work is evident from the mass of valuable material filling the two stout volumes sent forth during the three years of his occupancy.

When we examine these documents for their quality we find it difficult to decide what better message could have been set before the educational public of the country than the matter already described. There was the demonstration of the educational capabilities of the negro race from actual experience in the District of Columbia to encourage the education, in the common schools, of this "nation within a nation," now ten millions strong, but then with its foot just lifted up toward the threshold of republican civilization. The action of Congress in 1862 in making a new gift of public lands for the founding of agricultural and mechanical colleges for both races demanded such a publication of the European and home efforts in this radical new departure in the schooling of American youth as here appeared. The reluctance of great States and old cities toward making due provision for the training of their teachers was here confronted with a statement of the results of normal-school work not to be gainsaid. The thousands of school buildings with their fit furnishing waiting to be erected all over the land found here a partial republication of Dr. Barnard's original treatise on school architecture. The great South, on the brink of a new educational experiment, found ample encouragement in the thoroughgoing indorsement of the common-school system by the representative of the National Government, with additional description of the reformed methods of study, discipline, and school administration. That portion of the religious public which persisted in forcing the sharp distinction between "Christian" and "secular" schools was here shown that the American common school of the reformed type, perhaps better than any existing agency, was engaged in the training of young America into the genuine Christian ideals of character set forth nineteen centuries ago by the great Teacher of mankind in Palestine.

In short, it is not easy to say what could have been better done during the first three years of what finally became the National Bureau of Education within its original environments to hold up before the American people the grand ideals of universal education than to publish to a larger audience, under the authority of the National Government, much of the valuable information that hitherto had only been accessible to the limited number of the readers of the American Journal of Education.

There are times in the development of the higher life of a people, as of a man, when it seems that a friendly Providence sets narrow and insurmountable bounds and limits to human effort, which even discourage the noblest worker for better things; but, meanwhile, the sons and daughters of reform are held fast to some "one thing needful" to be done as a basis of all future progress. Such was the task of Dr. Henry Barnard as first United States Commissioner of Education.

---

### III.—ESTABLISHMENT OF THE OFFICE OF THE COMMISSIONER OF EDUCATION OF THE UNITED STATES, AND HENRY BARNARD'S RELATION TO IT.<sup>a</sup>

BY WILLIAM T. HARRIS.

As members of the National Council of Education, we are assembled this evening to pay our respects to the memory of Dr. Henry Barnard. By common consent Dr. Barnard ranks as the second of the two great educational heroes which America has furnished. Other members of the council have prepared papers on his work as a critic of education, on his influence in the establishment of normal schools in the country, on his influence upon the schools in the Western States, and, finally, on his home life and his influence upon education in Rhode Island and Connecticut. To

<sup>a</sup> Reprinted from the Proceedings of the National Educational Association, 1901.

me has been assigned the preparation of a paper on the establishment of the office of United States Commissioner of Education, and Dr. Barnard's relation to it.

The discussions relating to the life of Henry Barnard must center about his great work in the preparation of the *American Journal of Education*, which may be said to have practically absorbed the energy of his life and to have used up his financial resources. Dr. Barnard makes, and will make, in our educational history a heroic figure through his devotion to this one great purpose, namely, the preparation of a series of volumes containing all that is solid and valuable in the history of education. I think it was said by Horace Mann, in reviewing his own labors, that the greatest need existing at the time when he left his work in Massachusetts was the publication in a convenient form of the literature of education. Certain it is that Henry Barnard was early impressed with the need for such a publication, and took it upon himself as his life work to prepare it and offer it to his countrymen.

I think that whatever he undertook in other lines of education—and the list of items in this field is certainly an extensive one—was felt by him to be subsidiary to this one great purpose of his life, namely, to enlighten the teachers and directors of education throughout the United States by giving them access to a complete record of the history of education in all ages and countries. When Congress in 1867 passed an act establishing a Bureau of Education, it was quite natural that the name of Henry Barnard should be mentioned to the President as the fit man to fill the position of Commissioner of Education. Dr. Barnard would naturally think of his fixed purpose to provide educational literature, and it would occur to him at once that here was an opportunity providentially thrown in his way to take up a national work which could best be promoted by the same labors that he had undertaken as a private individual and supported from his private fortune.

I think that in forecasting the most important lines of usefulness for the newly established Bureau of Education he foresaw that the preparation of volumes containing the history of educational experiments, the discussions of educational reformers, the statistics of national systems of schools, and the biographies of great teachers would furnish the best material for a long series of official reports. During the three years (from March 14, 1867, to March 15, 1870) in which he held the office he seems to have been maturing his plans for this line of work and awaiting opportunities in the form of resolutions by Congress calling for reports on special themes connected with the promotion of schools in the nation.

His first opportunity was furnished by the call on the part of Congress for a special report of the Commissioner of Education on the condition and improvement of public schools in the District of Columbia. This work was completed and submitted to the Senate in June, 1868, and again submitted to the House two years later, namely, in June, 1870, with additions. Three thousand copies of it were printed by the Government Printer in 1871. The act calling for it was passed March 29, 1867, fifteen days after his appointment as Commissioner. This book of 912 pages forms the chief monument of Dr. Barnard's career as Commissioner of Education. It begins with an introduction by himself; this is followed by a special report of Franklin B. Hough (31 pages), and next comes the chief article in the shape of a compilation of the statistics of the schools in the States and cities of the country (pp. 44-144.) There are five appendices. The first appendix gives an account of the proceedings in the establishment of a permanent seat of government in the United States. The second appendix contains a full discussion of the legal status of the colored population in the District of Columbia, Virginia, Maryland, Alabama, Arkansas, California, Connecticut, Delaware, Florida, Georgia, Illinois, Indiana, Iowa, Kansas, and Kentucky. The third appendix contains an article on illiteracy in the United States, prepared and illustrated by Dr. Edwin Leigh. The fourth appendix contains an account of art instruction in the country. The fifth appendix contains an account of public

instruction in the cities of Germany, and a reprint of the report of Fraser on American schools; a brief statement of the course of study in Chicago, Philadelphia, Cincinnati, New Haven, Springfield (Mass.), New Bedford, Boston, New York City, St. Louis, and Louisville; and a table showing the salaries of teachers in the several cities.

The second opportunity of Dr. Barnard came with a call of the House of Representatives for a report on technical instruction. The first copy of the manuscript, which was not complete, was prepared in pursuance of an order of the House approved January 19, 1870; but it was never printed. A so-called second edition was published in Dr. Barnard's *American Journal of Education*.

What Dr. Barnard called the second edition (on p. 9 of Vol. XXI of his *American Journal of Education*) is not a second printed edition, but only an edition revised from the manuscript which he had prepared in compliance with the order of the House of Representatives. He says distinctly:

The resolution of the House \* \* \* to print 5,000 copies for distribution \* \* \* did not reach the Senate in time to be acted on before the close of the session. No subsequent action having been taken by the Senate, House, or Office of Education, to give circulation to a document which, etc., \* \* \* the following edition is issued for subscribers to the *American Journal of Education*.

So far as the ordinary usage of the word "edition" is concerned, this is therefore the first and only edition of the work, and it appeared in July, 1871, as Volume XXI of the entire series of Barnard's *Journal* and as Volume V of what he called the "National Series." Dr. Barnard had evidently intended his "National Series" to contain his reports as Commissioner.

The contents of this work on technical instruction are as follows:

An introduction (pp. 17-32) on the progressive development of schools and practical courses of instruction in science.

Part I, systems and institutions of technical instruction (pp. 33-800): (1) Austria, (2) Baden, (3) Bavaria, (4) Brunswick, (5) German free cities, (6) Hanover, (7) Hesse-Cassel, (8) Hesse-Darmstadt, (9) Mecklenburg, (10) Nassau, (11) Oldenburg, (12) Prussia, (13) Saxony, (14) Saxe-Altenburg, (15) Saxe-Coburg-Gotha, (16) Saxe-Meiningen, (17) Saxe-Weimar, (18) Württemberg, (19) France, (20) Belgium, (21) Holland, (22) Denmark, (23) Norway, (24) Sweden, (25) Russia, (26) Switzerland, (27) Italy, (28) Spain, (29) Portugal.

A prefatory note prefixed to the edition of this work in Volume XXI, 1870, throws more light upon the plans of Dr. Barnard with regard to the reports of the National Commissioner of Education. He states that in the original plan:

This document [namely, report on technical instruction] would have constituted Part IV of a comprehensive survey of national education in different countries which he [Dr. Barnard] had commenced in 1854 in view of a thorough discussion of the condition and improvement of public instruction in the United States.

Parts I and II of the survey of national education in different countries were to treat of elementary and secondary education, as follows:

Part I, in the German States, and in Belgium, Holland, Denmark, France, Norway and Sweden, Russia, Turkey, Greece, Italy, Spain, Portugal, Great Britain.

Part II, in the American States, with a comparison of the systems and condition of public schools in the United States with those of more advanced States in Europe.

Part III, in universities, colleges, and other institutions of superior instruction.

Part IV, professional classes and special instruction, including schools of theology, law, medicine, teaching, agriculture, commerce, engineering, navigation, mines, technology, etc.

Part V, supplementary instruction, including libraries, lectures, evening schools, etc.

Part VI, societies, museums, and collections for the promotion of education, science, literature, and the arts.

In the prefatory note Dr. Barnard states that the information relating to systems of elementary and secondary instruction had been collected and prepared for publi-

cation in the office of the Department of Education, and that it would be communicated in a few days to the Secretary of the Interior, with a plan for its speedy completion and publication.

As we read over this conspectus we can not help seeing that Dr. Barnard had begun to form a noble ideal of the work of the Bureau of Education (or "Department of Education," as it was named in the first law of Congress which organized it).

Dr. Barnard sent in his resignation as Commissioner of Education, to take effect March 15, 1870. His successor, Gen. John Eaton, endeavored as far as possible to realize in the conduct of the office the ideas of Henry Barnard, and to incorporate in them such new features as recommended themselves from time to time. He began from the first to lay much stress upon the collection of statistics of the institutions and systems in the United States, showing their actual working results. This direction given to the report by General Eaton has been followed subsequently with somewhat increased emphasis. But in the administration of Col. N. H. R. Dawson, my predecessor, an attempt was made to return more nearly to the ideas of Dr. Barnard by the preparation and publication of a series of circulars of information giving a history of the founding and conduct of the colleges and universities in the several States. The publication of this series has continued to the present date and is now (in 1901) nearly completed.

At my request General Eaton has written out for me a brief account of Dr. Barnard's connection with the Bureau of Education, which I will now read:

WASHINGTON, D. C., *May 29, 1901.*

SIR: In reply to your request for "a brief account of Dr. Henry Barnard's connection with the Bureau of Education, mentioning the devices which he invented that came down to his successors," it is difficult for me to answer in full. My indebtedness to him personally was very great, but how much of this indebtedness came to me thru the Bureau, and how much thru his writings and other works previously, and from personal acquaintance with him, it would perhaps be impossible to relate. His publications I had studied, beginning with the period in which he was connected in one way or another with Dr. Absalom Peters, Superintendent Randall, Dr. Wilder, and Professor N. A. Calkins, in publishing the *American Journal of Education* and the *College Review*, in the fifties, before the *College Review* was dropped from the title. At different times also I enjoyed opportunities to study on the ground what I could see of his administration of State systems, both in Connecticut and in Rhode Island, and I knew how he had influenced educational efforts in Charleston, S. C., in New Orleans, and elsewhere in the South. Indeed, I knew that he had suggested to the Secretary of the Department the taking of illiteracy in the census when that item was first included. Altho I had been acquainted with the work of Horace Mann while a teacher in Massachusetts schools in different places, perhaps I knew more of that period of educational revival thru Dr. Barnard in which he had been so prominent. I had gathered what I could from his trip to Europe, and of his labors as president of the university at Madison, Wis., and at St. John's College at Annapolis. To me he seemed to be the most eminent man at the time in the country in the knowledge of educational literature, and I felt great misgivings when I was called by General Grant to become his successor.

While I was Commissioner of Education I had visited him as State superintendent of schools and had drawn upon him by letter. How much I had received from him in these various ways and how much came to me thru his efforts in the Bureau, I repeat, it will be difficult to state. As early as 1854 he had made a movement for the establishment of a central office for educational information.

In response to a petition from a body of educators, especially made up of State and city superintendents of schools, prepared and presented by Hon. E. E. White, thru General Garfield, Congress had passed an act, approved March 2, 1867, establishing an independent Department of Education, to be conducted after the manner of the Agricultural Department, as it was administered at that time, with a Commissioner at a salary of \$4,000, and a group of clerks. Dr. Henry Barnard was appointed to organize the department, and entered most earnestly upon the work. In time he encountered opposition in Congress. At the end of two years the department was reduced from its independent position to that of a bureau in the Department of the Interior. One thousand dollars was taken from his salary, and the clerical force reduced to that of two of the lowest grade, with a salary of \$1,200 each, making the

salary of the Commissioner what it has remained to July of this year, \$3,000, from which time the amount is to be advanced to \$3,500.

On handing me the keys of the office the Doctor informed me of his trying experience in securing quarters for the office; for it had been moved from place to place without his approval. There was belonging to it no library, excepting a small number of city and State reports. The publications in his possession, in a separate room, had come to him in his capacity as an editor and were his private property. Later, as appropriations warranted, with the approval of the Secretary of the Interior, these were purchased, their value having been estimated by the Librarian of Congress, A. R. Spofford, esq., and others. He spoke somewhat specially of the difficulty of securing the passage by Congress of a resolution to print, but indicated that he had made a report May 30, 1868, to the Senate, which in July, 1868, had been ordered printed by the Senate separately to the number of 3,000 copies. The same resolution of the Senate included authority to print a like number of copies of the special report on the District of Columbia, prepared by him on the order of the House of Representatives. He also indicated to me the substantial preparation for printing of other material. Immediately, with the hearty approval of the President and of the Secretary, Hon. J. D. Cox, previously obtained, I prepared a letter recommending its printing at once, which the Secretary forwarded in due form with his official recommendation. Later, in order to facilitate the use of these letters for urgency among Members of Congress, they were printed. A resolution to print this material passed the House, but did not pass the Senate, and thus our efforts failed; but the material prepared afterward appeared in the Journal, and the Bureau, as far as possible, aided in its distribution. Later the Bureau furnished Dr. Barnard copies of its reports to supply the place of one number of the Journal, thus giving his subscribers information of the condition of education in the United States.

This Journal, it may be remarked, is his monumental work. Its publication absorbed his fortune and impoverished his last years. Thus he made his greatest contribution to the Bureau and to other educational agencies. This failure to secure a resolution to print left the Doctor and myself both in a very trying situation. If the office could not print, it must fail. Who was so well prepared as my predecessor, by long experience in educational literature, to offer for print what would be valuable for the country? This compelled me to study the situation, and I found that there were those among the school superintendents of the country not ready to answer questions and furnish the necessary information which the department needed; others claimed that it would meddle with their rights. Some pointed out the difficulty arising from the fact that there was no uniformity of dates in the reports of State and city systems and of educational institutions; others still fell back upon the fact that there was no authority given the Bureau but that of using such information as was freely accorded to it.

The plan of work, as unfolded by reports, and especially by the carefully prepared circulars printed by Dr. Barnard, was most comprehensive and seemed to leave little to be desired. What could be done? I inquired extensively among those who appreciated the importance of the office. In one of the reports of the State of Kentucky there will be found a portion of a statistical report copied from material obtained from Dr. Barnard and gathered by him. It was incomplete, and therefore it did not satisfy his judgment to use it, but its publication thus furnished evidence of the struggle he had made to get information which would satisfy the demands of Congress.

Of his devices, tables of statistics, abbreviated texts, the issue of periodical circulars, and the methods which he proposed for furnishing information to persons and officers, I had enough knowledge to lead me to value them most highly.

As county and city teacher I had been trained in the tabulation of school reports; as city superintendent of schools I had devices for the tabulation of data to enable me to see the situation of each school in each week's experience; in order to study the relation of education to crime I had collated the statistics of jails in Ohio, and as State superintendent of schools I had been called upon to prepare a complete system of recording and reporting attendance and finance; yet I could not see how his devices and methods could be essentially improved in form. What could be better? I determined in some way to find a method of securing publication. I was sure the reports of the office would have been enriched if they could have included his personal reminiscences of the progress of educational efforts, his long and varied experience, together with his alert editorial watchfulness of this progress, as it may be termed, which made his memories extremely valuable. But I could not obtain them for publication by any offer of compensation by the office.

After a few months of experience and consultation, material for a circular was submitted to the Secretary of the Interior and its publication approved with a measure of hesitancy. Less than eight months after my appointment material for an annual

report was submitted and published, with all its imperfections, substantially within the lines and forms adopted by Dr. Barnard, and in accordance with the forms required by law.

Of his relation to the shaping of the work of the office I might say perhaps more specifically of his plans and devices: (1) He gave his utmost influence to the establishing of the bureau; (2) he sought to make reports which would be truly national; (3) he sought most carefully to devise valuable forms for statistics and abbreviated statements; (4) he began the publication of circulars giving information in regard to miscellaneous educational topics; (5) he enforced the national obligation to education; (6) he emphasized the need of universal education; (7) he would make the bureau enforce the universal relation of education to all the details of man's improvement; (8) he would make it understood that the laws of education in their relation to man's welfare were the same to all races; (9) he would draw illustrations of educational processes from all nations and peoples; (10) he sought to stimulate improvement by using both the historical and comparative methods, setting over against each other different years and different institutions and systems, by the publication of facts.

Indeed, it will be hardly possible for a national office of education to find anything appropriate to publish which is not included in the plans of Dr. Barnard as touching education and its relations.

In preparing this statement, I may add, I have consulted with two of the clerks, of whom one was a translator employed by Dr. Barnard, and also with Hon. George S. Boutwell, a surviving member of the committee of the House of Representatives which proposed the organization of the department. However unsatisfactory this statement, I can hardly make it more definite without quoting Dr. Barnard's language more at length.

Very respectfully, yours,

JOHN EATON.

I have collected from the records of the Proceedings of the National Teachers' Association, of the National Superintendents' Association, and from other sources such items as relate to the conception of the National Bureau of Education, as follows:

*Appendix A.*—A letter addressed by the secretary of the American Institute of Instruction to John D. Philbrick, esq., January 4, 1851, informing him of his appointment as chairman of a committee to petition Congress to establish an educational department at Washington.

*Appendix B.*—(a) Extract from an address by Daniel Read, Proceedings of National Teachers' Association, at Cincinnati, 1858 (pp. 43, 44).

(b) 1859. Proceedings of National Teachers' Association, Washington, 1859. On motion of Rev. Dr. McJilton, it was resolved that a committee of three be appointed to memorialize Congress in relation to the establishment of a national agency, thru which the educational statistics of the several States and Territories may be collated and distributed thru the country.

(c) 1860. Extracts from an address by J. W. Bulkley, National Teachers' Association at Buffalo (p. 24), recommending that Congress be asked to inaugurate a department of national public instruction.

*Appendix C.*—(a) Proceedings of National Teachers' Association for 1863 (p. 46), showing that Prof. Noble Butler, of Kentucky, read an essay in 1863 recommending the establishment of a national bureau of education by the Federal Government.

(b) Proceedings for 1864 (p. 143), showing that Prof. S. H. White, of Illinois, read an essay on the same subject, and offered a series of resolutions.

(c) Proceedings for 1865 (p. 220). Prof. James S. Hart, of Philadelphia brought in resolutions recommending a memorial to the President and Congress for the establishment of such a bureau.

(d) Previous to the action of Professor Hart's resolution, Supt. A. J. Rickoff, of Cleveland, Ohio, read a paper on the subject showing the important services that such a bureau as was proposed would accomplish for education. (P. 223, same Proceedings, 1865.)

(e) The names of the persons appointed to memorialize the President and Congress are given in the volume of Proceedings of the National Teachers' Association published in 1866, and include members from ten different States.

*Appendix D.*—(a) A resolution adopted in 1866 to appoint a committee of five by the National Teachers' Association (Proceedings of 1865, pp. 305-307), to cooperate with the committee of the national superintendents.

(b) The report on the "National bureau of education" was read by Dr. E. E. White. Resolutions introduced by E. E. White, chairman (at the meeting of the National Association of Superintendents, 1866).

(c) Resolutions approving the Department of Education which had been established by the act of Congress in 1867, in pursuance of the recommendations of the committee above named, Dr. E. E. White, chairman.

*Appendix E.*—An address by Dr. E. E. White, commissioner of common schools of Ohio, February 7, 1866, on the subject of a National Bureau of Education.

*Appendix F.*—From Barnard's American Journal of Education, Volume XXI, 1870, page 5.

Prefatory note, on report on technical schools and special instruction in different countries, printed in answer to a call January 19, 1870, from the House of Representatives.

*Appendix G.*—Speech of James A. Garfield on a National Bureau of Education.

*Appendix H.*—Dr. Barnard's plan of a national agency for the United States to advance education (from Volume XXI of the Journal of Education).

*Appendix I.*—Dr. Barnard's plan, in 1862, for a new series of the American Journal of Education, published in Volume XXI.

*Appendix J.*—From Dr. Barnard's preface to his American Journal of Education for 1856, explaining the history of his plan.

## APPENDIX A.

LYNN, January 4, 1851.

DEAR SIR: At a meeting of the officers of the American Institute the following vote was adopted:

"*Voted*, That a committee be appointed to consider the expediency of petitioning Congress with reference to the establishment of an educational department at Washington, and that the following gentlemen compose this committee, to wit: Messrs. J. D. Philbrick, Boston; S. Adams, Boston; D. P. Galloup, Salem; Jacon Batchelder, Lynn; T. Cushing, Jr., Boston."

The committee to report at the next meeting of the officers.

Yours truly,

JOHN BATCHELDER, *Recording Secretary*.

JOHN D. PHILBRICK, Esq.,  
*Chairman of the Committee.*

## APPENDIX B.

(a) 1858.—Extract from address by Daniel Read, Proceedings of National Teachers' Association at Cincinnati, 1858 (pp. 43, 44):

"The subject of a national bureau of education, to be connected with the Department of the Interior at Washington, has often been spoken of and urged as worthy of Congressional legislation. Hitherto it has not met with that favor which its friends believe it deserves, especially from that portion of our fellow-citizens who are jealous of anything like a centralization of power, and who believe that all legislative power upon the subject of education belongs to the several States. While we believe that there is a work which might be legitimately and more effectually performed by such a bureau, and that it has quite as much claim for Government support as that of agriculture, yet we believe that for the present at least the wisest and most effective policy is to rely upon the States and voluntary effort for the accomplishment of the noble objects proposed thereby. We believe, however, in common with some of the wisest and most considerate friends of education, that a special effort should be made to establish at our national metropolis a central and national educational agency, by the aid of which more efficiency and uniformity of character may be secured in the educational movements of our country, and a library of educational books and publications collected from every part of our own country and the world. Such an agency would greatly aid in giving a nationality of character abroad and furnish the means for the publication of a national journal of education, which would be the means of spreading educational intelligence to every part of the civilized world. To carry out such a grand central agency successfully would require funds and effort, which could readily be secured if the advantages resulting therefrom could be brought to the comprehension of the very many liberal-minded men of wealth in our country.

"This is a great and noble work, and it will require great and noble efforts to accomplish it, but do I overrate the ability and efficiency of this association when I say I believe it can accomplish it? Are there not men of means who would be willing to contribute largely for so noble a purpose? And are there not men of the required talent to carry forward the work? Would not our profession be the gainers in the end if we were to take the whole responsibility? If we should undertake it in real earnest, we could not fail to receive sympathy and aid.

"One feature of this agency is so important as to be needed at once. I refer to a national journal of education, which, without interfering with or in any measure

superseding the many State educational journals, will collect and embody such educational matter of general interest as its central location and access to the best means of information will bring within its reach. Every teacher should receive, read, and pay for the educational journal of his own State, if there is one, which, with a properly conducted national journal, would put him in possession of such information as every teacher ought to possess. There is a journal already established by private enterprise and in the hand of a gentleman who is in every way qualified to conduct it, and which, perhaps, might be made to serve our purpose in connection with the plan of its proprietor. I refer to the American Journal of Education, under the direction of Hon. H. Barnard, of Hartford, Conn. The invaluable matter contained in this journal and its high character, claim, not only the confidence, but the support, of every teacher and friend of education who would be well informed. To those who have carefully read it no commendation is needed, for it speaks for itself, as it affords such information as can be obtained nowhere else."

(b) 1859.—Proceedings of National Teachers' Association, Washington, 1859. Mr. Valentine offered the following resolution (p. 4):

*Resolved*, That a committee of three be appointed to confer with the honorable the Secretary of the Interior to ascertain what additional statistics in relation to the subject of education are desirable and feasible to obtain by means of the approaching national census.

The resolution, having been discussed by Messrs. Valentine, McJilton, of Maryland; Smith, of Indiana; Z. Richards and Dennis, of the District of Columbia; and Roberts, of Pennsylvania, was adopted. The committee appointed under the above resolution was: Messrs. Read, of Wisconsin; McJilton, of Maryland, and Starke, of Missouri.

1859.—On motion of Rev. Dr. McJilton, it was resolved that a committee of three be appointed to memorialize Congress in relation to the establishment of a national agency through which the educational statistics of the several States and Territories may be employed and distributed through the country. The committee under this resolution was the same as under the preceding.

(c) 1860.—From address by J. W. Bulkley, National Teachers' Association, at Buffalo (p. 24): "It is by creating and diffusing an intelligent public sentiment in relation to our cause, first in our own immediate locality, enlarging from day to day till the circumference shall embrace the circuit of the States individually and the still more glorious circle of the Union. With such a public sentiment as this we may with confidence of success present our cause to Congress and ask for the inauguration of a department of national public instruction. With such a department, having the necessary appliances and an intelligent and efficient head, we can hardly estimate its power and influence."

#### APPENDIX C.

(a) 1863.—(Proceedings, p. 46.) "A national bureau of education should be established by the Federal Government." Assigned to Noble Butler, Kentucky, for discussion at next meeting.

(b) 1864.—(Proceedings, p. 143.) Prof. S. H. White read an essay entitled "A national bureau of education," and offered the following resolutions:

*Resolved*, That, in the opinion of this association, the educational interests of the country would be greatly advanced by the establishment of a national bureau of education.

*Resolved*, That a committee of three be appointed, whose duty it shall be to secure, if possible, the establishment of such an agency at Washington during the next session of Congress, and also to report the results of their action at the next meeting of this association, with their views upon the subject of "A national board of education and the appointment of a secretary of public instruction."

Mr. Z. Richards moved their adoption, and after a discussion by Messrs. Richards and Barnard they were adopted, and Messrs. Barnard, Richards, and White were appointed the committee.

(c) 1865.—(Proceedings, p. 220.) Prof. J. S. Hart, from committee on President's address, read a report, accompanied by the following resolution:

*Resolved*, That a memorial be prepared to be addressed to the President of the United States and to the two Houses of Congress, expressing the strong convictions of this association in regard to the necessity of having in every State a system of public schools for all classes, in order to the perpetuity and the right working of our political system, and expressing also the wish and the hope that the General Government will do whatever it can rightfully and properly toward inducing the establishment of such a system of common schools in those States where they do not exist.

*Resolved*, That this association commend to the favorable consideration of the General Government the organization of a bureau of education for the purpose of collecting and publishing educational statistics and of making suggestions for the advancement of popular education in the several States.

*Resolved*, That a committee of five be appointed to carry the foregoing resolutions into effect, and that the president of the association be chairman of said committee.

Laid on the table until after the reading of a paper on the same subject by Prof. A. J. Rickoff.

(d) 1865.—(Proceedings, p. 223.) The resolutions of Professor Hart, of New Jersey, were taken from the table, when Mr. Rickoff offered the following additional resolutions:

*Resolved*, That the committee above provided for be instructed to appoint one of their number, or such other person as they may deem best, to devote his entire time, so long as to them may seem desirable, in such labor as may be necessary for carrying out the wishes of the association as expressed in the above resolutions.

*Resolved*, That a committee of three from each State represented in the association be appointed, whose duty it shall be to circulate petitions among the people of their respective States, praying Congress to establish a department of education, and to collect funds for the payment of their own expenses for printing and for the support of the agent of the committee on memorial.

The resolutions were discussed by Prof. O. N. Hartshorn, of Ohio; W. D. Henkle, of Ohio; W. E. Crosby, of Ohio, and Douthett, of Pennsylvania. The amendment was agreed to, and the resolutions as amended adopted.

1865.—(Same Proceedings, p. 227.) At the time of going to press the following members have been named [on the committee on educational bureau]:

*Massachusetts*.—Supt. J. D. Philbrick, Boston; C. Goodwin Clark, Boston; N. T. Allen, West Newton.  
*Rhode Island*.—William A. Mowry, Providence; David M. Hoyt, Providence; Emory Lyons, Providence.

*New York*.—Dr. James Cruikshank, Albany; Supt. J. W. Bulkley, Brooklyn; Supt. E. A. Sheldon, Oswego.

*Pennsylvania*.—W. Henry Packer, Philadelphia; S. D. Ingram, Harrisburg; S. B. Thompson, Edinboro.

*Maryland*.—Dr. L. Steiner, Frederick; Prof. A. Hollingshead, Baltimore; Dr. S. A. Harrison, Easton.  
*Ohio*.—Hon. E. E. White, Columbus; W. E. Crosby, Cincinnati; Prof. W. D. Henkle, Salem.  
*Michigan*.—Hon. J. M. Gregory, Kalamazoo; Hon. O. S. Hosford, State superintendent; Prof. A. S. Welch, Ypsilanti.

*Missouri*.—Supt. Ira Divoll, St. Louis; C. S. Pennell, St. Louis; C. F. Childs, St. Louis.

*Iowa*.—Hon. Oran Faville, Des Moines; Gen. B. A. Wiltz, Dubuque; Rev. S. Williams, Keokuk.

*Oregon*.—Henry Cummins, Salem; A. C. Gibbs and T. M. Gatch, Salem.

(e) 1865.—(Proceedings, pp. 305–307. From address of A. J. Rickoff on a “National bureau of education.”) “Under the providence of God we have blindly fought for the freedom of the slave, and our next great task must be to educate him. The whole work should be under the direction of a commissioner of education, a man who should be qualified to organize and direct the energies of the whole people, not alone with reference to present emergency, and whose duty it should be to elaborate the best possible scheme of education for the South, which the Government should see carried out. This is not a missionary society having agents and teachers in the field. That ground is taken up by another association. But we can and we ought to advise as to the course to be taken by the Government in the first stage of the affair, and I repeat it that the very first and the most important of all recommendations to be made is that Congress, at the very next session, should establish an educational department and authorize the President to appoint a commissioner of education. But it is not only to meet the present state of affairs, in the only way in which it can properly be met, that I make this proposition. There is no plan by which the National Government can promote the cause of education in the North and in the South so easily as by the appointment of a national commissioner of education. We shall presently see that the interest to which we appeal has always been exercised by the legislative and executive departments at Washington. We propose no radical innovation, nor is the proposition new. It has been made again and again in State and national associations, and has, I believe, always received their sanction, and I shall make no argument in its favor further than the one I have already urged, except to state somewhat precisely the general duties to which a commissioner of education should devote his energies. But it will be seen that every specification is an argument.

“He should make himself thoroughly acquainted with the public-school system of each State as to its general and local officers and their relative duties; the different classes of public schools; the plans of taxation resorted to for public purposes, and the amounts raised thereby; the amount and nature of the investment of all school funds the interest of which is applied to school purposes, and the amount derived from all other sources. He should study the school statistics of the respective States, noting particularly, wherever it is possible to obtain such information, the average length of time the common schools have been kept open, the number of children entered, the average number belonging and average daily attendance, the number of children of each age attending school, and, so far as possible, the nature of the attendance as to the length of time children remain in the schools and the degree of regularity in attendance while enrolled, and of those matters which in their nature are variable he should make report on or before January 1 of each year, and of those matters which are more permanent he should make separate report as often as once in four years on the January preceding the expiration of each Presidential term.

"He should, as far as possible, ascertain the number of chartered institutions of learning of every grade, their endowments, courses of study, number of students, charges for instruction, etc.; the number and character of all societies for the diffusion of useful knowledge, and the plans adopted for effecting their objects, and the number of publications of different kinds made thereby; the number and character of societies of adults formed for mutual improvement, and the number of members participating in the advantages thereof; and these facts, and whatever other information he can gather from any and all sources whatsoever bearing upon the educational facilities in the respective States, he should embody in his annual report.

"He should be required to make himself acquainted, as well as possible, with the school systems of foreign countries; their means of support; their organization; the courses of study pursued in primary, grammar, and high schools, academies, seminaries, normal schools, gymnasia, colleges, universities, etc., for the education of the young; the means of support, organization, and plans of procedure of societies established for mutual improvement, and societies and institutions of all kinds for the increase and diffusion of knowledge among men, whether literary, scientific, artistic, or industrial; also of all institutions established for deaf, mute, blind, and imbecile children and adults, as well as schools and institutions of all classes designed for the care of orphan and destitute children, or for the reformation of juvenile vagrants and offenders against law; and of all special schools, not above named, for the improvement of their members in the various arts and professions of life.

"He should make it a special object to procure and keep on file for ready and convenient use all educational reports, both general and local, of all authorities engaged in the management and instruction of any and all of the institutions above named. He should establish an educational library which should contain not only these reports, but all valuable works and periodicals treating on educational subjects, especially those published in the English, German, and French languages, and of those which would be likely to prove most serviceable in this country he should make translations, or cause the same to be made, and print them in his annual reports. He should procure, and preserve for examination by teachers and school officers, specimens of all maps, charts, diagrams, and pictured representations of all kinds whatsoever used in the processes of instruction, all kinds of primary-school apparatus, all kinds of school furniture used in this or foreign countries, and finally:

"In his annual reports he should embrace all information which might seem valuable to school officers and teachers of all grades, and to officers and members of all kinds of scientific and literary institutions and associations; and he should especially direct attention to all those features of institutions at home and abroad which might seem to him best adapted for general introduction throughout the United States, and particularly should he communicate such information as would be likely to encourage the formation of societies for enlightened improvement among all classes of our population."

#### APPENDIX D.

(a) 1866.—(Proceedings at Indianapolis, National Teachers' Association, p. 10.) A resolution was adopted to appoint a committee of five to cooperate with the committee of the national superintendents in urging upon the Senate of the United States the passage of the bill of the House of Representatives to establish the department of education. The committee appointed was Messrs. Z. Richards, James Cruikshank, A. C. Shortridge, J. S. Hart, and R. Coburn.

(b) (Proceedings of National Association of Superintendents, Indianapolis, 1866, pp. 74-76.) The committee's report on a national bureau of education was read by Mr. E. E. White, chairman, and the following resolutions, offered by G. W. Hoss, were adopted:

Whereas an approved bill looking to the establishment of a national bureau of education has passed the House of Representatives in Congress: Therefore,

*Resolved*, That the thanks of this National Superintendents' Association are due, and are hereby tendered, to that body for its liberal and enlightened action on behalf of general education.

*Resolved*, That this body appoint a committee of five to properly bring the House bill to the attention of the United States Senate and secure its early passage by that body.

The committee appointed was Messrs. E. E. White, O. Hosford, D. Stevenson, and J. W. Bulkley.

(c) 1868.—(Proceedings of National Teachers' Association, pp. 36, 37.) The United States Department of Education was represented by Mr. Z. Richards, an officer in the Department at Washington. After the address of Mr. Z. Richards, Mr. E. E. White, of Ohio, offered the following resolution:

*Resolved*, That this association approves of the action of the Congress of the United States in organizing a national department of education, and the continuance and liberal support of such a department is most earnestly recommended.

## APPENDIX E.

NATIONAL BUREAU OF EDUCATION.<sup>a</sup>

[From Barnard's *Journal of Education*, Vol. XVI, 1866, pp. 177-186.]

Universal education, next to universal liberty, is a matter of deep national concern. The one distinctive, exhaustive idea of a democratic government is that it is a government by the people and for the people, i. e., by the whole people and for the whole people. A democracy is, in other words, but an organized people. They constitute the State. Its constitution and laws are but their recorded will, and all governmental power emanates from and centers in them.

In such a government, in its pure form, sovereignty is a universal right, to be exercised by all for the happiness and well-being of all. It is a right that can neither be denied nor restricted except by usurpation; and this is true whether the usurping power is one man or twenty millions of men. The right of sovereignty may be forfeited by crime or by its treasonable exercise, but it is in no sense an accident of birth or condition.

When the exercise of sovereignty by the people is both universal and for the welfare of all, a democracy is the perfection of human government; but to the extent that such right is withheld from the people or is wrongfully exercised by them, just to that extent are democratic institutions imperfect and a failure. Hence the capability of the people to exercise sovereignty for the general welfare is a fundamental and vital condition of republican institutions. When such capability does not exist, the universal exercise of sovereignty is a condition of national weakness, if not of peril. I am thus led to inquire what this capability includes and what are the essential conditions of its existence.

It clearly requires the necessary intelligence to determine what will best subserve the interests of all, and the degree of this intelligence must not only be sufficient for self-government on the part of individuals and individual communities, but the people, as a whole, must be able to weigh and decide upon questions which involve national interests. Hence the higher the civilization embodied, the wider the extent of territory embraced, and the more various the pursuits and physical conditions of the people, the higher the degree of intelligence required for the right exercise of sovereignty.

But intelligence is not enough. Sovereignty is to be exercised for the happiness and well-being of all, and this involves the moral capacity to act in accordance with the dictates of intelligence. The second great law of civil liberty, as well as of religion, is: "Thou shalt love thy neighbor as thyself." Wherever the moral sense of the people is too feeble to impel the public will to regard the general welfare, democracy becomes the livery of despotism. To general intelligence we must, therefore, add public virtue as one of the essential conditions of the right exercise of sovereignty by the people.

In his centennial address at Plymouth, in 1820, Webster assigned three fundamental conditions as essential for the maintenance of republican institutions, namely, universal education, universal religious training, and the general division of landed property. The same conditions are laid down by De Tocqueville and other writers upon democratic governments.

If we turn to the pages of history, we shall find abundant confirmation of these views. We shall certainly search in vain for a single example where an ignorant and corrupt people have exercised sovereign power wisely and justly, or have even retained such power for any length of time. In all the past, wherever the intellectual and moral condition of the people has been low, there civil liberty has been lost. Universal liberty without universal intelligence has ever been the sport of civil tempests. Stolid ignorance and moral degradation tread above the grave of civil liberty all along the shores of the Mediterranean; but free government still abides with the intelligent and virtuous descendants of Tell, among the mountains of Switzerland—that diamond of liberty, set by a divine hand in the very center of European despotism! Passing to the New World, I need only to point to Mexico, where civil liberty lies prostrate and helpless beneath the crossed bayonets of two European despotisms! In a word, both reason and history compel the conclusion that republican institutions can rest upon no other basis than intelligence and virtue, and that these must pervade all heads and all hearts.

But general intelligence and public virtue are not the spontaneous fruits of civil liberty, although it is favorable to their development. As a necessary condition of

<sup>a</sup>A paper read before the National Association of School Superintendents, at Washington, D. C., February 7, 1866, by E. E. White, commissioner of common schools of Ohio.

their existence, they must be assiduously cultivated and diffused among the people. No human agency but the common school is capable of accomplishing this great work. Aided and vitalized by religion, it is the only sure foundation of the sovereignty of the people—the strength and shield of liberty.

This great fact was well understood by the founders of the American Republic. They sought to found free institutions, not upon the quicksands of human instinct and passion, but upon the abiding rock of universal education and religious training. This was the grandest of all their innovations upon the moss-grown ideas of the Old World.

But the idea that education must be coextensive with sovereignty was not original with our fathers. This has been the favorite doctrine of aristocracy the world over. Wherever the heel of despotism rests upon the neck of humanity, the ignorance of the oppressed has been urged as the justification of the oppressor. Despotism clamors for a restricted education, because she maintains a restricted sovereignty. The former is made just as wide as the latter.

Nor is the idea of universal sovereignty distinctly and originally American. Democracy had drawn her sword to give the people political power long before the *Mayflower* cradled the new Republic, and had won the prize, too, but only to see it turn to ashes in their hands. The grand, distinctive, original idea of the American Republic is the union of these two principles, by making the one the basis of the other. With matchless wisdom our fathers joined liberty and learning in a perpetual and holy alliance, binding the latter to bless every child with instruction which the former invests with the rights and duties of citizenship. They made education and sovereignty coextensive by making both universal. Here is the grandest conception of civil history, the hope and strength of civil liberty. And yet how few the successive steps by which our fathers passed from a conception of this idea to its practical embodiment! Truly they must have builded better than they knew.

Who can measure the results which the union of these two principles has already accomplished? When the sources of the nation's wonderful vitality and power during the great civil conflict through which it has just passed shall be determined, then first and foremost will stand the common school. The civil war, which was a gigantic conspiracy against democratic institutions, found a people trained to comprehension of their duties and interests, with hearts to dare and hands to strike in their defense. The flame of civil liberty now burns with increasing brightness and new splendor, because our fathers, like the wise virgins, put into the lamp of free government the exhaustless oil of universal education.

I am thus brought back to the proposition with which I started, namely, that universal education is in this country a matter of deep national concern. Our experiment of republican institutions is not upon the petty scale of a single municipality or State, but it covers half a continent and embraces peoples of widely diverse interests and conditions, but who are to remain "one and inseparable." Every condition of our perpetuity and progress as a nation adds emphasis to the remark of Montesquieu, that it is in a republican government that the whole power of education is required. The one imperative necessity of this nation is that the public school be planted on every square mile of its peopled territory, and that the instruction imparted therein be carried to the highest point of efficiency.

But what can the General Government do to aid in securing this object? In view of the startling fact that the great body of the people that occupy nearly one-half of the national territory are largely destitute of the means of education, this inquiry has the deepest significance.

Three plans have been suggested:

1. The Government may establish and maintain throughout its territory a national system of education.
2. It may by Congressional legislation enforce the maintenance of a public-school system upon every State.
3. It may by conditional appropriations and by a system of general inspection and encouragement through the agency of a national bureau of education induce each State to maintain an efficient school system.

Notwithstanding the cogency of the argument which may be adduced in favor of the first plan suggested, it is, in my judgment, too wide a departure from the settled educational policy of the country to be seriously entertained. Such a system would doubtless prove highly advantageous in a portion of the country, but it would be very disastrous in those States that have already carried the work of general education to a high point. Besides, all experience shows, and I regard it a law of school progress, that the nearer the responsibility of maintaining schools is brought to those directly benefited by them, the greater the vital power and efficiency of school systems.

These remarks do not apply to the education of the freedmen. On the contrary, I believe it is the sacred and bounden duty of the General Government to undertake, for a time, the education of the emancipated millions who through the war have received back their birthrights of liberty and manhood. Deprived of the uplifting power of education they can but become idle and dissolute, and sink, if possible, still deeper in degradation and misery. Besides, the faith of the nation is solemnly pledged for the protection of these people in all their rights as freemen. But there is no protection so secure as the power of self-protection. Until the freedmen have their liberties in their own keeping they are not really free. They are now in a condition of abject ignorance, homeless and landless, subject to the heartless exactions of capital, and are the helpless victims of class prejudice and persecution. No protection of the Government that fails to bring them intelligence can save them from impending peril. No standing army can so effectually maintain the plighted faith of the Government toward these people as an army of schoolmasters. Let bayonets protect, if need be, the schoolhouse of the freedmen, and they will soon take care of their rights and liberties. They will do more. As free, self-directing, self-supporting laborers, they will bring prosperity again to the South and make her war-ravaged fields smile with plenty.

To the second plan suggested there are manifestly serious objections. The imposition of a system of public instruction upon the several States by compulsory legislation can be justified only on the ground of public necessity in a great national crisis. And I am free to admit that so great is the necessity for the establishment of public schools throughout the South that even such a measure would be imperatively demanded if no other course to attain the same end were practicable.

The third plan is clearly in harmony with the settled educational policy of the country. It will neither cripple nor endanger any part of our educational system, and it calls for the assumption of no questionable power by the General Government. What is proposed is that the Government shall undertake to do efficiently what it has in the past always done generously through its munificent grants of land for the encouragement of education.

Instead of unconditional grants of land or appropriations of money such assistance should be proffered to the several States on condition that they reach a prescribed standard in the maintenance of free schools, and, further, that a specified portion of such grants or appropriations be applied to the support of institutions for the professional training of teachers.

The fact that a State could by maintaining an efficient school system receive from the National Government, say, from \$100,000 to \$500,000 annually would certainly prove a potent influence in securing such action. I could, if necessary, fortify this statement by referring to experiments of the kind in other countries and also in several of the States of the Union where State appropriations for school purposes are conditioned on a compliance by the local school authorities with certain stipulations. This policy has uniformly, so far as my information goes, been successful. Communities indifferent to the advantages of free schools, if not prejudiced against them, have, with this assistance to their judgment, come to a wiser conclusion respecting their value. There is no eye salve so efficacious in removing mental blindness as self-interest, and instances of States permitting the bounties of the Government to pass by them have, at least, not been frequent. I am confident that the adoption of the plan suggested would speedily secure a common-school system in every State now destitute of such a system, and that it would lift up the schools, as it were, bodily in those States in which they are indifferently sustained. The impetus which it would give to the professional training of teachers throughout the country would be of incalculable value as a means of elevating and vitalizing school instruction.

There is one other consideration worthy of mention just here. The sparsely settled States of the far West and South need the assistance of the General Government in the establishment of systems of education commensurate with their growing necessity—a fact the Government has always recognized. There is not a State west of the Alleghenies that is not greatly indebted to the munificent grants of land made by Congress for the early establishment of its school system. Nor have common schools alone been aided. Several State universities are maintained largely from the proceeds of such grants. It is estimated that if the land grants of Congress for educational purposes had been properly managed they would now present an aggregate educational fund of about \$500,000,000.

On account of the unfortunate land-holding system of the South, and the consequent sparseness of population, it would be difficult to sustain an efficient general school system there, even in times of prosperity. A proper division of landed property is as essential to universal education as it is to democratic institutions. At all events,

in the present financial condition of the South the assistance of the Government in establishing public schools is needed, and clearly that assistance will prove the best which is conditional.

As a means of paying the national debt I know of no one measure fuller of promise than the increase and diffusion of intelligence among the mass of the people. The expenditure of \$5,000,000 to \$10,000,000 a year for this purpose would be made good by almost immediate returns to the Post-Office and Treasury departments. The unschooled millions of the South write few letters, take few papers, and pay small taxes on incomes. There are no mines in this country so productive of wealth as the mind of the country. Educated labor is the true alchemy that can turn everything it touches into gold.

There is one other agency forming an essential part of the third plan proposed which I hasten to consider. I allude to a national bureau of education, corresponding in many of its features to the national Department of Agriculture. The interests of education would unquestionably be greatly promoted by the organization of such a bureau at the present time. It would render needed assistance in the establishment of school systems where they do not now exist and prove a potent means for improving and vitalizing existing systems. I conceive it to be possible for a national bureau of education to be so managed as to well-nigh revolutionize school instruction in this country, and this too without its being invested with any official control of the school authorities in the several States. This it could accomplish:

1. By securing greater uniformity and accuracy in school statistics and so translating and interpreting them that they may be more widely available and reliable as educational tests and measures. The present great diversity in the modes of collecting school statistics in the several States makes it almost impossible to use them for the purpose of comparing the results attained.

2. By bringing together the results of school systems in different communities, States, and nations and determining their comparative value, not simply by measuring their length and breadth as with a yardstick, but by separating the pure gold of education from the dross as in a crucible.

3. By collecting the results of all important experiments in new or special methods of instruction and management and making them the common property of the school officers and teachers of the country.

4. By diffusing among the people much-needed information respecting the school laws of the different States, the various modes of providing and disbursing school funds, the different classes of school officers employed and their relative duties, the qualifications demanded of teachers and the agencies provided for their special training, the best methods of classifying and grading schools, improved plans for schoolhouses, together with modes of heating and ventilization, etc., information now obtained only by a few persons and at great expense, but which is of the highest value to all intrusted with the management of schools.

5. By aiding communities and States in the organization of school systems in which oft-exploded errors shall be avoided and vital agencies and well-tried improvements be included.

6. By the general diffusion of correct ideas respecting the value of education as a quickener of intellectual activities, as a moral renovator, as a multiplier of industry and a consequent producer of wealth, and, finally, as the strength and shield of free institutions.

It is not possible to measure the influence which the faithful performance of these duties would exert upon the cause of education in this country, and few persons who have not been intrusted with the management of school systems can fully realize how widespread and urgent is the demand for such assistance. Indeed, the very existence of the association I now address is of itself cogent proof of a demand for a national channel of communication between the school systems of the different States. Millions of dollars have been thrown away in fruitless experiments or stolid plodding for the want of just such information as a national bureau could make accessible to the people.

We have a strong confirmation of these views in the potent influence which Horace Mann exerted upon the schools of this country—notwithstanding his official reports had necessarily a limited circulation outside of his own State. Who can measure the influence which he would have exerted at the head of a national bureau of education? How great the necessity for such a vital power to flow down from the General Government, at the present time, permeating and vitalizing all parts of our school system!<sup>a</sup>

<sup>a</sup>Mr. Mann may have originated few measures of educational progress, but he gave wings, as well as vital power, to the measures and agencies of others.

We have also a very forcible illustration of the same position in the powerful influence exerted upon English elementary schools by the national committee of council of education while James Ray Shuttleworth was its secretary, and also subsequently.

But in determining the probable efficiency and value of a national bureau of education, there is a fundamental law, running through the entire history of educational progress, which must not be overlooked. Idolatry has never been self-moved to cast its idols to the moles and the bats; nor has benighted paganism ever lifted itself into the light of a beneficent civilization. The impulse to such progress always comes from without and above. The civilization of the world has a fountain head. The same law holds true in education. An ignorant community has no inward impulse to lead it to educate itself. Just where education is most needed there it is always least appreciated and valued. The half savage population of Ban de la Roche had for centuries hugged their barbarism when the good Oberlin went among them. Berkeley, a colonial governor of Virginia, thanked God that there were no free schools in his colony, and only twice twelve months ago the slave shamble instead of the schoolhouse still stood at the crossroads of the Old Dominion. The demand for education is always awakened by external influences and agencies. Hence, Adam Smith and other writers on political economy expressly except education from the operation of the general law of supply and demand.

This law has a wide application in school affairs. Communities that have, indeed, some general appreciation of education rest satisfied with very indifferent schools until some influence supplies the impulse to reform and progress. No one obstacle lies so directly across the track of school advancement as the idea entertained by nearly every community that it has attained unsurpassed excellence in education; and this self-flattery often exists where the work of reform needs to be most earnestly undertaken. A national bureau would hold up to many school systems a mirror which would reveal attainable results and desirable changes.

I remark, finally, that the creation of a national bureau of education would be a practical recognition by the Government of the value and necessity of universal education as a means of perpetuating free institutions. It would impart to the common-school cause a dignity and a character which would surely widen its influence and enhance its efficiency. It would be an argument for the education of the people which would be felt throughout the country.

The highest success of the bureau will, of course, depend much upon the manner in which it is officered. Instead of being made a burrow for seedy politicians, it must be made the center of the ripest experience and the most eminent attainments to be found among the educators of the country. The work of such a bureau must be directed by a mind that comprehends the aim and scope of education—its philosophy, its history, its processes, its practical details.

But we need to go further than this. Commissions similar to the great commissions that have been sitting successively in Great Britain should be appointed by Congress to examine respectively into our systems of collegiate education, our professional or special schools, and the instruction of our public schools. Such investigations would exert a powerful influence upon our educational systems which have as yet neither crystalized nor fossilized. Now is the opportune time to introduce changes and modifications.

Let it be remembered that the next great problem of republican institutions is the uplifting of each successive generation of Americans to a true comprehension of their high duties and responsibilities. In this sublime work society, the state, and the nation must be conjoined. Around each child born into American liberty they must stand as a triple guaranty that the boon of education shall not be denied.

#### APPENDIX F.

[From Barnard's American Journal of Education, Vol. XXI, 1870, p. 5.]

#### PREFATORY NOTE.

The following Report on Technical Schools, and Special Instruction Generally, in Different Countries, was printed in its present form by the subscriber in pursuance of a call, January 19, 1870, by the House of Representatives on the Commissioner of Education for information on the subject. It was not completed so as to be communicated to Congress at the time (March 15) his connection with the office ceased, and has been brought to its present still incomplete condition at the special request of members of the House Committee on Education and Labor, at whose instance the call was originally made. This portion (pp. 33-786) is now published under the order of the House to print, in advance of the completion of the chapters relating to

Great Britain and the United States, at the suggestion of the Commissioner of Education, to meet the calls on him for information respecting this class of institutions.

As originally planned, this document would have constituted a portion (Part IV) of a comprehensive survey of national education in different countries, which the undersigned had commenced in 1854, in view of a thorough discussion of the condition and improvement of public instruction in the United States.

This survey would embrace:

- Parts I and II. Elementary and secondary education.
- Vol. I. The German States..
- Vol. II. Switzerland, France, Belgium, Holland, Denmark, Norway and Sweden, Russia, Turkey, Greece, Italy, Spain, Portugal, Great Britain.
- Vol. III. The American States—with a comparison of the system and condition of public schools in the United States with those of the more advanced States of Europe.
- Part III. Universities, colleges, and other institutions of superior instruction.
- Part IV. Professional, class, and special instruction (schools of theology, law, medicine, teaching, agriculture, commerce, engineering, navigation, mines, technology, etc.).
- Part V. Supplementary instruction (libraries, lectures, evening schools, etc.).
- Part VI. Societies, museums, and collections for the promotion of education, science, literature, and the arts.

So far as the information relating to systems of elementary and secondary instruction was collected and prepared for publication in the Department or Office of Education, it will be communicated in a few days to the Secretary of the Interior, with a plan for its speedy completion and publication.

HENRY BARNARD.

WASHINGTON, June 29, 1870.

#### APPENDIX G.

##### EDUCATION—A NATIONAL INTEREST.

*Speech of James A. Garfield, of Ohio, in the House of Representatives, June 8, 1866, on a bill "To establish a national bureau of education," reported by the Select Committee (a) on the Memorial of the National Association of School Superintendents.*

(At the conclusion of a general discussion of the bill, the previous question upon the bill and the pending amendments was demanded and seconded, and the main question ordered.)

Mr. Garfield spoke as follows:

"I did intend to make a somewhat elaborate statement of the reasons why the select committee recommended the passage of this bill, but I know the anxiety that many gentlemen feel to have this debate concluded and to allow the private bills now on the Calendar and set for this day to be disposed of, and to complete as soon as possible the work of this session. I will therefore abandon my original purpose and restrict myself to a brief statement of a few leading points in the argument, and leave the decision with the House. I hope this waiving of a full discussion of the bill will not be construed into a confession that it is inferior in importance to any measure before the House, for I know of none that has a nobler object or that more vitally affects the future of this nation.

"I first ask the House to consider the magnitude of the interests involved in this bill. The very attempt to discover the amount of pecuniary and personal interest we have in our schools shows the necessity of such a law as is here proposed. I have searched in vain for any complete or reliable statistics showing the educational condition of the whole country. The estimates I have made are gathered from various sources and can only be approximately correct. I am satisfied, however, that they are far below the truth.

"Even by the incomplete and imperfect educational statistics of the Census Bureau, it appears that in 1860 there were in the United States 115,224 common schools, 500,000 school officers, 150,241 teachers, and 5,477,037 scholars, thus showing that more than six millions of the people of the United States are directly engaged in the work of education.

"Not only has this large proportion of our population been thus engaged, but the Congress of the United States has given 53,000,000 acres of public lands to 14 States and Territories of the Union for the support of schools. In the old ordinance of 1785 it was provided that one section of every township—one thirty-sixth of all the public lands of the United States—should be set apart and held forever sacred to the support of the schools of the country. In the ordinance of 1787 it was declared that 'religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall forever be encouraged.'

<sup>a</sup> The committee consisted of Garfield, of Ohio; Patterson, of New Hampshire; Boutwell, of Massachusetts; Donnelly, of Minnesota; Moulton, of Illinois; Goodyear, of New York, and Randall, of Pennsylvania.

"It is estimated that at least \$50,000,000 have been given in the United States by private individuals for the support of schools. We have thus an interest, even pecuniarily considered, hardly second to any other. We have tolerably complete school statistics from only 17 States of the Union.

"Our Congressional Library contains no educational reports whatever from the remaining 19. In those 17 States there are 90,835 schools, 190,000 teachers, 5,107,285 pupils, and \$34,000,000 annually appropriated by the legislatures for the support and maintenance of common schools. Notwithstanding the great expenditures entailed upon them during five years of war, they raised by taxation \$34,000,000 annually for the support of common schools. In several States of the Union more than 50 per cent of all the tax imposed for State purposes is for the support of common schools. And yet gentlemen are impatient because we wish to occupy a short time in considering this bill.

"I will not trouble the House by repeating commonplaces so familiar to every gentleman here, as that our system of government is based upon the intelligence of the people. But I wish to suggest that there never has been a time when all our educational forces should be in such perfect activity as at the present day.

"Ignorance—stolid ignorance—is not our most dangerous enemy. There is very little of that kind of ignorance among the white population of this country.

"In the Old World, among the despotic governments of Europe, the great disfranchised class—the pariahs of political and social life—are indeed ignorant, mere inert masses, moved upon and controlled by the intelligent and cultivated aristocracy. Any unrepresented and hopelessly disfranchised class in a government will inevitably be struck with intellectual paralysis. Our late slaves afford a sad illustration.

"But among the represented and voting classes of this country, where all are equal before the law and every man is a political power for good or evil, there is but little of the inertia of ignorance. The alternatives are not education or no education, but shall the power of the citizen be directed aright toward industry, liberty, and patriotism, or, under the baneful influence of false theories and evil influences, shall it lead him continually downward till it ruin both him and the government?

"If he is not educated in the school of virtue and integrity, he will be educated in the school of vice and iniquity. We are therefore afloat on the sweeping current; we must make head against it or we shall go down with it to the saddest of destinies.

"According to the census of 1860 there were 1,218,311 free white inhabitants of the United States over 21 years of age who could not read nor write, and 871,418 of those were American-born citizens. One-third of a million of people are being annually thrown upon our shores from the Old World, a large per cent of whom are uneducated, and the gloomy total has been swelled by the 4,000,000 slaves admitted to citizenship by the events of the war.

"Such, sir, is the immense force which we must now confront by the genius of our institutions and the light of our civilization. How shall it be done? An American citizen can give but one answer. We must pour upon them all the light of our public schools. We must make them intelligent, industrious, patriotic citizens or they will drag us and our children down to their level. Does not this question rise to the full height of national importance and demand the best efforts of statesmanship to adjust it? Mr. Mann has well said:

That legislators and rulers are responsible.

In our country and in our times no man is worthy the honored name of a statesman who does not include the highest practicable education of the people in all of his plans of administration.

He may have eloquence, he may have a knowledge of all history, diplomacy, jurisprudence, and by these he may claim, in other countries, the elevated rank of a statesman, but unless he speaks, plans, labors at all times and in all places for the culture and edification of the whole people, he is not, he can not be, an American statesman.

"Gentlemen who have discussed the bill this morning tell us that it will result in great expense to the Government. Whether an enterprise is expensive or not is altogether a relative question to be determined by the importance of its object.

"Now, what have we done as a nation in the way of expenses? In 1832 we organized a Coast Survey Bureau and have expended millions upon it. Its officers have triangulated thousands of miles of our coasts, have made soundings of all our bays and harbors, and carefully mapped the shoals, breakers, and coast lines from our northern boundary on the Atlantic to the extreme northern boundary on the Pacific coast. They have established 800 tidal stations to observe the fluctuations of the tides. We have expended vast sums in order perfectly to know the topography of our coasts, lakes, and rivers, that we might make navigation more safe. Is it of no consequence that we explore the boundaries of that wonderful intellectual empire which incloses within its domain the fate of succeeding generations and of this Republic? The children of to-day will be the architects of our country's destiny in 1900.

"We have established an Astronomical Observatory, where the movements of the stars are watched, latitude and longitude calculated, and chronometers regulated for the benefit of navigation. For this Observatory we pay one-third of a million per annum. Is it of no consequence that we observe the movements of those intellectual lights which shall, in the time to come, be guiding stars in our national firmament?"

"We have established a Light-House Board, who are employing all the aids of science to discover the best modes of regulating the beacons upon our shores; they are placing buoys as waymarks to guide ships safely into our harbors. Will you not create a light-house board to set up beacons for the coming generation, not as lights to the eye, but to the mind and heart, that shall lead them safely in the perilous voyage of life and enable them to transmit the blessings of liberty to those who shall come after them?"

"We have set on foot a score of expeditions to explore the mountains and valleys, the lakes and rivers, of this and other countries. We have expended money without stint to explore the Amazon and the Jordan, Chile and Japan, the gold shores of the Colorado, and the copper cliffs of Lake Superior; to gather and publish the great facts of science and to exhibit the material resources of physical nature. Will you refuse the pitiful sum of \$13,000 to collect and record the intellectual resources of this country, the elements that lie behind all material wealth and make it either a curse or a blessing?"

"We have paid three-quarters of a million dollars for the survey of the route for the Pacific Railroad, and have published the results at a great cost in 13 quarto volumes, with accompanying maps and charts. The money for these purposes was freely expended, and now, when it is proposed to appropriate \$13,000 to aid in increasing the intelligence of those who will use that great continental highway when it is completed, we are reminded of our debts and warned against increasing our expenditures. It is difficult to treat such an objection with the respect that always is due in this hall of legislation.

"We have established a Patent Office, where are annually accumulated thousands of models of new machinery invented by our people. Will you make no expenditure for the benefit of the intelligence that shall stand behind that machinery and be its controller? Will you bestow all your favors upon the engine, and ignore the engineer? I will not insult the intelligence of this House by waiting to prove that money paid for education is the most economical of all expenditure; that it is cheaper to reduce crime than to build jails; that schoolhouses are less expensive than rebellions. A tenth of our national debt expended in public education fifty years ago would have saved us the blood and treasure of the late war. A far less sum may save our children from a still greater calamity.

"We expend hundreds of thousands annually to promote the agricultural interests of the country; to introduce the best methods in husbandry. Is it not of more consequence to do something for the farmer of the future than for the farm of to-day?"

"As man is more precious than soil, as the immortal spirit is nobler than the clod it animates, so is the object of this bill more important than any mere pecuniary interest.

"The genius of our Government does not allow us to establish a compulsory system of education, as is done in some of the countries of Europe. There are States in this Union, however, which have adopted a compulsory system, and perhaps that is well. It is for each State to determine. A distinguished gentleman from Rhode Island told me lately that it is now the law in that State that every child within its borders shall attend school, and that every vagrant child shall be taken in charge by the authorities and sent to school. It may be well for other States to pursue the same course; but probably the General Government can do nothing of the sort. Whether it has the right of compulsory control or not, we propose none in this bill.

"But we do propose to use that power, so effective in this country, of letting in light on subjects and holding them up to the verdict of public opinion. If it could be published annually from this Capitol, through every school district of the United States, that there are States in the Union that have no system of common schools, and if their records could be placed beside the records of such States as Massachusetts, New York, Pennsylvania, Ohio, and other States that have a common-school system, the mere statement of the fact would rouse their energies and compel them for shame to educate their children. It would shame out of their delinquency all the delinquent States.

"Mr. Speaker, if I were called upon to-day to point to that in my own State of which I am most proud I would not point to any of the flaming lines of her military record, to the heroic men and the brilliant officers she gave to the late contest; I would not point to any of her leading men of the past or the present; but I would point to her common schools; I would point to the honorable fact that in the great struggle

of five years through which we have just passed she has expended \$12,000,000 for the support of her public schools. I do not include in that amount the sums expended upon our higher institutions of learning. I would point to the fact that 52 per cent of the taxation of Ohio for the last five years, aside from the war tax and the tax for the payment of her public debt, has been for the support of her schools. I would point to the schools of Cincinnati, Cleveland, Toledo, and other cities of the State if I desired a stranger to see the glory of Ohio. I would point to the 13,000 school-houses and the 700,000 pupils in the schools of Ohio. I would point to the \$3,000,000 she has paid for schools during the last year alone. This, in my judgment, is the proper gauge by which to measure the progress and glory of States.

"Gentlemen tell us there is no need of this bill—the States are doing well enough now. Do they know through what a struggle every State has come up that has secured a good system of common schools? Let me illustrate this by the example of Pennsylvania. Notwithstanding the early declaration of William Penn:

That which makes a good constitution must keep it, namely, men of wisdom and virtue, qualities that, because they descend not with worldly inheritances, must be carefully propagated by a virtuous education of youth, for which spare no cost, for by such parsimony all that is saved is lost;

notwithstanding that wise master-builder incorporated this sentiment in his "framework of government" and made it the duty of the governor and council "to establish and support public schools;" notwithstanding Benjamin Franklin, from the first hour he became a citizen of Pennsylvania, inculcated the value of useful knowledge to every human being in every walk of life, and by his personal and pecuniary effort did establish schools and a college for Philadelphia; notwithstanding the constitution of Pennsylvania made it obligatory upon the legislature to foster the education of the citizens; notwithstanding all this, it was not till 1833-34 that a system of common schools, supported in part by taxation of property of the State, for the common benefit of all the children of the State, was established by law; and although the law was passed by an almost unanimous vote of both branches of the legislature, so foreign was the idea of public schools to the habits of the people, so odious was the idea of taxation for this purpose, that even the poor, who were to be specially benefited, were so deluded by political demagogues as to clamor for its repeal.

"Many members who voted for the law lost their nomination, and others, although nominated, lost their election. Some were weak enough to pledge themselves to a repeal of the law; and in the session of 1835 there was an almost certain prospect of its repeal and the adoption in its place of an odious and limited provision for educating the children of the poor by themselves. In the darkest hour of the debate, when the hearts of the original friends of the system were failing from fear, there rose on the floor of the house one of its early champions, one who, though not a native of the State, felt the disgrace which the repeal of this law would inflict like a knife in his bosom; one who, though no kith or kin of his would be benefited by the operations of the system, and though he should share its burdens, would only partake with every citizen in its blessings; one who had voted for the original law, although introduced by his political opponents, and who had defended and gloried in his vote before an angry and unwilling constituency; this man, then in the beginning of his public career, threw himself into the conflict, and by his earnest and brave eloquence saved the law, and gave a noble system of common schools to Pennsylvania.

"I doubt if, at this hour, after thirty years crowded full of successful labors at the bar, before the people, and in halls of legislation, the venerable and distinguished member [Mr. Stevens], who now represents a portion of the same State in this House, can recall any speech of his life with half the pleasure he does that, for no measure with which his name has been connected is so fraught with blessings to hundreds of thousands of children, and to homes innumerable. I hold in my hand a copy of his brave speech, and I ask the clerk to read the passages I have marked:

I am comparatively a stranger among you, born in another, in a distant State; no parent or kindred of mine did, does, or probably ever will dwell within your borders. I have none of those strong cords to bind me to your honor and your interest; yet, if there is any one thing on earth which I ardently desire above all others, it is to see Pennsylvania standing up in her intellectual, as she confessedly does in her physical, resources, high above all her confederate rivals. How shameful, then, would it be for these her native sons to feel less so, when the dust of their ancestors is mingled with her soil, their friends and relatives enjoy her present prosperity, and their descendants, for long ages to come, will partake of her happiness or misery, her glory or her infamy! \* \* \*

In giving this law to posterity, you act the part of the philanthropist, by bestowing upon the poor as well as the rich the greatest earthly boon which they are capable of receiving; you act the part of the philosopher, by pointing, if you do not lead them, up the hill of science; you act the part of the hero, if it be true, as you say, that popular vengeance follows close upon your footsteps. Here, then, if you wish true popularity, is a theater on which you may acquire it. \* \* \*

Let all, therefore, who would sustain the character of the philosopher or philanthropist sustain this law. Those who would add thereto the glory of the hero can acquire it here; for, in the present

state of feeling in Pennsylvania, I am willing to admit that but little less dangerous to the public man is the war club and battle-ax of savage ignorance than to the lion-hearted Richard was the keen scimiter of the Saracen. He who would oppose it, either through inability to comprehend the advantages of general education or from unwillingness to bestow them on all his fellow-citizens, even to the lowest and the poorest, or from dread of popular vengeance, seems to want either the head of the philosopher, the heart of the philanthropist, or the nerve of the hero.

"He has lived long enough to see this law, which he helped to found in 1834, and more than any other man was instrumental in saving from repeal, in 1835, expanded and consolidated into a noble system of public instruction. Twelve thousand schools have been built by the voluntary taxation of the people, to the amount, for school-houses alone, of nearly \$10,000,000. Many millions of children have been educated in these schools. More than 700,000 attended the public schools of Pennsylvania in 1864-65, and their annual cost, provided by voluntary taxation in the year 1864, was nearly \$3,000,000, giving employment to 16,000 teachers.

"It is glory enough for one man to have connected his name so honorably with the original establishment and effective defense of such a system.

"But it is said that the thirst for knowledge among the young; the pride and ambition of parents for their children, are agencies powerful enough to establish and maintain thorough and comprehensive systems of education.

"This suggestion is answered by the unanimous voice of publicists and political economists. They all admit that the doctrine of "demand and supply" does not apply to educational wants. Even the most extreme advocates of the principle of *laissez faire* as a sound maxim of political philosophy admit that governments must interfere in aid of education. We must not wait for the wants of the rising generation to be expressed in a demand for means of education. We must ourselves discover and supply their needs, before the time for supplying them has forever passed. John Stuart Mill says:

But there are other things of the worth of which the demand of the market is by no means a test; things of which the utility does not consist in ministering to inclinations, nor in serving the daily uses of life, and the want of which is least felt where the need is greatest. This is peculiarly true of those things which are chiefly useful as tending to raise the character of human beings. The uncultivated can not be judges of cultivation.

Those who most need to be made wiser and better usually desire it least, and, if they desired it, would be incapable of finding the way to it by their own lights. It will continually happen on the voluntary system that, the end not being desired, the means will not be provided at all, or that, the persons requiring improvement having an imperfect or altogether erroneous conception of what they want, the supply called forth by the demand of the market will be anything but what is really required. Now, any well-intentioned and tolerably civilized government may think, without presumption, that it does, or ought to, possess a degree of cultivation above the average of the community which it rules, and that it should, therefore, be capable of offering better education and better instruction to the people than the greater number of them would spontaneously select.

Education, therefore, is one of those things which it is admissible in principle that the government should provide for the people. The case is one to which the reasons of the noninterference principle do not necessarily or universally extend.

With regard to elementary education, the exception to ordinary rules, may, I conceive, justifiably be carried still further. There are certain primary elements and means of knowledge which it is in the highest degree desirable that all human beings born into the community should acquire during childhood. If their parents, or those on whom they depend, have the power of obtaining for them this instruction, and fail to do it, they commit a double breach of duty: toward the children themselves, and toward the members of the community generally, who are all liable to suffer seriously from the consequences of ignorance and want of education in their fellow-citizens. It is, therefore, an allowable exercise of government to impose on parents the legal obligation of giving elementary instruction to children. This, however, can not fairly be done without taking measures to insure that such instruction shall always be accessible to them, either gratuitously or at a trifling expense.

"This is the testimony of economic science. I trust the statesmen of this Congress will not think the subject of education too humble a theme for their most serious consideration. It has engaged the earnest attention of the best men of ancient and modern times, especially of modern statesmen and philanthropists.

"I will fortify myself in the positions I have taken by quoting the authority of a few men who are justly regarded as teachers of the human race. If I keep in their company I can not wander far from the truth. I can not greatly err while I am guided by their counsel.

"In his eloquent essay entitled 'Way to establish a free commonwealth,' John Milton said:

To make the people fittest to choose, and the chosen fittest to govern, will be to mend our corrupt and faulty education, to teach the people faith, not without virtue, temperance, modesty, sobriety, economy, justice; not to admire wealth or honor; to hate turbulence and ambition; to place everyone his private welfare and happiness in the public peace, liberty, and safety.

"England's most venerable living statesman, Lord Brougham, enforced the same truth in these noble words:

Lawgivers of England! I charge ye, have a care! Be well assured that the contempt lavished upon the cabals of Constantinople, when the council disputed on a text, while the enemy, the derider of all their texts, was thundering at the gate, will be a token of respect compared with the loud shout of universal scorn which all mankind in all ages will send up against you if you stand still and suffer a far deadlier foe than the Turkman; suffer the parent of all evil, all falsehood, all hypocrisy,

all discharity, all self-seeking—him who covers over with pretexts of conscience the pitfalls that he digs for the souls on which he preys—to stalk about the fold and lay waste its inmates; stand still and make no head against him, upon the vain pretext to soothe your indolence, that your action is obstructed by religious cabals—upon the far more guilty speculation that by playing a party game you can turn the hatred of conflicting professors to your selfish purposes!

Let the soldier be abroad, if he will; he can do nothing in this age. There is another personage abroad, a person less imposing—in the eye of some insignificant. The schoolmaster is abroad, and I trust to him, armed with his primer, against the soldier in full uniform array.

“Lord Brougham gloried in the title of schoolmaster, and contrasted his work with that of the military conquerer in these words:

The conqueror stalks onward with the “pride, pomp, and circumstance of war,” banners flying, shouts rending the air, guns thundering, and martial music pealing to drown the shrieks of the wounded and the lamentations for the slain. Not thus the schoolmaster in his peaceful vocation. He meditates and prepares in secret the plans which are to bless mankind; he slowly gathers around him those who are to further their execution; he quietly, though firmly, advances in his humble path, laboring steadily but calmly, till he has opened to the light all the recesses of ignorance and torn up by the roots the weeds of vice. His is a progress not to be compared with anything like a march, but it leads to a far more brilliant triumph, and to laurels more imperishable than the destroyer of his species the scourge of the world ever won.

“The learned and brilliant Guizot, who regarded his work in the office of minister of public instruction, in the Government of France, the noblest and most valuable work of his life, has left us this valuable testimony:

Universal education is henceforth one of the guarantees of liberty and social stability. As every principle of our government is founded on justice and reason, to diffuse education among the people, to develop their understanding and enlighten their minds, is to strengthen their constitutional government and secure its stability.

“In his farewell address Washington wrote these words of wise counsel:

Promote, as an object of primary importance, institutions for the general diffusion of knowledge. In proportion as the structure of a government gives force to public opinion, it is essential that public opinion should be enlightened.

“In his inaugural message, when first taking the Presidential chair, the elder Adams said:

The wisdom and generosity of the legislature in making liberal appropriations in money for the benefit of schools, academies, and colleges, is an equal honor to them and to their constituents, a proof of their veneration for letters and science, and a portent of great and lasting good to North and South America and to the world. Great is truth—great is liberty—great is humanity—and they must and will prevail.

“Chancellor Kent used this decided language:

The parent who sends his son into the world uneducated defrauds the community of a lawful citizen, and bequeaths to it a nuisance.

“I shall conclude this citation of opinions with the stirring words of Edward Everett:

I know not to what we can better liken the strong appetite of the mind for improvement than to a hunger and thirst after knowledge and truth, nor how can we better describe the province of education than to say it does that for the intellect which is done for the body, when it receives the care and nourishment which are necessary for its growth, health, and strength?

From this comparison, I think I derive new views of the importance of education. It is now a solemn duty, a tender, sacred trust.

What! feed a child's body and let his soul hunger! pamper his limbs and starve his faculties!

Plant the earth, cover a thousand hills with your droves of cattle, pursue the fish to their hiding places in the sea, and spread out your wheat fields across the plains in order to supply the wants of that body, which will soon be as cold and senseless as their poorest clod, and let the pure spiritual essence within you, with all its glorious capacities for improvement, languish and pine! What! build factories, turn in rivers upon the waterwheels, unchain the imprisoned spirits of steam, to weave a garment for the body, and let the soul remain unadorned and naked!

What! send out your vessels to the farthest ocean, and make battle with the monsters of the deep, in order to obtain the means of lighting up your dwellings and workshops, and prolonging the hours of labor for the meat that perisheth, and permit that vital spark, which God has kindled, which he has intrusted to our care to be fanned into a bright and heavenly flame; permit it, I say, to languish and go out!

“It is remarkable that so many good things have been said, and so few things done, by our national statesmen in favor of education. If we inquire what has been done by the governments of other countries to support and advance public education, we are compelled to confess with shame that every government in Christendom has given a more intelligent and effective support to schools than has our own.

“The free cities of Germany organized the earliest school systems after the separation of church and state. The present schools of Hamburg have existed more than one thousand years. The earliest school codes were framed in the duchy of Würtemberg in 1565, and in the electorate of Saxony in 1580. Under these codes were established systems of schools, more perfect, it is claimed, than the school system of any State of the American Union. Their systems embraced the gymnasium and the university, and were designed, as their laws expressed it, “to carry youth from the elements to the degree of culture demanded for offices in church and state.”

"The educational institutions of Prussia are too well known to need a comment. It is a sufficient index of their aim and high character that a late Prussian school officer said of his official duties:

I promised God that I would look upon every Prussian peasant child as a being who could complain of me before God if I did not provide for him the best education as a man and a Christian which it was possible for me to provide.

"France did not think herself dishonored by learning from a nation which she had lately conquered; for when, in 1831, she began to provide more fully for the education of her people, she sent the philosopher Cousin to Holland and Prussia to study and report upon the schools of those States. Guizot was made minister of public instruction, and held the office from 1832 to 1837. In 1833 the report of Cousin was published, and the educational system of France was established on the Prussian model.

"No portion of his brilliant career reflects more honor upon Guizot than his five years' work for the schools of France. The fruits of his labors were not lost in the revolutions that followed. The present Emperor is giving his best efforts to the perfection and maintenance of schools, and is endeavoring to make the profession of the teacher more honorable and desirable than it has been hitherto.

"Through the courtesy of the Secretary of State, I have obtained the last annual report of the minister of public instruction in France, which exhibits the present state of education in that Empire.

"At the last enumeration there were in France, in the colleges and lyceums, 65,832 pupils, in the secondary schools 200,000, and in the primary or common schools 4,720,234.

"Besides the large amount raised by local taxation, the Imperial Government appropriated during the year 1865 2,349,051 francs for the support of primary schools.

"Teaching is one of the regular professions in France, and the Government offers prizes and bestows honors upon the successful instructor of children. During the year 1865 1,154 prizes were distributed to teachers in primary schools.

"An order of honor and a medal worth 250 francs is awarded to the best teacher in each commune.

"After a long and faithful service in his profession the teacher is retired on half pay, and if broken down in health is pensioned for life. In 1865 there were 4,245 teachers on the pension list of France. The minister says in his report: 'The statesmen of France have determined to show that the country knows how to honor those who serve her even in obscurity.'

"Since 1862 10,243 libraries for the use of common schools have been established, and they now contain 1,117,352 volumes, more than a third of which have been furnished by the Imperial Government. Half a million text-books are furnished for the use of children who are too poor to buy them. It is the policy of France to afford the means of education to every child in the Empire.

"When we compare the conduct of other governments with our own we can not accuse ourselves so much of illiberality as of reckless folly in the application of our liberality to the support of schools. No government has expended so much to so little purpose. To fourteen States alone we have given, for the support of schools, 83,000 square miles of land, or an amount of territory nearly equal to two such States as Ohio. But how has this bountiful appropriation been applied? This chapter in our history has never been written. No member of this House or the Senate, no executive officer of the Government, now knows, and no man ever did know, what disposition has been made of this immense bounty. This bill requires the Commissioner of Education to report to Congress what lands have been given to schools, and how the proceeds have been applied. If we are not willing to follow the example of our fathers in giving, let us, at least, perpetuate the record of their liberality, and preserve its beneficent results.

"Mr. Speaker, I have thus hurriedly and imperfectly exhibited the magnitude of the interests involved in the education of American youth; the peculiar condition of affairs which demands at this time an increase of our educational forces; the failure of a majority of the States to establish school systems; the long struggles through which others have passed in achieving success, and the humiliating contrast between the action of our Government and those of other nations in reference to education; but I can not close without referring to the bearing of this measure upon the peculiar work of this Congress.

"When the history of the Thirty-ninth Congress is written it will be recorded that two great purposes inspired it and made their impress upon all its efforts, viz, to build up free States on the ruins of slavery, and to extend to every inhabitant of the United States the rights and privileges of citizenship.

"Before the divine Architect builded order out of chaos he said 'Let there be light.' Shall we commit the fatal mistake of building up free States without expelling the darkness in which slavery shrouded them? Shall we enlarge the boundaries of citizenship and make no provision to increase the intelligence of the citizen?"

"I share most fully in the aspirations of this Congress, and give my most cordial support to its policy; but I believe its work will prove a disastrous failure unless it makes the schoolmaster its ally, and aids him in preparing the children of the United States to perfect the work now begun.

"The stork is a sacred bird in Holland, and is protected by public law, because it destroys those insects which would undermine the dikes and let the sea again overwhelm the rich fields of the Netherlands. Shall this Government do nothing to foster and strengthen those educational agencies which alone can shield the coming generation from ignorance and vice, and make it the impregnable bulwark of liberty and law?"

"I know that this measure presents few attractions to those whose chief work is to watch the political movements which relate only to nominating conventions and elections. The mere politician will see in it nothing valuable, for the millions of children to be benefited by it can give him no votes. But I appeal to those who care more for the safety and glory of this nation than for any mere temporary advantage to aid in giving to education the public recognition and active support of the Federal Government."

The final action of the House on the bill was not reached till June 19, when, the question being taken by yeas and nays, it was passed by a vote of 80 yeas to 44 nays, with the following title and provisions:

#### AN ACT To establish a department of education.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That there shall be established, at the city of Washington, a department of education for the purpose of collecting such statistics and facts as shall show the condition and progress of education in the several States and Territories, and of diffusing such information respecting the organization and management of schools and school systems, and methods of teaching, as shall aid the people of the United States in the establishment and maintenance of efficient school systems, and otherwise promote the cause of education throughout the country.

SEC. 2. *And be it further enacted,* That there shall be appointed by the President, by and with the advice and consent of the Senate, a commissioner of education, who shall be intrusted with the management of the department herein established, and who shall receive a salary of four thousand dollars per annum, and who shall have authority to appoint one chief clerk of his department, who shall receive a salary of two thousand dollars per annum, one clerk who shall receive a salary of eighteen hundred dollars per annum, and one clerk who shall receive a salary of sixteen hundred dollars per annum, which said clerks shall be subject to the appointing and removing power of the commissioner of education.

SEC. 3. *And be it further enacted,* That it shall be the duty of the commissioner of education to present annually to Congress a report embodying the results of his investigations and labors, together with a statement of such facts and recommendations as will, in his judgment, subserve the purpose for which this department is established. In the first report made by the commissioner of education under this act there shall be presented a statement of the several grants of land made by Congress to promote education, and the manner in which these several trusts have been managed, the amount of funds arising therefrom, and the annual proceeds of the same, as far as the same can be determined.

SEC. 4. *And be it further enacted,* That the commissioner of public buildings is hereby authorized and directed to furnish proper offices for the use of the department herein established.

The bill, in the Senate, was referred to the standing committee on the judiciary, who recommended its passage without amendment; and, after a debate on February 26, 1867, on a motion to substitute bureau for department, was passed without division on March 1, and signed by the President March 2. On March 11 Henry Barnard was nominated by President Johnson, on March 16 was confirmed by the unanimous vote of the Senate, and on March 17 entered on the duties of Commissioner of Education.

#### APPENDIX H.

[Dr. Barnard's plan of a central agency for the United States to advance education (Vol. XXI).]

The following plan for "the increase and diffusion of knowledge," of education, and especially of popular education, and plans for its improvement through the Smithsonian Institution, or the American Association for the Advancement of Education, was submitted to the association by Hon. Henry Barnard:

The institution (or association) to appoint a secretary or agent, with a salary, and to furnish a room for an officer and depository of educational documents and apparatus, and beyond this not to be liable for any expense.

Again by the secretary or agent:

1. To devote himself exclusively to the "increase and diffusion of knowledge" on the subject of education, and especially of the condition and means of improving popular education, and particularly

2. To answer all personal or written inquiries on the subject, and collect and make available for use information as to all advances made in the theory and practice of education in any one State or country.

3. To attend, so far as may be consistent with other requisitions on his time, and without charge to the funds of the institution (or association), educational conventions of a national and State character, for the purpose of collecting and disseminating information.

4. To edit a publication to be entitled the "American Journal and Library of Education," on the plan set forth in the accompanying paper (A).

5. To collect:

(a) Plans and models of schoolhouses and furniture.

(b) Specimens of maps and other material aids of education.

(c) Educational reports and documents from other States and countries.

6. To institute a system of educational exchange between literary institutions in this and other countries.

To make arrangements, and effect, if practicable, at least one meeting or conference of the friends of educational improvement in Washington (or elsewhere) every year.

8. To submit annually a report in which shall be given a summary of the progress of education in each State and, as far as practicable, in every country.

#### A.

*Plan of publication.*—A quarterly or monthly issue under the general title of the "American Journal of Education."

I. A Journal of Education, to be issued in quarterly or monthly numbers, embracing articles on systems, institutions, and methods of education, and the current intelligence of literature and education, and to make an octavo volume annually of at least 600 pages.

II. A Library of Education, to consist of a series of independent treatises on the following (among other) subjects, to be issued in parts, and to be forwarded with the Journal to subscribers; the several parts or treatises to make an octavo volume of at least 600 pages per year:

1. A catalogue of the best publications on the organization, instruction, and discipline of schools of every grade, and on the principles of education in the English, French, and German languages.

2. A history of education, ancient and modern.

3. An account of elementary instruction in Europe, based on the reports of Bache, Stowe, Mann, and others.

4. National education in the United States, or contributions to the history and improvement of common or public schools and other institutions, means, and agencies of popular education in the several States.

5. School architecture, or the principles of construction, ventilation, warming, acoustics, seating, etc., applied to schoolrooms, lecture halls, and class rooms, with illustrations.

6. Normal schools and other institutions, means and agencies for the professional training and improvement of teachers.

7. System of public education for large cities and villages, with an account of the schools and other means of popular education and recreation in the principal cities of Europe and in this country.

8. System of popular education for sparsely populated districts, with an account of the schools in Norway and the agricultural portions of other countries.

9. Schools of agriculture, and other means of advancing agricultural improvement.

10. Schools of science applied to the mechanic arts, civil engineering, etc.

11. Schools of trade, navigation, commerce, etc.

12. Female education, with an account of the best seminaries for females in this country and in Europe.

13. Institutions for orphans.

14. Schools of industry, or institutions for truant, idle, or neglected children, before they have been convicted of crime.

15. Reform schools or institutions for young criminals.

16. Houses of refuge for adult criminals.

17. Secondary education, including schools of agriculture, engineering, trade, navigation, etc.

18. Colleges and universities.

19. Schools of theology, law, and medicine.

20. Military and naval schools.

21. Supplementary education, including adult schools, evening schools, courses of popular lectures, debating classes, mechanic institutes, etc.

22. Libraries, with hints for the purchase, arrangement, cataloguing, drawing, and preservation of books, especially in libraries designed for popular use.

23. Institutions for the deaf and dumb, blind, and idiots.

24. Societies for encouragement of science, the arts, and education.

25. Public museums and galleries.

26. Public gardens and other sources of popular recreation.

27. Educational tracts or a series of short essays on topics of immediate practical importance to teachers and school officers.

28. Educational biography, or the lives of distinguished educators and teachers.

29. Educational benefactors, or an account of the founders and benefactors of educational and scientific institutions.

30. Self-education, or hints for self-formation, with examples of the pursuit of knowledge under difficulties.

31. Home education, with illustrations drawn from the family training of different countries.

32. Educational nomenclature and index, or an explanation of words and terms used in describing the systems and institutions of education in different countries, with reference to the books where the subjects are discussed and treated of.

The series, when complete, will constitute an encyclopedia of education.

#### APPENDIX I.

[Dr. Earnard's plan in 1862 for a new series of the American Journal of Education (Vol. XXI).]

With the number for March, 1862, we shall commence a new series of the American Journal of Education, and, with a moderate encouragement from the thoughtful and active friends of educational improvement, we shall continue our quarterly issues until they have reached at least 6 volumes. We shall make no change in the general plan of this periodical. It will be devoted, as from the start, exclusively to the

history, biography, science, art, systems, institutions, and statistics of education in different countries, with special reference to the condition and wants of our own. We shall studiously avoid the insertion of all papers foreign to these great subjects, or of a single line or word calculated to injure the feelings of any faithful laborer in any allotment of the great field of American education. We leave the work of controversy to those who have more taste for it than we have, and shall labor diligently on the following points:

I. The history of pedagogy, or the successive developments of human culture, both theoretical and practical, under the varying circumstances of race, climate, religion, and government as drawn from special treatises of teachers and educators in different languages, or as embodied in the manners, literature, and history of each people.

In the development of this great theme, embracing many ages, races, and governments, we propose, not in precise chronological or ethnological order, but in papers prepared from time to time, as our studies or those of our collaborators may suggest, to show, to an extent which has not yet been attempted in the English language, what has been accomplished in the family and schools, by parents, teachers, and educators, for the systematic training of children and youth:

1. In the eastern nations before the birth of Christ—in China, India, Persia, Egypt, and Palestine—by Confucius, by the Vedas and Buddha, by Zoroaster and the Ptolemies, by Moses, David, Solomon, and the Rabbi.

2. Among the Greeks, at Crete, Sparta, and Athens, under the institutions of Pythagoras, Lycurgus, and Solon; by poets and philosophers and teachers, by Homer, Socrates, Plato, Aristotle, and Plutarch.

3. Among the Romans, in the infancy, maturity, and old age of Rome, by the didactics of Cato, Seneca, Tacitus, the Plinies, Quintilian, and Lucian.

4. Among modern nations, as reached by the teachings of Christianity, in the gradual unfolding of the present received ideas of school organization, and of the principles and methods of instruction, through (a) the peculiar organization and distinctive teaching of the early Christians; (b) the first popular school of the Christian fathers, Chrysostom and Basil; (c) the catechist schools of Clement and Origen; (d) the seminaries and cloister schools of Tertullian, Cyprian, Jerome, and Austin; (e) the monastic institutions of Benedict, Dominic, and Francis; (f) the court schools and educational labors of Charlemagne and Alfred; (g) the modifications wrought by Arabic culture which followed the incursions of the Moors; (h) the rise and expansion of universities; (i) the demand of chivalry for a culture for man and woman distinct from that of the clergy, and of incorporated cities for schools independent of ecclesiastical authorities; (j) the revival of the languages and the literature of Greece and Rome; (k) the long protracted struggle between humanism and realism, or between, on the one hand, the study of languages for the purposes of general culture and the only preparation for professions in which language was the great instrument of study and influence, and, on the other, the claims of science, and of the realities surrounding everyone, and with which everyone has to do every day in the affairs of peace or war; (l) and the gradual extension and expansion of the grand idea of universal education—of the education of every human being, and of every faculty of every human being, according to the circumstances and capabilities of each.

While thus aiming to give in each number contributions to the history of pedagogy and the internal economy of schools, we hope in this series to complete our survey of—

II. Systems of national education, and especially an account of public schools and other means of popular education in each of the United States, and of all other governments on the American continent.

III. The history and present condition of normal schools and other special institutions and agencies for the professional training and improvement of teachers.

IV. The organization and characteristic features of polytechnic schools and other institutions for the education of persons destined for other pursuits than those of law, medicine, and theology, including a full account of military schools.

V. The history and courses of study of the oldest and best colleges and universities in different countries.

VI. The life and services of many teachers, promoters, and benefactors of education whose labors or benefactions are associated with the foundation and development of institutions, systems, and methods of instruction.

HENRY BARNARD.

HARTFORD, *March, 1862.*

## APPENDIX C.

[From Dr. Barnard's preface to his *American Journal of Education*, 1856, explaining the history of his plan.]

The plan of a series of publications, embracing a periodical to be issued monthly or quarterly, devoted exclusively to the history, discussion, and statistics of systems, institutions, and methods of education in different countries, with special reference to the condition and wants of our own, was formed by the undersigned in 1842, on the discontinuance of the first series of the *Connecticut Common School Journal*, commenced by him in August, 1838. In pursuance of this plan several tracts and treatises on distinct topics connected with the organization, administration, and instruction of schools of different grades, and especially of public elementary schools, were prepared and published, and the material for others was collected by travel, correspondence, purchase, and exchange.

The further prosecution of the work was suspended in consequence of his accepting the office of commissioner of public schools in Rhode Island, but was resumed in 1849, on his resigning the same. In 1850 the plan was brought, without success, before the American Institute of Instruction, at its annual meeting at Northampton, in connection with an agency for the promotion of education in New England. Having been induced to accept the office of superintendent of common schools in Connecticut for the purpose of reestablishing the educational policy which had been overthrown in 1842, the undersigned undertook to carry out his plan of publication by preparing a series of reports and documents, each devoted to one important subject, under authority of the legislature. In this connection *Practical Illustrations of the Principles of School Architecture*, *Normal Schools*, and *Other Institutions and Agencies for the Professional Training and Improvement of Teachers*, and *National Education in Europe* were prepared and published. Finding that the anxieties and labors of office combined with that general correspondence and special research and reflection which the completion of the series required were too much for his health, he resigned his office and addressed himself to the execution of the latter. Failing to enlist either the Smithsonian Institution or the American Association for the Advancement of Education in the establishment of a central agency, the undersigned undertook, in March, 1855, on his own responsibility, the publication of a *Journal and Library of Education*. Arrangements were accordingly made, in April, to print the first number of the *American Journal of Education*, in connection with the publication of the proceedings of the association for 1854, to be issued on or before the 1st of August, 1855.

## CHAPTER XXIII.

### LENGTH OF THE COLLEGE COURSE.

---

Owing to the increased requirements for admission to college, the extension in recent years of the professional courses of study, and the consequent advanced age at which college graduates begin their professional careers, the subject of shortening the college course of study has received considerable attention from the presidents and faculties of some of the leading institutions of the country.

As early as 1850 Brown University, at the suggestion of President Francis Wayland, rearranged the courses of study in order that the institution might increase the number of its students and become more useful to the community that it served. Among the reasons stated for the change may be mentioned the following:

Many young men who intend to enter the professions are unwilling or unable to spend four years in the preparatory studies of college. They would, however, cheerfully spend one or two years in such study if they were allowed to select such branches of science as they chose. This class would probably form an important addition to our numbers, and we would thus, in some degree, improve the education of a large portion of all the professions.<sup>a</sup>

It will thus be seen that the liberal education of professional men and the devising of means whereby the period of preparation for their careers might be shortened was receiving consideration at that early date.

In accordance with the recommendation of President Wayland the requirements of Brown University for the several degrees were modified. The catalogue for 1850-51 states:

It is the design of the corporation to require for the degree of bachelor of arts and of philosophy an amount of study which may be accomplished in three years, but which may, if he pleases, occupy the student profitably for four years; and to require for the degree of master of arts an amount of study which may be accomplished in four years, but which, if generously pursued, may occupy the student with advantage a considerably longer time.

Again, the catalogue for 1851-52 states:

The degree of bachelor of arts is designed especially for those who desire to prepare themselves for the different professions and yet, from unavoidable circumstances, are unable to pursue a complete course of liberal education. In order to render it accessible to such students the number of studies is limited and a large liberty of choice is granted, that they may be enabled to select such studies as will the better enable them to prepare themselves for a particular profession.

The requirements for admission in 1850 were stated as follows:

No student shall be admitted a candidate for the degree of bachelor or master of arts unless he sustain his examinations satisfactorily in arithmetic, ancient and modern geography, English grammar and the use of the English language, and in the Latin and Greek languages. He shall be able to translate and analyze grammatically the Greek Reader, or an equivalent portion of some classical Greek author, the *Æneid* of Virgil, *Cæsar's Commentaries*, and six orations of Cicero, or an equivalent amount of Latin, and be able to translate English into Latin and Greek.

---

<sup>a</sup>History of Higher Education in Rhode Island, by William H. Tolman, p. 130.

The requirements for the degree of bachelor of arts were as follows.

First. Ancient languages for two years, mathematics for two years, English literature and two other courses for one year each; or, Second. One ancient language for two years, two modern languages, mathematics for two years, English literature and two other courses of one year each; or, Third. One ancient language for one year, mathematics for one year, one modern language, English literature, and four other courses of one year each.

The three years' course leading to the degree of bachelor of arts was maintained during the presidency of Dr. Wayland, but was abandoned after the accession of Dr. Barnas Sears. In 1857 the corporation decided to return to the old custom of conferring the degree of bachelor of arts after a course of four years and the degree of master of arts on such persons only as already had obtained the bachelor's degree.

One of the reasons advocated for the shortening of the college course at the present time is that the course of study now is at least two years in advance of what it was in 1860. In this connection it may be interesting to quote from a statement made by President Wayland in 1842, comparing the college course as it then was with the course as originally established. He says:

We see that the college course, at the period of its first establishment, commenced substantially where it commences now. The same time, four years, has been allotted to it in both cases. But let us observe the different amount of knowledge for which in the two cases the college system is held responsible. The mathematical course has been greatly extended. The same is true of natural philosophy in all its branches. Optics has become nearly a distinct science. Chemistry, geology, and political economy have since that time almost begun to exist. Intellectual philosophy and rhetoric have been either added to the course or else have been greatly enlarged, and the same may be said of physiology.<sup>a</sup>

While the number of subjects included in the college course has increased very rapidly, the requirements for admission have also been raised to a very large extent. In the early days of our American colleges very little beyond Latin and Greek was required for admission. The great advance that has been made in this direction is shown very clearly in the admission requirements of Harvard University at various dates in its history. The requirements in 1642, 1734, 1803, 1825, 1850, 1875, and 1885 are given in the following tabular statement and are followed by the requirements in 1902. Owing to the large number of subjects from which candidates are now allowed to select in fulfilling the admission requirements it is impossible to incorporate those of 1902 in a comparative tabular statement.

---

<sup>a</sup> Thoughts on the Present Collegiate System of the United States, by Francis Wayland, p. 80.

	1642.	1734.	1803.	1825.	1850.
Latin.	Ability to read any classical author into English and readily make and speak true Latin and write it in verse and prose.	Read, construe, and parse Tully, Virgil, or such like common classical Latin authors, and write Latin in prose and verse.	Latin grammar, including prosody, Virgil, Sallust, Cicero's Select Orations.	Latin grammar (Gould's Adams's) including prosody; Virgil, Sallust, Cicero's Select Orations; composition.	Latin grammar (Andrews and Stoddard) including prosody; Virgil; Caesar's Commentaries; Cicero's Select Orations; composition.
Greek.	Read any classical author into English; decline the paradigms of nouns and verbs in the Greek tongue.	Read, construe, and parse ordinary Greek, as in the New Testament, Isocrates, or such like, and decline the paradigms of Greek nouns and verbs.	Greek grammar, including prosody; Dalzel's Collectanea Graeca Minora; Greek Testament.	Greek grammar (Gloucester or Buttman), including prosody; Jacobs's Greek Reader; the Gospels in the Greek Testament.	Felton's Greek Reader; Sophocles's Greek Grammar, including prosody; writing Greek with the accents.
Mathematics.			Arithmetic to the rule of three.	Arithmetic (Lacroix, Cambridge edition); algebra (Euler) to end of simple equations.	Arithmetic (Davies, Hill); algebra (Euler) or Davies's First Lessons in Algebra to extraction of square root; Introduction to Geometry and the Science of Form as far as the seventh section of proportions.
Geography and history.			Knowledge of geography.	Ancient and modern geography (J. E. Worcester).	Ancient geography (Worcester); ancient history (Worcester).
English.					
Modern languages.					
Science.					

of Harvard University.

1875.		1885.
Course 1.	Course 2.	
Latin grammar, including prosody; composition, and Latin at sight; <i>Cæsar</i> , <i>Gallie War</i> , I-IV; <i>Sallust</i> , <i>Catiline</i> ; <i>Ovid</i> , 4,000 lines; <i>Cicero</i> , eight orations, and the <i>Cato Major</i> ; <i>Virgil</i> , <i>Eclogues</i> , and the <i>Æneid</i> , I-VI.	Latin grammar, including prosody; <i>Cæsar</i> , <i>Gallie War</i> , I-II; <i>Cicero</i> , six orations, and the <i>Cato Major</i> ; <i>Virgil</i> , <i>Æneid</i> , I-VI.	<i>Cæsar</i> , <i>Gallie War</i> , I-IV (or I-III and <i>Sallust</i> , <i>Catiline</i> ), with questions on the subject-matter and on construction and grammatical forms; <i>Virgil</i> , <i>Æneid</i> , I-VI (or <i>Eclogues</i> , and <i>Æneid</i> , I-V), with questions on the subject-matter and on prosody; translation at sight from <i>Cæsar</i> , including questions on grammar, history, and antiquities; composition.
Greek grammar (including meters); composition (with the accents); <i>Goodwin</i> and <i>Allen's Greek Reader</i> or <i>Xenophon's Anabasis</i> , I-IV, and the seventh book of <i>Herodotus</i> ; <i>Homer's Iliad</i> , I-III, omitting the catalogue of ships.	Greek grammar (including meters); <i>Goodwin</i> and <i>Allen's Greek Reader</i> , first 111 pages, or <i>Xenophon's Anabasis</i> , I-IV; <i>Homer's Iliad</i> , I-II, omitting the catalogue of ships.	Translation at sight of easy passages from <i>Xenophon</i> (suited to the proficiency of those who have studied the first 111 pages of <i>Goodwin's Greek Reader</i> or <i>Anabasis</i> , I-IV), with a vocabulary of the less usual words. Translation into Greek of simple sentences (such as those in the first 55 lessons of <i>White's First Lessons in Greek</i> ), to test the candidate's practical knowledge of grammar.
Arithmetic (including the metric system of weights and measures, together with the use and the rudiments of the theory of logarithms); algebra, through quadratics; plane geometry (first 13 chapters of <i>Peirce's Geometry</i> ).	Arithmetic as in course 1; elementary algebra as in course 1; advanced algebra ( <i>Todhunter</i> , <i>Loomis</i> , <i>Greenleaf</i> , etc.); plane geometry as in course 1; solid geometry ( <i>Peirce's Geometry</i> ); plane trigonometry ( <i>Peirce's Trigonometry</i> , six chapters); elements of plane analytic geometry ( <i>Peck</i> , certain parts of).	Arithmetic (prime and composite numbers; factors, divisors, and multiples; proportion; decimals, percentage, simple and compound interest, and discount, but not the technical parts of commercial arithmetic; compound numbers, metric system, square roots); algebra, through quadratics; plane geometry (first 13 chapters of <i>Peirce's Geometry</i> ).
Greek history to death of <i>Alexander</i> , and Roman history to death of <i>Commodus</i> ( <i>Smith's smaller histories</i> ); modern geography ( <i>Guyot's Common School Geography</i> ); physical geography ( <i>Guyot</i> , Parts II and III).	Same as in course 1 .....	Greek history to death of <i>Alexander</i> ( <i>Smith's Smaller History of Greece</i> ); Roman history to death of <i>Commodus</i> ( <i>Leighton</i> ).
English composition on a subject taken from one of a number of prescribed works.	Same as in course 1 .....	English composition, based on certain prescribed works.
French or German: translation at sight of easy prose; proficiency in elementary grammar accepted as an offset for some deficiency in translation.	Same as in course 1 .....	French or German; translation at sight of easy prose.
		Physics ( <i>Rolfe</i> and <i>Gillet</i> , for high schools and academics, without appendix; <i>Avery's Elements</i> , or <i>Gage's Elements</i> ).

*Admission requirements of*

	1642.	1734.	1803.	1825.	1850.
Additional subjects.					

Harvard University—Continued.

1875.		1885.
Course 1.	Course 2.	
		Also two of the four following groups: I. <i>Latin</i> .—Cicero, orations against Catiline and for Archias, with questions on subject-matter, construction, and grammatical forms; translation at sight of average passages from Cicero's Orations, with questions on grammar, history, and antiquities; translation at sight of average passages from the <i>Aeneid</i> , and from Ovid's <i>Metamorphoses</i> , with questions on prosody; Latin composition. II. <i>Greek</i> .—Translation at sight of average passages from Herodotus, with such help in notes as should be needed by those who have studied the Herodotus in Goodwin's Reader (pp. 112-191), or Herodotus, VII, 196-239, and VIII; simple Greek prose composition; sight translation from the <i>Iliad</i> , or <i>Iliad</i> , I, II, verses 1-493, and III, with questions on the passages set for translation. III. <i>Mathematics</i> .—Logarithms, and plane trigonometry; solid geometry. IV. <i>Physical science</i> .—(1) Physics (Balfour Stewart's <i>Lessons in Elementary Physics</i> ); (2) chemistry (Nichols's <i>Abridgment of Eliot and Storer's Manual</i> ), or botany (Gray's <i>How Plants Grow</i> , with analysis of simple specimens).

1902.

A candidate for admission must offer from the list of admission subjects studies amounting to 26 points, of which points at least 4 must be in advanced studies. The studies offered must include: English, 4 points; one ancient language (elementary Latin or elementary Greek), 4 points; one modern foreign language (elementary German or elementary French), 2 points; elementary history, 2 points; algebra, 2 points; geometry or plane geometry, 3 or 2 points; studies amounting to 2 points from the following sciences: Elementary physics, chemistry, physiography, anatomy, etc., astronomy. The other points required may be selected from the subjects offered.

The studies which may be presented and the relative weights attached thereto are as follows:

*Elementary.*—English, 4; Greek, 4; Latin, 4; German, 2; French, 2; ancient history or English and American history, 2; algebra, 2; geometry, 3, or plane geometry, 2; solid geometry, 1; physics, 2; chemistry, 2; physiography, 1; anatomy, etc., 1.

*Advanced.*—Greek, 2; Latin, 2; German, 2; French, 2. One of the following four: Ancient history, 2; English and American history, 2; history of Europe, 2; history of a period, 2. Algebra, 1; logarithms and trigonometry, 1; astronomy, 1; physics, 2; meteorology, 1.

The requirements in the several subjects are:

1. *Elementary English.*—I. The candidate will be required to write a paragraph or two on each of several topics chosen by him from a considerable number—perhaps 10 or 15—set before him. The topics are drawn from certain prescribed works. II. A certain number of books are prescribed for careful study. The examination will be upon subject-matter, literary form, and logical structure, and will also test the candidate's ability to express his knowledge with clearness and accuracy.

2. *Elementary Greek.*—(a) Translation at sight of simple Attic prose. (b) A thorough examination on a prescribed portion of Xenophon (about 30 pages), directed to testing the candidate's mastery of the ordinary forms, constructions, and idioms of the language; the test to consist, in part, of writing simple Attic prose, involving the use of such words, constructions, and idioms only as occur in the portion of Xenophon prescribed. The portion of Xenophon prescribed is the second book of the Anabasis.

3. *Advanced Greek.*—(a) Translation at sight of Attic prose and of Homer, with questions designed to test the candidate's understanding of the passages set, and questions on ordinary forms, constructions, and idioms, and on prosody. (b) Translation into Attic prose of a short passage of connected English narrative (optional).

For the elementary examination in Greek, candidates should read from 130 to 170 pages of Attic prose. For the advanced examination from 30 to 50 pages more of Attic prose and from 3,000 to 5,000 verses of Homer.

4. *Elementary Latin.*—(a) Translation at sight of simple Latin prose and verse. (b) A thorough examination on a prescribed portion of Cicero's speeches (about 30 pages), directed to testing the candidate's mastery of the ordinary forms, constructions, and idioms of the language; the test to consist, in part, of writing simple Latin prose, involving the use of such words, constructions, and idioms only as occur in the speeches prescribed. The portion of Cicero prescribed is the second, third, and fourth speeches against Catiline.

5. *Advanced Latin.*—(a) Translation at sight of Latin prose and verse, with questions designed to test the candidate's understanding of the passages set, and questions on ordinary forms, constructions, and idioms, and on prosody. (b) Translation into Latin prose of a short passage of connected English narrative.

The course of reading for the examinations in Latin should include:

(a) Easy reading included in or following a suitable introductory book (Latin Lessons) amounting to from 30 to 40 pages.

(b) Nepos (Lives) and Caesar (Gallic war), 90 to 120 pages.

(c) Cicero, 90 to 120 pages, including the four speeches against Catiline and the speech on the Manilian law, with additional speeches selected by the teacher.

(d) Virgil and Ovid, 6,000 to 10,000 verses, including the first six books of the *Æneid*.

Preparation for the elementary examination alone should include (a) and (b), the four speeches against Catiline, and from 2,000 to 3,000 verses of Virgil or of Ovid and Virgil.

6. *Elementary German.*—(a) Translation at sight of simple German prose. (b) Translation into German of simple English sentences, or of easy connected prose, to test the candidate's familiarity with elementary grammar. (Candidates should have read not less than 200 pages of easy German.)

7. *Advanced German*.—(a) Translation at sight of ordinary German. (b) Translation into German of a connected passage of English prose, to test the candidate's familiarity with grammar. Proficiency in grammar may also be tested by direct questions. (Candidates should have read, in addition to the amount specified under elementary German, not less than 500 pages of classical and contemporary prose and verse. Books recommended are: Riehl, *Culturgeschichtliche Novellen*; Freytag, *Bilder aus der deutschen Vergangenheit*, *Die Journalisten*; Kohlrach, *Das Jahr 1813*; Schiller, *Der dreissigjährige Krieg*, *Wilhelm Tell*, *Maria Stuart*, *Die Jungfrau von Orleans*; Goethe, *Hermann und Dorothea*, *Egmont*, *Iphigenie*; Lessing, *Minna von Barnhelm*.)

8. *Elementary French*.—(a) Translation at sight of ordinary nineteenth century prose. (b) Translation into French of simple English sentences or of easy connected prose to test the candidate's familiarity with elementary grammar. (Candidates should have read not less than 400 pages from the works of at least three different authors.)

9. *Advanced French*.—(a) Translation at sight of standard French. (b) Translation into French of a connected passage of English prose to test the candidate's familiarity with grammar. (Candidates should have read, in addition to the amount specified under elementary French, not less than 600 pages of prose and verse from the writings of at least four standard authors.)

10. *Elementary history*.—1. *Greek and Roman history*.—(a) Greek history to the death of Alexander, with due reference to Greek life, literature, and art. (b) Roman history to the accession of Commodus, with due reference to literature and government. 2. *English and American history*.—(a) English history, with due reference to social and political development. (b) American history, with the elements of civil government.

11. *Advanced history*.—1. Greek history to the destruction of Corinth and Roman history to the death of Constantine (open to those only who have offered English and American history as an elementary study). 2. English history and American history (open to those only who have offered Greek and Roman history as an elementary study). 3. European history from the Germanic conquests to the beginning of the seventeenth century. 4. A year's study of any one of the four historical fields defined under elementary history and not already offered by the candidate, together with a year's detailed study of a limited period within that field, selected with the approval of the department of history.

12. *Elementary algebra*.—Algebra, through quadratic equations.

13. *Geometry*.—Plane and solid geometry, including problems in mensuration of plane and solid figures and original propositions in plane geometry.

13a. *Plane geometry*.

13b. *Solid geometry*.—Chauvenet's *Geometry*, revised and abridged, Books VI, VII, VIII, and IX.

14. *Logarithms and trigonometry*.—Theory of logarithms and use of logarithmic tables; plane trigonometry; solution of the right spherical triangle; applications to simple problems.

15. *Advanced algebra*.—Simultaneous quadratics and equations solved like quadratics; properties of quadratic equations; addition, subtraction, multiplication, and division of complex quantities; inequalities; variations; arithmetical and geometrical progressions; mathematical induction; simple problems in choice and chance; continued fractions; scales of notation; determinants, not including the multiplication theorem; simple applications of determinants to linear equations; solution of numerical equations of higher degree, and so much of the theory of equations as is necessary for this purpose.

16. *Elementary physics*.—A course of study dealing with the leading elementary facts and principles of physics, with quantitative laboratory work by the pupil.

17. *Chemistry*.—A course of at least 60 experiments, performed at school by the pupil and accompanied with systematic instruction in principles and their applications. (Both a written and a laboratory examination.)

18. *Physiography*.

19. *Anatomy, physiology, and hygiene*.—Elements. (Written and laboratory examination.)

20. *Advanced physics*.

21. *Meteorology*.—A course of observational study.

22. *Astronomy*.—A course of observational study.

An analysis of the foregoing requirements shows that in 1642 and in 1734 the only examinations required of candidates for admission to Harvard College were in Latin and Greek. By 1803 a small amount of arithmetic and a knowledge of geography

had been added. By 1825 the requirement in mathematics had been increased to include Lacroix's Arithmetic and Euler's Algebra to the end of simple equations, and Worcester's Ancient and Modern Geography was also required. Another increase in the amount of mathematics was made in 1842, and we find in the requirements for 1850 that geometry to proportions had been added, algebra to square root was required, and ancient history had taken the place of modern geography. In 1875 candidates were allowed to choose between two separate sets of admission requirements, the requirements given under course 2 differing from course 1 only in the amount of ancient languages and mathematics, course 2 requiring less of the ancient languages and more mathematics. Comparing course 1 of 1875 with the requirements of 1850 we find another increase in mathematics; Worcester's Ancient History had given place to Smith's smaller histories of Greece and Rome; Guyot's Common School Geography and Guyot's Physical Geography had been added; also the candidate was required to write an English composition based on certain prescribed works, and to pass an examination in elementary French or German.

In 1876 an examination in one elementary science was added to the requirements. In 1885 certain amounts of Latin, Greek, mathematics, history, English, modern languages, and elementary physics were prescribed, and the candidate was required to offer additional work in two of four groups, to wit, Latin, Greek, mathematics, and physical science, the last including physics and chemistry or physics and botany. The requirements of 1902 are given above in detail, and owing to the large degree of election allowed it is a difficult matter to compare them with those of previous periods. They show, however, that the requirements in English, modern languages, history, mathematics, and science have been advanced considerably, and that the amount of time needed to satisfy the requirements added since 1860 is undoubtedly not less than two years. On this subject Dean Wright, of the academic department of Yale University, says:

"To be properly prepared in the subjects now required for admission to Yale, the average boy must somewhere find room for from one and one-half to two years more of work than was needed in 1859, and must be prepared to pass an examination much more difficult in kind."<sup>a</sup>

That the increase in the admission requirements has resulted generally in an increase in the average age of candidates for admission to college can not be doubted. In 1842 President Wayland, of Brown University, stated the average age at which students were then admitted to college to be 14 years.<sup>b</sup> The president of Harvard University in his report for 1847-48 said that the age at which students entered Harvard had increased considerably in late years, and was then nearly 17 years. In the period from 1856 to 1860 the average age of freshmen at Harvard was almost 18 years, and in the period from 1896 to 1900 it was over 19 years. At Harvard, therefore, the average age of freshmen has increased by more than two years in the past fifty-three years. The average age at the University of Pennsylvania in 1900 was 18 years 9 months. At Yale University the average age of students at graduation in 1863 and 1902 was practically the same, 22 years 10 months, and at no time during that period did the average age fall below 22 years, and only once (in 1899) did it exceed 23 years.

Assuming that the average age of freshmen has increased by two years, and taking into account the extension of the professional courses of study by about two years, we find the average age at which a college graduate may begin the practice of law or medicine to be about four years higher than formerly. In a number of the institutions having professional departments the time of study has been reduced by one year by allowing students to elect for the senior year in college the first year studies of the professional courses, thus practically shortening the college course to three years.

<sup>a</sup> Report of the president of Yale University for 1901-2, p. 48.

<sup>b</sup> Thoughts on the Present Collegiate System of the United States, by Francis Wayland, p. 106.

Among the institutions allowing the election of the first year's work in a professional course in fulfillment of the requirements for the A. B. degree may be mentioned Columbia University, Cornell University, Western Reserve University, University of Nebraska, and Columbian University.

The following statement, taken from the report of the president of Harvard University for the year 1901-2, shows the action taken by that institution to enable students to complete the college course in less than four years:

The faculty of arts and sciences, stimulated by the board of overseers, arrived during the year under review at a clear definition of the terms on which the degree of bachelor of arts may be taken in Harvard College. In order to be recommended for the degree of bachelor of arts a candidate must have passed in studies amounting to 16 courses, together with such work in English as may be prescribed for him, making a total of 17 or  $17\frac{1}{2}$  courses, as the case may be. He must, moreover, have attained a grade above D in at least two-thirds of all the work done by him in Harvard University in satisfaction of the requirements for the degree. A student who enters the freshman class without serious deficiency may complete the requisite number of courses in four, three and a half, or three years.

This statement is the result of discussions which began in 1887. On December 6, 1887, the faculty of Harvard College received from the academic council the following communication:

"*Voted*, That with a view to lower the average age at which bachelors of arts of Harvard College can enter the professional schools and the graduate department the college faculty be requested to consider the expediency of a reduction of the college course."

This action of the council was due to the increasing difficulties caused by the prolongation of the period of professional education. The subject was first considered at some length by a large committee of the faculty, and after November 12, 1889, the faculty itself gave much time to it. On March 25, 1890, the faculty sent the following communication to the president and fellows:

"The faculty desires to modify its present regulations in accordance with the following propositions:

"1. That the requirements for the degree of bachelor of arts be expressed, under suitable regulations with regard to length of residence and distribution of work, in terms of courses of study satisfactorily accomplished.

"2. That the number of courses required for the degree be 16.

"3. That when a student enters college there shall be placed to his credit, toward satisfying the foregoing requirement of 16 courses, (1) any advanced studies on which he has passed in his admission examination beyond the number required for admission, and (2) any other college studies which he has anticipated.

"4. That a student may be recommended for the degree of bachelor of arts in the middle as well as at the end of the academic year.

"In case the measures here proposed should be adopted it is the purpose of the faculty to encourage the anticipation of college studies by students at the time of their admission and to facilitate the attainment of the degree of bachelor of arts in less than four years.

"The faculty further proposes to advise parents and teachers that 18 years is a suitable age for entering Harvard College."

The regular requirements for the degree of bachelor of arts were at that time 18.4 courses. It appearing to the board of overseers that the proposition of the faculty distinctly reduced the requirements for the Harvard A. B., the proposal was rejected by that board, the president of the university voting alone in favor of it. After that arrest of action certain votes were adopted by the faculty which reduced the total number of courses required for the degree; but they were not adopted with any intention to facilitate the gaining of the A. B. in less than four years. These votes were as follows: In 1890 a required course of elementary lectures on physics which had counted 0.2 of a course was abolished; and in 1894 a similar course in chemistry was abolished. These two faculty votes reduced the number of courses required for the A. B. to 18. In 1898 students who attained grade A or B in prescribed English A were exempted from the prescription of English B or BC; and the requirement for the degree of A. B. for such students was thereby reduced by a half course. In 1899 prescribed English C (a half course) was abolished, so that the requirement for the degree of A. B. became for all students not more than  $17\frac{1}{2}$  courses, and for some not more than 17. In 1899 also English A and English B were united to form a single full course prescribed for freshmen, so that the course now called English A became the only prescribed English. In consequence of the reductions which have

been made in prescribed English since 1894 the amount of prescribed English is now one course or one and one-half courses, depending on the grade the freshman obtains in English A. The student who obtains a grade higher than D in English A has no more required English; but the student who receives grade D is required to take in the ensuing year a half course in English composition in addition to his regular elective work.

The present regulations of the faculty make it practicable for any student to complete 17 or 17½ courses in three years without undue exertion, and the standard of attainment, as expressed in grades, is precisely the same for students who obtain the degree in three years, three and one-half years, or four years, this standard having been slightly raised by vote of the faculty during the year now under review.

The overseers having requested the faculty in April, 1900, to make a plain statement for the catalogue of the requirements for the degree of bachelor of arts—the existing statements being in their opinion confusing and obscure—the faculty accepted for publication in the catalogue issued in December, 1901, a statement of the actual practice of the faculty at that time, prepared by Mr. Richard Cobb, then corresponding secretary, and this statement being forwarded to the board of overseers, the board passed on December 11, 1901, the following vote:

“The overseers are gratified to find in the catalogue a clearer statement of the requirements for the degree of bachelor of arts, and they await with interest and sympathy the report of the faculty which will recognize in a more formal way the system by which students of unusual diligence or marked mental capacity may obtain the degree of bachelor of arts in three years.”

This vote encouraged the faculty to pursue the subject; so that last spring they abandoned the practice of requiring a candidate who accomplished the work for the degree in three years either to attain higher grades than were required of the candidate who took four years to complete the work or to wait a year for his degree on leave of absence; and they also raised a little the minimum attainment for the degree of A. B. as expressed in grades. A minority of the faculty favored a greater raising of the standard expressed in grades.

It is obvious from this review that the three years' course for the degree of A. B. at Harvard College is intended to demand as much work and as high attainments as are demanded in the four years' course. The governing boards and the faculty have had no intention of permitting the requirements for the Harvard A. B. to be lowered, although they have made it possible for diligent students to attain the degree in three years or three years and a half. This insistence on the sum of attainments for the degree is the characteristic feature of the whole evolution. Since the general effect of the elective system during the past thirty years has been greatly to raise the quality of the instruction throughout all the courses and half courses offered by the faculty of arts and sciences, it is obvious that the candidate who shall hereafter obtain the Harvard degree in three years will have to give on the average distinct evidences of higher scholarship than has been expected of his predecessors in any former generation.

To establish clearly this principle is worth the delay which has been experienced in bringing about this reform. From the financial point of view the delay has had one advantage—it has enabled the corporation to adapt its budget to a progressive loss of college students in the senior year. On the other hand, the college has had to forego the advantage of the large accessions of freshmen which might have followed from the sudden, unguarded offer of an A. B. degree in three years.

The faculty of arts and sciences has now done what it can to combat the great evil of too late entrance upon the professional careers or the business career. It has expressed its preference for the age of 18 as the age for entering college and its conviction that boys can be well prepared for college by that age, and it has made it possible for any diligent student to get the degree of bachelor of arts in three years. These two measures combined should enable parents to get their well-trained sons into the learned professions by 24 or 25 years of age and into business careers much earlier. To effect these improvements, however, the cooperation of parents, schools, and the community at large is essential.

The foregoing narrative shows conclusively that Harvard University has no sympathy with any efforts to lower the standard of the degree of bachelor of arts or to substitute for it an inferior degree. It proposes to uphold the standard of that degree by all appropriate legislation within its own walls and by the effect of its admission examinations on the secondary schools, and it has already done all that a university can do to support the primary degrees in arts and science by requiring such a degree for admission to its principal professional schools.

*Columbia University.*—The length of the college course is discussed very fully by President Butler, of Columbia University, in his first annual report for the year

1901-2. While President Eliot, of Harvard University, has thus far advocated the shortening of the period of residence for a bachelor's degree from four to three years, President Butler suggests the granting of the bachelor's degree at the end of a two years' course and the master's degree at the end of a four years' course of study. His reasons for the change are stated in detail in his report, and, owing to the general discussion occasioned thereby, his remarks on the subject are given in full, as follows:

I have pointed out that it is held to be settled policy at Columbia University that the several technical and professional schools shall rest upon a college course of liberal study as a foundation (although not necessarily upon a course four years in length), either at once or as soon as practicable. The school of law has already been placed upon the basis of a graduate school, to take effect July 1, 1903. On December 20, 1898, the university council recommended that the college of physicians and surgeons be made a graduate school as soon as such a step is financially practicable. The schools of applied science have constantly in mind a similar step, and much consideration has been given by the faculty to the best way of bringing about the change without undue sacrifice. This policy, however, does not pass unchallenged. It has recently been criticised and opposed in a cogent and noteworthy argument by President Hadley, of Yale University, in his annual report for the year 1901-2, on the grounds (1) that it tends to make the professions exclusive in a bad sense; (2) that it leads to a remodeling of the college course to meet the needs of intending professional students, which remodeling is at least a doubtful experiment; and (3) that it establishes an unfortunate distinction between the universities which require a bachelor's degree as a condition of admission to the professional schools and those which make no such requirement. This policy is also criticised and opposed by many intelligent persons, trusted leaders of public opinion, not university teachers or administrators, who are impressed by the fact that the whole tendency of our modern educational system is to prolong unduly the period of preparation or studentship, with the result that an increasing number of young men are held back from active and independent participation in the practical work of life until they are nearly or quite 30 years of age. In the face of such objections as these it is obvious that we at Columbia must consider carefully the probable social and educational effects of the policy upon which we have entered.

The questions raised in the discussion of this policy are to be decided, it seems to me, from the standpoint of the duty of the university to the public and to its own educational ideals. Two interests are immediately at stake—the standards of professional study in a university and the place of the American college in the higher education of the twentieth century. I doubt whether the two interests can be separated in any adequate consideration of the subject.

President Eliot, of Harvard University, impressively set forth the responsibilities and the opportunities of the learned professions in his address at the installation ceremonies on April 19 last, when he said:

"It is plain that the future prosperity and progress of modern communities is hereafter going to depend much more than ever before on the large groups of highly trained men which constitute what are called the professions. The social and industrial powers and the moral influences which strengthen and uplift modern society are no longer in the hands of legislatures, or political parties, or public men. All these political agencies are becoming secondary and subordinate influences. They neither originate nor lead; they sometimes regulate and set bounds, and often impede. The real incentives and motive powers which impel society forward and upward spring from those bodies of well-trained, alert, and progressive men known as the professions. They give effect to the discoveries or imaginings of genius. All the large businesses and new enterprises depend for their success on the advice and coöperation of the professions."

With such an ideal as this held up before the student of law, of medicine, of divinity, of teaching, of architecture, or of applied science, what standard of excellence shall the university require of him when he enters upon his professional studies? Three answers seem to be possible: The university may require (1) the completion of a normal secondary school course of four years, and so put admission to the professional and technical schools on a plane with admission to college, or (2) the completion of the present college course of four years, or (3) the completion of a shortened college course.

When weighing the advantages and disadvantages of these several lines of action it should be borne in mind that a uniform policy on the part of all universities in dealing with this question is not necessary and may not be desirable.

directly concerned with the question so far as it concerns the duty and the interest of Columbia; but the universities having different social and educational needs to meet, and somewhat different ideals to labor for, may be wise in reaching a conclusion quite different from that which most commends itself to us. This consideration seems to me to meet the third of President Hadley's objections, already referred to. Furthermore, the universities do not control admission to the practice of the professions, and it is not in their power, as it is certainly not their wish, to shut out from his chosen profession any competent person, whatever his training or wherever it has been had. If the standards of professional study required by the universities are higher than the minimum fixed by law, no one will attend a university for professional study unless its standards appeal to him and unless he hopes to find ultimate gain by conforming to them at some expense of both time and money. On the other hand, if the universities make the minimum standards fixed by law their own—and only by so doing can they avoid discriminating against some one—then they seem to me to have abdicated their functions as leaders in American intellectual life. The result would quickly be seen, I am sure, in the falling off of popular favor and support. These facts appear to meet the first of President Hadley's objections. His second objection involves a discussion of the significance of the college course, a subject which I shall consider in its proper place.

Columbia University can not be satisfied with a requirement of only secondary school graduation for admission to the professional and technical schools, for several reasons:

1. Such students at 17 or 18 years of age (or, as should be the case, at 16 or 16½ years) are too immature to carry on a severe course of professional study with profit.
2. When such students predominate, or form a large proportion of the total number attending any given professional school, the teaching deteriorates and the instruction tends to become either superficial or unduly long drawn out and wasteful of time.

3. Other institutions in various parts of the country afford the fullest opportunity for students who are compelled to remain satisfied with the shortest possible preparation for the practice of a profession, and Columbia would not be justified in using its funds merely to add to a provision which is already ample. Columbia offers the most generous assistance to students who are able and willing to meet its standards and who need help in order to carry on their studies, but is not willing to lower those standards at the cost of social and educational effectiveness.

4. Secondary school graduates, however well taught, are necessarily without the more advanced discipline in the study of the liberal arts and sciences and without that wider outlook on the world of nature and of man which it is the aim of the college to give. It is our hope and wish that those who hold professional or technical degrees from Columbia University will be not only soundly trained in their chosen professions, but liberally educated men as well. No stress is laid upon the college degree as a mere title, but it is held to stand, in the vast majority of cases, for greater maturity of mind and broader scholarship.

5. For Columbia University to admit students to the professional and technical schools upon the same terms as those by which admission to the college is gained would be to throw the weight of our influence against college education in general and against Columbia College in particular. After a few years, no student who looked forward to a professional career would seek admission to Columbia College, or to any other, except those who had ample time and money to spare.

On the other hand, while I hold a secondary school education to be too low a standard for admission to professional study at Columbia University, personally I am of opinion that to insist upon graduation from the usual four years' college course is too high a standard (measured in terms of time) to insist upon, and an unsatisfactory one as well. My view of the matter is concurred in by the dean of Columbia College, by the dean of the faculty of law, and by the dean of Teachers College.

My objections to making graduation from a four years' college course a prerequisite for professional study at Columbia University are mainly two:

1. I share the view, already alluded to, that the whole tendency of our present educational system is to postpone unduly the period of self-support, and I feel certain that public opinion will not long sustain a scheme of formal training which in its completeness includes a kindergarten course of two or three years, an elementary school course of eight years, a secondary school course of four years, a college course of four years, and a professional or technical school course of three or four years, followed by a period of apprenticeship on small wages or on no wages at all.

2. Four years is, in my opinion, too long a time to devote to the college course as now constituted, especially for students who are to remain in university residence as technical or professional students. President Patton, of Princeton University,

voiced the sentiments of many of the most experienced observers of educational tendencies when he said that "in some way that delightful period of comradeship, amusement, desultory reading, and choice of incongruous courses of what we are pleased to call study, which is characteristic of so many undergraduates, must be shortened in order that more time may be given to the strenuous life of professional equipment." For quite twenty years President Eliot has advocated this view and in arguments which have seemed to me unanswerable, under the conditions existing at Harvard, has urged that the degree of bachelor of arts be given by Harvard College after three years of residence. At Columbia, and elsewhere, the practice of counting a year of professional study as a substitute for the fourth, or senior, year of the college course has in effect established a three-years' college course for intending professional and technical students. The degree has been withheld until a year of professional study has been completed, in deference to tradition rather than from sound educational principle. In this way new conditions have been met without the appearance of shortening the college course. While the policy hitherto pursued in this regard was justified as a beginning toward a readjustment of the relations between the college and the professional and technical schools, it is hardly to be upheld as a final solution of the problems presented. From my point of view it is open to criticism in that it (1) shortens the college course without appearing to do so, (2) divides the interest of the student in a way that is satisfactory neither to the college nor to the faculties of the professional schools, and (3) fails to give the full support to a college course of purely liberal study which is so much to be desired.

There remains a third line of action, namely, that of basing admission to the professional and technical schools of the university upon a shortened course in Columbia College or its equivalent elsewhere. This I believe to be the wisest plan for Columbia University to adopt, as well as the one whose general adoption would result in the greatest public advantage.

One consideration of vital importance appears to have been overlooked in the numerous discussions of this whole matter, and that is the fact that there is no valid reason why the college course should be of one uniform length for all classes of students. The unnecessary assumption of the contrary view has greatly complicated the entire question, both in the public and in the academic mind. It must be remembered that for the intending student of law, medicine, or applied science who goes to college, three or four additional years of university residence and study are in prospect after the bachelor's degree has been obtained. For the college student who looks forward to a business career, on the other hand, academic residence closes with graduation from college. For the latter class, therefore, the college course may well be longer than for the former. While two or three years of purely college life and study may be ample for the man who proposes to remain in the university as a professional or as a technical student, three or even four years may be desirable for him who at college graduation leaves the university, its atmosphere, its opportunities, and its influence forever.

It must be remembered, too, that the four-years' college course is merely a matter of convention, and that there are many exceptions to the rule. The Harvard College course was at one time but three years in length, and the collegiate course at the Johns Hopkins University has been three years in length from its establishment. The normal period of residence for an undergraduate at both the English and the Scottish universities is three years. President Wayland, of Brown University, who was in so many ways a true prophet of educational advance, devised a plan for a normal three-years' college course over half a century ago. The question is not so much one of the time spent upon a college course as it is one of the quality of the work done and the soundness of the mental and moral training given. The peculiar service which the college exists to perform may be done in one case in two years, in another in three, in another in four, and in still another not at all.

Since 1860 the changes in American educational conditions have been revolutionary, and as one result the content of the A. B. degree has been wholly altered and that degree has been elevated, at Columbia College at least, to a point almost exactly two years in advance of that at which it then was. In other words, despite the fact that college admission requirements have been raised and much of the instruction once given in college is now given in the secondary schools, particularly the public high schools, the bachelor's degree has been held steadily at a point four years distant from college entrance, with the result that the average age of college students at graduation has greatly increased. Since 1880 the average age of the students entering Columbia College has increased exactly one year, and while no adequate statistics for 1860 are available, it appears to be true that the average age of admission in 1880 was one full year higher than in 1860. The registrar has made a careful examination of the official records, and reports that in Columbia College we are demanding two

years more of time and work for the degree of bachelor of arts than was required in 1860, and one year more of time and work than was required in 1880. President Hyde, of Bowdoin College, has recently said that "nearly all the distinguished alumni of Bowdoin College graduated at about the present average age of entrance, and were well launched on their professional careers at about the age at which, our students now graduate." He cited the cases of Jacob Abbott and William Pitt Fessenden, who were graduated before they were 17; Longfellow, who was graduated at 18; Franklin Pierce, John A. Andrew, Fordyce Barker, and Egbert Smyth at 19, and William P. Frye and Melville W. Fuller at 20. Instances might readily be multiplied from the records of the American colleges. The recent statistics compiled by Dean Wright, of the academical department of Yale University, which show the average age of graduation of the members of the class of 1863 at Yale to have been 22 years, 10 months, and 17 days and that of the members of the class of 1902 to have been 22 years, 10 months, and 20 days, point to what appears to be a striking exception, not yet explained, to the general rule.

So long as there were no graduate schools, and therefore no genuine universities, in the United States, and when the bachelor's degree was the highest academic distinction to be gained in residence, it was sound academic and public policy to make the requirements for the degree of bachelor of arts as high as possible. It was the only mark of scholarship that the colleges could give. As a result the average age at graduation increased. Now, however, conditions have entirely changed. Nearly or quite one-half of the work formerly done in college for the degree of bachelor of arts is now done in the rapidly increasing number of secondary schools, particularly public high schools, and no small part of it is required for admission to college. This does not appear if the comparison be restricted to admission requirements in Greek, Latin, and mathematics; but it is clearly evident when the present admission requirements in English, history, the modern European languages, and the natural sciences are taken into account. The standard of scholarship in this country is no longer set by the undergraduate courses in the colleges or by the time devoted to them, but by the post-graduate instruction in the universities and by the requirements demanded for the degree of doctor of philosophy.

These being the undisputed facts, it would appear to be wise and possible to treat the length of the college course and the requirements, both in time and in accomplishment, for the degree of bachelor of arts from the standpoint of present-day needs and the largest social service.

In my opinion it is already too late to meet the situation by shortening the college course for all students to three years, although such action would be a decided step forward so far as the interests of intending professional and technical students are concerned. When President Eliot first proposed a three-years' course for Harvard College the suggestion was, I think, a wise one. But in the interval conditions have changed again. If we at Columbia should be willing to go no further than to reduce the length of the college course from four years to three, we should (1) find it impracticable both on financial and on educational grounds to require that course as prerequisite for admission to the schools of applied science, and possibly to the school of medicine, and (2) we should be unable to resist the pressure for further reconstruction and rearrangement that would be upon us before our work was completed and in operation. My own belief is that Columbia University will perform the greatest public service if it establishes two courses in Columbia College, one of two years and one of four years, the former to be included in the latter, and if it requires the satisfactory completion of the shorter course, or its equivalent elsewhere, for admission to the professional and technical schools of the university. By taking this step we should retain the college with its two years of liberal studies as an integral element in our system, shorten by two years the combined periods of secondary school, college, and professional school instruction, and yet enforce a standard of admission to our professional schools which, both in quantity and in quality, is on a plane as high as the Columbia degree of bachelor of arts of 1860, which was recognized as conforming to a very useful standard of excellence. At the same time we should retain the four-years' course with all its manifest advantages and opportunities for those who look forward to a scholarly career, and for as many of those who intend to enter upon some active business after graduation as can be induced to follow it.

Under such a plan we should have in Columbia College four different classes of students: (1) Those who were taking the shorter course of two years in preparation for a technical and professional course, and who would, therefore, look forward to a total university residence of five or six years; (2) those who were taking the shorter course of two years, but without any thought of subsequent professional or technical study; (3) those who felt able to give the time necessary to take the longer course

of four years before entering a professional or technical school; and (4) those who, as now, take the four years' college course without any intention of technical or professional study. The second class of students would be a new and highly desirable class, and would be, for the most part, made up of earnest young men seeking a wider and more thorough scholarly training than the secondary school can offer, but unable to devote four years to that end. The third class of students would be able, by a proper selection of studies in the later years of their college course, either to enter a professional school with advanced standing or to anticipate some of the preliminary professional studies and to devote the time so gained to more intensive professional work. Undoubtedly many students who now take a four years' undergraduate course with no professional or technical end in view would take the shorter course, and that only, but on the other hand numbers of students would come to college for a course of two years who when obliged to choose between a four years' course and none at all are compelled to give up college altogether. The final result of the changes would certainly be to increase the total number of students taking a college course of one length or another.

The dean of Columbia College is of the opinion that such a shortened course of two years as is contemplated by this suggestion could readily be made to include all of the studies now prescribed at Columbia for candidates for the degree of bachelor of arts. This shortened course would, therefore, take on something of the definitiveness and purpose which in many cases the rapid developments of recent years have removed from undergraduate study; for it goes without saying that no effort would be spared to make such a two years' course as valuable as possible, both for intellectual training and for the development of character. The student would be a gainer, not a loser, by the change.

If Columbia College should offer two courses in the liberal arts and sciences, one of two years and one of four years in length, the second including the first, the question would at once arise as to what degrees or other marks of academic recognition would be conferred upon students who had satisfactorily completed them.

Two answers appear to be possible. First, we may withhold the bachelor's degree until the completion of the longer course, and grant some new designation to those who satisfactorily complete the shorter course. This has been done at the University of Chicago, where graduates of the junior college course of two years are made associates in arts. Or we may degrade—as it is called—the bachelor's degree from the artificial position in which the developments of the last forty years have placed it, and confer it upon the graduates of the shorter course of two years, and give the degree of master of arts for the longer course of four years. The latter alternative would be my own preference. Such a plan would bring the degree of bachelor of arts two years earlier than now and would place it substantially on a par with the bachelor's degree in France, the *Zeugniss der Reife* in Germany, and the ordinary degree in course as conferred by the English and the Scottish universities. It would also be substantially on a par with the Columbia College degree of 1860.

In this connection it must be remembered that it is not the A. B. degree of to-day which is so much extolled and so highly esteemed as the mark of a liberal education gained by hard study and severe discipline, but that of one and two generations ago. The A. B. degree of to-day is a very uncertain quantity, and time alone will show whether it means much or little.

The degree of master of arts is an entirely appropriate reward for the completion of a college course, under the new conditions proposed, four years in length. This degree has been put to many varied uses and has no generally accepted significance. In Scotland it is given in place of the degree of bachelor of arts at the close of three very short years of undergraduate study. In England it signifies that the holder is a bachelor of arts, that he has lived for a certain minimum number of terms after obtaining the bachelor's degree, and that he has paid certain fees. In Germany it is usually included in the degree of doctor of philosophy. In the United States the degree is more often than not a purely honorary designation; although in recent years the stronger universities have guarded it strictly and now grant it for a minimum period of graduate study for one year in residence. At the meeting of the Association of American Universities in February last there was a very interesting discussion on the subject of this degree, and the divergence of policy in regard to it was made plainly evident. As an intermediate degree between those of bachelor of arts and doctor of philosophy, that of master of arts has been, and is, very useful at Columbia. It marks the close of a period of serious resident graduate study, and is an appropriate reward for the work of those university students who have neither the inclination nor the peculiar abilities and temperament to fit themselves for successful examination for the degree of doctor of philosophy. At the same time it must be admitted that the rapid development of the elective system and the widely different standards of the

scores of colleges from which our graduate students come, have almost wiped out the distinction between the senior year in Columbia College and the first year of graduate study. To the best of my knowledge and belief, the fixing of the degree of master of arts at the close of a four years' undergraduate course would involve no real alteration in the standard required on the part of those coming to Columbia from other institutions. For students of Columbia College it would bring the degree within reach after four years of residence instead of five.

In the case of candidates for the degree of doctor of philosophy, the completion of the longer college course, or its equivalent elsewhere, would of course be required, and also the same minimum period of postgraduate resident study as now. There would be no alteration in the time necessary or the standard now set for that degree, which as conferred at Columbia is recognized as conforming to the highest and best standards.

With the courses in applied science and in medicine fixed at four years, to base them upon a two years' college course would be to elevate them to a proper university standard and to insure the best possible class of students. The law school and the professional courses in Teachers College could easily be put upon the same basis.

Reflection and a careful study of the facts will make it apparent that these suggestions are less radical than seems to be the case on first sight. They at least offer a solution to a generally recognized problem, one which has often been pointed to but toward the solution of which little progress has been made. I shall seek an early opportunity of bringing them before the university council and the several faculties for full consideration and discussion.

Should Columbia University adopt such a policy as has been outlined, and should the same or a similar policy commend itself to the governing bodies of any other American universities whose problems are similar to ours, a development already in progress throughout the country would be hastened. As the public high schools multiply and strengthen they will tend more and more to give the instruction now offered in the first year, or first two years, of the college course. In so far, they will become local colleges, but without the characteristic or the attractiveness of student residence. Furthermore, the time would sooner come when colleges, excellent in ideals and rich in teaching power, but without the resources necessary to carry on a four years' course of instruction satisfactorily, will raise the requirements for admission to a proper point and then concentrate all their strength upon a thoroughly sound course of two years leading to the bachelor's degree. More depends upon the strict enforcement of proper standards of admission to college than is generally believed; that is at present the weakest point in college administration. The general standard of college education in the United States would be strengthened more if the weaker colleges would fix and rigidly enforce proper entrance requirements and concentrate all their money and energies upon two years of thorough college work than if they continue to spread a college course over four years with admission secured on nominal terms or on none at all.

The policy outlined would, I think, largely increase the number of students seeking a college education, and many who might enter one of the stronger colleges for the two years' course would remain for four years. The loss of income due to the dropping out of students after two years of residence would be more than made good very soon by the large increase in college attendance.

As the system of higher education in the United States has developed it has become apparent that we have substituted three institutions—secondary school, college, and university—for the two—secondary school and university—which exist in France and Germany. The work done in the United States by the best colleges is done in France and Germany one-half by the secondary school and one-half by the university. The training given in Europe differs in many ways from that given here, but from an administrative point of view the comparison just made is substantially correct. The college, as we have it, is peculiar to our own national system of education, and is perhaps its strongest, as it certainly is its most characteristic, feature. It breaks the sharp transition which is so noticeable in Europe between the close surveillance and prescribed order of the secondary school and the absolute freedom of the university. Its course of liberal study comes just at the time in the student's life to do him most good, to open and inform his intelligence and to refine and strengthen his character. Its student life, social opportunities, and athletic sports are all additional elements of usefulness and of strength. It has endeared itself to three or four generations of the flower of our American youth, and it is more useful to-day than at any earlier time.

For all of these reasons I am anxious to have it preserved as part of our educational system and so adjusted to the social and educational conditions which surround us that a college training may be an essential part of the higher education of an American whether he is destined to a professional career or to a business occupation. It seems to me clear that if the college is not so adjusted it will, despite its recent

rapid growth, lose its prestige and place of honor in our American life, and that it may eventually disappear entirely, to the great damage of our whole educational system.

*Yale University.*—In discussing the requirements for admission to professional courses President Hadley, in his report for 1901-2, says:

The introduction of professional studies into the college course has been a disappointment to its advocates, except in those cases where the professional element and motive became so complete that it operated as a shortening of the college course itself. This shortening of the college course is advocated by a great many persons who say that the college graduate of to-day is a year older than he was a generation ago. But I doubt very much whether this is true of institutions which a generation ago had unquestioned rank as colleges instead of high schools. It is certain that the interesting statistics collected by Professor Wright show the change in this respect at Yale to have been less than is supposed. The class of 1863, the first for which we have records, had an average age of 22 years and 10½ months, an average which has been exceeded by only four classes in the years that have followed. It may be that the logic of events will cause us after a time to shorten our college courses. But for the present I see no reason why the man who is going into mercantile or manufacturing business should be deprived of one year of his college education because some of the medical schools and law schools wish their entering classes to be able to write the letters A. B. after their names. If a man can afford to take the bachelor's degree before entering the professional schools, and can benefit by the opportunities of the college, in the course and out of it, by all means let him pursue the course and take the degree. But let us not require the letters which show that he has taken the degree and sacrifice, either by changes in the character of our studies or the length of our courses, the underlying spirit which alone would render those letters valuable. Shape the college course for the needs of the men who want a college course rather than for those who take it more or less reluctantly as a compulsory stepping-stone to something else.

In the same report Dean Wright, of the academic department of Yale, says, concerning the opportunities for shortening the period of residence:

If, however, anyone desires by extra effort to save a year, the college offers him the opportunity. It does not lessen the amount of work required for the bachelor's degree, but will allow a good student to so arrange his work that the period given to college studies may be shortened. This can be done by anticipating one or more courses at the beginning of each college year or by taking extra courses in sophomore or junior year or both. The opportunity is also offered to academic students to take more or less work in the professional schools. Members of the senior class are allowed to elect five hours per week in courses given either by the law, the medical, or the theological faculty, and the work thus done may count at the same time toward the bachelor's degree. In addition, a student in his senior year may devote to studies in a professional school any hours not needed for the degree of bachelor of arts. If, by anticipating courses or by taking extra courses, ten additional hours are completed by the end of the junior year, the whole of the senior year may be devoted to professional study.

*University of Pennsylvania.*—The report of the provost of the University of Pennsylvania for 1901-2 contains the following concerning the length of the college curriculum:

The matter of chief general interest, so far as the colleges and universities are concerned, appears to be the length—or rather the shortening—of the college period. The views upon this subject are so discordant as to leave the question in a chaotic condition, and each institution does what it deems right from its own point of view. Undoubtedly the success of each is the result of the belief which each institution has that its way is the best. The University of Pennsylvania has not believed that a young man of 17 or 18 is the most competent judge of what is best for him, and has therefore for some years taken groups of selected subjects as the main basis of election. During the year under discussion the academic council of the college agreed with unanimity to make possible the giving of the degree in three years in the courses in arts and science, in finance and commerce, and in biology. I need not refer in minute detail to the arrangement under which this plan has been authorized. In general, it may be said that, in the three courses stated, the student who can successfully complete, by devotion to his work, the four years of study in three years will be permitted so to do. On the other hand, a student who wishes to arrange

the work now comprised in the four years' course may prolong, upon a systematic schedule, this work to five years. In brief, the normal four years' course may be abbreviated to three years in the case of such students as show themselves able to do the four years' normal course in one year's less time; or it may be prolonged to five years, when a student prefers, for reasons satisfactory to the dean or to his committee, to devote five years to his college work instead of four.

It was announced that these options would go into effect with the year beginning September 1, 1902, a year to be reviewed in a future report, but it is interesting to know that about 90 per cent of the students have chosen the full four years' course.

*Brown University.*—The practice of Brown University is thus stated by President Faunce in his report for the year 1901-2:

The question whether a student of sufficient ability should be allowed to complete his entire work in less than four years our faculty has met by allowing a student, if competent, to complete his work at the end of three years. If he fails to complete it then, he is not at liberty to do partial work in the senior year, but must take his full fifteen hours a week through his fourth year. \* \* \* But if one at any time during his senior year completes the work required for the A. B. or the Ph. B. degree, then the work he does during the remainder of the year may be counted toward the degree of master of arts. It thus becomes possible for a student by taking extra studies to do four years' work in three years and obtain his bachelor's degree at the end of the third year; or, even if he fails in this, to do five years' work in four years and obtain his master's degree at the end of the fourth year.

*Cornell University.*—That the authorities of Cornell University are not in favor of a reduction of the period of residence required for a bachelor's degree is shown in the following extracts from the report for 1901-2 of President Schurman:

But, while the university refuses to reduce the A. B. course from four years to three, it does permit juniors and seniors, who intend taking subsequently a professional course to anticipate one year of such work as a part of the A. B. course. The question has been raised whether, in such cases, the A. B. degree is given on the ground that the candidate has studied four years or that he has taken certain studies (arts and sciences) though for three years only. And the suggestion has been made that the subjects which juniors and seniors are permitted to take in the professional schools should be restricted to those which might be regarded as constituents of a liberal culture. But a university which allows its students to elect freely among languages, literature, philosophy, history, political science, mathematics, and the physical and biological sciences for the A. B. degree will meet great difficulty in applying the criterion suggested. Perhaps the best solution of the theoretical dilemma which has been raised is to recognize frankly that the privilege of doing a year of professional work as a part of the A. B. course, which juniors and seniors now enjoy, is a favor extended to candidates who study at a university six or seven years, and there is no reason for shortening the course of candidates whose studies cease on the receipt of the A. B. degree.

The practice of permitting students in the A. B. course to devote one of the four years of study to work in the professional colleges has been under consideration by the faculty of arts and sciences, and though no action has yet been taken it seems safe to predict that if any change is made it will not be the general reduction of the time required for the A. B. degree from four years to three nor yet the withdrawal of the privilege now enjoyed by students taking both the A. B. degree and a subsequent professional course of shortening the time prescribed for both by one year.

*Columbian University, Washington, D. C.*—A marked step in the shortening of the college course was taken by the trustees of Columbian University in an ordinance adopted in 1902. It provides for the granting of the bachelor's degree at the end of three years, and to fulfill the requirements of the third year the student will be allowed to elect the first-year studies of a professional or specialized course of study. The provisions of the ordinance relating to the course of study are as follows:

#### ARTICLE I.—*Division of work.*

The educational work of the university shall be divided into four groups, as follows:

SECTION 1. General culture courses. The subjects of study in these courses shall be prescribed or approved by the university council, with a view to the needs of graduates of the best high schools.

SEC. 2. Specialized courses in university subjects. These courses are designed to give a knowledge of the evolution and science of each subject and to fit the student for literary, professional, scientific, and industrial pursuits.

SEC. 3. Original research. This division is designed to promote original research and direct the efforts of students who desire the assistance of a master.

SEC. 4. Professional schools. At present there shall be schools of law, jurisprudence and diplomacy, medicine, and dentistry. Technical schools may be established, but at present work done in designated schools of this class shall be recognized by the university and proper credit given therefor.

#### ARTICLE II.—*University subjects.*

SECTION 1. For convenience of statement these subjects are grouped under six general heads:

(1) Philosophy; (2) language, linguistics, and literature; (3) mathematics, pure and applied; (4) science, natural and physical; (5) history and political science; (6) engineering and architecture.

#### ARTICLE IV.—*Development of university subjects.*

SECTION 1. Subjects shall be divided into three sections, as follows:

(1) The fundamental section, covering two years' work; this section to be assigned to students in the general culture courses.

(2) The advanced section, not exceeding three years; this section to be assigned to students specializing for literary, scientific, professional, or industrial pursuits.

(3) The original research section; this section to be assigned to students pursuing a subject for discovery and broader culture.

#### ARTICLE VI.—*Courses of study.*

SECTION 1. General culture courses for the first two years of study for candidates for the degrees of bachelor of arts and bachelor of science shall be arranged by the university council and printed each year in the bulletins of the university.

SEC. 2. The university council shall determine the minimum hours of class-room work required in the three years for the bachelor's degree. \* \* \* The scope of the general culture courses and the amount and standard of the work required in the three years shall be sufficiently high to make the degree equal in value to like degrees of other universities of the first rank in the United States.

SEC. 3. A student who has taken his bachelor's degree shall be entitled to credit for one year in his special or professional course, provided he has taken for a part of his third year for the bachelor's degree the first year's work in such special or professional course.

SEC. 4. The university council shall also arrange courses of one year each to be the fourth year in university studies, leading to the degree of master of arts or master of science, and the university council shall also arrange courses leading to degrees in engineering.

#### ARTICLE VII.—*Degrees.*

SECTION 1. The degree of bachelor of arts or of bachelor of science shall be conferred upon a student who has been regularly admitted and has satisfactorily performed the work and passed the examinations required in the general culture course of two years, and who has performed the work and passed the examinations in one year of specialized work approved by the university council.

SEC. 2. The degree of master of arts or master of science shall be conferred upon a student who has performed the work and passed the examinations of the fourth year of university studies.

*Tufts College.*—For some years this institution has granted the A. B. degree under certain conditions at the end of three years of residence. In his report for 1901-2, the president of Tufts College has the following to say concerning the matter:

It is now nine years since Tufts College granted the privilege to students of taking the degree of bachelor of arts after three years of residence on condition of maintaining grade B as an average for the entire work. Tufts College was the first college in New England, I think, to grant this privilege in a formal way. During the period that the rule has been in operation 13 students have availed themselves of the privilege.

An even greater number than that have completed the required one hundred and twenty-eight term hours in three years on the prescribed conditions, but have chosen to remain an additional year and take at the end of the four years the degree of bachelor of arts and master of arts as well. So far the rule has worked well and the faculty has seen no occasion to regret the step. Indeed, there are many reasons for going still further and offering the degree at the end of three years simply on the basis of a satisfactory passing mark. In the first place there would seem to be no defensible reason for imposing harder conditions upon one who chooses to complete the course in three years than upon one who elects to spread the work over four years. Especially is this true in view of the pressure of the college curriculum from both sides. The requirements for admission are now so high that very few persons, even in communities where the public school facilities are of the best, can get to college before 19 to 20 years of age.

Then the demands for professional and technical training have enormously increased within the last two decades. Medical schools gradually within that time have advanced their courses from two years of six months each to three years, and from three years to four years of eight months of actual work. Dental schools have raised their requirements from two years to three years, and some, our own among the number, are now demanding four years. Law schools have advanced their requirements likewise from two years to three years. Those who are looking toward independent and professional work in either science or letters can not obtain in reputable universities the degree of doctor of science or doctor of philosophy in less than three years. The saving, therefore, of one year in passage through college is of immense importance. The undergraduate department of Johns Hopkins University has been from the beginning on a three-year basis, and the collegiate department of Clark University, about to be opened, by the provision of the will of the late Jonas Clark, making provision for the same, is to be restricted to a three years' course. So that it would seem that the opportunity at least of attaining the degree of bachelor of arts in three years is becoming more and more imperative for all the colleges.

## CHAPTER XXIV.

### OXFORD UNIVERSITY.

*Contents.*—Oxford University and the Rhodes scholarships, by W. T. Harris.—History of the University of Oxford, by John W. Hoyt.—The Bodleian tercentenary, by J. B. Firth.—Oxford University extension lectures, official circular and programme.

---

#### OXFORD UNIVERSITY AND THE RHODES SCHOLARSHIPS.<sup>a</sup>

BY W. T. HARRIS.

[Reprinted from the Proceedings of the Department of Superintendence of the National Educational Association, 1903.]

One of the memorable events of last year was the offer of Cecil Rhodes, made known to us through the provisions of his will, providing for a hundred perpetual scholarships in the University of Oxford, two for each State and each Territory in the United States, a scholarship amounting to the handsome annual sum of three hundred pounds—say \$1,500—to support a student for three years at the most famous university in Great Britain.

This provision was made with the noble purpose of bringing about a more intimate and sympathetic acquaintance between the most influential class of citizens in the English nation and the people who have gone out from it in past times and founded an independent nation on the basis of constitutional liberty and local self-government. In the words of his will, “the union of the English-speaking peoples throughout the world” impelled him to make this endowment. He desired “to encourage in the students from the United States of North America, who will benefit from the American scholarships, to be established, for the reason given, at the University of Oxford under this my will, an attachment to the country from which they have sprung, but without withdrawing them or their sympathies from the land of their adoption or birth.”

As a guide to his trustees in the selection of incumbents of these scholarships, Mr. Rhodes mentions four qualifications: first, literary and scholastic attainments; second, fondness for outdoor sports; third, unselfishness and good fellowship; and lastly, moral force of character and zeal in the performance of public duties.

All good people will respond with a hearty spirit of cooperation to so noble a project, and we may well consider what it signifies and what are the conditions of its successful management.

The past three years have been noteworthy, in the history of industry and finance, for the development of productive industry. *Pari passu* with this has gone on the taking possession of the resources of nature, and the increase of the assets of civilization—wealth in mineral, vegetable, and animal productions; natural forces have been harnessed for the use of men, lessening distances and removing obstacles to communication by land and water. Never before has the potency of capital been so

---

<sup>a</sup> The educational provisions of Cecil Rhodes's will are given in the Report of this office for 1901, chap. 47, pp. 2447-2450.

awe-inspiring. To name in one word the function of the great process going on, one would say that it is the removal of the middle man, who effects exchanges, to the function of the end man, who is direct producer or direct consumer. By saving in the middle term of cost of manufacturing, transporting, and distributing there comes to be an enormous accumulation of capital. After apportioning to the producers and consumers their quota of the benefit derived from reducing the expense of the middle term, the owners of capital have for many years made large gifts to education.

The names of Tulane, Johns Hopkins, Cornell, Leland Stanford, Drexel, Vanderbilt, Sophie Newcomb, Vassar, Wellesley, Smith, Yale, Chicago, and Harvard come to our minds as the leading colleges recipient of endowments.

For the year 1899-1900, gifts for higher education amounting in the aggregate to \$11,995,463 were reported to the Bureau of Education by the several colleges and universities. For the year 1900-1901 the gifts amounted to \$18,040,413. For the year 1901-1902 thus far the gifts reported amount to \$16,989,967. Not all of the university reports for 1902 are in.

The Carnegie gifts for libraries and other institutions have been estimated at the following: For 1895, \$1,000,000; for 1898, \$310,000; 1899, \$3,370,000; for 1900, \$5,065,000; for 1901, \$30,243,500. Counting in his gift for the Carnegie Institution in Washington, his grand total of gifts in the United States is estimated at \$52,270,173. Besides this his total for Canada, Cuba, England, Ireland, and Scotland amounts to \$15,000,000 more.

This enormous increase in gifts to education incident to the amassing of capital is of special interest to this consideration of the Rhodes gift, by reason of the fact that the application of capital to the increase of wealth is a process somewhat mysterious to the common mind. Karl Marx's formula *C-M-C*, commodity—money—commodity—or the producer exchanges the commodity which he has created for money, and with money procures the other commodities which he wishes for use, states the first and obvious economic process (in a formula *C-M-C*); but the middle term, money, when expanded, comes to mean the market, and the market has a different function from *C-M-C*, or commodity—money—commodity—namely, it starts with *M*, or money, and buys commodities, to sell again for money, hoping to increase its money by the process—earning an income by the process of exchange—and this formula is *M-C-M*, according to Marx, and in that he sees the origin of all the evils in an industrial and commercial civilization, for this is the formula of the capitalist. The capitalist as the middle term represents a stock of goods and its transportation and distribution. Without this middle term the producer can produce only what is useful to himself and not for his neighbor or for the market of the world, because there is and can be no market without this second formula *M-C-M*, money—commodity—money.

It is obvious that the profit of the market, the middle term, is greater when its own expenses of collection and distribution are diminished—and when this is done on a large scale, say by gigantic railways on land or ships on the sea, great economy is secured, and there are large savings to be distributed, partly to the producer of raw material, partly to the manufacturer, and partly to the consumer, and a large dividend left for capital which supports the world market.

Things without use can not be counted as property, and there is no object in creating a surplus of goods that can not be used. To transport things from a place where they have no use to a place where they are needed is to produce value; and, as an actual fact, by far the largest portion of the final cost (to the consumer) of the commodities that in the aggregate constitute wealth derive their value from the two services of the market, namely, the collection and the distribution of commodities—the function of the market (*M-C-M*) so strangely misunderstood and suspected by Karl Marx.

But the market collects its toll from the consumer. It shares with the producer the total amount received from the consumer. The market causes competition, and competition reduces the producer's profit, and also the profit of the market. The less the charge of the market (that is to say, the middle man), the efficiency of collection and distribution remaining the same, the greater the profit to the end men, that is, to the producer and the consumer.<sup>a</sup> It is obvious that the increase of the efficiency of the market and the diminution of its charges indicate economic progress. It is in the line of the reduction of the necessary labor to conquer nature. The production of the raw material, its collection, its manufacture, distribution, and consumption, require less expenditure of human labor, or of its representative, which is money.

From this point we can see the significance of this great movement of capital in our times which diminishes the number of middle men and transfers them to the function of end men, that is, producers and consumers. It is the aim of every combination that capital makes to reduce the expenses of exchange, give the producer a higher reward, and share with the consumer by lowering the price of the finished product to him. For the performance of this function capital collects its tithes. It gets perhaps a tenth of what it saves, distributing on an average the other nine-tenths to the producers and the consumers.

In our day the enormous aggregates of capital are hastening forward this beneficent process with ever-increasing speed. It is, of course, out of place to consider here the fact that so important and radical a transformation as results from this great process necessarily involves much evil and much suffering to the human beings that are forced from the place of middle men to the place of end men. All readjustment of vocations involves inconvenience, and sometimes suffering, and even injustice.

But we may remark that if a new investment of capital pays well for a while, it is constantly attacked by newer inventions and newer combinations which, being more economical than the old—that is to say, needing fewer middle men—cause the old investment to pay less and less interest to the capital. Old investments, therefore, in capital are obliged constantly to divide with new combinations, and the producer and the consumer—the end men—finally get all the profit. The inventions of fifty years ago are nearly all now the property of the community at large.

Returning to our theme, endowments for education, we see what significance there is for the future of civilization in this accumulation of capital. For its accumulation stimulates the work of prospecting for natural resources, not only the home resources of the great nations, but the resources abroad in the world at large—the possible resources of all lands. Witness the acquisition of the oil lands, the deposits of gold, silver, and diamonds, the ore deposits of useful minerals—coal, iron, copper, and tin—wherever they are. Apparently the era has arrived when the possibilities of food producing which belong to the tropics—to the Amazon valley, for instance—shall be first capitalized, and after that made tributary to the populations of Europe by a vast commercial stream of merchandise consisting of cheap elements of food and textile fabrics and lumber. On reflection one sees the vast possibilities of raw material are more likely to be soon utilized if they come into the possession of great stock companies than if they belong to private owners. Great companies see to it that there are provided all the necessary means of production and of transportation to the best markets.

The era of the creation of capital is also the era of endowment of higher education. Higher education is becoming more and more a process of research and original investigation. And it is the experts furnished by the instruction of the laboratory

<sup>a</sup>A ready example of this is found in the reduction of the cost of transportation from St. Paul to New York City which has given the consumer his year's flour in New York as cheap as it can be had at St. Paul with the addition to that price of only a single day's wages.

and the seminary that are most needed in the work of prospecting for the natural resources and in the work of transporting and manufacturing.

There has never before been so much wealth created in the form of inheritable goods and chattels—wealth of a permanent kind that goes down from generation to generation, relieving the people of the future from the work of creating a plant of some kind or other—railroads, bridges, tunnels, waterworks, schools, and libraries. These and the like items of inheritance add a permanent contingent to the wealth of the future by their annual earnings and swell the income of after generations.

In the midst of this economic change our population is called to new objects of interest and new duties. In 1880 the national census indicated the arrival of a population of 50,000,000. At that time we began to ascend above the horizon to the great powers of Europe. Twenty years later our call to active participation in the control of the world which is exercised by the great powers has become so apparent that all see the necessity of forming a special class of experts who are to become familiar with the national purposes and ideals of such nations as Japan, Russia, Germany, Austria, France, Great Britain, Italy, Spain, and Holland. Foreign diplomacy will furnish a great field for the employment of a larger and larger class of American citizens, and the most successful among these will be recruited from the ranks of those who have made studies at the universities in those foreign countries and become familiar with that class of their population which furnishes the directive power. It is natural that each nation throws its influence in favor of the perpetuation of its own institutions in the world council of the great powers. It is, of course, necessary that the United States shall have an influence in the great council of the world, favorable to the preservation of our own national idea of local self-government and productive industry.

The Rhodes bequest comes opportunely at the beginning of this epoch of training our citizens for diplomatic influence abroad, for of all places for training diplomats the first one in direct usefulness is the University of Oxford. The offer of constant residence in that great English university to one hundred students from the United States will afford some of the best preliminary training for the experts required in our consulates, embassies, home cabinets, and international commissions.

Oxford is the English school for gentlemen. A typical English gentleman is a peculiar product, somewhat different from the ideal gentleman of France or Germany, or of any other country in Europe. An American would suppose, on first hearing of the English gentleman, that he must be a person very sensitive as to his caste—as to his wealth or nobility by birth, or by official position—and continually making demands for recognition, and that in his ordinary actions he is likely to imply a consciousness of his superiority in wealth or birth or official station. No greater mistake could be made. Of all people in Europe the Englishman is the most apt to see that any such manifestation is vulgar, and any consciousness of or self-assertion of caste is marked at once as a gross violation of the code of the gentleman.

Both universities, Oxford and Cambridge, have been long famous for their function in training youth in the principles of good breeding. This is especially true of Oxford. A rich man's son who comes to Oxford with conceits founded on the wealth of his family is made to feel very soon the difference between the ideal of the English gentleman and his own ideal. In most cases a three-years' residence will modify his character in this respect, so that he will come to avoid ostentation either in his clothing or other belongings, or in his manner toward people not wealthy. So, too, the scions of nobility. In all well-established houses the private tutors and governesses have already trained the young nobility, before they come to Eton or Winchester, in the code of English politeness, and they have not so much to learn in this matter at Oxford. But any youth from a noble family who has not already received this training is likely to learn the lesson so well in his residence at Oxford that it will become a second nature to him to stand on his humanity

and never to indicate a consciousness on his part of the possession of a noble ancestry, or of inherited possessions, or of the station of the head of his family in the army or navy, or as a member of the Government. This is true also of those who have risen to military or political station from the ranks of the people. The average child of a noble house learns this difficult art of behavior more readily than the other two species of aristocracy, namely, the aristocracy of wealth or the aristocracy of government position. This is so because of the fact that the nobility have been longer in training, whereas the wealthy family may have gained its property within the present generation; and the high position in the Government may also have been achieved by extraordinary services on the part of a citizen possessed of great strength of will-power or special capacities of intellect, all of which is sometimes accompanied by great deficiency in a knowledge of the code of the ideal gentleman.

This function of Oxford and Cambridge is of national and international importance. An aristocracy of wealth or birth or station whose children are trained in the ideal code of the gentleman have a certain great advantage over all other people brought up without the proper sense of self-control. They possess an imperturbable self-respect which intrenches itself on a humane basis and easily captivates not only all classes of British citizens, but makes an easy conquest of a citizen of any other nationality in the world. It has an inimitable charm. It is impossible to storm its intrenchments, because it assumes nothing for itself. It has habituated itself to this repression of the vulgar desire to attract attention to its havings and made it a second nature, so that it does not reveal any effort. If any effort on its part were visible, it would take the form of condescension and would betray its consciousness of caste; but the ideal English gentleman never permits himself to think of his rank or station; he has acquired a sense of honor that excludes even the thought of it as something odious. Indeed, the English gentleman can easily be distinguished from the other Englishmen by the ease with which he bears this impersonality, this sincere humanity, and this utter effacement of his own claims for special consideration. In the long run this accomplishment of being a true gentleman wins its way in the world and constantly reveals its power. In the diplomacy of Europe it has always held a high place.

The English nation is famous for its love of fair play. This love of fair play is sometimes, however, very brutal, as interpreted by the brutal classes, although even then it is far superior to the manifestations of treachery and fraud which the lower classes of people in some other nations furnish. But the Oxford gentleman realizes the English sense of fair play in a transfigured form by the complete suppression of all manifestations of the pride of aristocracy. He is the simplest of all men, but it is a simplicity with the wisdom of the serpent coiled up within it and ready for use. One would almost infer that the ideal of the English gentleman had changed somewhat since the publication of Thomas Carlyle's *Sartor Resartus*, and that the Briton had taken to heart the lesson of the philosophy of clothes and determined within himself to refute that philosophy by making the matter of clothes no indication whatever of character. The English gentleman puts his fine clothing upon his lackeys and goes about himself in easy and comfortable undress, choosing his clothing for its warmth and comfortableness—sparing no expense in this matter, but utterly refusing to make his clothing manifest wealth or position.

A good story illustrating this was once told by a visitor in my office. He mentioned a commercial traveler from the colonies who was riding from Edinburgh to the north. A very plain English gentleman entered the railway coach, took out his briar pipe, and began to smoke, and opened a conversation on current topics with simple, unaffected manners, and the humane spirit of an English gentleman, without the exhibition of any fad, or the consciousness of carrying with himself a desire to impress anyone else with any purpose of his, or any indication that he was charged with a particular mission or the advocacy of any cause. After a delightful

two-hours' ride another gentleman entered the railway carriage at Perth, quite as simply dressed and quite as urbane in his manners as the first. He entered readily into conversation with our commercial agent and his companion traveler. In the course of the morning they arrived at the station where passengers leave the train for Blair Athole. Here the second gentleman left the coach, and our commercial traveler took note that a splendid carriage with a train of lackies were in waiting for him, and he asked, with some haste, his companion: "Who is that man that just left our coach?" "Oh," he said, "that is 'His Grace the Duke of Athole.'" "Indeed," said our commercial traveler; "he was very condescending to talk in such a friendly and genial manner to two cads like us." The remark was cordially assented to by his companion. In the course of the journey to the north they arrived at a station, where the first gentleman left the coach, and an equally imposing train of lackies with a fine carriage awaited his arrival. If our commercial traveler had been astonished on the first occasion, he was astounded at a second incident of the same kind. He approached the guard or conductor of the train and asked him: "Who is that man that just now left my coach?" "Oh, that is His Grace the Duke of Southerland." Our friend, wishing now to probe the case to the bottom, fearing that he should make again a similar mistake in judging greatness by aristocratic manners and fine clothing, said to the guard: "And will you pray tell me who are you?" This manifestation of common humanity and the desire to be of service to one's fellowmen is the real tower of strength of the true English gentleman.

But Oxford trains not only the aristocracy of wealth, birth, and official position in these matters of ostentation, but it also trains the great scholar, the person who has achieved distinction in letters, or science, or art, making him conscious that it is vulgar to show in any way a consciousness of superiority or to advertise in any way what one has done to distinguish himself.

One reads in the apprenticeship of Goethe's Wilhelm Meister the studies which Goethe made on the difference between the born nobleman and the distinguished but not highborn citizen. In the one case the person is content to be, and never lets his possession either of culture or wealth or of great deeds appear—for that, he feels, would degrade him. To be a nobleman is sufficient for him, whereas the ordinary citizen stands on his achievements and finds it difficult to forget these (or to forget his *havings* in his sense of *being*). He must rely upon his possessions, and he is likely to make them obtrusive.

Our country, the United States, belongs to the vast regions of the world which may be called border lands. In the border lands there are found the most active processes of transformation. A synthesis is in progress between different nationalities. The raw materials of commodities, mineral, vegetable, and animal, are being gathered and worked over for transportation to the central emporiums—Paris, London, New York. On border lands the human spirit is fullest of hope and courage, because it sees from day to day and week to week the wilderness conquered for human purposes and for civilization. But the frontier is the most unstable and variable region of civilization. Its institutions are less firmly established.

In the times of King Alfred, and earlier, Oxford was on the borderland of Wessex, between it and Mercia on the north. Mercia, as its name indicates ("mark" or "boundary"), was the border land between the Anglo-Saxon kingdoms and the British tribes which, driven into the fastnesses of Wales, sullenly resisted the encroachments of the Teutonic wave of migration. Oxford was a fording place, shallow enough to allow herds of oxen and other cattle to be driven across without too much danger of loss by the flood. The Cherwell and the Isis united here, forming the Thames, and spread out in shallow reaches separated by islands. We may conclude that the place was on the line of trade which Besant speaks of in his book on West London. This commercial route led on its way to Dover through Westminster, the lowest ford on the Thames, much used before London Bridge was built in the fourth

century. In Oxford, of course, was a mart or market, and, after Christianity came to the Saxon, some religious houses were built there as early as 727 A. D., and with religious houses there came scholastic learning.

Wherever the Christian church went in Europe there was created an interest in the history of the religion of the Bible and in the history of Roman nationality. We do not forget that the history of Rome was for six hundred years practically the history of the world, the six hundred years including one century before and five centuries after *anno domini*. Hence in the monasteries of Britain, France, and Ireland there was more or less interest in regard to the history of the world and the dealings of God's providence with mankind. St. Augustine, the bishop of Hippo, said in his great work *The City of God* that "the world and its history is a sort of antiphonic hymn, in which God reads his counsels, and the earth and man read the responses." Those inclined to learning among the Christian monks all over Europe studied Orosius, the disciple who had been induced by St. Augustine, his master, to sketch a general history of mankind in the spirit of his view that made it an antiphonic hymn. This is noteworthy in our inquiry as to Oxford, because King Alfred the Great, king of Wessex—Oxford was in Wessex—translated the history of Orosius into Anglo-Saxon, so that it could be read by the laity as well as by the priesthood. But not only did Christianity take this first rational view of the world-history, but it also collected and prized certain elements of world knowledge. It had the trivium and quadrivium, of the seven liberal arts. The scholar and philosopher Boetius nurtured in the latest years of the Roman empire and the early years of the reign of Theodoric, the Goth, who held all Italy in order by his firm hand—Boetius has in his *Consolation of Philosophy* described the contents of the trivium and quadrivium, giving a brief résumé of the insights which formed the learning as to nature and man—another work that Alfred translated into Anglo-Saxon.

First, there was grammar, considering not only the structure of language, which reveals human nature in general, as will, intellect, and feeling, but also literature; then, in the next place, logic, which reveals the structure of the pure intellect; and, thirdly, rhetoric, which reveals the process by which ideas are made into feelings and convictions and result in deeds. These three constitute the trivium. Then there was arithmetic, including the science of numbers and what was known of analytical mathematics in the form of algebra. They had not yet discovered the works of Euclid, and what was called geometry in the quadrivium was an abridgment of the work of Pliny on geography. Music and astronomy complete the four branches of the quadrivium; music, relating not only to what we call music, but also and chiefly to poetry, art, and such matters as are found in the part of grammar called prosody; astronomy, relating to the facts and theories regarding the movements of the visible bodies of the heavens, the changes of the moon, the seasons, the climate, Meteorology, and the like. These elements of knowledge were more or less studied by the intelligent and influential monks. Of course, religion was the main interest, but these other matters were not entirely neglected, and there were some places in those early Christian countries where considerable attention was given to them.

As a matter of course, the Teutonic countries had to learn, besides their native tongue, the Latin language. It was a study of the language that had been rendered capable of expressing subtle thoughts of all kinds. Latin had become a sufficient organ for the description of the facts then known of Europe, Africa, and Asia, and its study opened up the world to the provincial youth who had left the narrow circle of his home to join the monastery which formed a ganglion in the great spiritual nervous system that contained the intellectual brotherhood of the world. Slender as was the store of human learning, it held in germ all that has been unfolded since. It was taught at Paris, Cologne, Metz, Bologna, Winchester, Oxford, Cambridge, Ely, St. Ninian's in Galloway, St. Columba on the is' and o' Iona (north of Argyle-

shire) in Scotland; St. Cuthbert's holy island, Lindisfarne, on the northeastern coast of England; St. Peter's, south of the Tweed, in Scotland—to name only the places which come to mind, without attempting a careful list.

It is certain that monastic education had gone on for centuries at Oxford before the foundation of the first college, in 1249. It seems that the nunnery of St. Frideswyde was founded there in 727. Edward the Elder, in 912, soon after Alfred died, took possession of Oxford and made it a fortified city as a defense against the Danes.

History records that Vacarius, professor at Bologna, lectured at Oxford on the Roman civil law in 1149, less than fifteen years after the discovery of the Pandects of Justinian and only eighty years after the Norman conquest; and it is well argued that this implies a European reputation already achieved by Oxford University. Evidences multiply from that time on of the existence of important schools at Oxford.

The first college, which is called University College, was founded in 1249, and there were two more before 1300, namely, Balliol and Merton; four more in the following century, 1300 to 1400, the century of the beginning of English literature, with Chaucer, Gower, and the author of *Piers Plowman*; these four colleges were Exeter, Oriel, Queen's College, and New College; in the next century (1400 to 1500) three more colleges—Lincoln, All Souls, and Magdalen; and in the century of the Reformation (1500 to 1600) there were six more colleges founded—Brasenose, Corpus Christi, Christchurch, under Henry VIII; Trinity and St. John's, under Queen Mary; Jesus College, under Queen Elizabeth. Two colleges—1613, 1624—were founded under King James, namely, Wadham and Pembroke colleges. Worcester College, founded in 1714, is the only one of the eighteenth century. In recent times Hertford College, St. Edmund's College, and Keble College, in the nineteenth century, make up the twenty-two colleges in the corporate body of the University of Oxford.

The college is the characteristic of Oxford and Cambridge, for the college collects within its walls anywhere from a dozen students up to something over three hundred. Of the twenty-two colleges in the University of Oxford, four have over two hundred students and twelve between one and two hundred, and the remaining six have less than one hundred each. Merton is sometimes called the oldest college, but it was founded in another town and removed to Oxford about 1270. Merton College is the first one which erected dormitories and study halls, a refectory and a chapel, surrounding the whole by a college wall with only one gate for entrance. A new step was taken with the foundation of New College, in 1370, by William Wykeham. This step consisted in the separation of preparatory students from the regular university students. The school at Winchester furnished the preparation, and New College contained only those students who were fitted to take up and to go on immediately with the university work. Other new departures are mentioned; one in particular was the founding of Corpus Christi, in the early part of the reign of Henry VIII—a new beginning, because it made so much more provision for the modern studies that had come into vogue with the revival of learning, particularly the study of Greek and of mathematics.

In America there prevails class feeling, but in Oxford the college feeling predominates. The small group of students living within the walls of a given college form a sort of family or monastic community, bringing together the older students and the younger ones, so that the unit is the college and not the class. It is better adapted than the American plan for the production of the type of gentleman which we have been discussing. The older students have much more influence on the younger students.

All books on Oxford tell us about the two courses of study—the easy one, called the “pass,” adapted to the students who desire the social culture of Oxford, with its athletics and good fellowship, and no more of its erudition than is necessary to pass

examination for its degree of bachelor of arts (master of arts is given in course to all bachelors who have been enrolled twenty-seven terms and who have paid the fees). This course of study shows in all its parts the influence of the trivium and quadrivium—especially the branch called “music” or “prosody,” in the insistence upon the study of the quantity of Latin words—the writing of Latin poetry.

Besides the “pass” examination for the minimum scholarship, there are courses of study for honors. The honor schools are eight in number: (1) English language and literature; (2) *literæ humaniores*—modern philosophy and logic and grammar—called “greats” (opposed to “greats” “responsions” are called “small”); (3) mathematics; (4) jurisprudence; (5) modern history; (6) theology; (7) oriental studies; (8) natural science.

The design of the honor examinations is to afford the fullest scope for scholarship—specialization and thorough research being required. The honor school in *literæ humaniores* is most sought and highest prized. The chief branches of study in that school are Latin and Greek, ancient history, logic, ethics, and philosophy.

The entrance examination, which is called “responsions,” is passed some time in the first year of residence, and is not required before matriculation, as in American universities. The second examination is called “moderations,” and comes in the second year of residence, about the middle of the undergraduate course. The third and final examination takes place in the last year. Three subjects must be offered for the “pass.”

One of the facts that excite surprise in an American student at first is the short period of residence required in Oxford each year. There are three terms, each of eight weeks—Michaelmas, beginning the first Monday after October 10; Hilary, on the first Monday after January 14; Easter and Trinity, beginning on the second or third Monday after Easter Sunday—twenty-four weeks of residence (which may be reduced to eighteen weeks) and twenty-eight weeks of vacation, the long vacation, ending about October 10, being sixteen weeks, and the other two vacations six weeks each. A greater surprise is created by learning that the hard work in scholarship is not expected so much at Oxford in term time as in the vacation. The demands of athletics and social functions at Oxford during term time are too severe to permit the hard study necessary for great success in scholarship.

Athletics is perhaps the most prominent feature in Oxford life. Boating leads; next come football, cricket, and golf; next, running, walking, cycling, etc. There is much literature regarding this phase of English university life.

The hours for exercise are between lunch and tea—1 p. m., 5 p. m.; that means that games begin usually at 2.15 or 2.30 and stop at 4 p. m., except in case of cricket, which goes on till sundown, or till dinner time when the days get longer. “Lunch is usually a very spare meal, often being simply dessert with bread and something simple to drink. Similarly tea is simply one cup, especially if a man is wanting to keep in good form both for exercise and for dinner at 7 p. m.”

Oxford has solved the problem of making athletics develop nervous force instead of nervous dyspepsia by its care to give its two hours in the best part of the day to systematic exercise and guard it against encroachment on the time needed for digestion of the chief meal of the day.

It would seem best that our candidates for the Rhodes scholarships should all have obtained a preparation in scholarship amounting to that required for the A. B. degree. But it is obvious that it was the intention of Mr. Rhodes himself to have the benefits

<sup>a</sup>(1) Classic languages (2) mathematics (3) modern history (4) the Bible. These with affiliated subjects form four groups, within which there may be selection for examination of one or more of four subjects of the classic group, one or more of the five subjects in the modern group, one or more of the seven subjects of the mathematical and scientific group, and one of the religious group. It is compulsory to choose one foreign language, ancient or modern, and to have some portion of the Old or New Testament (with Greek) and the elements of religious knowledge, and another subject from mathematics and science, or from moderns, or from classics.

of his bequest reach graduates of the secondary schools, though the provisions of the will give authority to the trustees to modify the bequest, if in their opinion a modification will make the grand purpose of the will more effective. I have found myself obliged to come to the conclusion that any and every attempt to fill the proposed scholarships from graduates of our secondary schools, or indeed even from college students of attainments below the degree of bachelor of arts, will fail to realize the expressed wishes of the testator. In the first place, there is not a sufficient maturity of mind on the part of graduates of our secondary schools to profit by the exceptional opportunities of Oxford, nor is there any considerable degree of maturity until entrance upon the third year of the American college or university.

Now, the chief difficulty with the immature student from the United States will lie in the fact of his sensitiveness to criticism and of his readiness to fall back upon what he believes to be his rights. While the criticism of his fellow-students at home actually prevails with him because there is no appeal, yet in a foreign university he will, if possible, reenforce his cause by an appeal to the importance of his State or to the importance of his nation. The candidate, if appointed by a State authority—say, a governor—or by a national authority—say, the President, or a board chosen by him—will feel himself in some sense a representative of his State or nation. This form of conceit will be more likely to take root in the mind of the immature student than in that of the holder of a bachelor's degree. It is needless to say that such a conceit in any form would be so offensive to his fellow-students in a foreign university, and to the authorities of such an institution, as to make his residence there impossible.

The Rhodes trustees have been fortunate in appointing as their agent Dr. George R. Parkin, whose wide experience in English-speaking communities within and without England has admirably fitted him to the work of adjusting the details of arrangements for filling our quota of these Rhodes scholarships. If the matter of primary selection and nomination of a list of candidates be left to our college presidents, this will be best. But certainly the final selection from the list nominated should be determined by an examination conducted by an Oxford "don," who should visit this country for the purpose annually and hold examinations at convenient points in the several States. The examination should be in place of "responsions," for the students chosen must be sure of their qualification before the serious undertaking of the long journey and large outlay of money necessary to reach Oxford.

It is admitted by all who are acquainted with the present and past of Oxford that it has fulfilled the function of educating the English gentleman. It has had the effect of creating a democratic code of manners and of securing its adoption by the sons of the powerful families in the Government and by the heirs of nobility. I have already discussed sufficiently this code. It has made it one of the distinguishing characteristics of the English gentleman that he never mentions his titles, or the influence of his family, or his wealth, or his literary productions, or any services of his to his nation or to his fellow-man. He holds his tongue under a severe restraint, and has learned to do this without the appearance of restraint. Not only Oxford, but other English institutions, are powerful in creating in the mind of the youth an ideal of good form in this respect; but Oxford is by far the most potent factor in this influence.

But there is another phase of this matter to be considered: Good form includes also the code of etiquette, established from time immemorial, which gives precedence in a certain fixed order to the members of the nobility, to the dignitaries of the national church, and to the elected or appointed representatives of the English commonalty, settling in advance the rank due to each order in all ceremonials. This recognition of fixed rank and position must be observed as an indispensable form of gentlemanly courtesy in such matters as the addressing of letters, or in personal allusions in a speech, or in a written communication, etc. It is a characteristic of

English good form that it makes a code of limitations for each class of people—the nobleman or other gentleman, the tradesman, the servant, and the common laborer. Each one not only observes carefully the proper manners toward his superior, but he is careful to expect and to exact the proper etiquette from those beneath his station. The most refined gentleman will not himself make a personal matter of the neglect of courtesy, but the class to which he belongs or moves in will take care of this matter on his behalf, and this, too, effectively.

On the whole, the code of the English gentleman has in it what is considered the most admirable the world over as belonging to polished manners. I have tried to show that these traits give the person a certain superiority in diplomatic councils, in statesmanship, and in social relations. While this is the case with the individual it is not so with the class influence which supports and makes valid on occasions the aristocratic prestige or pretence which underlies the condescensions and the reservations of the Englishman's manners. For the very reason that the English gentleman takes none of these upon himself individually in his own behoof, but only as a member of his caste or class in behalf of some other members of his class, the foreigner, not prepared in advance for this phase of English life, is apt to feel himself baffled even to exasperation. He finds himself unable to right himself. He meets only personal courtesy and democratic simplicity in individuals, but he finds himself proscribed by a caste. To attack this caste barrier is to meet an ignominious defeat without any ability to set oneself right.

It must be admitted that what is very noteworthy and impressive in English society as a whole is more or less to be met with in some degree in all social circles of Europe, and indeed of America, and it must also be admitted that the English form is more highly refined because within it the individual preserves his democratic cordiality of manner, calmness of demeanor, and careful observance of all the requirements of courtesy due to an individual from his equals.

In the new epoch that is upon us now we are compelled to come into foreign relations. We can not choose but take part in the councils of the great powers which determine in the aggregate the course of present history; we must have our say—have an influence in international decisions, and an influence that will be proportionate to our strength in population. But for all this there is need to provide sufficient skill.

Here is the important point: We must educate hundreds of our scholars and politicians in studies of jurisprudence and international law; we must have a corps of trained specialists who know the minute details of each great nation's past history and present achievements—Great Britain, Germany, France, Russia, Austria, Italy, Spain, Holland, and the Scandinavian countries.

The Rhodes bequest is the most timely of gifts for higher education, because it gives opportunity to begin this education of that class of our population which will furnish our consulates, our home offices, and our embassies with attachés. Out of the most successful of these will come by and by our foreign ministers and our home experts in diplomacy.

England is the best place in which to begin this work. The excellence of the University of Oxford is without doubt the training of the ready gentleman who can not be pushed off his feet by an attack directed upon the weaknesses of his personality. His training at Oxford gives him that secure self-possession and self-respect which commands the respect of his fellows.

Our American students need have no fear that they will lose their nationality at Oxford, for they will find the English ideal of a gentleman exactly fitted for Anglo-Saxons everywhere.

The more perfectly they accept its training in this regard the more ready they will be for the great work of extending our American influence in the councils of the world.

## HISTORY OF THE UNIVERSITY OF OXFORD.

By HOR. JOHN W. HOYT, LL. D.

## I.—ANCIENT AND MEDIEVAL OXFORD.

To an early period of the Middle Ages, a period only later than Bologna and Paris, belongs the origin of the University of Oxford. Legend has vainly tried to fix a date that would make it the earliest of all the universities in Europe. Years have been spent and volumes have been written to prove that it had its beginning with the great Alfred. Indeed, there were writers who went yet further, making Alfred but the restorer of what had been centuries before his day; and he died in 901. Even Huber, whose reliability was once beyond even the thought of question with many, concluded his extended labors in this field with these emphatic words: "Any further doubts as to the founding of scholastic institutions [the University of Oxford included] by Alfred ought to be relegated to the region of unhistorical and barren skepticism and negation, and be neglected accordingly." Schaarschmidt not only held the same view, but was able to satisfy himself that the famous school existing at Oxford even in the early Saxon days was far beyond anything found there in the twelfth century.

Prof. S. S. Laurie, of Edinburgh University, in his discussion of "Medieval education and universities," calls attention to the fact that Oxford had gained such importance during the first half of the twelfth century that in the third decade Robert Pulleyne returned from Paris and endeavored to restore the teaching of theology, and succeeded in infusing a higher spirit into the Oxford school. He further states that in 1149 Vacarius lectured there on civil law, but King Stephen and the church objected to civil law, and nothing came of Vacarius's venture; after further discussion, he says: "Accordingly we may conclude that Oxford was entitled to the name 'universitas' about 1140." By which, of course, he meant that, having so built herself up as a school of arts that there had been actual attempts to establish professional faculties of theology and civil law, she might, without too great a strain of courtesy, be allowed the use of a title beyond her real status.

Notwithstanding all these and other like claims, after the most thorough sifting of the evidence it is the opinion of Rashdall<sup>a</sup> that the year 1167, or a little later, was the date of what may be considered a proper beginning of the "studium generale" at Oxford—that being the date of migration of a multitude of English students from the University of Paris, where it is said they had been found in larger proportion than those of any other nationality; many of them, moreover, well beneficed, and not a few of them well advanced in the higher studies. This extraordinary migration from Paris came probably from the quarrel between Henry II and Thomas à Becket, Archbishop of Canterbury, on which account the latter fled to Paris, where there were many hundreds, if not even thousands, of English students, together with numerous masters, upon all of whom he might have been in the way of exerting an undesirable influence. Be that as it may, the University of Paris certainly had a much larger proportion of English students than of any other; and, for reasons of his own, the King ordered them all back to England, under pains and penalties that could not be ignored. Rashdall's opinion is that the repatriated students resorted to Oxford. Had there been an important beginning of a school of high grade elsewhere in England, it would doubtless have been the rallying point instead of Oxford. There are also other facts that, with some reason, have been assigned for the early choice of Oxford as a university seat, these, namely: That Oxford was central, as well as on the border between Mercia and Wessex, the two most important subordinate portions of the Kingdom; that it was at that point on the Thames where the stream spread into

<sup>a</sup>The Universities of Europe in the Middle Ages, II, 329.

several channels; that the place was within sufficiently easy reach of London and of the Continent, and that it was in a productive region, where supplies were cheap; besides which, masters and students in large numbers were already there.

Passing all these questions, once so troublesome to historians, it may be considered equally beyond doubt that ere the end of the twelfth century the University at Oxford had attained to considerable importance; that as a *studium generale* it then stood alone in England; that, although several of its halls were destroyed by fire in 1190, it was authentically spoken of soon after as being so full of students that the city could hardly hold them, and that important beginnings had been made in the study of both the civil and the canon law, Vacarius being its leading teacher in the civil branch.

It is also a well-established fact of history that Oxford made a great gain in the number of her students in consequence of a serious fray between the students at Paris and the provost of the city and his archers in 1229. Laurie is an authority for the statement that the university, by way of resisting what it considered an outrage, practically broke up, leaving its students to migrate "to Orléans, Angers, Rheims, and other towns, where teaching was conducted and degrees conferred independently of church or king." In harmony with other historians he further says that "Henry III of England seized the opportunity to invite the dispersed scholars to the rising schools of Oxford and Cambridge," and that they came (in considerable numbers he doubtless means) "and brought with them the university idea of studies and privileges."

It was not until about the time with which we are now dealing that the highest institutions were called universities. Originally they were known as "*studia*," and the title since used was adopted at about the beginning of the thirteenth century, not because they attempted instruction in the various branches of learning, but simply because they had been formed into legal communities, which in the Latin of that age were styled "*universitates*."

These communities or corporations of masters and scholars, moreover, although as a guild they were distinct from the townspeople, were not separated from them by living together in isolated buildings like the monks who lived in monasteries, but were scattered about in lodgings in the town, promiscuously at first, and then in "hostels," or halls, and chambers which were hired from the townsmen, as were also the "schools" in which lectures were given. The university, therefore, in its corporate capacity possessed no property in the first half of the thirteenth century. Its public business was transacted in parochial or conventual churches lent for the purpose, as there were no university buildings. The first university endowments were funds donated by benevolence to be loaned to poor scholars, and called "chests." Next, money was left for the support of masters from the county of Durham in lodgings to be provided at Oxford. The university was able to purchase houses as early as 1263 out of this fund, and then followed the foundation of the famous "colleges" themselves, whose constitution is characteristic of and peculiar to the two great English universities, each being an independent community with a separate charter, government, and endowments.

#### CONSTITUTION.

Speaking in general terms, the University of Oxford, as a corporate body, was known through a succession of ages by the style of "The Chancellor, Masters, and Scholars of the University of Oxford." It was finally so entitled by Parliament during the reign of Elizabeth.

Like the University of Paris, that of Oxford was also a masters' university, for there was even less of the democratic element in England than in France, and the student

body was proportionally subordinate to those who taught and to such ecclesiastical officers as the church could impose. But to what extent there was organization at that early day nobody seems to know with exactness.

We have good authority for fixing the number of students as high as 3,000 in the year 1209; when, moreover, there was a beginning of something like-recorded history for the school, since it was in this year that a collision between the mayor and citizens and the students resulted in a migration of most of the latter to other places. Some went to Reading, some to Paris, and some to Cambridge, which last was strangely destined to become a copartner with Oxford in the proud honors which have attached and still attach to English scholarship.

It was at this time, in consequence of a quarrel between the students and townspeople, that Oxford was placed for quite a period under interdict of the church, which was followed by the legatine ordinance of 1214. This was punitive in character, and the punishments were administered in forms as rude and grotesque as any which mark the history of the Middle Ages. Among others there were processions of the offenders, barefoot and coatless, and the awarding of fines against the townspeople, and decreeing half rent for years to come of hostels and schools occupied by clerical students; the distribution of so many shillings annually among poor scholars, besides the feasting of them liberally "on bread and beer, pottage and flesh, or fish," etc. The immunity from lay jurisdiction, which the university still enjoys, dates from this legatine ordinance. It was finally arranged (by ordinance of Bishop Grossetête, 1243) that this complicated punishment should take the form of an annual fine, to be expended in loans to poor scholars, without interest—no small favor in the eyes of young men, who were otherwise obliged to pay 43 per cent interest to the Jewish money lenders—and, a little later still, it was provided that the moneys accruing to the university from this source should be placed in a chest at S. Frideswyde's, in which, upon receiving a loan, the borrower should make a deposit equal in value. To this chest were afterwards added others by various founders, which were made the depositories of sums given the university on condition of so many prayers being offered annually for the repose of the founder's soul. According to Rashdall, "some twenty of these chests were established at Oxford during the Middle Ages."

The Grossetête ordinance also provided for the office of university chancellor, and hence for the beginning of a more systematic general government of the schools embraced in the university. It was such a chancellorship as no other university of the Middle Ages had; first, because the office was one that properly belonged to the chief ecclesiastic attached to a cathedral; secondly, because, while copying all that pertained to the Paris University chancellorship, it was an office, not of the university originally, but of the church, and its connection with the university was at first established only because the students subject to the chancellor's jurisdiction were clerks, one and all. When his jurisdiction was extended over lay students also it was only to the extent of their subjection to the ecclesiastical courts. The law administered was the canon law. Beginning his services to the university in this high capacity, as the representative of the bishop of Lincoln, Oxford's chancellor eventually became the acceptable head over the university in all its proceedings. The masters may have early had their own ideas of regulating the affairs of the university; nevertheless, we hear nothing of statutes until 1252, up to which time custom appears to have had its sway with what was, indeed, a "rudimentary university of masters." The organization, when it came more fully, was singularly democratic. There was nothing of a one-man power about it. Serious difficulties were disposed of by the masters (in guild, now) assembled, and in extreme cases, with the help of graduate students also.

Among the provisions of what may be regarded as the constitution of the university were these: That no one should be admitted to the license in theology who had not

been a regent in arts; that masters should be sworn to observe the statutes and to a faithful discharge of duty; and that the masters, unless positive provision were otherwise made, should have the responsibility of inflicting penalties. These formal statutes were in the name of the university only, nor were they even intrusted to the chancellor for execution. He doubtless presided at general meetings of the faculties and at great mass meetings of the whole institution. "And yet," says Rashdall, "there remained, and remain to this day, in our academical constitution clear indications of the fact that the chancellor was originally an extra-university official and was not the proper executive of the masters' guild. \* \* \* It is to the proctors, a few years later, that the execution of the sentence of suspension denounced for violation of the statutes is intrusted."<sup>a</sup> Finally (about the middle of the thirteenth century), the chancellor lost independence of position as an ecclesiastical official and became simply and solely the university's presiding officer.

It was in 1254 that the university received from Pope Innocent IV full confirmation of all its "immunities, liberties, and laudable, ancient, and rational customs, and approved and honest constitutions;" the bull being addressed, not to the chancellor and university, but to the "masters and scholars sojourning at Oxford in the diocese of Lincoln."

The proctors were originally the "heads of nations," and it is time to add that instead of four nations and four proctors, with a single rector over all, as at Paris, the nations at Oxford, at the earliest period of reliable history, were but two, namely, those known as Northerners (*Boreales*), or English north of the Trent (if they chose to divide for any reason), and Scotchmen; and Southerners (*Australes*), including Welshmen, Irishmen, and the rest of the world.

As relates to the relative powers and responsibilities of the several faculties at Oxford, it must be said, that it was much the same as at Paris, the difference being that in the more recent Oxford the faculty of arts enjoyed a still greater dominance and maintained it right on, while at Paris, with the development of other faculties, which soon had statutes and officers of their own, the exclusive initiative of the arts faculty was broken down; but at Oxford the professional faculties not only never acquired an independent existence, with deans of their own, but the right of initiative of the faculty of arts eventually extended itself to the actual right of veto upon the proceedings of the university. Nor did the ascendancy of the arts faculty stop here. Since every statute, or rather *projet* of a statute, must have promulgation in the "congregations" of regent-masters of arts, and said congregations were summoned and presided over by the proctors before the proposed statute could be acted upon by the university, the claim of this faculty to put a stop to a statute negatived in the congregation was a source of embarrassment for centuries after. Indeed, the proctors alone held the power of veto in their right to call the congregation.

Another peculiarity of the constitution is found in the several congregations for which it provides and the rights it accords to former teaching masters, known as nonregents in contradistinction to the resident masters or regents. Indeed, statutes were not valid in the early history of the university unless non-regents had been recognized in the calls issued.

The congregations were these:

(1) The black congregation, or previous congregation, made up of regents in arts, with its right of initiative and veto power.

(2) The lesser congregation, or regents' congregation, embracing the regents of all the faculties and charged with the granting of leases, the management of finances, the control of all matters relating to studies, lectures, and degrees, except such dispensatory graces from the latter as were specially reserved for the great congregation.

(3) The great congregation (*congregatio magna*), composed of both regents and

non-regents. This was the supreme governing body and alone competent to enact a permanent statute; and here, as at Paris, concurrence of the four faculties, as shown by faculty votes, was undoubtedly necessary, as also was a concurrence of the non-regents; although in the year 1303 a statute was adopted which established the principle that a majority of the faculties, the non-regents being counted as one, should be competent to bind the whole university.

The office of chancellor came to be one of the most exalted that could be bestowed by any learned body in England. From being known at first as rector, or master, of the schools, with two years as the term of office, and chosen from among the masters who were resident in the university, and always, till 1552, from the ecclesiastical body, the chancellor came in later times to be chosen by the votes of all members of the convocation—by the doctors of divinity, law, and medicine, and by all regent-masters of arts, whether dependent or independent members of their respective societies—and for a life term.

It was in 1484 that John Russell, bishop of Lincoln, was first elected for life, since which time a life term has been the rule; but it was not until 1552 that the rule of selection from the ecclesiastical body was broken by the choice of Sir John Mason, knight; since which time the general rule has been the choice of lay statesmen, usually peers, Cardinal Pole and Archbishops Bancroft, Laud, and Sheldon being the only exceptions.

The high steward was named by the chancellor, with the approval of the convocation. The term came to be for life. His duties were to assist the chancellor and other university officers, to defend the rights of the university, and to hear and determine according to law all capital causes to which any matriculant was a party.

The vice-chancellor, formerly known as vice-gerent and later as commissary, was appointed by the chancellor from among the heads of houses and was subject to drafts for service regularly performed by the chancellor when he could not act.

The proctors, two in number, were quite early, as later, two masters of arts of at least four years' standing, but not more than fifteen. It was their duty to attend the chancellor on all important occasions, to regulate the assemblies of masters, to administer oaths, to keep the public accounts, to exact payment of fines, and to preserve the discipline of the university.

#### CONTEST WITH THE FRIARS.

The fourteenth century brought with it a contest with the mendicant friars in regard to taking university degrees before being allowed to lecture—a repetition on a smaller scale of that which so seriously, and for so long a period, afflicted the University of Paris. The friars made a beginning of their work of gaining converts quite early in the thirteenth century. The Dominicans established themselves at Oxford in 1221, very soon after their appearance in England. While their special mission was to convert the Jews of the town, their connection with the university was established by founding a school in theology conducted by one of their doctors. Next came the Franciscans, and they were successful in drawing in a considerable number of students of rank, thus adding to their importance. They may be said to date from 1224. The Carmelites followed in 1256, and in 1317 they removed to a palace graciously accorded them by King Edward II in Beaumont Fields. The Augustinians made ready for a convent in Holywell on the site of Wadham College in 1268.

The reputation of the friars for sanctity, associated with practical asceticism, was sufficient for a considerable time to maintain harmony between them and the seculars of the university. But after a time the multiplication of friar doctors alarmed the seculars, lest the university should fall under dominion of the orders, and they began to resist this increase in order to make sure that the control over graduates should permanently remain with the university. Instead of setting a fixed limit to the number of friar doctors by statute, as was done at Paris, the Oxford statute

simply required the candidate to be a graduate in the arts as a condition of inception in theology. This was highly distasteful to the friars, since they were unwilling to have their students study a secular branch of learning, such as the course in philosophy, which was necessarily included in the studies of the faculty of arts. There was an attempt on their part, finally, to meet this demand by providing for instruction in philosophy by their own teachers. But this did not satisfy the masters. The university seculars demanded by statute that the instruction in philosophy should be given by masters belonging to their own faculty—that of the arts. But at the same time it was liberally provided that there should be a dispensing power in this respect with the university chancellor and regents (the “grace”), the generous exercise of which preserved for some time the friendly relations hitherto subsisting between what were inevitably to become conflicting forces.

The real struggle began by the enactment of quite a number of statutes from 1303 onward, which were obviously directed against the friars, all tending to place the power to grant degrees solely in the control of the university. Friars were eventually compelled to take the degree of bachelor of theology in the university and not merely obtain the authorization of their own superiors to lecture upon the Bible. The “graces” dispensing from the obligation to graduate in arts began to be refused them. Secular masters began to refuse admission to friar candidates who would not take the oath to obey the statutes of the university, one Dominican doctor being expelled from the university for refusing the oath. Contumacious friars were even excommunicated by the Archbishop of Canterbury. The whole dispute was finally appealed to Rome, where it was decided in 1314 in the main in favor of the university, with some concessions to the friars.

#### OXFORD STUDIES.

The following programme of studies is taken from Rashdall. According to him the chief requirements for the various degrees in 1267 A. D. were these:

#### IN THE FACULTY OF ARTS.

*For the degree of B. A.* (admissio ad lecturam Alicuius libri Facultatis Artium).—Four years' study.

*For “determination”* (first public step looking to a degree and consisting of the defense of a thesis before masters) in 1267 A. D.—To have been admitted as above and “read” some book of Aristotle. To have responded de questione. To have heard: (1) The Old Logic; i. e., Porphyry's Isagoge; the Categoriae and De Interpretatione of Aristotle; the Sex Principia of Gilbert de la Porrée, twice, and the logical works of Boethius (except Topics, Book IV), once. (2) In the New Logic, Priora Analytica, Topica, Soph. Elenchi, twice; Posteriora Analytica, once. With either (1) Grammar, i. e., Priscian, De Constructionibus, twice; Donatus, Barbarismus, once. Or (2) Natural Philosophy, i. e., Aristotle, Physica, De Anima, De Generatione et Corruptione Animalium. To have responded de Sophismatibus for a year or have heard the Posteriora Analytica twice, instead of once.

*For license and inception* (admission to the mastership).—Three years' additional study. To have been admitted “ad lecturam alicuius libri Aristotelis” and to have lectured thereon. To have been admitted to determine (?). To have responded apud Augustinenses [at the cloister?] and taken part in a certain number of other disputations.

#### ADDITIONAL REQUIREMENTS—STATUTE OF 1431.

To have heard (in addition to the books already read for B. A.):

*In the seven arts.*—Grammar: Priscian in maiore vel minore, one term. Rhetoric: of Aristotle, three terms; or the Topics of Boethius, Book IV; or Cicero, Nova Rhetorica; or Ovid's Metamorphoses; or Poetria Virgilii. Logic: Aristotle, De

Interpretatione, three terms; or Boethius, Topics, first three books; or Aristotle, Prior Analytics, or Topics. Arithmetic: Boethius, one term. Music, Boethius, one term. Geometry: Euclid [?, six books]; or Alhag en, two terms [or Vitellio, Perspectiva]. Astronomy: (Ptolemy ?) Theorica Planetarum, two terms; or Ptolemy Almagesta.

*In the three philosophies.*—Natural: Aristotle, Physica or De C elo et Mundo, or certain other books of Aristotle, two terms. Moral: Aristotle, Ethica, or Economica, or Politica, three terms. Metaphysical: Aristotle, Metaphysica, two terms.

#### IN THE FACULTY OF MEDICINE.

*For M. B.* (admissio ad legendum librum Aphorismorum).—No time specified.

*For admission "ad practicandum" in Oxford.*—For M. A. candidates, four years' study. To pass an examination conducted by the regent doctors. For others, eight years' study and examination.

*For license and inception.*—For M. A. candidates, six years' study (in all). To have "read" one book of Theorica (i. e., the Liber Tegni of Galen, or Aphorismi of Hippocrates), pro maiore parte. To have "read" one book of Practica (i. e., Regimenta Acutorum of Hippocrates, Liber Febrium of Isaac, or the Antidotarium of Nicholas). To have responded to and opposed in the schools of the regents for two years.

For others, to have been admitted to practice, as above: eight years' study (in all): to have given the above lectures.

#### IN THE FACULTY OF CIVIL LAW.

*For B. C. L.* (admissio ad lecturam libelli Institutionum).—For M. A. candidates, four years' study.

For others, six years' study.

*For license ad legendum aliquod volumen juris civilis (e. g., the Digestum Novum or Infortiatum).*—To have heard the libri apparitati of the civil law.

*For inception*—(No additional time specified). To have lectured on the Institutes, the Digestum Novum, and the Infortiatum. To have given an ordinary lecture for each regent doctor. To have opposed and responded in the school of each decretist.

#### IN THE FACULTY OF CANON LAW.

*For bachelor of decrees* (admissio ad lecturam extraordinariam alicuius libri decretalium).—Five years' study of civil law. To have heard the decretals twice, and the decretum for two years.

*For inception as doctor of decrees.*—To have read "extraordinarie" two or three "causes" or the tractate De Simonia, or De Consecratione, or De P enitentia (parts of the Decretum). To have opposed and responded to the questions of every regent. To have given one lecture for each regent.

[After inception, two years, afterwards one year of necessary regency.]

#### IN THE FACULTY OF THEOLOGY.

*For opponency*—For M. A. candidates, four or five years' study, presumably divided between the Bible and Sentences, since three years' "auditio" of the Bible are required for inception.

For others, eight years in the study of arts; six or seven years in theology.

*For B. D.* (admissio ad lecturam libri Sententiarum).—For M. A. candidates, two years more, i. e., seven years in all. Certain opponencies, number not specified.

*For license.*—Two years' further study. To have lectured on one book of the Bible and on the Sentences. An examinatory sermon at St. Mary's. Eight responses to nongraduate opponents. To dispute (as opponent) with every regent D. D. Vespers.

Considerable prominence was given to mathematics and the sciences then most

closely associated with that study, viz, music and astronomy or astrology. Degrees in music were granted in the fifteenth century. The candidate was required to compose a mass and a song (cantilena) to be performed at St. Mary's at the summer inception. The M. B. degree was taken to "read any book of music" or "any book of the music of Boethius." Rashdall states that "this graduation in music was a peculiarity of the English university system which we have hitherto seen only in certain Spanish universities." "The doctor of music was academically on a level with the humble master of grammar." In the sixteenth century a scholar was admitted to practice in astrology.

At the end of the fifteenth century is found "the practice of creating poets laureate by their actual investiture with a laurel crown."

The Greek and Hebrew professorships ordered by the council of Vienne in 1311 were actually founded.

French was another study which held a somewhat anomalous position. It was evidently studied with a view to practice in the law.

#### EXAMINATIONS AND CONFERMENT OF DEGREES.<sup>a</sup>

Examinations at Paris included any process of inquiry into the candidate's fitness, as well as direct testing of his scholastic attainments. There was an examination in the modern sense by the chancellor and examiners. But at Oxford there is no express evidence of the existence of an examination in the literary sense of the word. The candidate for the license in arts presented himself before the chancellor and swore that he had heard certain books, and nine regent masters (besides his own master, who presented him) were required to swear to their knowledge of his sufficiency, besides five other masters who were willing to certify to their belief in him. In the faculty of theology all the regent masters were required to testify to their "knowledge" of the sufficiency of his qualifications, a single negative vote being fatal to his success.

It is important to notice that only the regent masters of the faculty had any share in advising the chancellor as to the fitness of a candidate for the license. So in the actual admission to the mastership—the inception—none but regents of the faculty took part except the chancellor and proctors. The actual ceremony of inception—the presentation of the book and ring, and the putting on of the biretta with the kiss of fellowship—was performed by a regent of the faculty. Some of this ancient ceremonial survived until comparatively recent times.

#### THE SYSTEM OF INSTRUCTION.

This was the same as at Paris. It was certainly less effective in the times from the twelfth to the sixteenth centuries than under later and better conditions, and for very good reasons.

First, there was no sufficient support for university teaching. The teachers were obliged to depend upon a share of fees paid by students (the *collecta*), which was not a certain source of income.

Secondly, the enforced teaching which came of the rule of necessary regency was sure to provide a measure of poor instruction. Under that rule or statute every master, at his inception, was required to bind himself to do two years of teaching. He at the same time, by virtue of his graduation, became a regent. Hence the term "necessary regency," a system which was calculated not only to load the university with inferior lecturers, but also to embarrass it greatly by the resulting fluctuations, notwithstanding the fact that under a pretty strict code of regulations the master could continue his lectures any length of time. It was a realization of the

<sup>a</sup>Rashdall, II, 442.

faultiness of this system and of the weakness which came of an uncertain and insufficient pecuniary reliance that prompted the Duke of Gloucester (Humphrey) in 1436 to found lectureships for each of the seven arts and three philosophies. But they counted but little in the strengthening of the university, for the reason that these foundations terminated with his death.

The enduring relief came with the founding of colleges, which, by doing much of the work at first done by the university, allowed the use unreservedly of whatever resources they possessed in carrying forward university teaching. And by and by it came to be popular to found chairs in the university itself, i. e., in what might be properly styled the university division of that aggregation of schools which came to be known as Oxford University.

#### CIVIL HELPS AND HINDRANCES.

The universities of the present day convey but a faint conception of the general importance of the relations which came to exist between the university at Oxford on the one hand and the royal and municipal authorities on the other. In so far as the Kingdom is concerned, the relation was of course pretty one-sided—that is, the King had his way. But, happily, the sovereigns of England, even in the earliest days of the university, were of a capacity and culture that for the most part made them its friends, protectors, and promoters.

The government of Oxford and of other English towns in the Middle Ages was characteristic in that it was both local and central—self-government of the town, with reserved rights of inspection and control on the part of the King and council. And a happy thing it was, for the King and his council were much more likely to appreciate the needs of the university than were the mayor and council of Oxford. A happy thing, too, that the usage of the times allowed the will of the sovereign to pass for law within limits which especially concerned the well-being, even the comfortable and respectable living, of the university community. The King, if not satisfied with the slow motions of the local authorities, as very often he was not, would issue an order to the sheriff requiring him to see that the occupants of a given street, for example, complained of put their own premises in order, as well as the pavement in front, and that beyond these individual obligations the rest should be attended to by the town itself. The faculty—masters and students—were from abroad, many of them delicate in constitution, and perhaps more subject to disease than natives of the town. The prosperity and future importance of Oxford were to be held above all else, and it was, therefore, a double duty of the authorities and of the people—a duty resting both on self-interest and upon honor—to see that the rules of hygiene were observed. The sovereign was ever on the alert lest even the wrong stream of water be tapped for the town and university supply; lest bad bread and bad beer should also result therefrom and the people and students suffer in common. Nor did the protecting care of King and council limit itself to material interests. It was often in demand and the king was usually very ready to intervene in the settlement of controversies, disputes, and quarrels between university and town, as well as between conflicting forces in the university itself. Sometimes the decision was *pro urbe* and sometimes *pro universitate*, the victory in more than one instance going so far to the popular side as to include the removal of both chancellor and proctors from the posts of honor in the university. There were even royal measures in use for protecting the morals of university students from the demoralizing influence of tournaments, jousts, etc., by forbidding them altogether, and by what was deemed a fitting censorship over such theatrical entertainments as were allowed.

At first the jurisdiction of the chancellor was purely ecclesiastical, the authority having, in so far as the masters and scholars of Oxford were concerned, been delegated to him. As was usual in those days, everybody who had attained to the

dignity of even a scholar at the university was supposed to have one or more dependents, while the masters and officials generally were favored with something of a retinue. And, finally, there were servants and workmen not a few who served the university in its corporate capacity. The more serious cases of discipline were, nevertheless, quite commonly reserved for the bishop, or rather for his representative, the arch-deacon, there being then no bishop at Oxford.

Excommunication and penance were doubtless sufficient to insure the chancellor's jurisdiction, and the rapid growth of the university afforded enough for him to do outside of the usual order. And then gradually that jurisdiction extended in complicated cases of conflict between scholars and townfolk who were laymen. And, finally, the commonness of such cases, coupled with the ever-increasing dignity and importance of the university, made it easy to ignore the barriers between civil and ecclesiastical powers and to increase the advantage of the more aggressive force, so that quarrels could be settled as early as 1214 by papal legate and bishop without reference to the King, and but a few years later (1228) a case arose in which the town so far yielded as to permit the offending party to be sent all the way to Rome for trial.

It was at this same time that the King issued orders to the mayor and bailiffs allowing the chancellor to use the town prison for the confinement of offending students; as also, later still, the royal prison. There was no bishop's prison then.

In the year 1231 a royal brief was issued for the expulsion of all scholars without masters. The town was full of a rattling, noisy, comparatively ignorant, and often turbulent crowd, who added to the fame which came of numbers but who were in every other respect a detriment to the university.

The year 1244 brought in important enlargement of the prerogatives of the chancellor in questions of debt, disputes over prices, rents, etc., "and all other contracts of movables" to which at least one party was a clerk or regular student. It came of violence in the streets of so serious a nature that some fifty of the students were imprisoned. They had been charged what was thought unreasonable interest. And the result of the conflict was that, soon after, a charter was granted which forbade the Jews of Oxford to take a higher right than 2d. per pound per week as interest from scholars.

Four years later a charter was granted giving to the chancellor and proctors the right to assist at the assaying of bread and beer, on the one hand, while upon the mayor and bailiffs who had the first part in this business it imposed an oath upon admission to office to respect the rights and customs of the university. And seven years after that, to wit, in 1255, was added to the steadily growing powers of the university in affairs both ecclesiastic and civil a criminal jurisdiction also, even over laymen in cases of breach of the peace. It was natural that under these conditions there was steady grasping for more authority by the university. Nor was it strange that a rude and resolute people should at times give way to a deep feeling of resistance to what was so plainly an advancing, and in a greater or less degree an encroaching power in their midst, or strange that conflicts resulted. For this reason it was natural, if not inevitable, that conflicts between town and gown should occasionally lead to the abandonment of Oxford by numbers of her students. Sometimes they distributed themselves among institutions on the continent; but in a number of instances the secessions were sufficient for the beginning of new institutions, such, for example, as that of 1209 to Cambridge, and that of 1238 to Salisbury, and the maintenance there of a quite flourishing school for a considerable time. That of 1334 from Northampton to Stamford, when the former rebellious town was captured by Henry III, was due, however, more to a warlike conflict between Northerners and Southerners than to differences between the school and the community.

In those times customs, where the thing done or claimed was at all reasonable, or had gained a beginning in some interest of importance, like that of church and school,

made an easy start, and in a very few years were for the most part as good as law. Nevertheless, where vital interests, like those of personal freedom and security in general, were involved, the royal confirmation of custom by charter, by formal order, or even by a personal command, was always welcome. But in 1275 Edward I went beyond an act of mere confirmation, while according to the chancellor cognizance of all cases where a student was in the rôle of "defendant," by his issue of a charter wherein the broader expression of "party" took the place of "defendant." And in 1303 he decreed that a room or hall once rented to a scholar or scholars could not afterwards be let to a layman so long as there were students still unaccommodated. The first and formal definition of the chancellor's jurisdiction by both King and Parliament was made in 1290. He now obtained jurisdiction in case of all crimes committed in Oxford where one of the parties was a scholar, except pleas of homicide and mayhem.

The most fearful of all the many conflicts between the university and the town was that of 1354, wherein a miserable broil in a tavern between a number of students and the proprietor led to desperate fights and to pitched battles all over the town, even to the slaughter of numerous persons on both sides as well as to much destruction of property.

The story, as Rashdall has it from Anthony Wood, is worth telling, for it gives an idea not otherwise so easily gained of student life in those days, and of the state of society encountered by the university of the mediæval period.

On Tuesday, 10 Feb. (being the feast of St. Scholastica the Virgin), came Walter de Springhouse, Roger de Chesterfield, and other clerks to the tavern called Swyndestock (being now the Mermaid Tavern at Quatervois, styled at this day in leases Swynstock), and there, calling for wine, John de Croydon, the vintner, brought them some, but they disliking it, as it should seem, and he avouching it to be good, several snappish words passed between them. At length the vintner giving them stubborn and saucy language, they threw the wine and vessel at his head. The vintner therefore receding with great passion, and aggravating the abuse to those of his family and neighborhood, several came in, encouraged him not to put up the abuse, and withal told him they would faithfully stand by him. That was all. The same narrative would be a sufficiently exact description of scores of similar conflicts at Oxford, Paris, or any other university town.

After this affairs took the stereotyped course. The vintner's friends rang the bell of the town church of St. Martin. The commonalty "in an instant were in arms, some with bows and arrows, and others with divers sorts of weapons." The scholars, at present defenseless, were shot at. The chancellor appeared upon the scene to "appease the tumult;" he was shot at, and had to flee for his life back into gownland. By his order St. Mary's bell is rung. At such a moment the chancellor is not overmuch distressed to find that his annual proclamation "contra portantes arma" has not been too literally observed. Ere long he is at the head of an army of English archers. With such weapons it is difficult to understand how the fight could have been maintained till even the close of a February day without a single man on either side being killed or mortally wounded. But neither townsmen nor gownsmen were as skilled with their weapons as the yeomen of Cressy.

The fight had begun on a holiday; the next day was a "legible" one. The chancellor made proclamation against breaches of the peace. The obedient scholars, we are assured, betook themselves meekly to the schools. But not so the townsmen. The bailiffs had ordered the citizens to prepare for a renewal of hostilities, and had even hired reinforcements of peasants from the surrounding country. A "determination" which was going on at the Augustinian Convent (the present Wadham College) was broken in upon by a band of armed townsmen. Fourscore citizens, armed with bows and arrows, laid wait in St. Giles's Church till after dinner, when the scholars began to appear in their accustomed recreation ground in Beaumont fields. This time some of the scholars were mortally wounded. Again the rival bells of St. Mary's and St. Martin's were heard, and preparations made for a pitched battle. The gownsmen shut the town gates, for the rustics were seen swarming in from Cowley, Headington, Hinksey; but it was too late to prevent a party of some 2,000 entering, with an ominous black flag displayed, by the west gate. Hatred of the secular clergy was a pretty strong passion in the rustic mind of the fourteenth century. Now was a fine opportunity for paying off old scores against the parish priest. Some twenty inns or halls were pillaged. Scholars were killed or wounded;

their eatables and drinkables plundered; their books torn to pieces; the halls themselves were fired. The next day the chancellor is dispatched at the head of a deputation to the King at Woodstock. Meanwhile proclamation is made that the scholars (who had been outnumbered and completely overpowered on the preceding day) shall remain in their houses. But again the halls are broken into. More scholars are killed outright in cold blood and their bodies mutilated. Others, horribly wounded, are carried off to the town prison. "The crown of some chaplains, viz, all the skin so far as the tonsure went, these diabolical imps flayed off in scorn of their clergy." Churches supply no sanctuary. The fugitives are beaten and wounded, clinging to the very altars, nay, to the tabernacle itself. The friars, forgetting for the moment their own very bitter differences with the university, come out in solemn procession bearing the host and chanting a litany for peace. The crucifix is planted in the midst of the rioters with a "*procul hinc ite profani*;" but the sacred symbol is dashed to the ground. One scholar is killed even while clinging to the friar who bears the host. At last the scholars begin to flee the town, and no further mischief remains to be done. But for the scholars of Merton, safe behind their solid walls, and a few others, the town is deserted.

But now comes the day of vengeance. For more than a year the town lies under an interdict, which is proclaimed in all the churches with the accustomed paraphernalia of bells and curses and extinguished tapers. The King issues a special commission for the investigation of the affair and the punishment of the offenders. The mayor and bailiffs are sent to the Marshalsea prison; the sheriff, who was held, we may presume, responsible for not preventing the inroad of the rustics, is removed from his office. The further hearing of the affair is adjourned to London. Both university and town surrender all their privileges and charters—the university including even those received from the Holy See—into the King's hands. The university had of course decreed a "cessation," and indeed most of the scholars had of their own accord fled into the country. Not till a general pardon was proclaimed for the offenses of the clerks—an indication, by the way, that the scholars' conduct in the affair had not been altogether as lamblike as their advocates represented—and published throughout the country did they begin to flock back to their old haunts. As late as June 11, 1355, it was necessary for the King to send a writ to Oxford to entreat the masters to resume their lectures.

As the outcome of the whole affair there resulted fresh privileges for the university; fresh humiliation for the town. The assize of bread, wine, and ale; the assize of weights and measures; the cognizance of cases of forestalling and regrating; the "correction of victuals;" the punishment of both clerks and laymen for carrying arms; the cleansing and paving of the streets (which was to be enforced by ecclesiastical censure); the "assessment and taxation" of privileged persons—all these matters were now placed under the sole and exclusive jurisdiction of the chancellor. \* \* \* On every one of the long-standing subjects of contention between town and university the latter scored a permanent triumph. From this time forward the town of Oxford was practically governed by the university. <sup>a</sup>

The town was also to pay to the chancellor and scholars £250 as compensation for injuries to property; all goods of the scholars undestroyed were to be restored at once. Besides the material compensation which they received from the Crown, the scholars were awarded satisfaction at the hands of the bishop. He enjoined an annual penance on the city to be performed forever, as follows:

On every anniversary of St. Scholastica's day, the mayor, bailiffs, and sixty burghers were to appear in St. Mary's Church at the celebration of mass with deacon and subdeacon (at their own expense) for the souls of the slaughtered scholars, and at the offertory each one of them was to offer 1 penny at the high altar. Of this sum 40 pence was to be distributed by the proctors among poor students and the rest to go to the curate of the church. The length of time during which this penance has been performed is one of those curious links between past and present which would hardly have been possible in any country but our own. After the Reformation the town availed itself of the opportunity of neglecting the popish ceremony, but upon the university bringing an action against the city upon their old bond for its observance, the council ordered that the mass should be commuted to a sermon and communion, the offering to be made as heretofore. After a few years the service was changed to a litany. In the year 1800 the municipality once more attempted to shake themselves free from the humiliating observance. Once more the fine of 100 marks provided for in the bond was demanded by the University and paid by

the town. It was only in 1825 that on the humble petition of the city the university was graciously pleased to forego its rights and that the citizens of Oxford ceased to do annual penance for the sins of their forefathers on St. Scholastica's day, 1354.<sup>a</sup>

Henry IV went beyond all his predecessors in one important regard—that of granting to the university the right to claim the surrender of "privileged persons," though indicted for felony, and their trial, by an officer of the university, newly appointed and known as the seneschal or steward, if deemed competent by the lord high chancellor; the trial itself to be under civil law and by a jury composed half of privileged persons like the accused, chosen from a panel offered by the bedel, and half of townsmen summoned in the ordinary way by the county sheriff—another illustration of the slowness of the English to abandon a rule of action once adopted, for this unexampled and even unconstitutional charter has proven itself superior to the urgent appeals of the Commons and still endures, nay, has been sanctioned by act of Parliament. These "privileged persons" were laymen, servants of scholars, and members of privileged trades, not clerks. Where the offender was a clerk, in cases which, under the law, could not be tried by the chancellor, he was, after conviction at assizes, turned over to the bishop for punishment in accordance with ecclesiastical law.

Punishments were generally light, not unfrequently amounting to a mere compliance with the law in all the requisite formalities, with an easy penance or acquittal on the testimony of friends, and up to the Reformation more or less of favor was shown the clerks. After the Reformation members of the university were no longer treated as clergymen, and clerks had no more benefit of clergy than laymen.

Finally, not long after the opening of the fifteenth century, the authority of the university was almost supreme over the town. It was a turbulent period. The frequency of assaults, not merely among rowdies in the streets, but even among monks, masters of arts, beneficed clergymen, principals of halls, and heads of colleges, was notorious. Ecclesiastical discipline at this time involved interference with the private lives of individuals, and inquisitions were conducted under university sanction and jurisdiction into the character and conduct of the townspeople. The town was divided into districts, each under a theological doctor and two masters of arts as judges. They sat in the various churches of the town and held their investigations, a jury of citizens being summoned to give evidence. They reported to the chancellor, before whom the offenders were summoned for sentence, the punishment being excommunication and penance.

#### THE GROWTH OF INDEPENDENCE.

The University of Oxford had its beginning in the church; the town being in the diocese of Lincoln, the university was under the control of the bishop of that diocese, the chancellor being merely the bishop's delegate.

While the functions of the chancellor were very nearly the same as at Paris, the circumstances at Oxford furnished a vantage ground which he was not slow to occupy. At the outset all authority was with the bishop, and the chancellor was simply his representative. But the distance between Lincoln and Oxford (120 miles) was so great in those days as to make it easy for the chancellor to gain authority to act on his own judgment more and more. Especially was this the case during the incumbency of Bishop Robert Grossetête, whose broad and generous nature, coupled with a sincere love of learning and a worthy ambition for his alma mater, made him a welcome helper in every way. The first disagreements between the university and the bishop broke out during the incumbency of Bishop Grossetête's successor, Henry of Lexington, upon the question of autonomy, whether the university should be governed by itself or the bishop. The dispute continued until 1257, when a

<sup>a</sup> Rashdall, II, 407-408.

peace was arranged before the King in Parliament. The terms of this agreement are not known, but subsequent royal grants of privilege were made in favor of the chancellor's jurisdiction, thus making him independent of the bishop.

Richard of Gravesend, successor to Lexington in 1258, was of a different type, and during his rule, which lasted until 1279, matters went smoothly on in the direction of a further enlargement of the university's powers, so that, in his last year, a council of Archbishop Peckham and his co-provincials, held at Reading, solemnly confirmed the privileges of the university, and provided for the exercise of the chancellor's power of excommunication, even to the extent of securing the execution of his judgments against offenders in any diocese to which they might have escaped.

But Bishop Sutton, Gravesend's successor, assumed again the rôle of opponent to the university. Nevertheless, in the very first year of his incumbency the congregation swore to maintain these solemn declarations in opposition to the bishop, namely: (1) That a scholar might cite a lay defendant before the chancellor; (2) that probate of the wills of scholars was with the chancellor; (3) that the right of inquiry into the moral delinquencies of scholars belonged to the chancellor; (4) that no master could be required to plead in any court other than the chancellor's, in the matter of contracts entered into within the university.<sup>a</sup>

In 1281 another instance of a repudiation of the bishop's authority is found in the summons of the chancellor, proctors, and other masters to answer before Bishop Sutton for contempt in resisting his visitatorial powers. In answer, they pleaded that the chancellor had authority to act in cases like those mentioned in the summons, and that jurisdiction was with the bishop only "in defeat of the chancellor," or in case of an appeal to him after an appeal in vain had been made to the university congregation. The question was finally taken before a provincial convocation, wherein the archbishop and his colleagues so warmly espoused the cause of the university that the bishop yielded with the best grace he could. And from this time on the chancellor's jurisdiction was practically exclusive of the bishop's.

Then followed a contest over the matter of the chancellor's confirmation—first, as to whether he should appear before the bishop in person to receive such confirmation, and, secondly, as to what should be done in case of the bishop's refusal to act or of serious delay. The result was an appeal to the archbishop, who, in the case of neglect by the bishop of Lincoln himself, took the responsibility. The pope, on appeal from the bishop, issued a final decision to the effect that, while confirmation lay first with the bishop, yet the right of the archbishop to act in default of the Bishop of Lincoln should be without question. The confirmation thus became a mere formality, and had in fact disappeared long before 1368, when it ceased altogether by papal decree.

It was at this time (late in the fourteenth century) that Wycliffe came upon the stage, with his denial of transubstantiation and of the "sacrifice of the mass," on the one hand, and his bold declaration that the civil powers might seize and use the property of "habitually delinquent clergy," on the other. It mattered not that Wycliffe's doctrines had been condemned by the pope in 1377, by the "Earthquake Council" in 1382, as well as by the archbishop and his assessors, at the Blackfriars' chapterhouse in London, the chancellor refused to comply with the mandate of the archbishop directing him to publish the condemnation of Wycliffe's theses in the usual way, on the ground that the university was exempt from the archbishop's jurisdiction. Sermons were preached at Oxford supporting Wycliffe's doctrines, which took strong hold at the university. The chancellor was subsequently compelled to beg pardon of the archbishop, but the subjugation of the university to the ecclesiastical authority was not completed until a full generation after Wycliffe's death. Meanwhile, in 1395, "Boniface IX granted a bull exempting the university

<sup>a</sup> Rashdall, II, 422.

from the jurisdiction of all archbishops, even "legati nati," bishops and ordinaries. Even exempt persons, such as the mendicants and monks of exempt monasteries, and exempt cases, such as assaults on clerks, which continually sent the clerks of Paris to seek absolution from special papal delegates, were now expressly placed under the jurisdiction of that most anomalous of dignitaries, the chancellor of Oxford."<sup>a</sup>

But the whole church had been aroused, and ere the incoming century had dawned the exemption of Boniface IX had been disregarded by the archbishop, on a fictitious plea, and actually surrendered by a university proctor in open convocation. True, the university was determined not to yield its rights because of such surrender, made without authority, and held its ground for a while. But the contest went on until in 1411 the archbishop of Canterbury brought matters to a crisis by appearing upon the scene and summoning the university to appear before him in his capacity of visitor, in St. Mary's. Whereupon Chancellor Richard Courtenay, and the proctors Benedict Brent and John Byrche, flatly refused the archbishop entrance to Oxford in any such capacity; besides which the students occupied the streets armed with their bows and arrows, and with a bold declaration of their determined purpose to use them should the primate make his appearance. Deeming discretion the better part of valor, he desisted, but made such representation to the King of the contempt put upon him "by a company of boys" that the King forthwith ordered the masters to choose a new chancellor and proctors; but the masters so far refused obedience as to elect the ruling ones over again, who, by the mediation of Henry, Prince of Wales, were eventually allowed to retain their offices. Nevertheless, the bull of Boniface IX, making the cherished exemptions, was revoked by John XXIII, in November, 1411, and the university was compelled to surrender to the archbishop.

The causes of this revocation were undoubtedly the free run of Wycliffism and Lollardism, with more or less of an abuse of freedom among both masters and students. A just and considerate use of the great privileges of the university would have insured their permanency.

This long period in the history of the university appears to have been marked by but one very important change in the constitution, or at least in the usage—the change from biennial elections of the chancellor and from his being the actually resident head of the university, to permanency in office and to a residency subject to the will and pleasure of the incumbent. Moreover, the subjection of the university was more and more strengthened by a growing spirit of domination in the royal court and of accordance between the papal and the royal powers; so that the court was becoming more ecclesiastical and the church hierarchy more court-like than of yore. In this way the bishop of Lincoln himself secured the chancellorship of the university, and in time the chancellor became in effect an obedient servant of both church and state. This subjection of the university to ecclesiastical authority lasted until, in 1479, a bull was obtained from Sixtus IV legally restoring the exemption from all English ecclesiastical authority. In 1490 the chancellor received the privilege of licensing preachers to preach in every diocese in England, a privilege which, though obsolete, the university still nominally retains. This was the last accession of dignity to that office.

#### OXFORD COLLEGES.

The colleges of Oxford were an outgrowth of the halls or hostels system of the early time—those little groups of scholars, often only four or five in number, who banded themselves together for mutual advantage, rented a little house or hut, chose their leader (finally known as principal), as a means to some sort of order, and began their studies. After a while these became independent communities after the fashion of boarding houses, each governed by a master under authority of the university.

<sup>a</sup>Rashdall, II, 430.

Naturally they multiplied, and the colleges which supplanted them grew by degrees, with the help of many benefactions, until they numbered some fifteen during the Middle Ages, and now number over twenty, their order in time being as follows (dates taken from Rashdall and Andrew Clark):

1. University College .....	1249-1280	9. All Souls College.....	1438
2. Balliol College.....	1261-1282	10. Magdalen College.....	1448
3. Merton College .....	1264	11. Brasenose College.....	1508
4. Exeter College.....	1314	12. Corpus Christi College .....	1516
5. Oriel College .....	1324	13. Christ Church College .....	1524
6. Queen's College .....	1341	14. Trinity College .....	1555
7. New College.....	1379	15. St. John Baptist College.....	1555
8. Lincoln College.....	1429	16. Jesus College.....	1571

To which have since been added:

17. Wadham College .....	1613	20. Hertford College.....	1740, 1874
18. Pembroke College .....	1624	21. Keble College .....	1870
19. Worcester College .....	1714	-	-

The relation of the halls to the university authorities was at first very slight indeed. But, little by little, the university extended its authority over them; the requirement of security before the chancellor for the rent of the house in which the society would maintain itself being the first step. This served to prevent disputes between competing applicants. Any scholar who tendered the required amount could claim the right to be recognized as principal. On the other hand, the chancellor assumed the right to reject any principal thus claiming the honor, and even to remove such as had gained the principalship already by means contrary to the university regulations in such matters; and, as was natural, there was much increase of arbitrary power, even to the vetoing of the statutes agreed upon by the halls, whether singly or in common. Scholars expelled from any hall for violation of the statutes could not be lawfully received into another by its principal; and it was further enjoined that only scholars of good character should be received into any hall; also that all scholars should reside in the halls of principals "lawfully approved and admitted by the chancellor and regents" of the university; and, finally (in 1432), that no one could be principal who had not received at least the degree of bachelor of arts. The next step was to require that a principal should help the scholars under him in their studies. And then it was that a club of students, led by one of their own, under rules of their own making, gradually grew into a recognized university institution.

Coming now to the colleges, properly speaking, we find that they furnish a most interesting history, sufficient, as Andrew Clark, fellow of Lincoln College, has said, to make as many volumes. But hardly more can be done here than to indicate in a general way their constituents of official or titular rank, and the characteristic features of the several institutions embraced in the university, as the central, all-embracing, and supreme body. Of their characteristics he says: "The constitutional changes, with the six, four, or fewer centuries of their existence, were neither few nor slight. The society within the older of them has reflected from age to age the social, religious, and intellectual condition of the nation." He further says, dealing with their salient features severally, from the first of them to the nineteenth century:

Brasenose and Hertford furnish a history of the multiplicity of halls for seculars, out of which the colleges grew. In Trinity and Worcester we have a glimpse of the houses for regulars, which for a while mated the colleges, but disappeared at the Reformation. In Queen's early social conditions are illustrated. In New College are shown the early studies. Balliol gives prominence to the Renaissance movement; Corpus Christi, to the consequent changes in studies. In Magdalen we see the

divisions and fluctuations which followed the Reformation; in St. Johns, the golden age of the early Stuarts; in Merton, the dissensions of the civil war; in Exeter, the strong contrast between Commonwealth and Restoration. The history of University College enlarges on the Romanist attempt under James II. The bright and dark sides of the eighteenth century are exhibited in Pembroke and Lincoln. To the history of Corpus, which describes the Renaissance, belongs the right to depict the renewed love of letters which distinguished the nineteenth century. Lincoln sets forth the constitutional arrangements of a pre-Reformation college. Lincoln and Worcester show what uncertainties projected colleges must go through before they are legally settled. Christ Church suggests the architectural and artistic wealth of Oxford.

The college officials consisted of a head and a body of masters of arts or fellows.

The head of the college (who in different institutions was variously known as dean, principal, master, provost, warden, president, rector), except in the case of Christ Church, where the dean is named by the Crown, was, and is, chosen by the fellows. His duties were, as now, to superintend, present candidates for degrees, etc.

The qualifications of fellows have varied more or less in each of the several societies. In some they were limited to the natives of particular counties in England, and in other cases the choice was fixed by the founder, whose will provided that a given number of his own kindred should become at once members of the house endowed by him.

The fellows, in conjunction with the head of a college, were in all cases directors of the regulations of the society and the managers of its estates, and from them the officers of the college were selected.

A limited number of poor boys were admitted as scholars and were quasi probationary fellows in most cases. Indeed in Christ Church a scholar was equivalent to a fellow. They were in some colleges appointees and servitors of the fellows. The system of competitive examination for scholarships is of modern origin.

Exhibitioners were those who, coming from particular counties or schools, received from the bequest of private persons, or from colleges themselves, a fixed sum for support during the period of their study—a period of from three to seven or nine years, and sometimes even longer. The holders were generally required to reside at the college a given length of time annually, and were subject to certain regulations.

*Bible clerks.*—The duties of these officials varied in different institutions. Generally speaking, they were required to attend the chapel service and to keep a memorandum of the undergraduates present.

The bursars' duties were to receive the rents from the estates and other properties of the college, to disburse all sums necessary, as expenses, and to pay the stipends due to the fellowships and scholarships.

Enough has now been said to convey a general idea of the beginning, growth, and final status of Oxford University at the close of the Middle Ages, with its grand galaxy of colleges, so alike, and yet unlike, in their characteristic features, and so deeply interesting to the student of educational history.

#### OXFORD AND MEDIEVAL PROGRESS.

Great was the influence of the mother University of Paris upon the beginning of university work in Oxford—so great that the early University of Oxford has been described by Rashdall as being “in all probability, a cluster of Parisian schools transferred to English soil.”<sup>a</sup> But, unlike Paris, the political and ecclesiastical influence of Oxford was inconsiderable, both because of its isolation, with sparsity of population, and the less complete subordination to the Papal power of those who founded and built it up. The inhabitants of the British Isles always possessed a spirit of independence, and were not special favorites with the powers at Rome.

<sup>a</sup> Rashdall, II, 520.

Its political influence was also but slight because the men of superior force in public affairs were not so ready as on the Continent to give themselves to university work; also because, unlike Paris, Oxford was a country town, far away from the capital; and, finally, because the stronger English kings were more intense lovers of power, and found it agreeable to keep their hold upon an institution claiming supremacy in the intellectual realm.

It was the scholastic studies that, first of all, engaged the sympathies and efforts of the early thinkers and workers at Oxford, and in this great field she soon won a place only second to that which in those times was quite universally accorded to Paris. This practical limitation of Oxford was not so much a matter of choice as of necessity. The British Isles during the Middle Age period were scarcely more isolated geographically than ecclesiastically. Besides, on the part of the people and of their rulers there was a degree of rugged force and independence of thought and feeling that made them less ready to fall under dominion of the ruling church. Rashdall says:

It was not as a great semiecclesiastical corporation, but as a center of speculative thought and of religious life, that Oxford contributed to the making of English history. It was through her influence upon the religious life of England that the University of Oxford did, as we shall see, at one supreme moment open a new page in the history of England and of the civilized world.<sup>a</sup>

Oxford so readily followed Paris into the scholastic field that they were in effect workers side by side. But it also deserves to be said that owing to its famous teachers in the thirteenth century, broad and profoundly cultured men of genius, she became more than a merely scholastic center, even at that early time.

These great men were Edmund Rich, afterwards archbishop of Canterbury, who is credited with being the first master who taught the new logic in her schools, and the yet greater Robert Grossetête, her first chancellor, and Roger Bacon. Grossetête opened the way for Aristotle, not only by teaching his philosophy, but also by securing the translation of his ethics. His range of thought and study was so great that he was at home at once in physical science, linguistics, and theology, and was also accorded high rank as an agriculturist, physician, lawyer, preacher, and French poet. Moreover, besides being an independent theologian and great ecclesiastical statesman, he was one of the staunchest champions of the rights of the English Church in defiance of both Pope and King. He encouraged theological studies, but insisted on keeping the distinct line of separation between theology and philosophy observed by the Latin fathers and the earlier mediæval doctors.

Roger Bacon was of a different type. He made himself of special and incalculable value by pointing out and bravely condemning the vices of scholasticism—the wasting of time and intellectual energy upon a few metaphysical questions, the solution of which was as yet impossible, owing to the blind deference to authority in science and philosophy as well as in religion, to the abuse of syllogistic reasoning, and to the neglect of observation and experiment. Notwithstanding his attitude of criticism of scholastic methods, his participation in the scholastic discussions was an important event in the history of that philosophy. To him has been attributed Oxford's antagonism to the Dominican teaching. He was prior to Duns Scotus in his criticism of the Thomist doctrine of "unity of form." In his doctrines of "universals" and in other metaphysical doctrines he is regarded as having anticipated the fundamental ideas of the great Ockham. To his high conception of the value of mathematics, in both education and scientific inquiry, was largely due the prominence enjoyed by Oxford in that department—the honor of doing the best teaching in that field, and of claiming the two best mathematicians of the thirteenth century.

The writings of Roger Bacon were hardly more remarkable for his anticipations of

<sup>a</sup> Rashdall, II, 519-520.

modern thinking than for his plan of educational reform, his theory being that mathematics and the ancient languages were the proper foundation of science, medicine, philosophy, and theology; that science must be studied mathematically and experimentally, and that philosophy and theology should, on the other hand, find their basis in philological and historical studies.

The University of Oxford, as compared with that of Paris, was more conservative in the whole realm of philosophy. Indeed, at a later period—say by the middle of the fourteenth century—it was recognized throughout Europe as the center of scholasticism. The disposition to make an independent study of nature had declined, and Oxford entered into the scholastic strife with yet greater zeal than Paris, where, indeed, and in whose university, it was the English “nation” that took the lead of all others. And so with the revival of realism in a new form by Duns Scotus, and with the nominalistic reaction led by Ockham—both of these were Oxford men. The leading schoolmen of the fourteenth century, and nearly all of any note yet later, were either Englishmen or Germans educated in the traditions of the English nation at Paris.

After Scotus followed the keen analysis and vigorous criticism of William of Ockham, under whom nominalism took a ready root; whose theology, though in other respects orthodox, was openly against the Church as to what should be the relations between the Papacy and the civil power, while at the same time he was an earnest champion of Franciscan superstition.

As intimated before, there was a greater breadth of thought at Oxford in the thirteenth century, as compared with Paris, as well as little of the scepticism or pantheism so hard to overcome at the Parisian center. There was at Oxford more intellectual freedom during the fourteenth century, and hence no inquisition and no fierce punishments for heresy until the statute for burning heretics in 1401.

It should also be remarked in this connection that, while the nominalism of Ockham was for a time triumphant over the realism of Scotus, there came a reaction against the extravagances of Scotus within the ranks of his own followers, led by that famous schoolman and religious reformer, John Wycliffe, who, while an opponent of Ockham in metaphysics, yet as a political thinker following in the steps of that great scholastic doctor, the intellectual leader of his day, and in politics the champion of secular authority against the usurpations of the Papacy, made a great impression of his own upon the intellectual movement of the time, which was destined to endure long after his death. Even the victory of Archbishop Arundel over the university and Lollardism in 1411 was unequal to entirely neutralizing the leaven of Wycliffe's teachings, to which are traceable, as scarcely to those of any other reformer, the growth of intellectual and religious freedom during the fifteenth century.

It thus appears, even from these few facts of history, that the services of Oxford University, and of her many original, brilliant, and heroic workers in all the great fields of intellectual and religious endeavor, won for her immortal honor and gave her a most conspicuous place among the world's mediæval universities.

## II.—OXFORD IN THE MODERN ERA.

Mediæval Oxford had its beginning of what could be called university life as late as the latter half of the twelfth century. Previously it had been, as Mr. Brodrick, of Merton College, has styled it, “a loose aggregation of students under the paramount jurisdiction of a bishop resident at Lincoln.” It was not until the end of the old and the dawn of the new era that it had an organization, enjoyed the protection of the King, and became a power in the affairs of the nation.

The university contributed greatly to the revival of classical learning, as to which Erasmus, the foremost of its promoters, was enthusiastic over what had already been accomplished at Oxford by Colet, who has been regarded as one of the

most influential leaders in the field of Latin scholarship; by Grocyn, who upon his return from study in Italy gave the first public lectures on Greek in Exeter College, and by Lynacre and others. Indeed, by the close of the fifteenth century there had been so marked a growth of Oxford and Cambridge in classic culture that Erasmus claimed for England a rank higher than either France or Germany, and second only to Italy.

But the greatest step forward in the history of Oxford, as of universities in general, came through the improvements in the arts of printing and paper making, and the discovery of the New World. It is wonderful how much had been accomplished before the coming of the printing press gave the means of laying books without stint before university students and the civilized world, notwithstanding the fact that the previous books had been in the Latin tongue, and therefore limited in their usefulness, in a very large degree, to the learned class of the people.

Richard Fox, Bishop of Winchester, has the honor of having first duly endowed lectureships (professorships) at Oxford for both the Greek and Latin languages. They were established in connection with Corpus Christi College, and as part of a new endowment of it. Fox, in thus making provision for twenty fellows and twenty students, also made the innovation of offering the colloquial use of Greek as an alternative of Latin, and of choosing professors from southern Italy and Greece.

Curiously enough, there was strong opposition to the introduction of Greek by a combination calling themselves "Trojans." Their opposition proved fruitless, however, for the classics had powerful friends at the seat of government, and Henry VIII seems to have required no urging to induce him to issue a very positive order in support of Greek teaching, as early as 1519. Besides, Wolsey, the great cardinal, then a power in the state as well as in the church, was an earnest friend of learning, and did not forget Oxford or to see what reforms were needed, and soon found himself so completely possessed of the confidence of the authorities of the university that they were pleased to place its charters in his hands for any changes he might deem desirable. This was in 1518, and in 1523 he returned the old charters with a more liberal and excellent one, fresh from the hand of the King, and granting to the university practical independence.

Wolsey, moreover, undertook the forming of a new college at Oxford, to be known as Cardinal College, to that end suppressing, by authority of pope and King, priories and convents sufficient in number to create a revenue of £2,000. But death overtook him and put an end to what was considered a magnificent enterprise. Among the many distinguished friends of the university he had been foremost, so that Shakespeare did but duly honor him when he said:

"He was most princely: ever witness for him  
Those twins of learning that he raised in you,  
Ipswich and Oxford! one of which fell with him,  
Unwilling to outlive the good that did it:  
The other, though unfinished, yet so famous,  
So excellent in art, and still so rising,  
That Christendom shall ever speak his virtue."

While the power of the King was such that he had pretty much his own way in things temporal, yet there were things which he could not do without the authority of the head of the church, or his approval. Among these was his divorce of Catherine of Aragon, without just cause, and his marriage to Anne Boleyn. The replies from the universities regarding the legality of the divorce were by no means unanimous, and among the dissenters was Oxford. Notwithstanding threatening letters from the King many of the masters stood by their convictions, and the consent of the university convocation was only procured by their exclusion when the vote was taken. Unable to forgive this "disloyalty" of some, Henry again (in April, 1530) visited Oxford, and took back the charters, not only of the university, for which

he maintained a sincere and friendly interest, but also the charter of the city, which had of late shown itself opposed to some of the privileges the university had enjoyed. The retention of the university's charters for a period of thirteen years was, in the nature of the case, a serious embarrassment.

But the disgraceful act of compelling the consent of convocation to the King's unrighteous act, and the wresting of charters in April, 1530, did not stand alone. In 1531 the clergy were constrained to acknowledge Henry as "head of the church and clergy, so far as the law of Christ will allow;" and in 1532 Parliament was induced by him to enact a law prohibiting all appeal to Rome. In 1534 the university concurred in the separation from Rome, by which Henry VIII became the "supreme head of the Church of England," and in the following year a visitation of the university was instituted for the purpose of establishing ecclesiastical uniformity and the substitution of a larger measure of the classics for the old scholastic teaching. The study of Aristotle was enjoined upon the university, together with that of the Bible. The university was exempted from the payment of tenths granted by statute to the Crown, on condition of such classical lectureships being founded as the King might assign. The support of these lectureships was charged upon the five richest colleges. At the same time Henry, of his own motion, founded and endowed with a stipend of £40 each five regius professorships—of divinity, Hebrew, Greek, civil law, and medicine—and he in some measure carried out the noble purpose of Cardinal Wolsey concerning "Cardinal College." It would be well if rulers and the representatives of the people everywhere could rise to such an appreciation of the higher learning as, according to Holinshed (quoted in Brodrick's *Oxford*, p. 79), was shown by Henry in his royal answer to the courtiers about him, who would have been pleased to have him deal with the colleges and universities as he had with the monasteries (by defacing and even tearing them down), whereupon he sternly said:

"Whereas we had a regard onlie to pull down sin by defacing the monasteries, you have a desire also to overthrow all goodness by subversion of the colleges. I tell you, Sirs, that I judge no land in England better bestowed than that which is given to our universities. For by their maintenance our realm shall be well governed when we are dead and rotten. I love not learning so ill that I will impair the revenues of anie one House by a penie, whereby it may be upholden."

The writer who said that at the beginning of Edward's reign the university was far less prosperous than it had been under Wolsey was far too mild in his account; for his reign was, in fact, from first to last, a period of direst calamity. The number of students grew less and less, the number of halls dwindled accordingly, and comparatively few degrees were conferred. The university had become a scene of religious conflict of the most uncompromising sort. Accordingly, a royal commission of visitation to look into the condition of the university not only framed new statutes for both Oxford and Cambridge, without trace of popery left in the constitution, but also drove out all dignitaries charged with favoring any articles of the old faith, destroyed everything suggestive of it, such as architectural ornaments, images, statues, and, of course, altars, and gave to the flames great quantities of classical and scientific manuscripts, some of them beautifully illuminated by masters of the art. The truth is that after a suppression of the canon law almost the only good the commission did was to encourage the study of civil law, ancient philosophy, Hebrew, logic, rhetoric, mathematics, and medicine; though it is also to their credit that they provided for matriculation examinations in grammar and Latin, for examinations after lectures, and that fellowships, besides being terminable, should also be tenable only on condition of a six months' residence at the university.

Nevertheless the spirit infused by Wolsey, with the help of a few heroic coworkers, had so far died away that the importation of eminent foreign divines and other means employed to revive it were unavailing. Teachers of the civil law left their

places for a more peaceful service at Louvain; studies generally lost their powers of attraction, and the best of the professors and lecturers one after another disappeared.

The condition of Oxford, so unhappy under King Edward VI, became yet more deplorable under the reign of Queen Mary.

Yet during Mary's reign, two new colleges, Trinity and St. John, were founded by Roman Catholics on the ruins of monasteries, and Mary conferred upon the university a number of favors; but at the same time, acting by her authority and that of the Pope, Cardinal Pole inaugurated a new visitation in 1556, which many times canceled all the real good she had done by hunting down obnoxious persons yet remaining in Oxford, by burning in the market place all the English Bibles that could be found, and by so revising the university and college statutes (by repealing Edward's statute allowing the use of the English language in and about the university, and otherwise) that she alienated completely many who might otherwise have remained in active sympathy with the university.

The crowning of Elizabeth in November, 1558, brought another turn of the university wheel; but her rule was far different from that of Mary. There was naturally a measure of reaction, but it was comparatively moderate, for she was really more of an Anglo-Catholic than a Protestant, and meant to restore peace and promote the welfare of the institution with less regard to ecclesiastical differences; and she would have recalled to its service distinguished exiles of both parties where the reason seemed imperative. Characterized in part by qualities much like those of Mary, she also possessed remarkable judgment as well as the courage and strength of will requisite to the undertaking of whatever policy seemed to her best. The visitors whom she appointed were to "make a mild and gentle, not rigorous, reformation." And it was comparatively mild. Yet the heads of nine colleges, the dean of Christ Church, and a few canons were made to give place to Protestants; while such fellows as refused the oath of supremacy were removed.

Through Elizabeth's influence Robert Dudley, Earl of Leicester, held the chancellorship so long that the university finally fell into the rut of uniformity, and lost the spirit which a change of administration might have inspired. He did, however, a very good service when he induced Parliament to incorporate the "chancellor, masters, and scholars," which saved the institution from the risk of obtaining new charters from successive Kings.

The Queen's two visits to Oxford (1566 and 1592) were showy demonstrations. Leicester took an active interest in the administration of the university, mainly with beneficial results. The most permanent monument of his administration, however, is the test of subscription to the famous Thirty-nine Articles and the Royal Supremacy to be required of every student over 16 years of age. This rule, which was intended to exclude papists from the university, was mainly felt by the descendants of the Puritans. Thenceforth the university, once opened to all the world, became narrowed to a Church of England institution. Only in recent years have these restrictions been lessened.

James I, notwithstanding the fact that he entered upon the exercise of his powers when the conflict was sharp between the Puritans and the high-church party, was quick to perceive the importance of the influence of the universities, and was pleased to make a manifestation of his interest by commanding at the very beginning of his reign that each of the two universities should choose "two grave and learned men, professing the civil law, to serve as burgesses in the House of Commons." He also made a visit to Oxford in 1605, entering the city upon horseback with an imposing cavalcade of nobles and courtiers, to be received, as Elizabeth had been, with costly banquets and pompous ceremonies.

James was a true friend of the universities and meant to show them other favors, as the times and conditions should allow. He also had in view a reform of the

church, and frankly pointed out to the chancellors of both Oxford and Cambridge the evils resulting from a diversion of church revenues "by means of impropriation to private aggrandizement." In his initiation of an authorized translation of the Bible he selected learned men from both universities, Oxford furnishing seven heads of colleges and four other of the clergy, who afterwards became bishops. Under appeal from William Laud, president of St. John's College, who by this time (1616) had become a power in the university, there came about the order for subscription to the three articles in the thirty-sixth canon by every candidate for a degree, "for strict attendance on university sermons, and for the enforcement of other safeguards against heterodoxy;" also, in 1622, the university convocation showed its obsequious loyalty by burning the works of Paraeus, professor of divinity at Heidelberg, who advocated resistance to royal authority when tyrannically exercised in religious matters, and by a declaratory resolution in positive terms "condemning resistance to a reigning sovereign, offensive or defensive, upon any pretext whatever."

Notwithstanding all these pitiful manifestations of servility on the part of its convocation, the university gained strength and enlarged its influence during the reign of James I. This movement was manifested by new buildings and new endowments, the beginning of the "new schools," and the founding of two additional colleges—one by the widow of Nicholas Wadham, in 1610, under a royal license, and known as Wadham; the other, known as Pembroke, by the King himself, though at the actual cost of others; besides which six new professorships were instituted during his period, among them being the Savile professorships of geometry and astronomy, which have since become famous. As a consequence, the university grew in favor, so that in his last decade the residents (officers, professors, other teachers, and students) numbered between two and three thousand, with increase from year to year, until the upheaval of the civil war under his successor.

Charles I was also well disposed toward the university, and would probably have done more for its furtherance than he did had he been blessed with advisers other than Buckingham for matters of state and Laud in those of the church. Laud, though too intense in his Arminian prejudices, and too strongly in sympathy with the absolutism of the King, did not forget the university, but was determined to have his way at whatever cost. From the accession until 1630 he was simply dean of Westminster, and thus escaped the immediate trials which came of the occupation of the buildings of the university for a time (in 1625) by the Parliament on account of the plague at London. But he was, nevertheless, the King's adviser just the same, and was practical dictator in the committee appointed by the King for a settlement of the disturbances which attended the election of university proctors in 1628; and in 1630, upon the death of the Earl of Pembroke, he was elected chancellor.

During his incumbency of eleven years Laud was so active and vigilant a head of the university that nothing escaped him, not even the smallest details of student life, much less the religious bearing of all members of the university who gave the slightest signs of sympathy with Puritanism or Calvinism.

It will not be denied that Laud's most important work was that of framing and finally promulgating the statutes which came to be known as "Laudian" or "Caroline," and which governed the university for two hundred years. Up to his time the statute making had been more or less in the hands of the university itself (the congregation or convocation). This new "corpus statutorum" was revised by Laud, a copy was posted by him in each college or hall for a year for the convenience of any who might wish to make suggestions; it was then confirmed by the King, and finally, in all humility and thankfulness, was formally accepted by the university convocation itself. Its general drift was oligarchic. The public election of proctors was superseded by a private election limited to doctors and masters of a certain standing in each of the colleges; it provided that the vice-chancellor

should be annually nominated by the chancellor from the heads of colleges with the approval of convocation. He was thus the agent of the chancellor and the actual ruler of the university (the chancellor becoming an ornamental personage), guarding the university pulpit from heterodoxy and clothed with many powers in the work of administration.

In the matter of studies the new statutes made requirements so far superior to those of a later day that it may be doubted whether they were strictly enforced. Thus a candidate for the degree of bachelor of arts, already master of Latin and other preparatory studies, must have spent four years in the study of grammar, geometry, rhetoric, the ethics, politics, and economics of Aristotle, logic, moral philosophy, and Greek, while the degree of M. A. meant three additional years spent more especially upon geometry, astronomy, natural philosophy, metaphysics, Greek, and Hebrew. Examinations were exhaustive, but after a century and a half the examination system of Laud became mostly a name.

Besides these contributions of labor and genius, Laud did much else that contributed to the prosperity and popularity of the university, such as giving to the library an important collection of Oriental manuscripts; founding and endowing a professorship of Arabic; procuring valuable gifts of many kinds; inducing the King to annex canonries of Christ Church to the professorship of Hebrew and the office of public orator; obtaining from the King the university's right of printing Bibles; securing to it a new charter; extending all its ancient liberties and privileges; and, as many believe, doing much toward the founding of the Botanic Gardens, as well as toward the establishment of the convocation house and the extension of the Bodleian library.

Even before his resignation of the chancellorship, in 1641, there were premonitory indications of the civil war, and no little disturbance of the studies at Oxford. But in the matter of discipline and of orderly conduct there had been noteworthy improvement since the days when Oxford swarmed with noncollegiate students and there was little power to enforce regulations, however good, though even yet there was little of decent courtesy among students, and occasional town and gown outbreaks occurred, as of old. King James had deprecated rough sports because they brought crowds together and might lead to disorder.

Because of Charles's sympathy with the desire of the university to maintain the "apostolical order" of the bishops, Parliament, which was on the point of passing the "Root and branch bill" for abolishing episcopacy, was all the more determined to reject the petition of the university on behalf of episcopacy and the cathedrals which he favored. He firmly believed that "Learning and studies must needs perish if the honors and rewards of learning were destroyed," meaning the revenues of church preferment for university graduates, and "would rather feed on bread and water than mingle any part of God's patrimonie with his own revenues." On the other hand, the House of Commons proceeded to pass the "grand remonstrance," which was the famous general indictment of the Crown and appeal to the people of England, and soon after the rupture between King and Parliament was complete. The university received a "protestation" from the speaker of the house, to be subscribed by the vice-chancellor and heads of colleges, binding them to maintain Protestantism and the union of the three kingdoms. This was in February, 1642. In August the King raised his standard at Nottingham, and in the September following parliamentary troops were occupying Oxford and its university in order to make sure of the treasures known to be there; but on October 29 Charles I marched into Oxford at the head of an army, making it not only his base of military operations, but the seat of the royal government also. It had previously contributed money and college plate to the King's cause, and many graduates and students had enrolled themselves in response to a royal proclamation. The King was welcomed both by the university and the mayor and leading citizens of the town, the former expressing

its devotion in Latin addresses and by conferring degrees on the noblemen and courtiers of his train. The different colleges were converted into military quarters and lectures and exercises were nearly suspended, the less loyal students leaving the place. The arrival of the Queen in 1643 was celebrated with great ceremony. Oxford presented the aspect partly of a royal residence and partly that of a camp, instead of a seat of learning, for three long years.

Three years later, and a new scene of the military history of Oxford was witnessed. It was Fairfax at the head of a besieging force and demanding of Sir Thomas Glenham, the governor, the immediate surrender of Oxford, and yet in terms so moderate and so mindful of the university as to be always remembered to the honor of his name. These were his words: "I very much desire the preservation of that place so famous for learning from ruin, which inevitably is like to fall upon it unless you concur." Repeated conferences were had, and after nine days (on June 20, 1646) a surrender was agreed upon; the conditions being that both the city and the university should "enjoy all their ancient privileges with immunities from taxation;" that the colleges should "enjoy their ancient form of government, subordinate to the immediate authority and power of Parliament, \* \* \* and that all churches, chapels, etc., shall be preserved from defacing and spoil;" also, that if any removals were made by Parliament the persons removed should retain their emoluments for six months.

On the 24th of June the royal garrison of 3,000 troops marched out of Oxford, with colors flying, and both its citizens and such officers and students as had remained took a long free breath once more, though so nearly starved that even those most needy were constrained to divide with their suffering neighbors; and All Souls passed an ordinance that "there shall be only one meal a day between this and next Christmas, and so longer, if we shall see occasion." All the buildings of university and colleges had been seriously damaged; supplies of every sort, as well as plate, were gone. In fact, as Anthony Wood has said, "In a word, there was scarce the face of an university left, all things being out of order and disturbed;" and the university was impoverished by the sacrifice of its money and plate for the King.

Charles had escaped in disguise even before the appearance of Fairfax, but his work for the university had now ended. Parliament was in control. Its first act touching the university was to pass the ordinance of May 1, 1647, "for the visitation and reformation of the University of Oxford and the several colleges and halls therein;" the object being "the due correction of offenses, abuses, and disorders, especially those of late times committed there." The visitors were 24 in number, 10 clergy and 14 laymen, but very soon by the absence of laymen became practically an ecclesiastical body. Moreover, it soon became manifest that its work, which included an inquiry concerning those who had not taken the "solemn league and covenant," those who had opposed the Parliament in arms, etc., was designed for the promotion of Presbyterianism rather than for the university's advancement. The proceedings of the visitors became more and more arbitrary as time went on, until the entire management of the university was given them; complete subjection to the Parliament was enforced by expulsions of heads of colleges, and even military aid was brought in to enforce obedience to the Parliament. Meanwhile Fairfax and Cromwell visited the university in May, 1649. They were handsomely entertained, and the university authorities were addressed by Cromwell in terms which gave assurance of his regard for learning and of his desire to promote the welfare of the university for the sake of the Commonwealth. A little later he became chancellor, but limited himself chiefly to the appointment of Dr. Conant, rector of Exeter, to the vice-chancellorship and in 1657 resigned, after presenting the university with a valuable collection of manuscripts. The parliamentary visitation ceased in 1658, when a general reaction against Puritanism was setting in all through England, and the university recovered its independence. The visitation had really fostered

learning, or rather had not stifled it, notwithstanding its political severity. "The academical population was already larger than it had been in the reign of James I" (Brodrick), while there were quite as many scholars and divines. Clarendon, quoted by Brodrick, states that Charles II found the university "abounding in excellent learning."

After the Restoration Charles II, like his father, proved himself friendly to the university by repeated visits, and in 1681 held his Parliament at Oxford—the last ever held in that city. A number of important improvements in both city and university were made during his reign, among them the building of a great theater by Gilbert Sheldon (at first warden of All Souls, then Archbishop of Canterbury, and in 1667 chancellor) at a cost to himself alone of £25,000, Christopher Wren acting as architect. But his most important part was done when in June, 1660—steps toward a "free parliament" having already been taken—he sent or caused the sending of a new set of visitors to Oxford to see to the undoing of what had been wrongly done during the "usurpation." Of course the expelled royalists who had survived were recalled. Besides which an act of uniformity provided that candidates for a fellowship should make, in the presence of the vice-chancellor, a declaration of conformity to the liturgy of the Church of England, a provision which rendered the position of Puritans practically untenable and made Oxford again a school for the clergy and gentry. During the political disturbances of the civil war, as well as after the Restoration, there was great intellectual activity at Oxford. The Royal Society held its early meetings there, its founders being largely Oxford men. During this period, too, the change from scholastic disputations to *literæ humaniores* took place in examinations, and the fashion of writing Latin sonnets as an accomplishment was introduced, which became a prominent literary feature of the university. In the latter part of Charles II's reign there was a decline of the university, which the historian Wood ascribes—

(1) To the continued expectation of another Parliament to be held at Oxford and occupy the university buildings to the exclusion of teachers and students.

(2) To the fear on the part of the Whigs (in harmony with Parliament) that their sons, if sent, would become Tories.

(3) To the ground that the university was suspected of sympathy with the Romish Church.

The last act of the university convocation under his reign was to issue a decree condemning resistance to a king, and the last of Charles's own acts touching the university was to order the removal of John Locke from his studentship upon a grossly false charge of disloyalty.

James II characteristically disregarded the privileges of the university; for notwithstanding the university's remarkable proofs of loyalty to him by affording volunteers for his cause and celebrating the victory of Sedgemoor, besides other acts less noteworthy, yet all of them entitling it to his gratitude, he brutally overrode the elective rights of some of its colleges, or attempted to do so, going so far as to visit Oxford in September, 1687, and in person using threats to insure obedience to his nomination of an unworthy head of Magdalen College. To its everlasting honor, Magdalen refused obedience and took its own course in a manner that won the respect of the nation and contributed not a little to his downfall.

The eighteenth century was almost barren of results for the university. William and Mary did little or nothing for its benefit. The university was strongly Tory and was so demonstrative when the rebellion in Scotland broke out in 1715, that it was necessary to quarter a regiment of troops in Oxford to overawe the Jacobites of the university, whose hostility to the House of Hanover was outspoken. Jacobitism, however, gradually waned; George II was friendly and became the recipient of grateful acknowledgments because of a concurrence between the King and university on religious grounds, and George III so won its favor by his dissolution of the coali-

tion ministry, and transferring his confidence to William Pitt, as to receive its public acknowledgments, in return for which he was pleased to visit Oxford in both 1785 and 1786. Stagnation at the university so prevailed that the institution was in strong terms reproached by such men as Adam Smith, Lord Chesterfield, Lord Malmesbury, Lord Eldon, and Edward Gibbon. One refers to the inefficiency of professors and tutors; another speaks of the "drinking strong ale and the smoking of tobacco as the chief accomplishments;" another condemns the examinations as being "merely nominal;" and numbers of others equally trustworthy noted still other faults and deficiencies.

Brodrick declares it "certain that Oxford contributed far less than in former ages to politics or literature," and that "in learning it was distanced by Cambridge, where the modern examination system was developed earlier, and where the immortal researches of Newton and the solid learning of Bentley had raised the ideal of academical study."

But in justice it should be added that a number of distinguished men have in a measure discounted these severe judgments, among them Bishop Lowth, Lord Sheffield (editor of Gibbon's *Memoirs*), John Wesley, Dr. Samuel Johnson, Sir William Jones, and the illustrious Berkeley; and it should be remembered that the epoch-making Methodist movement had its origin at Oxford at this time. But the eighteenth century was also signalized by scientific activity at Oxford. The Regius professorship of modern history was established by George I in 1724. In 1749 the first professor of experimental philosophy was appointed. In 1780 the clinical professorship was established, in 1795 the professorship of Anglo-Saxon, and in 1798 that of anatomy, medicine, and chemistry.

As for the history of Oxford during the nineteenth century, Dr. Brodrick, warden of Merton College, would divide it into two periods—the first to the date of the reform act of 1832 and the ecclesiastical reaction which followed; the second embracing the last few years of the reign of William IV and the whole reign of Victoria. He quotes the Oxford University commission, named in 1850, as declaring that up to the statute passed in 1800 the studies of the university had been for a considerable time in an "abject state." The system introduced by Laud had failed, because it furnished no guaranty for the competency of examiners or against their collusion with candidates for degrees, who in turn were left without inspiration or hope of distinction. Credit for the curative statute of 1800 is given to Dr. Eveleigh, provost of Oriel. He based the new statutes on the Laudian system, which presupposes an inherent supremacy in the faculty of arts, specifying grammar, rhetoric, logic, moral philosophy, and the elements of mathematics, but adding Latin and Greek literature, as the subjects essential to examination. His original and very important remedy for the stagnant condition of things was a system of examinations that would vigorously arouse and make alive both teachers and students. Candidates for degrees could content themselves with what is now known as a "pass," which stands for a bare squeeze through the graduate gate, or, if ambitious, could win "honor" degrees. Moreover, the honor list was divided into two classes and the names of honor men were arranged in the order of merit. The M. A. degree was also to depend on another examination in advanced studies, such as the higher mathematics, history, and Hebrew. The same with civil law, the degree in which, resting primarily upon the degree of A. B. or an examination in the branches requisite thereto, finally depends on examinations in jurisprudence and history. Moreover, the examiners were to be paid salaries for their services, and were to serve for terms of several years, after solemn pledges of faithful and impartial service.

Proof of the practical value of the reform instituted by Eveleigh is found in the fact that in the very year after it went into operation the number of B. A. degrees rose to 250, "largely exceeding the average of degrees and even of matriculations in several preceding years."

Various changes in the system were made by statute at various times, until in August, 1850, a royal commission was instituted for a general inquiry into the state of the university and colleges—a commission whose report is said to have been the most comprehensive review of the entire university system ever published. Its recommendations were for the most part adopted and put in force, some by act of parliament in 1854 and some by means of ordinances framed by executive commissioners appointed by it for the several colleges.

Some of the more important reforms effected by this act of 1854 were these:

(1) There was created a new "congregation," to embrace all resident members of the "university convocation," which congregation soon became a great and "vigorous deliberative assembly, with the right of speaking in English," instead of Latin, as theretofore.

(2) The colleges, though deprived of what had been a monopoly for so long a time, thus opening the way to university extension through growth of private halls, were, on the other hand, now released from their bondage to laws enacted in the Middle Ages, invested with new constitutions and accorded new legislative powers.

(3) The fellowships were thrown open to merit—a reform which had the effect of stimulating students and of placing the governing power of the colleges in the hands of able and progressive men.

(4) By the removal of many unwise restrictions upon scholarships they were thrown open to merit, while their number was greatly increased.

(5) It prohibited religious tests both at matriculation and on taking a bachelor's degree.

(6) On the part of the university, as such, there were added to the enlarged curriculum an improved system of examinations, an important museum of natural science, and an assurance of permanency in the means of extension was provided by a clause in the college ordinances to the effect that fellowships should be appropriated "for the encouragement of all the studies recognized by the university."

In commenting upon the reform acts of 1850 and 1854, especially the latter, Dr. Brodrick says:

Other salutary changes naturally grew out of this comprehensive reform, and far greater progress was made by the university during the thirty years immediately following it than in any previous century of its history. The impulse given to education reacted upon learning and research; Oxford science began once more to command the respect of Europe; the professoriate received an accession of illustrious names, and college tuition, instead of being the mere temporary vocation of fellows waiting for livings, gradually placed itself on the footing of a regular profession. Instead of drying up the bounty of founders, as had been confidently predicted, the reforms of 1854 apparently caused the stream of benefactions to flow with renewed abundance. Nearly all the older colleges have extended their buildings, mostly by the aid of private munificence. [A new one (Keble) has been established and an old one refounded under its original name (Hertford), with an increased endowment.] Meanwhile, a new class of "unattached" or "noncollegiate" students has been created, the number of which rose to 284 in 1880, though it has since manifested a tendency to fall. The aggregate strength of the university has been doubled within the same period of thirty-two years, and the net total of undergraduates in residence has been swelled from about 1,300 to upward of 2,500, and the annual matriculations have increased in a like proportion.

The complete abolition of university tests was effected by an act of 1871, after successive years of petitions from the university. This act admitted nonconformists to the degrees and endowments of the university.

In 1873 a scheme was inaugurated for indirectly connecting the universities of Oxford and Cambridge with the middle class (or secondary) public schools, by which the said universities instituted the examinations of such schools by a joint board, representing the universities, and the granting of certificates to be recognized at Oxford and Cambridge.

In 1876 a bill, which had its origin in Gladstone's initiatory commission of 1872, inquiring into the financial condition of the colleges and the university, was introduced by the Marquis of Salisbury, who was at the same time chancellor of the university and an important member of the Government, with the intent to strengthen the university by such diversions of college funds as should seem proper. Somewhat amended, it was passed in 1877, instituting an executive commission with "sweeping powers of revision and legislation," which for the most part seem to have been wisely exercised. Accordingly the past half century has been characterized by many important changes for the better.

Passing in review the several halls, including two for women, the many colleges, with their stately and beautiful edifices of varied architecture, mediæval and modern, a stranger unfamiliar with the history of Oxford would doubtless look around inquiringly for the university itself. If persistent, he would find that it exists, though in an intangible form. It has its convocation house, its own libraries, especially the Bodleian; its museums, its special apparatus for teaching, and its own "university chest" or treasury. There are also at Oxford four nonresidential theological institutions, namely, Wycliffe Hall, Pusey House, Mansfield College, Manchester College. Mr. J. Wells, fellow of Wadham College, says:

I should say that Oxford is a federal republic of colleges. As every citizen of the United States is a citizen of some special State, so every Oxford man is a member of some college; and so the Bodleian Library and university chest at Oxford may compare with the institutions (Congressional Library and National Treasury) at Washington.

The institutions supported and controlled by convocation are these: The Bodleian Library, the Radcliffe Library (scientific), the Taylor Institution (modern languages), and the Sheldonian Theater.

The museums are: The Ashmolean, the university museum, the university galleries, the Pitt-Rivers (anthropological), the Indian Institute, and the botanical garden and collections.

The press, so fruitful of valued products, is known as the Clarendon.

The observatories available are the university observatory and the Radcliffe, the last named being under its own trustees.

The university is a sovereign body of some 13,000 men, whose names are on its books as well as on those of some one of the 23 colleges. They are resident and non-resident.

The federal government of the university consists of two branches, the legislative and the executive.

The executive officers of the university are:

(1) The chancellor, who is chosen by convocation for life and has been for centuries some nobleman of distinction, usually nonresident, whose powers are to a large degree judicial as well as executive, and whose duty it is annually to delegate his authority to a vice-chancellor of his nomination.

(2) The vice-chancellor, who, according to Louis Dyer, M. A., author of *Oxford As It Is*, is required to live at the university to see "that all statutory meetings, lectures, and the like, take place in due order, and that only worthy men be promoted to degrees;" to inquire into reported wrongdoing and punish offenders against the statutes; with the proctors and lesser officers to exercise a general oversight of all university records, registers, property, and affairs, as well as a guardianship of the rights and liberties of the university—to this end also serving as head of the vice-chancellor's court.

(3) The proctors, senior and junior, who are chosen from among masters by the several colleges in rotation, and whose function it is to enforce the university and college discipline.

(4) Professors, lecturers, tutors, and other subordinate officers.

The legislative and administrative bodies which constitute the governing powers are:

(1) The convocation—a body of some 6,000 graduates, who have taken the degree of M. A., or that of D. D., or D. C. L., or M. D., and who are resident or nonresident. It is the supreme body with the most important of appointive rights and the right of conferring degrees granted by either diploma or decree.

(2) The congregation—a comparatively small body, consisting in any given year of such members of the convocation as have resided in Oxford for at least one hundred and forty days during the previous academic year. Its function is to receive and approve or reject measures of legislation originated below, and finally to submit the same to convocation for approval or rejection without amendment.

(3) The hebdomadal council, composed of the vice-chancellor, the ex-vice-chancellor (during the first year of his retirement), the proctors, and 18 members elected by congregation. Its sole prerogative is to initiate measures and pass them on to the congregation.

(4) Delegacies (standing committees) of convocation, acting in its behalf: (1) In the work of superintending the instruction of selected candidates for the civil service of India; (2) in the training of elementary teachers; (3) in conducting local examinations; (4) in the examination of schools; and (5) in the extension of teaching to points outside of Oxford, the number of such at present being 200. Summer schools or vacation lectures come under the delegates for extension of teaching.

Mr. Wells, of Wadham College, has said: "The faults of the English universities have been mainly due to the fact that they have reflected only too faithfully the aristocratic organization of society in England. They have given their best to the few, but they have not reached the many." And yet he appears to have so long deplored this great fault as to have unduly lost heart and overlooked the many changes of recent years. The aristocratic element has not yet been extinguished; ecclesiasticism, though still supreme, has in good part yielded up its despotism of the mediæval times; and the proportion of "pass" graduates will grow less and less under the changed condition of things brought about within the past few years—changes so clearly and concisely set forth by the able warden of Merton College, already more than once quoted, that I can not do better than to borrow his words of the year 1900, namely:

The introduction of representative government into the academical constitution has not only cleared away many abuses, but has at once popularized and centralized university administration. The recognition of unattached students [connected with no college] has broken down the monopoly of colleges; the abolition of close fellowships has infused new blood and new ideas into the more backward collegiate bodies; the spontaneous development of numerous clubs and associations—athletic, literary, or political—has created many new ties among undergraduates, and weakened the old exclusive spirit of college partisanship. The "combined lecture system," under which the inmates of one college may receive instruction in another, has also favored a division of labor among tutors which is directly conducive to specialism in teaching. The great extension of the professoriate, including the new order of university readers, and still more the liberal encouragement of new studies, has infinitely expanded the intellectual interests both of teachers and of students; the admission of nonconformists and the progress of free thought have powerfully modified theological bigotry; the multiplication of feminine influences has undermined the ideal of seminomastic seclusion, and greatly increased the innocent æsthetic distractions which are the most formidable rivals of the austerer muses. The gulf between Oxford society and the great world outside, never very impassable, has been effectually bridged over in every direction. A very large proportion of professors and college tutors have traveled widely; many are well known in London as contributors to scientific and literary periodicals, or otherwise; while Oxford itself is constantly thronged with visitors from the metropolis. In ceasing to be clerical and aristocratic, the university has become far more cosmopolitan; all religions are there mingled harmoniously, nor is it uncommon to meet in the streets young men of Oriental race and complexion wearing academical costume.<sup>a</sup>

<sup>a</sup> Brodrick's History of the University of Oxford, pp. 220-221.

Dr. Brodrick also claims that "in the meantime a marked and widespread reformation has been wrought in the morals of the university," and that "the ostentation of wealth has been visibly diminished."

### THE BODLEIAN TRICENTENARY.

[On the 8th of October, 1902, was celebrated the tricentenary of the Bodleian Library. In reference to this event the *Fortnightly Review* published (October, 1902, pp. 637-647) an historical review, by J. B. Firth of the institution, from which the following particulars are cited.]

Early this month the University of Oxford will celebrate the tricentenary of one of its most famous and picturesque institutions, the Bodleian Library. Its doors were first opened to readers on November 8, 1602, but the commemoration has been antedated by a month, so that it might not fall during term time, when the colleges would not have been able to offer adequate hospitality to the distinguished representatives of the chief libraries in this country and abroad, and of many foreign universities and learned societies, who are expected to be present. The event is of interest to all friends of learning and to all lovers of books, for the Bodleian, though not the largest library in the world, is certainly the most romantic and the most fascinating. There is no other which can compare with it in the charm of its setting; none which is so essentially the work of one pious founder. Who, for example, thinks of the British Museum as having grown up round the library which Sir John Cotton presented to the nation? Like the *Bibliothèque Nationale* in Paris, and the Library of Congress at Washington, the British Museum is simply a great institution of State, supported by public moneys, thoroughly impersonal, and making little or no appeal to sentiment. But the Bodleian, or rather Bodley's Library—to give it the title by which it was always known during the first two centuries of its career—makes an intimate and personal appeal to all who climb the winding staircase which gives access to its ancient galleries and halls. The spirit of Sir Thomas Bodley pervades them; one feels instinctively that here is the handiwork of a single man, and that a single brain devised the whole magnificent scheme. The librarian is still Bodley's Librarian. Bodley is, and must ever continue to be, the presiding genius of the place.

As his praise will be on the lips of all those who attend the tricentenary of the opening of the library, a word may be said of the circumstances which induced him to embark upon such an enterprise. The University of Oxford was without a library when Thomas Bodley entered at Magdalen College in 1560, as a boy of sixteen. He had already been well grounded in all the voluminous learning of Geneva, whither he had been taken in childhood by his father, a Devonshire Protestant from Exeter, who had been driven to fly from England during the Marian persecutions. The youthful Bodley had studied Greek with Beroaldus and Constantius, and Hebrew with Chevalerius. Beza and Calvin had taught him theology, and as the fiery Knox was also living in exile in the Swiss city of refuge, Bodley probably had often "sate under" him and learned from his discourses the principles of religion and the applications of rhetoric. But when he went to Oxford he found the old university library denuded of books, and stripped of the shelves to which they had been chained. Even the benches of Duke Humphrey's library had been sold five years before, and the hall was desolate.

The story of this pre-Bodleian library is a curious one. There is no mention of a university library in Oxford before the beginning of the fourteenth century. Such few books as there were belonged to the colleges or to the monkish communities which had habitations there, and it was not until 1320 that Thomas Cobham, Bishop of Worcester, laid the foundations of a university library. The beginnings were small, merely a chestful of books kept in the University Church of St. Mary. Then, in 1367, a room 45 feet by 20 was built over the old house of congregation, which

stood in the northeast corner of the church. It was erected leisurely, for it does not seem to have been finished for forty-two years, and the enthusiasm of the authorities can hardly have been overpowering. This chamber, which also served the purpose of a lecture room for the Professor of Law, constituted the university library until it became inadequate to hold the books which were presented to it by Duke Humphrey of Gloucester. \* \* \*

We can forgive much to the long-forgotten schoolmen of his day when we remember their admirable taste in architecture. In 1426 the divinity school—one of the most exquisite examples of late Gothic architecture—was begun. It took many years to build, and while it was rising from its foundation the duke sent down to Oxford large consignments of manuscripts. The university was not ungrateful; on the contrary, we find the authorities presenting a memorial to Parliament in which they declare that the duke has magnified the university with a thousand pounds' worth and more of "precise books," and they beseech the speaker and the Commons "in their sage discrecions to thank hym heartly and also pray Godde to thank hym in tyme comyng when goode deedes ben rewarded." When the books became too numerous to be accommodated in the upper room of the annex of St. Mary's Church, it was determined, in 1444, to carry the divinity school a story higher and build a more commodious place for their reception. This is now the central portion of the Bodleian Library and still bears Duke Humphrey's name. \* \* \*

In 1550 the library suffered a crushing blow. The boy king, Edward VI, in the zeal of his Protestantism, published an edict for "the calling out of all superstitious books, as missals, legends, and the like," and commissioners were appointed to visit the universities for that purpose. In due course they came to Oxford and presented themselves at Duke Humphrey's library. There they worked havoc. They carried out their instructions so literally that they destroyed every illuminated missal or manuscript on which they laid hands. It is probable, indeed, that they condemned volumes at a hazard without regard for their contents, and that the mere presence of a rubricated initial was held to be sufficient evidence that a manuscript was Papistical and idolatrous. Possibly, too, in the confusion caused by such a visitation, books were freely looted and stolen; but the fact remains that after they had completed their visitation the library stood empty. Edward VI was no enemy of learning, as his foundation of Christ's Hospital and other schools throughout the Kingdom plainly shows. The dispersal and destruction of the library at Oxford were due principally to religious bigotry, but one can not help suspecting that the commissioners had some private reasons for venting their spite upon the books of Duke Humphrey's collection. Apparently the university acquiesced without demur; at any rate, after the commissioners had gone, the authorities made no attempt to repair the mischief which had been wrought, and five years later a delegacy of five "venerabiles viri" was appointed to sell the benches and bookshelves which had formed the furniture of the Duke's library. They did as they were bidden to do; the hall was stripped bare, and from 1555 down to the day when Thomas Bodley refounded the library the university had no books. \* \* \*

It was in 1598, then, that Bodley wrote to the vice-chancellor offering to refound Duke Humphrey's library. He was a man ideally fitted to undertake such a work, and his qualifications, as he himself explained, were fourfold. He possessed "some kind of knowledge as well in the learned and modern tongues as in sundry other sorts of scholastical literature, purse ability to go through with the charge, great share of honorable friends to further the design, and special good leisure to follow such a work." Like most of the Elizabethan worthies, he was scholar and man of affairs combined. He had married the widow of a rich Bristol merchant, and apparently made free use of the lady's purse. His friends included the most influential men of his time, and he had the remainder of his life before him in which to carry out his project. Naturally his offer was accepted with enthusiasm, for he took upon

himself the cost of refitting Duke Humphrey's library with shelves and seats, procuring benefactions of books, and endowing the library with an annual income. The workmen found that the building itself had been allowed to get into a lamentable state of disrepair. The roof had become rotten and required to be replaced. Bodley thereupon persuaded Merton College to find the timber, and the exquisitely paneled ceiling, divided into square compartments, each bearing the university arms, which is now one of the sights of Oxford, was prepared and set up. Bodley was determined that his library should be lacking in nothing that might increase either its beauty or utility. He sent his agents all over the Continent buying manuscripts and books. The times were favorable to his design, for book collectors were few, money was scarce, and many of those who owned manuscripts were quite ready to sell. So his agents returned with many excellent bargains which they had made in Spain, France, Germany, and Italy. Bodley did his own book hunting in London, and was so successful in his search that by the time the library was ready for opening in 1602 there were 2,000 volumes chained to their cases.

One energetic man can accomplish much, and Bodley's efforts did not cease when he saw the completion of his self-imposed task. He devoted his life to the library, and the authorities at Oxford gave him an absolutely free hand to do as he thought fit. It was he who appointed the first librarian, one Dr. James, at the very modest salary of £5 15s. 4d. a quarter. Bodley insisted that his librarians should be unmarried—that they might have no domestic distraction from their duties—and though he exempted James from this regulation, it remained in force down to 1813. Nor was it until 1856 that the rule was abolished which enacted that a librarian should be unmarried at the date of his election. A much sounder regulation was that which forbade any volume being taken out of the library on any pretext whatever, "by any person or persons of whatsoever state or calling, upon any caution or offer of security for faithful restitution." The Duke's library had suffered grievously on this account; Bodley determined that his should not. This statute was faithfully observed even when kings sought to break it. When Charles I was in Oxford in 1645 and wanted to borrow D'Aubigné's *Universal History*, he asked permission from the vice-chancellor of the day. The vice-chancellor assented, but the librarian refused the books, and it stands to the King's credit that he took the rebuff graciously. "Let the will of the founder be observed," said His Majesty. It may be that he remembered the £500 which he had borrowed from Bodley's strong box three years before and never repaid. Nine years later Cromwell met with a similar refusal. \* \* \*

In 1610 the eastern wing of the library was completed, and at Bodley's death, in 1613, the present picture galleries were nearing completion. \* \* \*

Great, however, as his earlier benefactions had been, perhaps the most valuable day's work which Bodley did for the library was in 1611, when he obtained from the Stationers' company an agreement whereby they stipulated to send to the Bodleian a copy of every book entered at their hall. There is a tradition that Bodley presented the Company with a piece of plate, valued at £50, in consideration of this indenture, but it is impossible to say whether this was actually the case. But to have obtained such an agreement at all shows the provida mens of the founder, who by a stroke of the pen secured for the library the, at that time, unique distinction of being a depository of the national literature. Since 1611 the privilege has been extended to others. Cambridge secured it in the reign of Charles II. In Queen Anne's time it was granted to nine libraries; in George III's reign to eleven. It has been since restricted to five—the Bodleian, the British Museum, the Cambridge University Library, the Advocates' Library at Edinburgh, and the library of Trinity College, Dublin. But each successive copyright act has indorsed the original agreement which Sir Thomas Bodley so diplomatically obtained from the Stationers' Company. The result was that even when the university cared more for

politics and port than for manuscripts and learning, the stream of books never ceased to flow from London to Oxford. Whether they were consulted or not, they were at least to be found upon the shelves.

Such was the foundation of the Bodleian Library, and for three centuries it has continued to grow in strength. It has profited magnificently by many superb bequests. Archbishop Laud, John Selden, Bishop Rawlinson, Gough, Douce, Mason—these are among the most conspicuous names on the long roll of benefactors. Judicious purchases at times when manuscripts and rare books did not command their present inflated prices have added largely to the richness of the library, with the result that in many important departments the Bodleian stands without a rival among the great libraries of the world. According to a rough computation, it now contains more than 600,000 bound volumes and 30,000 manuscripts. If title-pages were counted, the number would be nearer a million and a half. It is impossible to estimate the services which the Bodleian has rendered to learning. The utility of an institution which for three hundred years has been the resort of learned scholars from every quarter of the globe is immeasurable. It has had, of course, its vicissitudes, its periods of comparative neglect. \* \* \*

The well-known passage in Gibbon's *Autobiography* in which he mercilessly condemns the sloth of the university and its absolute indifference to study finds a curious confirmation in the records of the Bodleian. For example, the registers for the years between 1730 and 1740 show that it was a rare occurrence for more than one or two books to be asked for in a day, and sometimes a week passed without a single entry being made. \* \* \*

It is of course almost unnecessary to add that the reproach of indifference has long ceased to be applicable to the Bodleian. To render the library as efficient as possible, to keep it abreast of all modern requirements, to meet as fully as can be the needs of every reader, whatever his subject, is the daily care of all those who are responsible for its management. Sir Thomas Bodley would be well content if he could visit his favorite haunt; he would find it pervaded with a whole-hearted enthusiasm similar to his own.

But he would promptly bestir himself to improve its financial position, and would not rest until he had succeeded. It is a matter for sincere regret that an institution with such a past and with an even more splendid future before it should find itself crippled at its tercentenary by lack of pence. Its means are not merely slender; they are notoriously and pitifully inadequate. The University of Oxford is poor, the calls which are made upon its resources are endless in their variety, and the outside critic who is constantly urging the university to modernize itself and bring itself "up to date" very rarely suggests where the necessary funds are to be found; and of recent years most of the money which the university has had to dispose of has been expended upon the erection of buildings for the teaching of natural science. There has been little left for the Bodleian. The agricultural depression, which has seriously affected the revenues of nearly all the colleges, has made it impossible for All Souls to pay the £1,000 a year which the last university commission directed them to pay toward the maintenance of the Bodleian. For many years together the college was unable to pay anything at all; in the last general statement of the Bodleian accounts its contribution was but £350. That balance sheet is an interesting document. It shows that the total revenue was about £9,000, of which £2,500 was derived from endowments and about £5,000 from grants by the university, the remainder being made up by special contributions and fees of various sorts. The expenses show that the salaries of the staff amount to nearly £5,000, and that the upkeep of the building and general printing bill absorb another £1,000. During the last year £1,835 was spent on the purchase of manuscripts and books and £681 on binding. There were special reasons why certain necessary and normal expenditure

was postponed in 1901, and the credit balance of £500 which was carried forward to the present year is therefore quite misleading.

An income of £9,000 may seem large, but it is, as a matter of fact, entirely inadequate. The extent of its deficiency may be judged by comparing it with the corresponding income of the British Museum. After deducting the cost of all the departments in the Bloomsbury institution, to which there is nothing analogous in the Bodleian, the fact remains that the nation spends on the library of the British Museum a sum not far short of £70,000 a year. Yet this library is not more than twice the size of the Bodleian, and when every allowance is made for the difference between them, for the greater number of readers in London and the inevitably larger expenses connected with the British Museum, the relative poverty of the Bodleian still remains sufficiently striking. At the lowest estimate its income ought to be double what it is at the present time. \* \* \*

The problem of finding accommodation for the annual increase of the library, which amounts to about 17,000 ordinary octavo volumes, has long been serious. It is now acute. Every inch of available space in the Bodleian itself and the adjoining Radcliffe has been occupied. All the latest inventions for economizing room have been adopted. Both garrets and cellars have been turned into storehouses, and the books have begun to overflow into the subterranean regions of the neighboring Sheldonian Theater. But the time is rapidly approaching when the policy of temporary makeshift will have to be abandoned, when it will be necessary to build either above or below ground. Plans have been prepared for the construction of a vast underground and damp-proof storage house below Radcliffe square, which would accommodate a million volumes, and it is not improbable that the scheme would be adopted if the university has the funds available to carry it through. It would certainly be less costly than building above ground, for the erection of a mere utility warehouse in the immediate vicinity of the Bodleian would be an outrage upon the stately buildings which cluster there, to say nothing of the difficulty of obtaining a site. How, then, is the money to be found? Government assistance is hardly to be looked for. Some claim might undoubtedly be based upon the fact that the Bodleian binds and houses a vast mass of Government publications, which the authorities would not dream of buying, yet which must be preserved on the chance that some day they will be called for by the specialist student. But good though this claim may be, it is obvious that there are many other demands on the treasury which ought to be satisfied first. The ideal solution, of course, would be to discover a second Sir Thomas Bodley, or, failing him, a rich benefactor. \* \* \*

The founding of public free libraries, whose principal function—at any rate, at present—seems to be that of providing the homes of the lower middle classes with a regular supply of inferior fiction, is the passion of the moment. One wishes these no harm, but it is just a little incongruous that, while they are liberally provided for, an institution like the Bodleian is left to struggle with adversity.

---

## OXFORD UNIVERSITY EXTENSION LECTURES.

### GENERAL SUMMARY OF THE AIMS AND METHODS OF UNIVERSITY EXTENSION TEACHING.

[From the Official Prospectus.]

*The object of the university extension movement.*—The university extension movement seeks to bring the university to the people when the people can not come to the university. Its aim is to bring within the reach of every one the opportunity of higher education, which widens the intelligence, enlarges the sympathies, and enables men and women to employ their leisure better, and to enjoy it more. A certain number of students can obtain this higher education at the universities; but

for those who are unable to come to the universities, the university extension movement secures as many as possible of the advantages of a university education. It furnishes instruction organized in courses of lectures, with discussions, classes, exercises, examinations, and certificates of proficiency or distinction. It seeks not only to supply teaching adapted to popular needs, but to stimulate the demand for such teaching. It directs readers to the best books in each subject, and, by encouraging habits and suggesting methods of systematic study, helps students to make the best use of libraries and to assist them in home reading and self-culture. The lecturers—some sixty in number—by whom its work is carried on, are graduates of distinction specially selected for their competence as teachers. They form the staff of what is in effect a university college maintained by the cooperation of nearly three hundred towns.

*The history of the university extension movement.*—The phrase “University extension” became current in Oxford about 1850, but the university first took a direct part in the education of nonmatriculated students when it established its local examinations in 1858. The example of Oxford in this matter was soon followed by the University of Cambridge. The University of Cambridge further supplemented its local examinations by the scheme for local lectures in 1873. Similar arrangements for local lectures—or university extension teaching, as it is usually called—were completed by the University of Oxford in 1878, but continuous work was not begun until 1885. Since 1885, 23,016 lectures have been delivered in some 300 centers, and have been attended by over 316,988 students. As the courses are not expensive, it has been found practicable to arrange for their delivery in small as well as large towns. In order to meet the requirements of different communities, the university leaves the details of organization as elastic as possible.

*The audience.*—The audience usually consists of two divisions: (1) The general audience, consisting of men and women of all ages and all classes, who attend the lectures only, and who vary in numbers from 30 or 40 in country towns to 1,000 in large industrial centers. The average is about 150. (2) A smaller body of students who attend lectures and classes, who write the essays and are encouraged to enter for examination. These find in the lecturer a tutor who advises them in choice of books, directs their reading and corrects their written exercises. No one under 15 years of age may enter for examination, and the vast majority are adults who desire neither elementary nor secondary but higher education.

*The method of university extension teaching.*—A new center of university extension teaching is usually established as follows: A local committee is formed for the purpose of guaranteeing the expense of the lectures and of undertaking the necessary local arrangements. The members of the local committee then select a subject for the course, and, after deciding on the number of lectures to be given, arrange with the university delegates for the services of the lecturer whose attendance they require. The course, a list of which is appended, comprise subjects drawn from ancient and modern literature and history, natural science, political economy, political science, and art.

A course consists of from six to twelve lectures, delivered at weekly or fortnightly intervals. (When less than twelve lectures are arranged, it is best, if the subject is of a literary or historical character, to have the lectures at fortnightly intervals. This plan gives time for the students properly to read the books supplied in the traveling library. In some scientific subjects, however, when the student is more dependent for information on the lecturer’s oral teaching, the weekly arrangement of lectures is generally thought to be the best.) Each lecture lasts about an hour, and at its conclusion those who so wish form a class in which the lecturer discusses with the students any points of difficulty which may have arisen during the lecture. Thus, while the lecture audience consists of those who are generally interested in the subject, the attendants of the class are usually those students who are prepared to work at home in connection with the teaching. At the end of each lecture, questions are read out

or distributed to be answered by the students at home. These answers are sent by post to the lecturer, and, after having been read and corrected by him, are returned to the writers at the next week's class. During the class, students may obtain from the lecturer further oral criticism of their written exercises. They will also find additional direction in their studies by availing themselves of the system of reading circles.

*The syllabus.*—In their use of text-books the students are assisted by the printed syllabus, which gives an analysis of the lectures and provides lists of books recommended for private study.

*The traveling libraries.*—In connection with each course the delegates issue a traveling library, which contains copies of the principal text-books and authorities recommended by the lecturer. The library is returned to the delegates at the end of the course. Several courses are also illustrated by portfolios of engravings and autotypes, and many by the oxyhydrogen lantern.

Courses are classified in two departments, viz: (1) those consisting of ten lectures and upward, on which certificates are awarded, and (2) those of less than ten lectures on which no certificates are given. Certificates are awarded, under certain conditions, on two connected short courses delivered in successive sessions.

*The examination.*—At the conclusion of the course an examination is held by an examiner, other than the lecturer, appointed by the university.

In the examination those students who have not only attended the lectures but have thoroughly studied the subject of the course during its delivery in the books recommended by the lecturer have the opportunity of distinguishing themselves.

*Certificates.*—Entrance to the examination, which is in writing, is optional and open to all students over 15 years of age, who have attended not less than two-thirds of the classes following each lecture of the course, and have written for the lecturer answers to two-thirds of the questions set by him. According to the report of the examiner certificates of two grades or printed lists are awarded to the successful candidates, and a prize is given to the student whose work, if worthy of "distinction," is considered by the examiner to have shown the greatest merit. Prizes offered by local donors are awarded by the examiners on receipt of clear instructions as to the conditions on which they are offered.

The award of certificates of distinction depends on the joint recommendation of lecturer and examiner.

Terminal certificates are awarded only after courses of ten or twelve lectures; sessional certificates after a complete session's work. Examinations are permitted on shorter courses, but successful students receive, in place of a certificate, a copy of the examiner's award.

*Affiliation and higher certificates of systematic study.*—Centers undertaking to provide a suitable course of instruction extending over a period of years may apply for recognition as centers affiliated to the university. And in order further to encourage the connected and progressive study of a sequence of subjects, the delegates offer, under special conditions, affiliation certificates, or higher certificates of systematic study. Suitable certificates obtained by students on courses delivered under the supervision of the University of Cambridge, Victoria University, and the London University extension board are accepted as part of the qualification for these higher certificates. A further certificate, the vice-chancellor's certificate, is also awarded by the delegates.

*Students' associations.*—In a large number of centers students' associations have been formed to supplement the work done in the lecture room. These associations meet periodically under the guidance of a president or leader. Information as to the methods pursued, together with model rules, can be obtained on application.

*Reading circles for the guidance of home study.*—The delegates have also arranged means by which students may obtain on economical terms private tuition by correspondence in history, literature, political economy, and some departments of natu-

ral science. More than thirty reading circles have been formed, and can be joined at any time by isolated students or by groups of students. The reading circles provide opportunities for the guidance of a student's reading between the delivery of the courses of lectures. The prospectus of the reading circles can be obtained on application.

*The summer meeting.*—Steps are also taken by the delegates from time to time to arrange for university-extension students a period of study in Oxford during August. These summer meetings have been held in 1888, 1889, 1890, 1891, 1892, 1894, 1895, 1897, 1899, and 1901, each meeting being attended by about one thousand students.

#### SUMMER MEETING, 1903—OUTLINE OF THE PROGRAMME.<sup>a</sup>

[From the official announcement.]

The eleventh meeting will be held this year in Oxford, from August 1 to August 24. The meeting will be open as usual to all students, English and foreign, and will be divided for the convenience of those who can not stay the whole time into two parts: Part I, August 1-13, inclusive; Part II, August 13-24, inclusive.

The inaugural lecture will be delivered on Saturday, August 1, at 8.30 p. m., by His Excellency Mr. Joseph H. Choate, Hon. D. C. L. (Oxon), United States ambassador to the Court of St. James.

The main courses of lectures will be as follows:

*Section 1. History.*—The lectures in this section will follow in exact sequence upon those delivered at the last meeting, and will be designed to illustrate the main lines of English and general European history from Magna Charta (1215) to the close of the Middle Ages (circ. 1485).

There will be general introductory lectures designed to give a conspectus of the period as a whole, and in addition detailed lectures upon the following among other topics:

(a) The great charter and its confirmations; (b) The early history of the English Parliament; (c) The mendicant friars, Wycliffe and the Lollards; (d) The church and the universities; (e) Social history—the manor, villeinage, the black death, and the peasant revolt; (f) The hundred years' war; (g) The wars of the roses; (h) The mediæval empire; (i) The mediæval papacy; (k) The Italian republics; (l) Feudalism in France; (m) The great mediæval trade routes.

There will also be a special course of lectures on Shakespeare's English kings by Mr. J. C. Powys, and a performance of Marlowe's Edward II will be given by the Elizabethan Stage Society under the direction of Mr. William Poel.

Among other lecturers in this section will be: Rev. Augustus Jessopp, D. D., Hon. fellow of Worcester College; Rev. Hastings Rashdall, Litt. D., fellow and tutor of New College, preacher at Lincoln's Inn; Prof. A. V. Dicey, B. C. L., Vinerian professor of English law; Dr. Vinogradoff; Rev. H. L. Thompson, late censor of Christ Church; Mr. Arthur Hassall, student and tutor of Christ Church; Rev. W. H. Hutton, B. D., fellow and tutor of St. John's College; Mr. A. L. Smith, fellow and tutor of Balliol; Mr. Edward Jenks, B. C. L., reader in English law; Rev. W. H. Shaw; Mr. Horsburgh; Rev. W. K. Stride; Mr. Raymond Beazley; Mr. R. W. Jeffery, and Mr. Marriott.

*Section 2. Literature.*—This section will have special reference to (a) Chaucer and Piers Plowman, on which there will be a full course of lectures by Prof. Walter Raleigh, professor of English literature in Glasgow University; Mr. E. de Selincourt, university lecturer in modern literature; and Mr. J. A. Dale. (b) Dante, Petrarch, and Boccaccio.

Besides lectures by the Lord Bishop of Ripon (Dante) and Mr. Edmund Gardner (Petrarch and Boccaccio) there will also be a full course of lectures on Dante by Mr. Wicksteed.

<sup>a</sup>Some of the arrangements are at present provisional.

There will also be a class in middle English by Dr. Henry Sweet, reader in phonetics, and (if sufficient applications are received) a class for advanced students in the study of Dante by Mr. Wicksteed. The latter will be strictly limited in numbers.

*Section 3. Natural science.*—This section will be designed to illustrate the relations of science to industry and will be organized in three subsections dealing respectively with (a) chemistry; (b) electricity; (c) bacteriology.

Among the lecturers will be: Prof. Sims Woodhead, M. D., F. R. S. E., professor of pathology in the University of Cambridge; Prof. Raphael Meldola, F. R. S., professor of chemistry in Finsbury Technical College; Professor Warrington, F. R. S., late professor of rural economy at Oxford; Dr. C. W. Kimmins, chief inspector to the technical education board of the L. C. C.; Dr. Ritchie, reader in pathology in the University of Oxford; Mr. A. F. Walden, M. A., lecturer of New College. (This section is far from complete.) There will also be a conference on the relations of science and industry. Chairman, Sir Philip Magnus.

*Section 4. Social economics.*—This section will deal mainly with economic questions of contemporary interest, such as free trade and protection; zollvereins and preferential tariffs; taxation, imperial and local; municipal trading; trusts and combinations.

Among the lecturers will be: Hon. W. P. Reeves, agent general for New Zealand; Sir Vincent Caillard; Prof. W. J. Ashley, M. A., professor of commerce in the University of Birmingham; Prof. W. A. S. Hewins, M. A., director of the London School of Economics; Mr. M. E. Sadler, M. A.; Mr. J. H. Morgan, B. A., and others.

*Section 5. Early renaissance art and the architecture of the period.*—Among the lecturers will be: Mr. Walter Ford, M. A., King's College, Cambridge (mediaeval folk song); Br. Vaughan Williams; Mr. F. Bond, M. A., F. R. I. B. A.; Mr. Basil de Sélincourt, B. A., New College; and Mr. E. F. Caritt, M. A., fellow and lecturer of University College.

Special architectural visits and demonstrations will be arranged in connection with this section.

*Special classes.*—There will be special classes (for which a small extra charge will be made, and which will be limited in numbers) in:

(1) The history, theory, and practice of education; (2) middle English—lecturer, Dr. Henry Sweet; (3) Dante—lecturer, Mr. Wicksteed; (4) the Greek language, and (5) Italian language, if the demand justify their arrangement.

Special sermons will be preached in the Church of St. Mary-the-Virgin (University Church) by the Right Rev. the Lord Bishop of Oxford, the Right Rev. the Lord Bishop of Ripon, the Very Rev. the dean of Christ Church, the Rev. Augustus Jessopp, D. D., Hon. Fellow of Worcester College, the Rev. D. H. S. Cranage, M. A., secretary to the Cambridge syndicate for local lecturers, and others.

Theological lectures will be given by the Rev. C. Bigg, D. D., canon of Christ Church and regius professor of ecclesiastical history; the Rev. W. H. Hutton, B. D., fellow and tutor of St. John's College and Bampton lecturer (1903); and Miss Elizabeth Wordsworth, principal of Lady Margaret Hall (on Bible lessons in schools).

Conferences have been arranged on: (1) The education act of 1902 and university extension; chairman, Sir William R. Anson, D. C. L., M. P., warden of All Souls College, and parliamentary secretary to the Board of education. (2) Free libraries and higher popular education; chairman, the Right Hon. Viscount Goschen, D. C. L., F. R. S. (3) Science in its relation to industry; chairman, Sir Philip Magnus, technical education board of the L. C. C.

*Conversazioni, etc.*—There will be a conversazione, a garden party, and on August 13 excursions will be arranged to places of historical and architectural interest in the neighborhood of Oxford.

*Reception room and library.*—The reception room and reading rooms, with a refer-

ence library for students, will be in the examination schools, and will be open from 9 a. m. to 7 p. m.

A guide to preparatory reading for the summer meeting of 1903 has been published in the University Extension Journal for January and February, price 3 d., post free from the university extension office, Oxford.

*Accommodation for students.*—The full programme will contain a revised list of lodging houses, with terms. A limited number of (1) men students will be received at Balliol College, and (2) women students at Lady Margaret Hall and St. Hugh's Hall. For rooms in Balliol College, early application should be made to the secretary, university extension delegacy; for St. Hugh's Hall to the principal; for Lady Margaret Hall to Mrs. Toynbee, 10 Norham Gardens, Oxford. The charge for board and lodging at Balliol College will be 5 s. per day; at Lady Margaret Hall and St. Hugh's Hall, 30 s. per week.

*Scholarships.*—A limited number of scholarships will be awarded to enable students otherwise prevented from doing so to attend the meeting. Only those who have obtained certificates in Oxford extension courses are eligible. Particulars on application.

*Railway tickets.*—The principal railway companies have kindly made arrangements whereby holders of summer meeting tickets will this year be entitled to travel to and from Oxford for a fare and a quarter for the double journey. A special form of certificate, signed by the secretary to the delegates, must in each case be presented to the booking clerk at the station of departure. A certificate will be forwarded with each summer meeting ticket.

#### PRICE OF TICKETS.

	£	s.	d.
I. For the whole meeting.....	1	10	0
II. For the first part of the meeting only (August 1 to 13).....	1	1	0
III. For the second part of the meeting only (August 13 to 24).....	1	1	0
IV. Tickets for parties of not less than five university extension students making application before June 1 will be issued at a reduction of 10 per cent.			

[All tickets are nontransferable, and do not admit to the classes for which a special fee is charged. They entitle the holder to specially reduced terms for recreation.]

#### FORM OF APPLICATION FOR TICKETS.

Name of applicant in full (Mr., Mrs., or Miss), ————.

Home address in full, ————.

University extension center (if any) where lectures have been attended, ————.

Summer meetings in Oxford previously attended (if any), ————.

Tickets required, whether for—

(1) Whole meeting, ————.

(2) Part I only, ————.

(3) Part II only, ————.

(4) Special classes, ————.

Money inclosed, ————.

Application for tickets and all inquiries in connection with the summer meeting should be addressed to

The Secretary (J. A. R. MARRIOTT, Esq.),  
University Extension Office,  
Examination Schools,  
Oxford.

## CHAPTER XXV.

### EDUCATION IN GREAT BRITAIN AND IRELAND—1902.

Great Britain and Ireland, constitutional monarchy; area, England and Wales, 58,186 square miles; population, 32,526,075 in 1901. Scotland, 29,820 square miles; population (estimated, 1899), 4,281,850. Ireland, 32,583 square miles; population (estimated, 1896), 4,535,516.

#### TOPICAL OUTLINE.

PART I.—Current educational statistics, Great Britain and Ireland. Elementary education in Eng-  
land: Comparative statistics, 1870 to 1902; the Education Law of 1902; reaction against the adminis-  
trative policies established by the law of 1870; origin of these policies; causes of reaction; main  
features of the new law; text of the law. Appended articles elucidating the law: The new local  
authorities (from speech in the House of Commons by James Bryce, M. P.); the National Aspect of the  
Education Bill (London Times); The Clergy and the Education Act, by D. C. Lathbury (Nineteenth  
Century and After, January, 1903); The New Education Act at Work, by T. J. Macnamara (The For-  
tightly Review, January, 1903).

PART II: *Secondary and Higher Education in Great Britain and Ireland.*—The new education law in  
relation to the province of secondary and technical education. Historic survey of measures relating

to secondary education: (1) Commissions appointed to inquire into the state of endowed secondary schools; (2) examining agencies; (3) movement for promoting science and technical art instruction. State of secondary education in Scotland and Ireland. Statistics of secondary education, Great Britain and Ireland. Typical schools and programs. Higher Education in Great Britain and Ireland, statistics 1889-1901; current university notes.

*a* Owens College, Manchester, University College, Liverpool, and Yorkshire College, Leeds, are associated together as the Victoria University; and the Welsh colleges at Aberystwith, Bangor, and Cardiff, as the University of Wales; Mason College is incorporated with Birmingham University.

*b* Undergraduates.

*c* The three colleges include the academic college at Durham, college of medicine and college of science, Newcastle. The number of students in medicine is not reported.

*d* Also 4,942 evening students. For account of the reorganized University of London, see p. 1064.

*e* Also 3,781 evening students.

*f* Average enrollment.

*g* Grants by Board of Education.

## THE ENGLISH SYSTEM OF ELEMENTARY EDUCATION—DEVELOPMENT, 1870 TO 1902.

By reference to the above table it will be seen that in 1902 the public elementary schools of England enrolled 5,881,278 pupils, or 17.8 per cent of the population. They employed 153,492 teachers, equivalent to one teacher for every 38 enrolled pupils, and were maintained at a cost of £13,005,162 (\$65,025,810), of which government appropriations supplied 62 per cent and local sources 38 per cent.

The bearing of these statistics is more fully disclosed by the retrospective tables (I–XIV), which show a remarkable development in elementary education since 1870, the year in which the Forster law was passed. The comparison is of special importance at this time because the system of education established by that act has been radically changed by recent legislation. In particular, the elected school boards created by the Forster law for the maintenance of public schools have been abolished, although to their efficiency the country is chiefly indebted for the progress achieved during the period under review. Tables I and II show the distribution of pupils for the successive years 1870 to 1902 in the two classes of schools, board and “voluntary” (i. e. chiefly denominational), that make up the school supply of the country. The board schools, which began their operations in 1870, have made provision for 45 per cent of the school population and enroll nearly 48 per cent of all children on the registers of elementary schools. The Church of England schools, which far exceed the combined strength of all other classes of “voluntary” schools, have accommodation for 42 per cent of the school population and enroll 39.5 per cent of all pupils (Tables I and II). The extent of their work explains the predominating influence of the church party in respect to the recent school legislation.

By reference to the summarized statistics (Table XIV) it will be seen that the ratio of enrolled pupils to total population rose from 7.6 per cent in 1870 to 17.7 per cent in 1900, which latter proportion covers practically the whole school population. The average attendance has risen from 68 to 83 per cent of the enrollment, and the entire population of the country has been brought under compulsory school laws, as shown by Table IV, with a constantly rising standard of attainment required for the partial exemption of children from school attendance (Table V).

The statistics relative to the teaching force (Tables X–XIII) show a steady increase in the proportion of certificated teachers and a decline in the proportion of pupil teachers. The latter, who constituted about half the whole force in 1870, now form only one-fifth the force. The corresponding increase in the proportion of adult teachers has been accompanied by an advance in salaries amounting for men teachers to an increase of 36 per cent since 1870 and for women teachers to an increase of 68 per cent (Table XII).

The current expenditure for elementary schools, £13,005,162, or \$65,000,000, is equivalent to \$1.75 per capita of population and to \$11.05 per capita of enrollment. For comparative purposes the ratio per capita of average attendance is even more suggestive, as the Government grant in recent years has been based on that item.

From Table VII it will be seen that, estimated on average attendance, the current expenditure per capita increased in the three decades 1872 to 1902 as follows: In board schools from £1 8s. 4½d. (\$7) to £3 0s. 9d. (\$15), and in voluntary schools from £1 7s. 5d. (\$6.85) to £2 6s. 4d. (\$11.55). In other words, the current expenditure has more than doubled in board schools and has nearly doubled in voluntary schools<sup>a</sup> since the passage of the education law of 1870.

<sup>a</sup> The corresponding ratios for the United States in 1901 were \$11.90 per capita of enrollment and \$17.37 per capita of average attendance. It should be observed that the enrollment in public schools in the United States includes that of pupils in public high schools. These schools comprise 75 per cent of all pupils in secondary schools, which are more costly than elementary schools. In England, on the contrary, the schools comprised in this comparison include few pupils above the elementary grades.

If capital expenditure be included, as in Table VI, the increase in annual expenditure appears still more impressive. \* In 1871 it reached a total of £2,496,192 (\$12,480,960), and in 1895 (the last year for which the entire report is available) a total of £14,605,525 (\$73,027,625), or nearly six times the earlier expenditure. Comparison here can not be made between board and voluntary schools, excepting with reference to the capital expenditure (Table VI, columns *f* and *g*). It is important also to observe that the local taxes (for board schools only) increased from £71,184 in 1871 to £3,987,790 in 1895, or more than fifty times the earlier amount. Since 1895 the receipts from this source have increased still further (by 60 per cent; see column *a*). This increase in local taxes is even more significant than the increase in the Government appropriations which are applicable to both board and voluntary schools.

From the Government grant the school boards derived £3,878,789 in 1902, as against £6,331,811 from local taxes applicable to both current and capital expenditure. (Compare Table IX, B, line 5, with Table VI, column *a*.)

In comparison with this vast increase in local appropriations the increase of subscriptions and income from endowments in the case of voluntary schools (Table VI, columns *b* and *g*) is meager and explains the "intolerable strain" of which those schools complained and which led in 1897 to the creation of a special aid grant in their behalf.

The increase in the local school taxes is a striking proof of the local interest and support which the school boards have evoked, and in this light it appears the most important outcome of the law of 1870. The strength of this local spirit, which is most active in the great cities, was manifested in a striking manner throughout the recent debate in Parliament over the new education law to be presently considered.

#### STATISTICS OF ELEMENTARY SCHOOLS OF ENGLAND, CURRENT AND RETROSPECTIVE.<sup>a</sup>

Table I shows the comparative growth of board and "voluntary" schools, the latter chiefly denominational, as indicated by average attendance for successive years from 1870 to 1902, inclusive. Table II shows the accommodation and enrollment in the different classes of schools for the year 1901 and brings the totals in comparison with those for the successive years 1899-1901.

<sup>a</sup> Census of 1891.<sup>b</sup> This population is under the jurisdiction of 2,560 school boards, viz: the London school board, 199 municipal borough boards, and 2,360 parish boards.<sup>c</sup> This population is under the jurisdiction of 731 school-attendance committees—viz, 112 in municipal boroughs, 90 in urban districts, and 529 in unions.

The Board of Education has issued summaries of the "standards of exemption" in England and Wales, the last issue being for 1900. The following are the essential facts:

TABLE V.—*The standards (grades) of exemption.*

## I. Local authorities fixing for half time:

Standard II .....	121
Standard III .....	1,180
Standard IV .....	1,462
Standard V .....	177

## II. For full time:

Standard IV .....	886
Standard V .....	2,006
Standard VI .....	363
Standard VII .....	72

The advance since 1897 is indicated by the following:

	1897.	1900.
Local authorities fixing for full time:		
Standard IV .....	1,209	886
Standard V .....	1,843	2,006
Standard VI .....	140	363
Standard VII .....	4	72

The latest measures affecting school attendance are explained as follows in the Report of the Board of Education for 1900-1901:

The elementary-education (school attendance) act, 1899, was followed last year by the elementary-education act, 1900, which introduced further changes into the law of school attendance. It enabled school authorities to extend their by-laws so as to include children up to the age of 14, raised the penalties that could be inflicted on parents from 5s. to 20s., and increased the number of attendances required for exemption by the elementary-education act, 1876, from 250 to 350. The law of school attendance under the elementary-education acts, as it now stands, may be summarized as follows:

(1) If the by-laws contain a special provision to this effect, children may be employed in agriculture at the age of 11, provided that they attend school 250 times a year up to the age of 13.

(2) With this exception, no child subject to the by-laws can obtain either partial or total exemption under the age of 12.

(3) A child between 12 and 13, or (if the by-laws are extended) between 12 and 14, can only obtain total or partial exemption on the conditions prescribed by the by-laws.

(4) In districts where the by-laws are still restricted to children of 13 years of age a child between 13 and 14 can obtain total exemption either on passing the fourth standard, or on making 350 previous attendances after 5 years of age in not more than two schools during each year for five years.

(5) A child between 12 and 14 may claim partial exemption on making 300 previous attendances, but in the view of the board this exemption can only be claimed in cases where the by-laws themselves contain a provision for partial exemption.

The Report of the Board of Education for 1901-2 states that out of a total of 3,348 local education authorities (2,560 school boards and 788 school-attendance committees) 1,732 (1,182 school boards, 550 school-attendance committees) have passed revised school laws under the law of 1900. Of this number 1,567 have raised the age of exemption to 14 years, while only 165 have refused to do so. The standard approved for total exemption is in no case lower than the fifth, nor (with but few exceptions) is that for partial exemption lower than the fourth.

The special agricultural by-law provided for in the laws as to school attendance summarized above has been adopted in 822 cases.

TABLE VI.—*Expenditure on public elementary education (England and Wales), 1871-1895 (current and capital).*

Year.	(a) Paid from rates (local taxes board schools only).	(b) Voluntary subscrip- tions and income from endowments.	(c) Total of columns (a) and (b).	(d) Fees of scholars in elementary schools and students in training colleges.	(e) Total of columns (a), (b), and (d).	(f) School-board loans for building purposes. <sup>a</sup>	(g) Estimated average an- nual subscriptions for voluntary school buildings.	(h) Grand total of col- umns (a), (b), (d), (f), and (g).	(i) State expenditure (ed- ucation department and science and art department).

<sup>a</sup>The law of 1870 authorized school boards to borrow money on the security of local taxes (rates) for the building of schoolhouses. Up to the 1st of April, 1901, the education department had sanctioned loans to the amount of £41,624,464 (£208,122,320). The new accommodation thus furnished is sufficient for 2,788,120 children. The estimated cost per child is thus about £14 18s. 7d. (£73). The department has also sanctioned loans to the amount of £132,998 to 10 school boards for providing accommodation for 729 blind and deaf children, and also £26,818 18s. to 5 school boards for providing accommodation for 390 defective children.

THE EDUCATION LAW (EDUCATION ACT, 1902, 2 EDWARD VII, CHAP. 42).

The year under review has been marked by the passage of an education law of scarcely less importance than the Forster law of 1870. The new law virtually brings to a close the administrative system provided by the earlier act, and introduces new policies of far-reaching consequence. The elected school boards which the law of 1870 called into existence are abolished and the schools maintained by them transferred to the charge of the county and city councils. The "voluntary" schools are allowed to share in the local taxes, and by an unexpected amendment to the original provisions are brought under a slight measure of local public control. The law, moreover, has extended the sphere of the public system of education to include both elementary and secondary education.

The measure is applicable to England and Wales, excluding only London, which is to be dealt with separately. A bill to this effect already introduced into the House embodies the same policy as the general law.

To understand the tenacity of the dual system of elementary schools which for the moment seems to be strengthened by the law, it is necessary to keep in mind the origin of that system. Board schools, as we have seen, date from 1870, but denominational schools have a much longer history—as long, in fact, as the history of the Christian church in England. Moreover, these schools had been organized into a system under Government supervision prior to the passage of the education law of 1870. This result had been achieved largely through the efforts of two societies formed early in the nineteenth century to provide schools for the common people. The earlier of the two societies was started in 1808 by the educational philanthropist Joseph Lancaster. It still exists as the British and Foreign School Society, and provides at present a small proportion (about 4 per cent) of the elementary schools of the country. The second society, which was organized in 1811, under the auspices of the established church, has steadily advanced and controls at present more than one-half the elementary schools, with accommodation for a little more than 40 per cent of the school population of the country. (Table II, p. 1005.)

The extension of the franchise, through the passage of the reform law of 1832, increased solicitude as to the instruction of the masses, and the appeal of the two societies named for Government aid in their work received powerful support both at court and in Parliament.

In 1833 an appropriation of £20,000 (£100,000) for elementary schools was made, to be disbursed by the two societies. The appropriation was annually renewed, and

other denominations (in particular the Wesleyan Methodists and Roman Catholics; see Table II), stimulated by the prospect of public aid, entered into the work. In 1839 the Government appropriation was increased to £30,000 (\$150,000), and the same year a committee of council was created to superintend the disbursement of the education grant. This committee at once decided to require the right of inspecting the schools aided; so that, at the time of the passage of the education law of 1870, there was in existence a system of denominational schools aided and inspected by the Government, and under the general supervision of a Government department. But this system, though sustained by the zeal of the church and fostered by the Government, failed to stem the ever rising tide of illiteracy. In his speech before the House of Commons in 1870 in support of his bill, Mr. Forster stated that "not more than two-fifths of the children of the working classes between the ages of 6 and 10" were on the "registers of Government schools, and only one-third of those between 10 and 12." It was estimated that in Liverpool, with 80,000 children between the ages of 5 and 13, there were 20,000 children who attended no school and 20,000 more in schools not worth the name. In Manchester 16,000 children out of 65,000 were destitute of school accommodation.<sup>a</sup> The conscience of the English people and the instinct of self-preservation were aroused at these disclosures, and for the time differences of opinion were sunk in view of the common danger.

The spirit which was making for civic control in many departments of public affairs asserted itself in this, and the duty of making up the educational deficiency of the nation was intrusted to school boards to be elected for the purpose. While it was evident that these boards were not intended to supplant the denominational agencies, it was equally evident that they were regarded as the hope of the future. The law carefully provided for their election, the whole country being organized in school districts for this purpose.<sup>b</sup> Each district was authorized to elect a school board for the maintenance of public elementary schools in such number as the circumstances might require. In case a district failed of its own motion to elect a school board the Government would order the election upon proof that adequate provision of efficient elementary schools did not exist therein. The sincerity of the purpose thus expressed is shown by the fact that up to 1900 the election of school boards had been ordered in 57 municipal districts and in 1,298 towns and rural parishes. (Table III, p. 1005.) The school boards were authorized to borrow money on the security of local taxes for the purchase of sites and the erection of schoolhouses, and to levy taxes to meet such part of the current expenses of the schools as were not provided by the Government grant. The denominational schools were to receive the Government grant on the same terms as the board schools, but were not allowed any share in the local taxes, the excess of their expenditure above the Government grant being met by endowments and subscriptions. By reason of their more stable finances and freedom from traditional restrictions, the board schools have made almost phenomenal development, and have even invaded the province of secondary education by their upward extension. The disparity between the two classes of schools has been emphasized by differences in location, the board schools being chiefly city schools and the church schools most numerous in rural districts. The obvious evils of this inequality have been aggravated by the very natural antagonism of the church to the extension of civil control in a province so long exclusively its own. With the return of the conservative party to power in 1895, this antagonism reached an acute stage, and the educational problem assumed from that time the aspect of a partisan conflict. The new law should therefore be viewed in a

<sup>a</sup> Forster's speech in support of the education bill of 1870.

<sup>b</sup> The school districts were the metropolis, all municipal boroughs except Oxford, the district of the local board of Oxford, and all civil parishes not included in these. It should be noticed that there are three classes of parishes in England: Civil parishes (about 14,900), ecclesiastical parishes (13,000), and highway parishes (14,700).

double aspect, (1) as an effort to eliminate serious evils by equalizing the educational provision of the country, and (2) as an effort to meet pledges <sup>a</sup> made by the conservative party to their clerical adherents.

In submitting the bill to the House Mr. Balfour stated that its purpose was "to fulfill the pledge given in the King's speech that a bill should be introduced dealing not with secondary education or with primary education in their isolation, but with both in one measure and with a view to their better coordination."

For the accomplishment of this purpose it was proposed to establish in each specified area a single local authority responsible for carrying the law into effect.

The bitter opposition to the bill which was maintained throughout the Parliamentary proceedings centered in two points, namely, the scope of the new local authority and the proposition to apply local taxes to the support of church schools without subjecting them to public control. The adoption of clause 1 after hot controversy settled the first point. It swept out of existence the elected school boards, which, said Mr. Bryce, leader of the opposition in the House, "have been the most potent and active force in education since 1870," and transferred their functions to the county and borough councils.<sup>b</sup> To the accusation that the boards had trespassed on the field of secondary education, Mr. Bryce said further: "They only did so because there was a void that nobody else attempted to fill, and they did it with the approval of successive ministers of education."

The opposition of the large cities in which the school boards had achieved their great success was partially overcome by their recognition as independent areas of school administration. The fear also that the higher-grade schools would be sacrificed by the change was measurably allayed by an amendment to clause 2. As originally drawn, the local education authority was simply authorized to supply education other than elementary. The amendment made the action compulsory, and specified particularly the duty of making provision for training teachers and for coordinating all forms of education. It will be noticed also that the councils of cities not recognized as independent areas of school administration have concurrent powers with the county councils in respect to the expenditure for higher-grade schools (clause 3). This provision, which gives to all populous centers a certain initiative in respect to higher-grade schools, was, however, severely criticised as a departure from the "one authority" policy which had furnished the strongest argument for the sweeping change in the local administration of education. The clause virtually introduced "about 850 new units of organization to deal with the serious matter of higher instruction." Said Mr. Bryce:

The bill does not give us the single authority that we are promised. \* \* \* In the case of a large borough the area is suitable for both classes of education, and here, I think, the arrangement is satisfactory. The third case is the small boroughs which have a population exceeding 10,000, and suburban districts with a population exceeding 20,000. In these boroughs and districts the local authority is the authority for elementary education, but they are not an authority for secondary education. Therefore, in these small boroughs and suburban districts, representing 5,000,000 of the population of the county, you are so far from having a single authority that you have one authority for elementary education on the spot, while the authority for secondary education is the county council. This work would have to be disposed of in Essex, for instance, by the county council, and in West Ham by the borough council. Similar instances will occur in Lancashire and Yorkshire, where there are numerous large parishes in which there are borough councils, and thus there will be two local authorities administering secondary education. Thus the bill fails to provide the administration that the House has been promised.<sup>c</sup>

<sup>a</sup> For accounts of the successive efforts to fulfill these pledges and the opposition thus excited, see Reports of the Commissioner for 1895-96, Vol. I, pp. 78-121; 1898-99, Vol. I, pp. 42-47; 1901, Vol. I, pp. 944-956.

<sup>b</sup> By the local government act of 1888, the whole of England and Wales was mapped out into 60 administrative counties, and 61 county boroughs having more than 50,000 inhabitants, making with the county of London 122 new administrative areas for the purpose of local self-government.

<sup>c</sup> Daily News (English), May 6, 1902.

Although under the new law the councils (county and city) have become the local authorities in charge of education, they are not directly responsible for the creation and maintenance of schools. These functions will be discharged through education committees appointed under schemes which must be approved by the education department. (Part IV, clause 17.)

We need not here dwell upon the constitution and powers of these committees, excepting with reference to the single provision that women must be appointed upon them. This provision is a significant admission of the great service women have rendered as members of the school boards, although it fails to give them a place in the really authoritative bodies, i. e., the councils, which was urged by progressive men and women all over the country. At a public meeting held in Manchester to excite action in this matter the Dean of Manchester said:

We think that women ought to be eligible for appointment (whether by a public authority or by cooptation) upon both sets of authorities (county and borough), and that it is indeed desirable to provide that a certain number shall be women, as experience seems to have shown that the interests of girls often receive insufficient attention, and that there is also a risk that women may not be chosen unless some special provision for their presence is made.<sup>a</sup>

In a similar meeting held in London the same view was earnestly supported by Sir Joshua Fitch and Mr. Bryce.

The direct control of elementary schools will be in the hands of managers appointed in accordance with the provisions of clause 6 (Part III). The former board schools will henceforth be known as public elementary schools provided by the local education authority (or, briefly, "provided" schools). If city schools, they will be in the charge of the city councils, or of managers appointed by those councils, and if rural schools, they will be in the charge of managers appointed by the county council and the minor local authority.

The "voluntary" schools (i. e., church schools) will hereafter be known as "non-provided schools." They will be in the charge of a body of managers of whom four out of every six will be appointed under the terms of the trust deeds of the respective institutions, and two out of every six appointed by the local authority. The combination of local authorities, education committees, and school managers seems to have complicated rather than to have simplified school administration. Such was the view taken by Mr. Bryce, whose analysis of the administrative provisions of the new law is cited among the appended papers. From another point of view, as will be seen by an article cited from the London Times, the law, in spite of these complications, appears to be an advance toward a unified national system.

The slight concession of two managers appointed by the local authority out of every six managers in charge of a denominational school was brought about by ominous signs of discontent, even within the conservative ranks, at the bold proposal that the Government should assume the entire support of church schools without imposing upon them any degree of public control. The importance of this slight concession was emphasized by the subsequent adoption of the now famous Kenyon-Slaney amendment with respect to the control of religious instruction in "nonprovided" schools. The amendment reads as follows:

Religious instruction given in a public elementary school not provided by the local authority shall, as regards its character, be in accordance with the provisions (if any) of the trust deed relating thereto, and shall be under the control of the managers. (Clause 7, p. 4.)

The full bearing of this amendment, which is discussed in an appended paper, seems not to have been grasped by either party till the bill had become law. Taken

---

<sup>a</sup> Manchester Guardian, March 15, 1902.

in connection with the clause that gives the civil authorities representation in the board of managers of church schools, the above amendment virtually establishes the principle of civil supervision in respect to denominational teachings.

The remaining provisions of the law respecting religious instruction are found in clause 4 (1), relative to higher grade schools, and clause 7 (5), authorizing the appointment of assistant teachers and of pupil teachers in church schools without regard to their religious beliefs.

Apart from the provisions above considered the chief opposition to the bill came from those who hold that the interests of education are likely to be safer in the control of a body elected as were the school boards for that special interest ("ad hoc bodies") than in that of local authorities already overburdened with multifarious affairs.

Without considering this objection, we present here the full text of the new law, appending for its further elucidation several articles pertaining to it from English sources.

#### EDUCATION ACT, 1902.

##### ARRANGEMENT OF SECTIONS.

##### PART I.—*Local education authority.*

###### Section.

1. Local education authorities.

AN ACT to make further provision with respect to education in England and Wales.

[18th DECEMBER, 1902.]

Be it enacted by the King's most Excellent Majesty, by and with the advice and consent of the lord's spiritual and temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:

#### PART I.—*Local education authority.*

1. For the purposes of this act the council of every county and of every county borough shall be the local education authority:

*Provided*, That the council of a borough with a population of over ten thousand, or of an urban district with a population of over twenty thousand, shall, as respects that borough or district, be the local education authority for the purpose of Part III of this act, and for that purpose as respects that borough or district, the expression "local education authority" means the council of that borough or district.

#### PART II.—*Higher education.*

Power to aid higher education.

2. (1) The local education authority shall consider the educational needs of their area and take such steps as seem to them desirable, after consultation with the board of education, to supply or aid the supply of education other than elementary, and to promote the general coordination of all forms of education, and for that purpose shall apply all or so much as they deem necessary of the residue under section one of the local taxation (customs and excise) act, 1890, and shall carry forward for the like purpose any balance thereof which may remain unexpended, and may spend such further sums as they think fit: *Provided*, That the amount raised by the council of a county for the purpose in any year out of rates under this act shall not exceed the amount which would be produced by a rate of two pence in the pound, or such higher rate as the county council, with the consent of the local government board, may fix.

(2) A council in exercising their powers under this part of this act shall have regard to any existing supply of efficient schools or colleges, and to any steps already taken for the purposes of higher education under the technical instruction acts, 1889 and 1891.

Concurrent powers of smaller boroughs and urban districts.

3. The council of any noncounty borough or urban district shall have power as well as the county council to spend such sums as they think fit for the purpose of supplying or aiding the supply of education other than elementary: *Provided*, That the amount raised by the council of a noncounty borough or urban district for the purpose in any year out of rates under this act shall not exceed the amount which would be produced by a rate of one penny in the pound.

Religious instruction.

4. (1) A council in the application of money under this part of this act shall not require that any particular form of religious instruction or worship or any religious catechism or formulary which is distinctive of any particular denomination shall or shall not be taught, used, or practiced in any school, college, or hostel aided but not provided by the council, and no pupil shall, on the ground of religious belief, be excluded from or placed in an inferior position in any school, college, or hostel provided by the council, and no catechism or formulary distinctive of any particular religious denomination shall be taught in any school, college, or hostel so provided, except in cases where the council, at the request of parents of scholars, at such times and under such conditions as the council think desirable, allow any religious instruction to be given in the school, college, or hostel otherwise than at the cost of the council: *Provided*, That in the exercise of this power no unfair preference shall be shown to any religious denomination.

(2) In a school or college receiving a grant from or maintained by a council under this part of this act,

(a) A scholar attending as a day or evening scholar shall not be required as a condition of being admitted into or remaining in the school or college to attend or abstain from attending any Sunday school, place of religious worship, religious observance, or instruction in religious subjects in the school or college or elsewhere; and

(b) The times for religious worship or for any lesson on a religious subject shall be conveniently arranged for the purpose of allowing the withdrawal of any such scholar therefrom.

#### PART III.—*Elementary education.*

Powers and duties as to elementary education.

5. The local education authority shall throughout their area have the powers and duties of a school board and school attendance committee under the elementary education acts, 1870 to 1900, and any other acts, including local acts, and shall also

be responsible for and have the control of all secular instruction in public elementary schools not provided by them, and school boards and school attendance committees shall be abolished.

6. (1) All public elementary schools provided by the local education authority shall, where the local education authority are the council of a county, have a body of managers consisting of a number of managers not exceeding four, appointed by that council, together with a number not exceeding two appointed by the minor local authority. Management of schools.

Where the local education authority are the council of a borough or urban district they may, if they think fit, appoint for any school provided by them a body of managers consisting of such number of managers as they may determine.

(2) All public elementary schools not provided by the local education authority shall, in place of the existing managers, have a body of managers consisting of a number of foundation managers not exceeding four, appointed as provided by this act, together with a number of managers not exceeding two appointed—

(a) Where the local education authority are the council of a county, one by that council and one by the minor local authority; and

(b) Where the local education authority are the council of a borough or urban district, both by that authority.

(3) Notwithstanding anything in this section—

(a) Schools may be grouped under one body of managers in manner provided by this act; and

(b) Where the local education authority consider that the circumstances of any school require a larger body of managers than that provided under this section, that authority may increase the total number of managers, so, however, that the number of each class of managers is proportionately increased.

7. (1) The local education authority shall maintain and keep efficient all public elementary schools within their area which are necessary, and have the control of all expenditure required for that purpose, other than expenditure for which, under this act, provision is to be made by the managers; but, in the case of a school not provided by them, only so long as the following conditions and provisions are complied with: Maintenance of schools.

(a) The managers of the school shall carry out any directions of the local education authority as to the secular instruction to be given in the school, including any directions with respect to the number and educational qualifications of the teachers to be employed for such instruction, and for the dismissal of any teacher on educational grounds, and if the managers fail to carry out any such direction the local education authority shall, in addition to their other powers, have the power themselves to carry out the direction in question as if they were the managers; but no direction given under this provision shall be such as to interfere with reasonable facilities for religious instruction during school hours;

(b) The local education authority shall have power to inspect the school;

(c) The consent of the local education authority shall be required to the appointment of teachers, but that consent shall not be withheld except on educational grounds; and the consent of the authority shall also be required to the dismissal of a teacher unless the dismissal be on grounds connected with the giving of religious instruction in the school;

(d) The managers of the school shall provide the schoolhouse free of any charge, except for the teacher's dwelling house (if any), to the local education authority for use as a public elementary school, and shall, out of funds provided by them, keep the schoolhouse in good repair, and make such alterations and improvements in the buildings as may be reasonably required by the local education authority: *Provided*, That such damage as the local authority consider to be due to fair wear and tear in the use of any room in the schoolhouse for the purpose of a public elementary school shall be made good by the local education authority.

(e) The managers of the school shall, if the local education authority have no suitable accommodation in schools provided by them, allow that authority to use any room in the schoolhouse out of school hours free of charge for any educational purpose, but this obligation shall not extend to more than three days in the week.

(2) The managers of a school maintained but not provided by the local education authority, in respect of the use by them of the school furniture out of school hours, and the local education authority in respect of the use by them of any room in the schoolhouse out of school hours, shall be liable to make good any damage caused to the furniture or the room, as the case may be, by reason of that use (other than damage arising from fair wear and tear), and the managers shall take care that, after the use of a room in the schoolhouse by them, the room is left in a proper condition for school purposes.

(3) If any question arises under this section between the local education authority and the managers of a school not provided by the authority, that question shall be determined by the board of education.

(4) One of the conditions required to be fulfilled by an elementary school in order to obtain a parliamentary grant shall be that it is maintained under and complies with the provisions of this section.

(5) In public elementary schools maintained but not provided by the local education authority, assistant teachers and pupil teachers may be appointed, if it is thought fit, without reference to religious creed and denomination, and, in any case in which there are more candidates for the post of pupil teacher than there are places to be filled, the appointment shall be made by the local education authority, and they shall determine the respective qualifications of the candidates by examination or otherwise.

(6) Religious instruction given in a public elementary school not provided by the local education authority shall, as regards its character, be in accordance with the provisions (if any) of the trust deed relating thereto, and shall be under the control of the managers: *Provided*, That nothing in this subsection shall affect any provision in a trust deed for reference to the bishop or superior ecclesiastical or other denominational authority, so far as such provision gives to the bishop or authority the power of deciding whether the character of the religious instruction is or is not in accordance with the provisions of the trust deed.

(7) The managers of a school maintained but not provided by the local education authority shall have all powers of management required for the purpose of carrying out this act, and shall (subject to the powers of the local education authority under this section) have the exclusive power of appointing and dismissing teachers.

Provision of  
new schools.

8. (1) Where the local education authority or any other persons propose to provide a new public elementary school, they shall give public notice of their intention to do so, and the managers of any existing school, or the local education authority (where they are not themselves the persons proposing to provide the school), or any ten ratepayers in the area for which it is proposed to provide the school, may, within three months after the notice is given, appeal to the board of education on the ground that the proposed school is not required, or that a school provided by the local education authority, or not so provided, as the case may be, is better suited to meet the wants of the district than the school proposed to be provided; and any school built in contravention of the decision of the board of education on such appeal shall be treated as unnecessary.

(2) If, in the opinion of the board of education, any enlargement of a public elementary school is such as to amount to the provision of a new school, that enlargement shall be so treated for the purposes of this section.

(3) Any transfer of a public elementary school to or from a local education authority shall for the purposes of this section be treated as the provision of a new school.

Necessity of  
schools.

9. The board of education shall, without unnecessary delay, determine, in case of dispute, whether a school is necessary or not, and, in so determining, and also in deciding on any appeal as to the provision of a new school, shall have regard to the interest of secular instruction, to the wishes of parents as to the education of their children, and to the economy of the rates; but a school for the time being recognized as a public elementary school shall not be considered unnecessary in which the number of scholars in average attendance, as computed by the board of education, is not less than thirty.

Aid grant.

10. (1) In lieu of the grants under the voluntary schools act, 1897, and under section ninety-seven of the elementary education act, 1870, as amended by the elementary education act, 1897, there shall be annually paid to every local education authority, out of moneys provided by Parliament—

(a) A sum equal to four shillings per scholar; and

(b) An additional sum of three halfpence per scholar for every complete twopence per scholar by which the amount which would be produced by a penny rate on the area of the authority falls short of ten shillings a scholar: *Provided*, That, in estimating the produce of a penny rate in the area of a local education authority not being a county borough, the rate shall be calculated upon the county rate basis, which, in cases where part only of a parish is situated in the area of the local education authority, shall be apportioned in such manner as the board of education think just.

But if in any year the total amount of parliamentary grants payable to a local education authority would make the amount payable out of other sources by that authority on account of their expenses under this part of this act less than the amount which would be produced by a rate of threepence in the pound, the parlia-

mentary grants shall be decreased, and the amount payable out of other sources shall be increased by a sum equal in each case to half the difference.

(2) For the purposes of this section the number of scholars shall be taken to be the number of scholars in average attendance, as computed by the board of education, in public elementary schools maintained by the authority.

11. (1) The foundation managers of a school shall be managers appointed under the provisions of the trust deed of the school, but it if is shown to the satisfaction of the board of education that the provisions of the trust deed as to the appointment of managers are in any respect inconsistent with the provisions of this act, or insufficient or inapplicable for the purpose, or that there is no such trust deed available, the board of education shall make an order under this section for the purpose of meeting the case. Foundation managers.

(2) Any such order may be made on the application of the existing owners, trustees, or managers of the school, made within a period of three months after the passing of this act, and after that period on the application of the local education authority or any other person interested in the management of the school, and any such order, where it modifies the trust deed, shall have effect as part of the trust deed, and where there is no trust deed shall have effect as if it were contained in a trust deed.

(3) Notice of any such application, together with a copy of the draft final order proposed to be made thereon, shall be given by the board of education to the local education authority and the existing owners, trustees, and managers, and any other persons who appear to the board of education to be interested, and the final order shall not be made until six weeks after notice has been so given.

(4) In making an order under this section with regard to any school, the board of education shall have regard to the ownership of the school building, and to the principles on which the education given in the school has been conducted in the past.

(5) The board of education may, if they think that the circumstances of the case require it, make any interim order on any application under this section, to have temporary effect until the final order is made.

(6) The body of managers appointed under this act for a public elementary school not provided by the local education authority shall be the managers of that school both for the purposes of the elementary education acts, 1870 to 1900, and this act, and, so far as respects the management of the school as a public elementary school, for the purpose of the trust deed.

(7) Where the receipt by a school, or the trustees or managers of a school, of any endowment or other benefit is, at the time of the passing of this act, dependent on any qualification of the managers, the qualification of the foundation managers only shall, in case of question, be regarded.

(8) The board of education may, on the application of the managers of the school, the local education authority, or any person appearing to them to be interested in the school, revoke, vary, or amend any order made under this section by an order made in a similar manner; but before making any such order the draft thereof shall, as soon as may be, be laid before each House of Parliament, and if within thirty days, being days on which Parliament has sat, after the draft has been so laid before Parliament, either house resolves that the draft, or any part thereof, should not be proceeded with, no further proceedings shall be taken thereon without prejudice to the making of any new draft order.

12. (1) The local education authority may group under one body of managers any public elementary schools provided by them, and may also, with the consent of the managers of the schools, group under one body of managers any such schools not so provided. Grouping of schools under one management.

(2) The body of managers of grouped schools shall consist of such number and be appointed in such manner and proportion as, in the case of schools provided by the local education authority, may be determined by that authority, and in the case of schools not so provided, may be agreed upon between the bodies of managers of the schools concerned and the local education authority, or in default of agreement may be determined by the board of education.

(3) Where the local education authority are the council of a county, they shall make provision for the due representation of minor local authorities on the bodies of managers of schools grouped under their direction.

(4) Any arrangement for grouping schools not provided by the local education authority shall, unless previously determined by consent of the parties concerned, remain in force for a period of three years.

13. (1) Nothing in this act shall affect any endowment or the discretion of any trustees in respect thereof: *Provided*, That, where under the trusts or other provi- Endowments.

sions affecting any endowment the income thereof must be applied in whole or in part for those purposes of a public elementary school for which provision is to be made by the local education authority, the whole of the income or the part thereof, as the case may be, shall be paid to that authority, and, in case part only of such income must be so applied and there is no provision under the said trusts or provisions for determining the amount which represents that part, that amount shall be determined, in case of difference between the parties concerned, by the board of education; but if a public inquiry is demanded by the local education authority, the decision of the board of education shall not be given until after such an inquiry, of which ten days' previous notice shall be given to the local education authority and to the minor local authority and to the trustees, shall have been first held by the board of education at the cost of the local education authority.

(2) Any money arising from an endowment, and paid to a county council for those purposes of a public elementary school for which provision is to be made by the council, shall be credited by the council in aid of the rate levied for the purposes of this part in the parish or parishes which in the opinion of the council are served by the school for the purposes of which the sum is paid, or, if the council so direct, shall be paid to the overseers of the parish or parishes in the proportions directed by the council, and applied by the overseers in aid of the poor rate levied in the parish.

Apportionment of school fees.

14. Where before the passing of this act fees have been charged in any public elementary school not provided by the local education authority, that authority shall, while they continue to allow fees to be charged in respect of that school, pay such proportion of those fees as may be agreed upon, or, in default of agreement, determined by the board of education, to the managers.

Schools attached to institutions.

15. The local education authority may maintain as a public elementary school under the provisions of this act, but shall not be required so to maintain, any marine school, or any school which is part of, or is held in the premises of, any institution in which children are boarded, but their refusal to maintain such a school shall not render the school incapable of receiving a parliamentary grant, nor shall the school, if not so maintained, be subject to the provisions of this act as to the appointment of managers, or as to control by the local education authority.

Power to enforce duties under elementary education acts.

16. If the local education authority fail to fulfil any of their duties under the elementary education acts, 1870 to 1900, or this act, or fail to provide such additional public-school accommodation within the meaning of the elementary education act, 1870, as is, in the opinion of the board of education, necessary in any part of their area, the board of education may, after holding a public inquiry, make such order as they think necessary or proper for the purpose of compelling the authority to fulfil their duty, and any such order may be enforced by mandamus.

#### PART IV.—General.

Education committees.

17. (1) Any council having powers under this act shall establish an education committee or education committees, constituted in accordance with a scheme made by the council and approved by the board of education; *Provided*, That if a council having powers under Part II only of this act determine that an education committee is unnecessary in their case, it shall not be obligatory on them to establish such a committee.

(2) All matters relating to the exercise by the council of their powers under this act, except the power of raising a rate or borrowing money, shall stand referred to the education committee, and the council, before exercising any such powers, shall, unless in their opinion the matter is urgent, receive and consider the report of the education committee with respect to the matter in question. The council may also delegate to the education committee, with or without any restrictions or conditions, as they think fit, any of their powers under this act, except the power of raising a rate or borrowing money.

(3) Every such scheme shall provide—

(a) for the appointment by the council of at least a majority of the committee, and the persons so appointed shall be persons who are members of the council, unless, in the case of a county, the council shall otherwise determine;

(b) for the appointment by the council, on the nomination or recommendation, where it appears desirable, of other bodies (including associations of voluntary schools), of persons of experience in education, and of persons acquainted with the needs of the various kinds of schools in the area for which the council acts;

(c) for the inclusion of women as well as men among the members of the committee;

(d) for the appointment, if desirable, of members of school boards existing at the time of the passing of this act as members of the first committee.

(4) Any person shall be disqualified for being a member of an education committee, who, by reason of holding an office or place of profit, or having any share or interest in a contract or employment, is disqualified for being a member of the council appointing the education committee, but no such disqualification shall apply to a person by reason only of his holding office in a school or college, aided, provided, or maintained by the council.

(5) Any such scheme may, for all or any purposes of this act, provide for the constitution of a separate education committee for any area within a county, or for a joint education committee for any area formed by a combination of counties, boroughs, or urban districts, or of parts thereof. In the case of any such joint committee, it shall suffice that a majority of the members are appointed by the councils of any of the counties, boroughs, or districts out of which or parts of which the area is formed.

(6) Before approving a scheme, the board of education shall take such measures as may appear expedient for the purpose of giving publicity to the provisions of the proposed scheme, and, before approving any scheme which provides for the appointment of more than one education committee, shall satisfy themselves that due regard is paid to the importance of the general coordination of all forms of education.

(7) If a scheme under this section has not been made by a council and approved by the board of education within twelve months after the passing of this act, that board may, subject to the provisions of this act, make a provisional order for the purposes for which a scheme might have been made.

(8) Any scheme for establishing an education committee of the council of any county or county borough in Wales or of the county of Monmouth or county borough of Newport shall provide that the county governing body constituted under the Welsh intermediate education act, 1889, for any such county or county borough shall cease to exist, and shall make such provision as appears necessary or expedient for the transfer of the powers, duties, property, and liabilities of any such body to the local education authority under this act, and for making the provisions of this section applicable to the exercise by the local education authority of the powers so transferred.

18. (1) The expenses of a council under this act shall, so far as not otherwise provided for, be paid, in the case of the council of a county out of the county fund, and in the case of the council of a borough out of the borough fund or rate, or, if no borough rate is levied, out of a separate rate to be made, assessed, and levied in like manner as the borough rate, and in the case of the council of an urban district other than a borough in manner provided by section thirty-three of the elementary education act, 1876, as respects the expenses mentioned in that section: *Provided, that—*

Expenses.

(a) the county council may, if they think fit (after giving reasonable notice to the overseers of the parish or parishes concerned), charge any expenses incurred by them under this act with respect to education other than elementary on any parish or parishes which, in the opinion of the council, are served by the school or college in connexion with which the expenses have been incurred; and

(b) the county council shall not raise any sum on account of their expenses under Part III of this act within any borough or urban district the council of which is the local education authority for the purposes of that Part; and

(c) the county council shall charge such portion as they think fit, not being less than one-half or more than three-fourths, of any expenses incurred by them in respect of capital expenditure or rent on account of the provision or improvement of any public elementary school on the parish or parishes which, in the opinion of the council, are served by the school; and

(d) the county council shall raise such portion as they think fit, not being less than one-half or more than three-fourths, of any expenses incurred to meet the liabilities on account of loans or rent of any school board transferred to them, exclusively within the area which formed the school district in respect of which the liability was incurred, so far as it is within their area.

(2) All receipts in respect of any school maintained by a local education authority, including any parliamentary grant, but excluding sums specially applicable for purposes for which provision is to be made by the managers, shall be paid to that authority.

(3) Separate accounts shall be kept by the council of a borough of their receipts and expenditure under this act, and those accounts shall be made up and audited in like manner and subject to the same provisions as the accounts of a county council, and the enactments relating to the audit of those accounts and to all matters incidental thereto and consequential thereon, including the penal provisions, shall apply in lieu of the provisions of the municipal corporations act, 1882, relating to accounts and audit.

(4) Where under any local act the expenses incurred in any borough for the purposes of the elementary education acts, 1870 to 1900, are payable out of some fund or rate other than the borough fund or rate, the expenses of the council of that borough under this act shall be payable out of that fund or rate instead of out of the borough fund or rate.

(5) Where any receipts or payments of money under this act are entrusted by the local education authority to any education committee established under this act, or to the managers of any public elementary school, the accounts of those receipts and payments shall be accounts of the local education authority, but the auditor of those accounts shall have the same powers with respect to managers as he would have if the managers were officers of the local education authority.

#### Borrowing.

19. (1) A council may borrow for the purposes of the elementary education acts, 1870 to 1900, or this act, in the case of a county council as for the purposes of the local government act, 1888, and in the case of the council of a county borough, borough, or urban district as for the purposes of the public health acts, but the money borrowed by a county borough, borough, or urban district council shall be borrowed on the security of the fund or rate out of which the expenses of the council under this act are payable.

(2) Money borrowed under this act shall not be reckoned as part of the total debt of a county for the purposes of section sixty-nine of the local government act, 1888, or as part of the debt of a county borough, borough, or urban district for the purpose of the limitation on borrowing under subsections two and three of section two hundred and thirty-four of the public health act, 1875.

20. An authority having powers under this act—

#### Arrangements between councils.

(a) May make arrangements with the council of any county, borough, district, or parish, whether a local education authority or not, for the exercise by the council, on such terms and subject to such conditions as may be agreed on, of any powers of the authority in respect of the management of any school or college within the area of the council; and

(b) If the authority is the council of a noncounty borough or urban district may, at any time after the passing of this act, by agreement with the council of the county and with the approval of the board of education, relinquish in favor of the council of the county any of their powers and duties under this act, and in that case the powers and duties of the authority so relinquished shall cease, and the area of the authority, if the powers and duties relinquished include powers as to elementary education, shall, as respects those powers, be part of the area of the county council.

#### Provisional orders and schemes.

21. (1) Sections two hundred and ninety-seven and two hundred and ninety-eight of the public health act, 1875 (which relate to provisional orders), shall apply to any provisional order made under this act as if it were made under that act, but references to a local authority shall be construed as references to the authority to whom the order relates, and references to the local government board shall be construed as references to the board of education.

(2) Any scheme or provisional order under this act may contain such incidental or consequential provisions as may appear necessary or expedient.

(3) A scheme under this act, when approved, shall have effect as if enacted in this act, and any such scheme, or any provisional order made for the purposes of such a scheme, may be revoked or altered by a scheme made in like manner and having the same effect as an original scheme.

#### Provision as to elementary and higher education powers respectively.

22. (1) In this act and in the elementary education acts the expression "elementary school" shall not include any school carried on as an evening school under the regulations of the board of education.

(2) The power to provide instruction under the elementary education acts, 1870 to 1900, shall, except where those acts expressly provide to the contrary, be limited to the provision in a public elementary school of instruction given under the regulations of the board of education to scholars who, at the close of the school year, will not be more than sixteen years of age: *Provided*, That the local education authority may, with the consent of the board of education, extend those limits in the case of any such school if no suitable higher education is available within a reasonable distance of the school.

(3) The power to supply or aid the supply of education other than elementary includes a power to train teachers, and to supply or aid the supply of any education except where that education is given at a public elementary school.

#### Miscellaneous provisions.

23. (1) The powers of a council under this act shall include the provision of vehicles or the payment of reasonable travelling expenses for teachers or children attending school or college whenever the council shall consider such provision or payment required by the circumstances of their area or of any part thereof.

(2) The power of a council to supply or aid the supply of education, other than elementary, shall include power to make provision for the purpose outside their area in cases where they consider it expedient to do so in the interest of their area, and shall include power to provide or assist in providing scholarships for, and to pay or assist in paying the fees of, students ordinarily resident in the area of the council at schools or colleges or hostels within or without that area.

(3) The county councillors elected for an electoral division consisting wholly of a borough or urban district whose council are a local education authority for the purpose of Part III of this act, or of some part of such a borough or district, shall not vote in respect of any question arising before the county council which relates only to matters under Part III of this act.

(4) The amount which would be produced by any rate in the pound shall be estimated for the purposes of this act in accordance with regulations made by the local government board.

(5) The mortmain and charitable uses act, 1888, and so much of the mortmain and charitable uses act, 1891, as requires that land assured by will shall be sold within one year from the death of the testator, shall not apply to any assurance, within the meaning of the said act of 1888, of land for the purpose of a schoolhouse for an elementary school.

(6) A woman is not disqualified, either by sex or marriage, for being on any body of managers or education committee under this act.

(7) Teachers in a school maintained but not provided by the local education authority shall be in the same position as respects disqualification for office as members of the authority as teachers in a school provided by the authority.

(8) Population for the purposes of this act shall be calculated according to the census of nineteen hundred and one.

(9) Subsections one and five of section eighty-seven of the local government act, 1888 (which relate to local inquiries), shall apply with respect to any order, consent, sanction, or approval which the local government board are authorised to make or give under this act.

(10) The board of education may, if they think fit, hold a public inquiry for the purpose of the exercise of any of their powers or the performance of any of their duties under this act, and section seventy-three of the elementary education act, 1870, shall apply to any public inquiry so held or held under any other provision of this act.

21. (1) Unless the context otherwise requires, any expression to which a special meaning is attached in the elementary education acts, 1870 to 1900, shall have the same meaning in this act.

Interpretation.

(2) In this act the expression "minor local authority" means, as respects any school, the council of any borough or urban district, or the parish council or (where there is no parish council) the parish meeting of any parish which appears to the county council to be served by the school. Where the school appears to the county council to serve the area of more than one minor local authority the county council shall make such provision as they think proper for joint appointment of managers by the authorities concerned.

(3) In this act the expressions "powers," "duties," "property," and "liabilities" shall, unless the context otherwise requires, have the same meanings as in the local government act, 1888.

(4) In this act the expression "college" includes any educational institution, whether residential or not.

(5) In this act, unless the context otherwise requires, the expression "trust deed" includes any instrument regulating the trust or management of a school or college.

25. (1) The provisions set out in the first and second schedules to this act relating to education committees and managers, and to the transfer of property and officers, and adjustment, shall have effect for the purpose of carrying the provisions of this act into effect.

Provisions as to proceedings, transfer, &c., application of enactments and repeal.

(2) In the application of the elementary education acts, 1870 to 1900, and other provisions referred to in that schedule, the modifications specified in the third schedule to this act shall have effect.

(3) The enactments mentioned in the fourth schedule to this act shall be repealed to the extent specified in the third column of that schedule.

26. For the purposes of this act the council of the Isles of Scilly shall be the local education authority for the Scilly Islands, and the expenses of the council under this act shall be general expenses of the council.

Application of act to Scilly Islands.

27. (1) This act shall not extend to Scotland or Ireland, or, except as expressly provided, to London.

Extent, commencement, and short title.

(2) This act shall, except as expressly provided, come into operation on the appointed day, and the appointed day shall be the twenty-sixth day of March, nineteen hundred and three, or such other day, not being more than eighteen months later, as the board of education may appoint, and different days may be appointed for different purposes and for different provisions of this act, and for different councils.

(3) The period during which local authorities may, under the education act, 1901, as renewed by the education act, 1901 (renewal) act, 1902, empower school boards to carry on the work of the schools and classes to which those acts relate shall be extended to the appointed day, and in the case of London to the twenty-sixth day of March nineteen hundred and four.

(4) This act may be cited as the education act, 1902, and the elementary education acts, 1870 to 1900, and this act may be cited as the education acts, 1870 to 1902.

## LOCAL SCHOOL ADMINISTRATION UNDER THE NEW EDUCATION LAW.

The complicated administrative system for which the education law of 1902 provides was summed up in a speech by Mr. Bryce during the proceedings in the House of Commons. His analysis, which is cited below from a report of the session, referred to the bill as it stood before the amendment which gave two civil managers to every church school, a concession to which Mr. Bryce's speech materially contributed.

The Government said that their aim was to simplify the system of education, to define functions, and to remove occasion of friction. What is their scheme of authority? We have four authorities. At the top there is the board of education at Whitehall, which loses some of its control, but how much the Government will not or can not tell us. It is perfectly clear that Whitehall will have far less opportunity for using its influence for the improvement of schools, and it will no longer be able, as in times past, to work up inferior schools, for it will no longer be in the same direct contact with local managements. Below Whitehall we come to the county and borough councils. The councils have no powers except to raise and borrow money. They will not know anything about the condition of the schools. They will not know why the money is to be spent nor will they know whether the money is doing good, for they will have no contact with the schools. Then we have the education committees. The education committees, we are told, are to be supreme in everything except finance. They will have information, but without the powers to carry out any scheme that they believe required. They may propose expenditure, but it will not rest with them to vote the money. If the county council does not see the necessity for the expenditure which they propose or if the county council has other objects in view, such as local improvement, it may refuse the schemes which the education committees lay before it. When the county council refuses, the education committees will be paralyzed. A scheme for separating the county council and the education committees is a scheme for divorcing financial responsibility from administrative responsibility. The committee will have knowledge without power and the council will have power without knowledge. At the bottom of the series we come to the local managers. The local managers are one of the most intricate parts of this measure, for the local managers consist of two different sets of persons. About voluntary managers there is little doubt; they will be perfectly independent of the education committees. They are not appointed by the education committees, and they can not be removed by them. They are, we are told, to carry out the directions of the education committees as regards secondary education, but how can they be compelled to carry out these directions? At present if a board of management does not obey the instructions from Whitehall its grant is stopped, and it suffers; but if it disobeys the direction given by the education committee under this scheme, the education committee will suffer. If the local managers persist in disobedience, the only course which the education committees and the county council can follow will be to provide a school for themselves and charge the cost of building and maintaining the school upon the rates. Is it not perfectly clear that the local managers occupy a position of very great strength and importance? See how little power education committees have. Local managers may dismiss good masters or introduce religious instruction into the school which may be opposed to the wishes of all the Church of England parents of the parishes, and the education committee will not be able to interfere. As long as there is an average attendance at a school of 30, the county council must continue to support that school, even if they believe it to be needless.<sup>a</sup>

## THE NATIONAL ASPECT OF THE EDUCATION BILL.

["From an occasional correspondent." London Times, October 3, 1902.]

There are abundant signs that a large number of moderate minded men in the country are anxious above all things to see our numerous educational agencies brought more or less under one common authority, in order to provide us with a more effective third line of defense for competing with the increased "brain output" of rival nations. Not only is our commerce vitally interested in the question, but the supreme need of greater efficiency pervades every calling and profession. It makes itself felt as much among the masses as the classes, as much among the rank and file as among the leaders. In fact, the absence of sufficient backing for those who are best qualified to lead the nation on the question is largely due to the defects in the education received by the average man of to-day.

Those who realize how dire is the country's need at the present moment of educational reform must view with alarm the ever-rising tide of religious warfare, which threatens, with its manifold exaggerations and misrepresentations, to obscure the graver issues at stake. One would be very far from denying the immense value of the religious and ethical part in education, and yet it seems almost humiliating at the beginning of the twentieth century to find the whole future of national education trembling in the scales of sectarian differences. Does the theologian, then, as Mr. Waddington said in his speech to the National Union of Teachers, really block the way? Is the children's future a mere appendix; is the whole welfare and destiny of the nation a mere corollary to the solution of what is styled the religious difficulty? The enormous space occupied by this topic by those who have written for or against the bill must have struck the most superficial observer. It seems essential, therefore, from the patriotic and national point of view, that an attempt should be made to restate once more what the bill actually proposes to do for increasing the educational efficiency of the country, and to urge on these religious disputants that, if they can not, like that great Englishman, Lord Howard, of Effingham, put their country before their religious differences, they may at least realize the tremendous issues at stake, and for the sake of that country which they all delight to serve may attempt to compose their differences.

Let us first see what the bill, as it stands, will probably effect. It will give us, with certain exceptions, a single authority for education of all grades below the university. It will enable us to bring our elementary and secondary schools into closer contact and connection, and thereby allow the "lad of parts" to mount from the gutter to the university. It will give the local authority the chance of providing secondary education in many areas where it is now lacking; it will also enable it, from its knowledge of the district, to provide the right sort of education that the district requires. By "standardizing" our schools it will help to eliminate the charlatan, with his bogus academy, and, by thus rendering the function of every grade of education intelligible, it will allow the people at large an opportunity of learning their exact value to the community and of appreciating thereby their work as keenly as the ordinary "man in the street" in autocratic Germany or democratic Switzerland.

Of course, the bill is in certain points a compromise. But no practical statesman can ever dream of framing an ideal scheme. He must first study the problem and then prescribe to the best of his ability. Universal education boards have in the abstract a certain amount to recommend them. But it would be probably easier to pull down and rebuild London than to impose such a brand-new system of national education on the country where there are already so many educational agencies established.

Of the two main rival agencies, it is clear that one has had to go. When one authority was fairly popular with both sections of the community and the other only with one, the choice of the county councils was pretty clear. Many of the larger noncounty boroughs and urban districts have, however, already developed a vigorous political activity. There is a certain amount to be said in favor of their claim to the management of at least a part of their own education. The Government have compromised with them in a fashion that spoils the superficial symmetry of the one authority, but ways and means are provided for their working harmoniously with the larger body, as well as for allowing them to surrender their rights to it, if they please. Another subject for compromise is the taking over of the Church schools. What was the Government to do? Spoliation was out of the question. To spend £40,000,000 on building rival schools, while withdrawing, or not, State supplies from the religious schools, was equally impracticable. To buy up the buildings at an outlay of £26,000,000 depended not only on the taxpayer, but on the willingness of the religious bodies to sell. The only feasible course was to form a sort of national trust

and offer equitable, or at least acceptable, terms to those who were partially independent. But the financial reason was not the only one behind the cabinet's proposal. No system of national education in England can succeed if based on ostracism. Suppose, for a moment, that secular education could possibly be established in England, it would mean that such a so-called national system would be largely a sham. An immense number of parents would still persist in sending their children to denominational schools, with the result that a large quota of the rising generation would remain outside the pale of national superintendence and supervision. Such "nationalism," one may feel certain, is repugnant to the great majority of Englishmen. Now it is estimated that the denominational schools, capitalized at  $3\frac{1}{2}$  per cent, represent an income of over £700,000 a year. The principal terms on which the denominational bodies agreed to enter the trust were the nomination of their own teachers and of a majority of the school managers in return for the loan of their buildings to the State. The immense gain of bringing practically all our schools under one head is so great that the bargain would seem a satisfactory one from the national point of view.

## THE CLERGY AND THE EDUCATION ACT.

By D. C. LATHBURY.

[From the Nineteenth Century and After, January, 1903.]

The education bill of 1902 has contained many surprises, but the greatest of them has been reserved for the clergy of the Church of England. With few exceptions they saw nothing in the bill but an end to a financial burden. Their schools were to be maintained out of the rates, and if the obligation to keep the buildings in repair caused some of them a passing anxiety it was slight in comparison with the relief afforded in other directions. That the bill would make a radical change in their own relation to their schools never occurred to them. Nor, indeed, did it occur to their opponents. A measure which embodies the greatest ecclesiastical revolution that the Church of England has seen since the Reformation is still regarded by Non-conformists as a formal confirmation of the clergy in all their traditional privileges. A measure which makes the vicar of each parish in which there is a church school the removable deputy of a lay committee is still commonly described as a fresh riveting of sacerdotal chains. The clergy may be pardoned for not being wise before the fact when as yet their adversaries have not become wise after it.

The explanation of this inability to realize what the bill would do must be sought in a remote past. Before the act of 1870 the elementary education of the country was practically in the hands of the clergy. They had taken it up when there was no one else to do it. For a generation, indeed, the State had contributed largely to the support and to a less extent to the building of voluntary schools. But the initiative in the vast majority of cases had lain with the clergy. As the Government grants were increased to meet new and larger conceptions of the meaning of education the burdens thrown on the clergy grew in at least an equal degree. Nominally, indeed, they were borne by the body of subscribers to the schools. But these subscribers had to be obtained by the importunity, stimulated by the example, and not infrequently replaced by the self-sacrifice of the clergy. It was only natural, therefore, that in the clerical scheme of the universe the parish school should hold a place only second to that of the parish church. Indeed, as the parish school had often to be kept going out of the vicar's own pocket, while the parish church kept itself, there was some excuse for his thinking it the more important of the two. The act of 1870 altered all this. The elementary education of the country became the concern of the State. The clergy were no longer the sole providers of schools. They had indeed provided those which the State found in existence, and they were encouraged to provide more. But their default no longer left their parishes schoolless; it only insured the setting up of a State school. As we look back thirty years it seems strange that the significance of this change was not better understood. In giving voluntary schools a formidable rival in the shape of board schools the act took away one of the most effective inducements to the continuance of voluntary subscriptions. This was the origin of the "intolerable strain" of which so much has been heard, and of the desire of the clergy to gain access to the inexhaustible fund out of which the board schools were able to make good their deficiencies.

For a long time, as the late Archbishop of Canterbury told us not long ago, this desire was kept in check by the fear that aid from the rates meant control by the ratepayers. In an evil hour some ingenious person bethought him of the plan which

has been adopted in the new act. Representation the ratepayers must have, but so long as a perpetual majority was assured to the denominational managers no great harm need come of this. The representative managers would grow weary of being perpetually outvoted, and in time they would cease to attend. But the contribution from the rates would survive their departure and place the church schools on the secure financial level enjoyed by the board schools. How far this expectation would have been borne out by the event we shall never know, because the introduction of the Kenyon-Slaney clause has imported into the bill a new and graver mischief than any necessarily associated with rate aid. But even without this addition the new education act would in the end have been fatal to the value if not to the existence of church schools. If, indeed, the act had in express words given the clergy the control of the religious teaching and the managers the control of the secular education—which was what in the first instance was supposed to be intended—the best of the church schools would not have been injured. There would often have been friction, there would sometimes have been ill will, but in the end the parson, if he were a resolute man, would have got his way. But he would have got it at the cost of a severe struggle; and how many of the clergy would have had the strength of purpose to carry on such a struggle? The object of the representative managers would have been to water down the religious teaching so as to make it suitable for all the children attending the school. This wish would certainly have been shared by some, very often by all, the denominational managers, and thus a united board would have been able to represent to the clergyman that he was imperiling the peace of the parish, and perhaps depriving Nonconformist children of the benefit of the religious lesson, for the sake of teaching the church children dogmas which might equally well be imparted to them when they had left school and were preparing for confirmation. So put, the appeal would, I believe, have made a very strong impression on large numbers of the clergy, and in this way the religious teaching in church schools would gradually have been assimilated to that of a good board school. The clergy, however, as a body either refused to admit the existence of any such danger, or accepted it as at all events a less evil than the sale of their schools to the State.

They forgot when they did so that the exclusive attention paid to voluntary schools had by this time become positively detrimental to the object for which those schools had been founded. That object was the religious education of the people. In the first instance, indeed, the church had given secular instruction as well, but this was only because at that time there was no one else to do it. Down to 1870 all went smoothly. When pretty well every school was a church school, there was no need to inquire whether religious teaching and secular teaching were separable or inseparable. After 1870, however, the face of things was altered. In spite of all the efforts of the supporters of voluntary schools, the board schools first overtook and then passed them. Wherever a church school was given up, a school board got possession of it. Wherever a new parish was formed, the chances were that to provide school as well as church was more than the parishioners could compass, and the work was left to a school board. Every year, therefore, the number of children who ought to have been in church schools grew larger and the impossibility of ever bringing them into church schools plainer. The utmost that was to be hoped from rate aid was the continuance of existing church schools, yet every year the existing church schools became more inadequate to the work they were designed to do. The children belonging to the Church of England had insensibly distributed themselves into a declining minority which still attended church schools, and a growing majority which attended board schools. Hereafter I believe the clergy will look back with wonder at the indifference with which they had come to regard this latter class. It was simply an accident that the children included in it were not in church school, and that accident did not lessen in the least degree the responsibility of the clergy in regard to them. But it was a responsibility which the law forbade them to discharge in the most natural and convenient way. They could not follow the children into the board schools and teach them their religion in the hour set apart for the religious lesson.

It is fair to say that some time before the introduction of the present act the bishops had made an effort to get the right of entry secured by law. In certain resolutions adopted by the joint committee of the convocations of Canterbury and York, there is one asking that facilities may be granted to the clergy to give religious instruction to any of the children in board schools whose parents may wish them to receive it, and offering similar opportunities for the entry of Nonconformist teachers into church schools. The value attached to this proposal by its authors may be judged from the fact that it was not pressed upon the Government in the course of the negotiations which we must suppose to have been going on while the bill was on the stocks. There must have been a time when the bishops were consulted or

sounded as to the terms which would satisfy the church, and if the spiritual welfare of the vast army of children in board schools had been very much in their thoughts, it is inconceivable that the bill when it came should have contained no provision for their instruction. It has even been said—I do not know with what amount of truth—that there was a time when the Government were not indisposed to give the right of entry a prominent place in their measure, and only abandoned the idea in deference to episcopal opposition. Anyhow, the church, so far as her mind could be gathered from the bishops, the convocations, and the diocesan conferences, was willing to let those of her children who were in board schools go untaught, provided that she was allowed to throw the maintenance of her own schools on the rates. It was certain that the denominational right of entry to all schools could not be carried through Parliament unless the church was prepared to give the representatives of the ratepayers a majority of places on the boards of management, and rather than make this concession she left the children in board schools to the chances of the Cowper-Temple clause.

Two reasons—two presentable reasons, that is to say—may be assigned for this choice. A theory had been set up, having no known origin and applied to no other system of education, that religious and secular instruction must be given by the same teacher. No doubt this combination of functions had its advantages. It set the clergy free for other work, and it secured some knowledge of the art of teaching in the teacher. It is to be feared that by the side of the schoolmaster the vicar of the parish often showed to disadvantage. He had never learned how to give a lesson, and he, and the children, soon discovered that to do so is seldom a matter of intuition. On the other hand, the effective teaching of religion demands something more than mere technical aptitude and the power of keeping order in a class. It requires a strong sense of the importance of the work the teacher has taken upon himself and of the part that religion plays in the formation of character. In theory the schoolmaster in a church school had been chosen for his religious quite as much as for his secular qualifications. But the secular qualifications were far more easily tested and the absence of them entailed the loss of the Government grant. In many cases, therefore, the fact that a teacher had been a student at a church training college was held sufficient as a religious test, and it is difficult to say what other could have been suggested for general adoption. But when two years' residence at a church training college became a regular mode of entry into the teaching profession it necessarily ceased to have any religious significance. I once asked the principal of a great training college what the religious standard among the students was. "Very much," he said, "what it is among the young men from whom they are taken." With most of them the professional side of their work was more absorbing than the religious side. They got up a certain minimum of religious knowledge, but there their interest in the subject ended. It is evident that teachers of this quality were not likely to do much toward the creation of that special atmosphere which is often described as the glory of a church school. That the existence of such an atmosphere is a very great advantage from the point of view of religion, I should be the last to deny. But I contend, first, that it is not created by the mere fact that the teachers come from St. Mark's or Whitelands, and, next, that where it exists it must necessarily constitute a very serious grievance to nonconformists. It is an awkward fact that in some 8,000 parishes there is only one school and that a church school. In the great majority of cases nonconformist parents have not, so far as appears, objected to this. The religious character of the school has not been marked enough to exercise any real influence on their children. If any appreciable number of these schools were what a church school ought to be—if, that is, the purpose of all concerned in them were to present the church in the most favorable light possible, and if that purpose were carried out with the deliberate enthusiasm which befits men to whom religion is the great end of life—what might not be the effect on nonconformist children? Proselytism, in the strict sense of the word, there would be none. Men who value their own creeds are not the men to treat lightly the creeds of others. But it is a commonplace that the surest of all methods of conversion is to make a religion attractive, to create in those who are outside a desire to be like those whom it animates. If every church school in England were what a very few are, nonconformist parents would have real cause for alarm. As it is, they have next to none, but that is because such church schools as I have described are only to be found here and there. The atmosphere argument either proves nothing or proves a great deal too much. Either the atmosphere is not to be found, or it is an atmosphere which ought not to exist except where there are more schools than one.

We are now in a position to review the nature of the choice which the clergy have made. The control of elementary education had passed from them in 1870. For a time they hoped that board schools would only have to be provided in a few excep-

tional districts, and that voluntary schools would remain the rule. By degrees it became evident that, instead of this, board schools were everywhere beating the voluntary schools, in virtue of the automatic method of their creation and of the fact that they were maintained out of the rates. The lesson that the clergy ought to have learned from this was that the days of voluntary schools were over, that an effort which had been heroic at a time when but for the clergy the people would have gone uneducated was an anachronism when the state had taken the duty of education upon itself. The lesson that the clergy did learn was that they must capture a share of the rates for their own schools. They forgot, that is to say, the object for which those schools had been founded. They forgot that a church school exists, or ought to exist, for the one purpose of teaching religion, and that in so far as it serves any other it is only to enable it to teach religion to more children. They forgot that in practice the secular interests of their schools had often trespassed upon the religious interests, and that church schools had often become famous as places of education at the sacrifice to a great extent of their distinctive character. And most of all, they forgot that every year more and more children were passing altogether out of their hands and that every year the comparative number of children in board schools and in church schools was changing to the disadvantage of the latter. In other words, they forgot that schools which existed solely for the sake of church teaching ought to be abandoned without hesitation whenever church teaching could be better served in other ways. What they should have proposed to the Government as the only solution that would satisfy them was the taking over by the local authorities at a fair price of all church schools which stood in need of aid from the rates, and the recognition of a right of entry in the vicar of the parish or his deputies into every school provided or taken over by the local authority for the purpose of giving religious instruction during school hours to all children entered in the school register as belonging to the Church of England. This would have secured them the substance of church teaching, though at the sacrifice of the machinery by which this substance had hitherto been secured. And even the sacrifice would have been only apparent, since the money paid for the school buildings might have been spent in training a distinct class of teachers for the express purpose of giving the religious lesson in state schools.

So far, therefore, as the wishes of the clergy went, the Government were left in no doubt. In this respect Mr. Balfour has been blamed without reason. He is accused of accepting an amendment which converted a measure designed to secure the clergy in the possession of their schools into a possible instrument of expulsion. But the mistake was not Mr. Balfour's. He only took the clergy at their word and gave them neither more nor less than they had asked for. It was they who took no account of the change in the position of school managers, which the mere fact of a church school having a right to rate aid would be certain to effect in it. The Bishop of Rochester put this quite rightly in the Lords on the 15th of December. "It is," he said, "a matter of public notoriety that the management clause in which the sting of the Kenyon-Slaney amendment lay hid is the work of the whole representative body of the church." From every place where the clergy met together had gone up the demand for rate aid, coupled with the concession of two places on the managing board to the representatives of the ratepayers. It is quite true that the majority of those from whom the request came did not realize what was involved in it. Indeed, I am not at all sure that Mr. Balfour himself fully realized it until, alarmed by the Sevenoaks election, he set to work to discover how far the bill could be modified to meet nonconformist and anticlerical objectors.

His search in this direction was soon rewarded. The management clause said nothing about the clergyman of the parish. It spoke only of the four foundation or denominational managers and of the two managers appointed by the local authority. To these, therefore, belonged all the rights of management, except such as were reserved for the local authority. With the consent of that authority they could appoint the teachers, and, as this consent might not be withheld except on educational grounds, their choice, so far as it was made on religious grounds, was quite unfettered. Indeed, the Kenyon-Slaney clause, as amended in the House of Lords at the instance of the Government, operated rather in restraint than in amplification of the managers' powers. The reference to the trust deed and the appeal to the bishop, limited and worthless as they are, were not in the seventh clause. That contained no restriction on the powers of the managers. What the Kenyon-Slaney amendment really did was to bring out the true meaning of the clause—to say in words what the managers might do instead of leaving it to be slowly discovered by experiment. But for this the clergy would have gone on believing their position secure until some managers, bolder than the rest, had closed the school door against the vicar. I can not see, therefore, that they have any case against the Government. They said by their representatives, official and other, "Give us a two-thirds

majority on the committees of management, and maintenance out of the rates, and we are content." They have got both.

But the fact that the clause which has aroused so much opposition among the clergy was in the bill all along, though it clears the Government of blame, does not make it, and ought not to make it, less of a shock to the clergy. What the bill does is to laicize the church schools. The opposition wanted to do more than this. Their contention was that church schools ought to be secularized. This demand the Government have consistently resisted. The church schools were to remain church schools in name. They were to retain their denominational character so far as this is compatible with the rejection of a foundation principle of the denomination to which they are supposed to belong. A church school under the Kenyon-Slaney clause is like a Baptist school from which all mention of adult baptism is excluded, or a Wesleyan school which knows nothing of the conference. So long as the education act of 1902 remains in force, so much of a clergyman's pastoral work as has been done in the school will be done in subjection to the laity. The right to pronounce whether a particular doctrine is the doctrine of the Church of England will, it is true, belong to the bishops, but to the laity will belong the more practically important function of deciding whether the doctrine in question shall be taught in a Church of England school.

The speeches of the lord chancellor in the House of Lords and of the prime minister in the House of Commons show that the powers now for the first time intrusted to the laity are intended for use, not for show. The lay managers are meant to serve a purpose. The Government are evidently alarmed at the threatened revival of the agitation of 1898. If they look at the matter from the strictly ministerial point of view they may possibly be right. An antiritualist movement of any magnitude in the country generally seems to me a most unlikely event. I could almost say that I wish it were more likely than it is; for an anti-ritualist movement, where it is genuine and not a mere political dodge, is, at least, evidence that those who take part in it care something about religion. It is better that a man should wish to suppress confession because he thinks that it puts the priest in the place of God than that he should extend to it a contemptuous tolerance because he does not really believe that there is such a thing as sin. The reason why we are secure against an anti-ritualist agitation on a large scale is that a large proportion of the electorate has ceased to take any interest in religion. The vision of a future life, the thought of their own position in regard to that future life, no longer excites either hope or fear. But a prime minister has to take into account the state of opinion in his party as well as in the country, and I can easily believe that Mr. Balfour finds this part of the prospect less satisfactory. The squire is seldom a sacerdotalist, and the squire is still a power in the Unionist ranks. On the 17th of last month Mr. Balfour said plainly that if the management clause of the act had not been understood to exclude clerical management the house would not have looked at it. "I had difficulty enough," he went on, "in passing it as it was \* \* \* difficulty among those who are my most constant and loyal friends on this side of the house." These words reveal a state of feeling in the Unionist party of which few of the clergy had any suspicion. More than any other party at this moment it is an anticlerical party. It may seem absurd to say this just when the whole Nonconformist body are in arms against the alleged greed and arrogance of the Anglican clergy. But there is a very real difference between the two tempers. The Nonconformists dislike the clergy because they are established. If the Church of England were a voluntary body they would no more concern themselves with her clergy than they do with the Roman Catholic clergy. The Unionists whom Mr. Balfour had in his mind do not, indeed, dislike the clergy, but they like them—as some people like cats—in their place, and that place a strictly subordinate one. The Kenyon-Slaney clause exactly meets this feeling. It does not forbid the managers of a church school to leave the clergyman in undisturbed possession of the position he has hitherto held. Provided that he behaves himself nicely, he will be allowed and even pressed to remain. It is only when his preaching or ritual happens to offend them that they will make use of their new powers. In their eyes the clergyman is a useful agent, but a bad principal, and an agent they mean him to remain. So long as the clergy were content to accept the status thus assigned to them there was no need to register it in an act of Parliament. Now that so many of them take a different view of their duties and responsibilities they need to be restrained by legislation. But, as Mr. Balfour explained when the Kenyon-Slaney amendment was first submitted to the House of Commons, the passing of a clergy discipline bill would be a long, troublesome, and doubtful business. The advantage of the education act as completed by this clause is that it does half the work of a clergy discipline act without either trouble or uncertainty. It gives the school managers the power of hitting the clergy in what, for various reasons, is a

very tender place. The managers, as the Lord Chancellor has pointed out, will be able to hold it in terror over them, and, now that attention has been drawn to their powers, there is good reason to believe that they will be used.

This, then, is the unappetizing mess of pottage for which the clergy have sold their birthright. They have, it is true, been unconscious Esau's, but, all the same, they have played Esau's part. They have been so absorbed in considering how to keep their schools alive that they have not stopped to ask themselves of what use they will be to them under the new management. It will not be long, however, before they will have evidence on this head. Wherever a clergyman is not popular with his parishioners they will now have the means of making him feel their displeasure. The managers of the church school will have only to express their regret that, by lighting candles in the daytime, or wearing "Mass vestments," or preaching the Real Presence in the pulpit, or sitting in the church to hear confessions, he has forfeited their confidence and driven them to refuse him admission to the church school. Thus the act makes a change of vital importance in the position of every parish priest. Hitherto he has had nobody over him except the bishop and the law courts. In future he will be subject as regards a large part of his work to a lay tribunal of first instance, with nothing to guide its members except their own fancies. No doubt it is a part of his work which in many cases he has left to be done by others. Mr. Balfour had facts on his side when, in replying to Lord Hugh Cecil, he charged the clergy with systematically making over to the elementary schoolmaster their function in the church school. Possibly this is one explanation of the strange fact that the church is often weakest in the districts where single schools are most frequent. She has had the education of the children in her own hands, but she has allowed religious instruction to rank among the incidents of school life which find their natural end when the school age is passed. But though Mr. Balfour's charge is a true one as regards many of the clergy, it does not bear out the conclusion he sought to draw from it. There is a world of difference in principle between a system which makes the parish schoolmaster the delegate of the vicar of the parish and a system which makes him the delegate of the school managers. In the former case the authority remains with the vicar. He can at any moment resume the function he has laid aside, and he can exercise an effectual supervision over the deputy to whom he has for the time intrusted it. In the latter case the vicar is in the school only on sufferance; the control of the religious instruction is out of his hands.

It is inconceivable that the clergy should long accept such a state of things as this. Parliament can not relieve them of a duty intrusted to them at their ordination, or bid them trouble themselves no further about a responsibility which has passed into the keeping of a lay committee. If a clergyman is shut out of his school, it will at once become his business to make other provision for the religious instruction of the children whom he can no longer reach in the school building or during school hours. How far such an arrangement will conduce to the religious peace of a parish I leave to the imaginations of the authors of the Kenyon-Slaney clause. There is no need to inquire, with Mr. Balfour, whether the Church of England regards teaching as the inalienable right of the clergy, or, with Sir William Harcourt, whether at the Reformation she did not, by express ordinance, make over that right to the laity. Both speculations belong to a class on which the time of politicians is very idly spent. For them the only question worth considering is not: "Are such and such bodies of men right in thinking this or that?" but: "Is it true that they think it?" There was a great deal of very useless discussion last spring as to the supposed want of logic in Nonconformists when they objected to support voluntary schools out of the rates, after supporting them without protest out of the taxes. Probably many politicians wish now, and many more will wish at the next general election, that they had been at equal pains to ascertain whether Nonconformists really did feel this objection. In the same way the smooth working of the education act will depend much less on the reasonableness than on the strength of the hostility it has evoked in the clergy. They are indeed a body of men as to whose action it is specially unsafe to hazard a positive prediction. They are isolated; they are divided; they have no recognized leaders. But to be turned out of the schools they have till now held to be their own, or to be let remain in them only so long as the managers think that they can be of use to the regular schoolmaster, is a greater slight than has yet been offered them. And it is one which, as I sincerely hope, they will not take patiently.

But what are they to do? It is not often that a question of this moment admits of so plain and straightforward an answer. Let them in the first place bethink them of the large and increasing number of the children nominally under their charge whom they have allowed to slip out of knowledge. What has until now been their defense when they have been accused of neglecting church children in board schools? That entry into these schools could only be had by giving up their own schools, and

that to do this would be to sacrifice all the advantages which children enjoy who are brought up in a thoroughly church atmosphere. We shall not hear much of this argument under the new act. Whatever other merits a school in which the parish priest has of right no place may chance to possess, it will certainly not have a church atmosphere. The parish priest who tries to give it one will soon discover that in order to succeed he must secure the support of a majority of his colleagues on the management, two of whom need not, and probably will not, be churchmen. When the clergy come to realize that for this they have raised controversial passion to an almost unprecedented height, undone all the advances previously made toward a better understanding with Nonconformists, and permitted themselves to be presented to one-half of their countrymen as setting rate aid above every other consideration, they will surely see that it is better to have a secure position in every public elementary school than a position from which they may at any moment be dislodged in a particular variety of elementary schools. At all events, this conviction is every day becoming more general. A year ago the churchmen who entertained it could almost be counted on the ten fingers. Now those who hold this to be the only ultimate solution of the religious difficulty in education are to be found at every corner. The only point on which there is any real difference of opinion is the length of time it will take to bring it about.

There are three systems, any one of which might conceivably be substituted for that set up by the new act—the Scottish system, the German system, and the system which provides religious instruction in all public elementary schools, but provides it at the cost and by the agents of the denominations. The Scottish system leaves the local authority free to teach what religion it likes in its own schools, while permitting local minorities to build schools for themselves and to draw their share of the government grant. The German system takes care that, in every school where the children are of more than one religion, each creed shall furnish a corresponding proportion of the teachers. Either of these plans is defensible in principle, but it is more than doubtful whether either of them would work well in England. The German system involves concurrent endowment, and so has no chance of being accepted by Nonconformists. The Scottish suits a country where the immense majority of the people are of one religion, and that a religion the members of which are not divided among themselves on any important matters of doctrine. This is not a description which can be applied to the Church of England. Among us the local authorities would constantly be asked to decide, not merely whether the religion taught in their schools should be that of the Church of England, but whether it should be that of the High Church or the Low Church section of the Church of England. In this way the question for the clergy is narrowed to the simple issue: "Shall we, in the matter of religious teaching, rest content with the education act of 1902, or do our utmost to get universal State schools with denominational religious instruction set up in place of it?" I can not believe that the clergy as a body will be long in making up their minds what their answer shall be. They will prefer State schools into which they can enter as of right, to church schools in which they will at best be tolerated visitors. They may, however, hesitate to declare themselves active supporters of the change because of the difficulties which are assumed to lie in the way. Some of these difficulties are purely mechanical, and may be got over by a little common sense. Others relate to the supposed injury done to the children by the discovery that mankind is not of one mind upon the subject of religion—a fact which we may safely assume them to have learned when first they saw some of their companions going to church and some to chapel. Others again rest on the alleged unwillingness and incompetence of the clergy to give the religious lesson. That some of the clergy will dislike going into the State schools, just as they have disliked going into their own schools, is certain. But to say this is only to say that every profession is irksome to some of its members. Probably there are clergymen who do not welcome the return of Sunday, and are happier outside their churches than inside them, but we do not for that reason abolish public worship. We are content to hope that a more careful use of patronage and a sounder public opinion will gradually mend matters. That there are some of the clergy who can neither give a lesson properly nor keep a class in decent order is likely enough, but if every bishop would make six months at a training college part of the necessary preparation for taking orders, this difficulty would soon disappear. It can not be impossible for a curate, with time and proper preparation, to rise to the level of a certificated teacher. Nor will the work be wholly done by the clergy. The need of providing religious instruction in State schools will create a class of laymen who will offer themselves for this duty, just as they do now for that of a lay reader. The office of religious instructor in State schools will supply a new and useful outlet for that lay energy which, as we are so often told, is now allowed to run to waste.

Details like these, however, belong to the future. The business of the present is to give expression and organization to the growing determination of the clergy that, so far as its arrangements for teaching religion are concerned, the education act of 1902 shall have but a short time to live.

## THE NEW EDUCATION ACT AT WORK.

By T. J. MACNAMARA.

[From the *Fortnightly Review*, January, 1903.]

In at least one important respect the new education act has proved, and will prove, a blessing in disguise. During the eight months it has been before Parliament and the country it has aroused the English people to something approaching a sense of interest in the question of national education. Such an achievement is by way of being a modern miracle, for the English people, up to the present, have had little or no belief in intellectualism as a factor in national defense. They have in the past won their way to supremacy by physical superiority. And, broadly speaking, it is John Bull's belief that since muscle has been the ruling force of yesterday so it will be the governing power of to-morrow. John is too conservative to connote the changes going on around him. He does not yet see that mere physical superiority can avail nothing against the magic forces that can be called up by the electrician, the chemist, and the scientist generally. The new education act, by awakening in him a concern for the education problem—even though that concern be either purely political or purely sectarian—has helped very materially to move him with the times.

And when the act actually gets into operation the newly found interest to which I refer is scarcely likely, for some time at any rate, to subside. The act—inasmuch as it wipes out the school boards, and, for the first time in the history of this country, not only universalizes the local rate for education but boldly puts the denominational schools upon these rates—will arouse many irritations and cut clean across many traditions. In so doing it will stimulate local interest. For the next ten years this act will keep the education question acutely before the country, and at the end of that time some of its leading features will be the subject of drastic Parliamentary modification. Well, this is all to the good. Rather a thousand times a faction-creating education act and strenuous agitations for its repeal, than a humdrum act and national education hopelessly eddying to and fro in the placid backwash of public apathy. John Bull has got to be kept awake on the education question for the next decade; and, thank Heaven, this act will perform the operation.

### THE ACT, THE MUNICIPAL COUNCILS, AND THE LOCAL CONTROL OF EDUCATION.

After so much by way of general reflection I come to the act itself. Its first operation is to destroy all the school boards. Thus, 2,544 public authorities which have been engaged upon elementary education for thirty years are wiped out of existence. Probably nobody will shed many tears over the disappearance of the small village school boards; but it is an educational leap in the dark thus to destroy the great urban school boards which have done so much to raise the level of public elementary education in this country. In lieu of the ad hoc local education authority the Government makes every county and every county borough council the authority for the education in its area. Thus, at one stroke, not only do the school boards disappear; not only is the local control of education "municipalized;" not only, for the first time, will every area in the country possess a public authority charged with the administration of education, but also—and again for the first time—it is made possible to bring all grades of education, elementary, technical, and secondary, under one and the same local authority in each district. Thus, in the first place, the act creates 67 county borough education authorities and 62 administrative county education authorities. Each of these authorities, acting through an "educational committee," will be charged with the control of all the public education within its area.

No sooner, however, is the policy of "one paramount authority in each area" vindicated than the act is made by way of proviso and exception to run ignominiously away from the principle.

In the counties every municipal borough of over 10,000 people, and every urban district of over 20,000 is to be autonomous, both as to administration and rating charges for elementary education. Thus, throughout the 62 counties there will be 140 municipal boroughs and 61 urban districts, which, though the higher education will

be administered from the county center in each case, will set up for themselves educational committees for elementary education. This is not quite the scheme of educational coordination to introduce which we understood in the earlier days of the education debates was the Government's fondest aim.

But this is not all. Having given way to the local patriotism of the middle-sized urban areas and promised them education committees of their own for elementary education, the Government found itself confronted with the smaller urban areas. "If you give an educationally misplaced measure of autonomy to 10,001, what do you propose to do for 9,999?" Thus the inevitable political pressure. "Very good," said the Government, amiably forgetting all its old zeal for coordination, avoidance of overlapping, prevention of the duplication of administrative machinery, and so on and so on, "we will allow every municipal borough with under 10,000 people and every urban district with under 20,000 to levy over its own area an extra penny (over and above the 2 pence the county will levy) for higher education. If it cares to do this it may have autonomy, financial and administrative, for purposes of higher education so far as the penny will carry it; at the same time it will be governed by the county in respect of its elementary education." This charmingly characteristic little bit of complaisance on Mr. Balfour's part confronts us with the possible calling into being of 108 further education committees for municipal boroughs of under 10,000 people, and of 745 more for urban districts of under 20,000 people.

Thus, in the "one-authority" act, we get the following:

#### LOCAL EDUCATION AUTHORITIES WHICH MUST BE CREATED.

Autonomous for elementary education and autonomous for higher education up to 2 pence in the pound. (This limit was afterwards removed):	
The county boroughs.....	67
Autonomous for elementary education and autonomous for higher education up to a rate of 2 pence in the pound:	
The administrative counties.....	62
Autonomous for elementary education and autonomous for higher education up to 1 pence in the pound. (Also liable to be rated for higher education, without autonomy, by the county council up to 2 pence in the pound):	
The municipal boroughs with over 10,000 population.....	140
Autonomous for elementary education and autonomous for higher education up to 1 pence in the pound. (To be rated also by county, without autonomy, up to 2 pence):	
Urban districts with population of over 20,000.....	61

#### LOCAL AUTHORITIES WHICH MAY BE CREATED.

Non-autonomous for elementary education, but autonomous for higher education up to a limit of 1 pence in the pound. (Ratable also up to 2 pence more, without autonomy, by the county council):	
The municipal boroughs of under 10,000 population.....	108
Non-autonomous for elementary education, but autonomous for higher education up to 1 pence in the pound. (Ratable also up to 2 pence more, without autonomy, by the county council):	
Urban districts up to a 20,000 population.....	745

For myself I hope the latter 853 will all resolve to throw in their lots with the county for higher education. It is little they can do with their penny rates, and it would be the maximum of stupidity thus to cut holes in the general scheme of higher education for any county.

#### THE EDUCATION COMMITTEES.

Having resolved to destroy the ad hoc local education authorities, and to go to the municipal councils for its new education authorities, the Government at once found itself faced with the fact that already the municipal councils have enough to do. So, though nominally they are to be the "authority" in each case, directly the new responsibility is conferred upon them they must delegate it to another body—the "education committee." The function of the municipal council is confined to "the power of raising a rate or borrowing money." Educational administration is delegated in each case to the "education committee." In every urban district, of whatever size, this "education committee" must consist, as to a majority of its members, of members of the municipal council. In the administrative counties it may so consist. But even here the county council must nominate a majority of the persons to serve

upon the county "education committee." As for the rest, each municipal council must submit a "scheme" for the approval of the board of education, and that "scheme," as regards its cooptative elements, must provide:

"For the appointment by the council on the nomination, where it appears desirable, of other bodies, of persons of experience in education, and of persons acquainted with the needs of the various kinds of schools in the area for which the council acts;

"For the inclusion of women as well as men among the members of the committee;

"For the appointment, if desirable, of members of school boards existing at the time of the passing of this act as members of the first committee."

Further, it should be noted that "any person is disqualified for being a member of an education committee who, by reason of holding an office or place of profit, or having any share or interest in a contract or employment, is disqualified for being a member of the council appointing the education committee. But no such disqualification shall apply to a person by reason only of his holding office in a school or college aided, provided, or maintained by the council."

There is no reason why every municipal council having powers under the act should not get together a thoroughly representative and able "education committee."

Existing school board members, existing technical instruction committee's members, members of the governing bodies of the various voluntary and secondary schools of the area, and representative members of the various grades of the teaching profession—these are the elements from which the coopted membership of each "education committee" should be drawn. One of the dangers of the situation is this, that the "committees" may, in places, be packed with too many representatives of diocesan and church associations. Another is the stupendousness of the work in each of the great county boroughs. In any one of the ten or dozen great cities there are from 700 to 800 school departments to supervise; the education of some 100,000 pupils of all ages to direct; the work of some 3,000 teachers to overlook, and about half a million of money annually to expend. Now, in these cases, a majority of the members of the "education committee" must be members of the city council. And these city councilors are already very hard-worked business men.

What will follow? The control of this great and detailed public work will necessarily fall into the hands of officials and of persons not directly responsible to the ratepayers. I can not think that this will make for effective local government, and I can well imagine the time when there will be a general demand from the great urban centers for reestablishment of the ad hoc local board of education.

#### THE LOCAL MANAGEMENT OF THE SCHOOLS.

Although the "education committee" is to have complete control of all the education given in the schools hitherto known as "board schools," and of all the secular education in the schools hitherto known as "voluntary schools," it is obvious that it can not directly "manage" each individual school. This task will be essayed by a body of six managers in each case. As to the "board schools" (in future they may as well be known as "undenominational" schools) there will be no difficulty. The "education committee" will nominate the managers for each school as the London school board does to-day. In the boroughs the "education committee" may, indeed, for its own schools, dispense with "local managers" altogether. The managerial problem becomes acute when we come to the "voluntary" schools (which may as well be known in future as the "denominational" schools). Here the "education committee" is to nominate two managers; the managers under the trust deed of the school are to send four. Thus the six. These six—two public and four denominational—are to have managerial control over all the work of the school, secular (subject to the direction of the "education committee") and religious (subject to the provisions of the trust deed). Trouble as regards both the secular and the religious instruction may be anticipated under this arrangement. The "education committee," which is from public funds to send to the school the whole of the money necessary for its maintenance, is likely to (and I sincerely hope will) impose obligations respecting the staffing of the schools, the payments to and the conditions of service by the teachers, the choice of books and apparatus, etc., which will certainly be resented by those very estimable clergymen who in the past have been not only the sole managers of the school, but the sole and undisputed dispensers of all the little patronage connected therewith. It is scarcely in human nature to expect that these good folk will in all cases take the stripping from them of their ancient authority with anything approaching equanimity. Then there is the question of the religious instruction in these schools. It is to be in accordance with the trust deeds, and at the same time, by the terms of the famous Kenyon-Slaney clause,

under the direction of the six managers. But the trust deed usually in force, in Church of England schools, for instance, provides that "the principal officiating minister for the time being \* \* \* shall have the superintendence of the religious and moral instruction of all the scholars," subject, in case of dispute, to an appeal to the bishop of the diocese. Supposing the clergyman resents the interference of the other five managers. What then? Supposing, on appeal, the bishop upholds the view of the incumbent. Again, what then? Visions of difficulty, therefore, both in respect of the secular and of the religious instruction arise without any vigorous exercise of the imagination under this two-and-four arrangement.

In any case it is open to the grave objection that it does not give the public a sufficient return for the public money by which the denominational school will in future be maintained; and this, of course, will be its ultimate undoing. A rough estimate shows that in future the rates and taxes will find 55 shillings a year for each child in the denominational schools. The church adds to this (*a*) the use of the school building, and assisted by the public authority, (*b*) the cost of keeping that building in good repair. As to (*a*) the annual value of the buildings, at the church's own estimate, is £750,000. The public is to have the use of these for five days a week, and for, say, six hours each day, plus also the free use for three nights a week. Call this, roughly, two-thirds of the week, and the value of the rental comes down to, say, £450,000. Divide this among the 3,000,000 of children attending the denominational schools, and the value of the buildings works out at about 3 shillings a child per year—an estimate which, it will be noted credulously, swallows the absurd contention that these buildings are in all cases church property built with church funds. To this 3 shillings a child per year must be added the cost of (*b*)—the duty of keeping the buildings in good repair. A fair estimate puts this at 2 shillings a child per year, or £300,000 a year in all. Originally this sum was to have been met out of that £800,000 a year voluntary subscriptions which will no longer be needed for educational "maintenance," that being entirely met out of rates and taxes. Toward the later stages of the bill's discussion, however, steps were barefacedly taken, and taken after the scheme of "closure by compartments" had made any serious discussion quite impossible, to secure that, for the purpose of keeping the fabric in repair, the managers should in each case be allowed a share of the school fees paid by the children, the income from endowments, and the proceeds of the rent charged for the teachers' residences. Even after this had been done the Lords, on the motion of the Bishop of Manchester, threw part of the cost of repairs on the local authority! The result of this impudent raid upon funds which ought properly be applied to the relief of the education rate will be that little or no voluntary contributions will be needed for the upkeep of the fabric. However, I will put the case with hypercritical fairness, and let the 2 shillings a child by way of voluntary contributions for the fabric stand. So I get this:

	Shillings.
Furnished by the public in rates and taxes . . . . .	55
Furnished by the church (3 shillings for use of buildings, 2 shillings for upkeep of fabric) . . . . .	5
Total cost per child per year . . . . .	60

Thus the public which finds eleven-twelfths of the money is to get two out of six, or four-twelfths of the managerial seats! Of course the thing can not stand. And Mr. Balfour simply essays the rôle of an educational Mrs. Partington in endeavoring to stem the measure of local control which must follow from rate aid. The government, in an act which it has taken eight months to pass, stakes the whole future of the denominational system on a single word of four letters! That word is the word "four" in the fourteenth line of the sixth section of the act. Let a liberal Government pass—which it could do inside of a week—a bill of one clause, as follows:

"Be it enacted by the King's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:

"I. That the word 'four' in the fourteenth line of the sixth section of the education act, 1902, be read and construed as if it were the word 'one.'"

What then? The public would have two managers on each body as in the act; the denomination would have one. And down like a house of cards would come the whole fabric, to build which has nearly smashed the Unionist party, has bitterly alienated the free churches, and has eaten up a whole year of the time of the Empire's Parliament.

At this point it may be well to set out the whole position as between the public and the denominationalists, which this act establishes.

The denominationalists get—

1. Denominational schools and denominational religious instruction entirely maintained out of rates and taxes equal 55 shillings a child per year.
2. The right to impose a denominational religious test upon 14,000 out of the 20,000 head teachers appointed to the public elementary schools.
3. The appointment of four local managers in each case out of six.
4. The right to use the school buildings for denominational and parochial purposes, and the school furniture (which must all soon be new and the property of the public), free of cost all day Saturday and Sunday, and four evenings a week.
5. The right to claim part of the fees, the endowments, and the rent of the teachers' residences in aid of the upkeep of the fabric.

The community gets—

1. General supervision of the secular instruction by the "education committee."
2. Veto by the "education committee" over the appointment and dismissal of the teachers—questions affecting religious instruction being excluded from the said veto.
3. The appointment of two managers out of six.
4. The free use of the buildings five days a week and six hours a day and also for three nights a week, equals about 3 shillings a child per year.
5. Buildings to be kept in good repair by the managers and the local authority, equals about 2 shillings a child per year.

I leave the impartial reader to make his own comment on this scheme of give and take as between the public and the denominationalists.

#### THE FINANCE OF THE ACT.

The act revolutionizes the system of financing education in this country. It sweeps away once and for all the dangerous anachronism of endeavoring in part to maintain the education of more than half the children attending the elementary schools out of voluntary contributions. And for that alone I am profoundly grateful—subject, of course, to the reservation I have already made respecting the inadequacy of the measure of local control. In the past the financial support accorded to both "board" and "voluntary" schools has been of two kinds—central and local. The central support has consisted of grants from the exchequer paid upon the report of His Majesty's inspectors of schools; and, generally speaking, has been receivable by the "voluntary" schools on the same terms as by the "board" schools. But this exchequer aid has, admittedly, not been enough to run the schools efficiently. It has been necessary, therefore, to supplement it by moneys drawn from local sources. In the case of the schools known in the past as "board" schools this supplementary income has been provided from the rates, and in school-board districts this local contribution has been compulsory upon all ratepayers. The schools hitherto known as "voluntary" schools, and now to be known as denominational schools, have had no such compulsory local income to turn to. They have had to supplement their central aid from the offerings of benevolent and charitable persons. The school boards last year found it necessary to supplement their central aid by a sum equal to £1 8s. 2d. per child of the children in attendance in the schools. The conductors of the voluntary schools were only able to secure a local supplement to their central aid in the form of a voluntary subscription equal to 6 shillings 8 pence per child. It is this serious difference in the local income of the schools which, by placing all the schools boldly upon the rates for their local maintenance, the education act of 1903 sweeps away once and for all.

For the first time, too, the local rate will be universalized. Up to the present, eight county boroughs (Preston, St. Helens, Chester, Lincoln, Stockport, Wigan, Bournemouth, and Bury), never having had a school board, have never levied a local rate for education. Now they will be compelled to do so. So, too, will something like half the 248 municipal boroughs which up to now have never had a school board. In this way the townspeople of 109 municipal boroughs, including such towns as Accrington, Cambridge, Chatham, Chelmsford, Cheltenham, Chichester, Crewe, Deal, Devizes, Doncaster, Dover, Eastbourne, Ealing, Grantham, Hereford, Penzance, Peterborough, Pontefract, Ramsgate, Richmond, Ripon, Southport, Taunton, Torquay, Truro, Weymouth, Whitehaven, and Winchester, will find themselves at last compelled to pay their due share in what ought long ago to have been viewed as a communal obligation. Ninety-two urban districts, too, will for the first time be rated,

these including such towns as Bilston, Bishop's Stortford, Clevedon, Ilfracombe, Nantwich, Rhyl, Rugby, and Stretford. Finally, about half the rural parishes of the country (or, as nearly as I can gather, some 5,000) will also be rated for the first time. Of the entire rateable value of England and Wales—£186,500,000—quite sixty millions will thus be brought under compulsory contribution toward elementary education for the first time.

In the administrative counties there will be a general county rate laid for elementary education. This must reach 3 pence in the pound, or the locality will be fined a portion of its share of the exchequer grants. The danger here is that this "3 pence in the pound" may be taken as a maximum. Indeed, the attorney-general, Sir Robert Finlay, says he is sorry that it has not been possible to fix it as a statutory maximum for the agricultural areas under the act. This, as coming from a Scotsman, strikes me as rather startling. Of course, where there has been no rate raised in the past this 3 pence in the pound is 3 pence to the good. But I must point out that at the present time in the areas where a local rate for elementary education is levied the average amount so raised is in the English boroughs 9.4 pence in the pound, in the English parishes 15.5 pence in the pound, in the Welsh boroughs 13.1 pence in the pound, and in the Welsh parishes 13.6 pence. I must also point out that last year 92 per cent of the English school boards and 94 per cent of the Welsh school boards found it necessary to raise a rate which in each case was higher than 3 pence. Further, over a third of the areas rated in England and Wales were rated at a shilling and upward in the pound.

It must also be remembered that rate aid is now to be given, roughly, to double as many children as heretofore. It is now to be raised on behalf of the denominational as well as on behalf of undenominational school children. So any talk of even keeping the rate—in districts where it has hitherto been levied—at anything like its present level can only mean that part of the efficiency of the present board school is to be sacrificed to make up the leeway between them and the voluntary schools. For instance, take a town like Gloucester. The present school-board rate is 10 pence on behalf of 2,500 children in average attendance in the board schools. But you have now to rate-aid 4,000 voluntary-school children at 15 shillings a head on the rates—which is a moderate estimate—and this would raise the Gloucester rate from 10 pence to 1 shilling 2 pence. Again, take the case of Birkenhead. The rate is, roughly, 5 pence on behalf of the 2,800 board-school children. Add to the rates a share of the maintenance charge for 12,580 other children now in the voluntary schools and you raise the rate to over 9 pence. Take, again, the extreme case of Blackburn. There you have 1,000 school-board children and a rate of 3½ pence. But you have now to rate-aid 18,260 voluntary-school children. On the 15-shillings-a-head estimate the people of Blackburn would need to raise their rate from 3½ pence to 10 pence.

As I shall have to explain presently, this necessity has been in some degree mitigated by the provision during the passage of the act through committee of about £1,360,000 further grants in aid of elementary education from the imperial exchequer. On the other side of the account, however, there is the fact that not only have you to rate-aid double as many elementary-school children as before, but you have to proceed with the development of higher education, which is now to include all pupil-teacher instruction, all training of teachers, and a very great deal of evening-school work. The counties in respect of this higher education are to rate themselves up to 2 pence in the pound, with a further subsidy from the rates by grace of the local government board. The county boroughs may rate themselves for higher education up to any limit. Now, 2 pence in the pound on the rateable value of England and Wales comes to £1,554,000, which is not much more than the additional exchequer grants provided for elementary education. Therefore, let no locality be in a fool's paradise over this matter. Where it has never been rated before for elementary education it must face with equanimity a new rate which it will have to levy, and face that rate without any jeremiads about 3 pence in the pound. Where a rate has been previously levied the locality must be prepared, despite the additional exchequer grant, and having regard to new obligations placed upon it in respect of higher education, to see its present rate increased by anything from 3 pence up to 6 pence in the pound—and even more in certain cases. Otherwise the board-school Peter will be robbed to pay the voluntary-school Paul.

With regard to the new grant in aid of elementary education, a word or two as to its dispensation will be useful. The Government annexes the special-aid grants under the voluntary schools and necessitous school boards act of 1897, in all a sum of £860,000 a year; and to this it adds an entirely new State grant of about £1,360,000. These two together, making in all a special-aid grant of £2,220,000, are to be dispensed on the following plan: First of all, there is to be a fixed grant of 4 shillings

per head allowed. This, on the average attendance, excluding London, will eat up £824,600. The remaining portion—£1,395,000—will be distributed as follows: For every 2 pence below 10 shillings which the proceeds of a 1-penny rate divided by the number of children in average attendance would produce, the Government will give a sliding scale grant of  $1\frac{1}{2}$  pence per child. This sliding-scale grant will range from 6 shillings 9 pence per child in the case where the proceeds of a 1-penny rate divided by the number of children in average attendance will only produce 1 shilling, to nothing at all in the case where the proceeds of a 1-penny rate divided by the number of children gives 10 shillings. All schools will receive from this new grant sums varying from 4 shillings a child to 10 shillings 9 pence a child, according to the circumstances of the case. \* \* \*

#### THE ULTIMATE RESULT.

So far, what I have written deals with the immediate working of the act. But no matter how it may be worked, it can not be viewed as the last word on the education question. That word will not have been spoken until all publicly aided schools are not only entirely under public control but are conducted in such a way as to impose no religious disability upon any pupil or teacher. Toward this end the Liberal Party will, of course, work; and the task before it has, in my opinion, been enormously lightened by the placing of all the schools upon the rates for maintenance.

Ultimately, I have no shadow of doubt, we shall arrive at a national system, the main features of which will be:

1. All schools, as to general supervision and local management, under complete public control.
2. The denominational school buildings will be rented to the public authorities for the hours they will need them daily.
3. Religious instruction will take the form of a common family opening service of an undenominational character, right of entry being conceded to denominationalists for purposes of denominational teaching before and after the hours of the public authority's occupancy.
4. All teachers to be appointed by the public authorities for the purposes under their jurisdiction, and to be exempt from any theological test.

---

## PART II.

### SECONDARY AND UNIVERSITY EDUCATION IN GREAT BRITAIN AND IRELAND.

#### RELATION OF THE NEW ENGLISH LAW TO THE PROVINCE OF SECONDARY EDUCATION.

The education law of 1902 is the first measure adopted for England which includes in its scope both elementary and secondary education. Besides the laws pertaining to elementary education, several laws have been passed since 1860 dealing with particular classes of secondary schools, but the new law deals with both grades of education as related interests. The unsatisfactory condition of secondary education in the country had much to do with bringing about this legislation, and its importance as the initiatory step toward a unified national system of education can not be understood without reference to this higher department, which is no longer dealt with piecemeal, but in a comprehensive manner.

It should be observed at the outset that the typical secondary schools of England, the great endowed schools that prepare for the universities, form a class by themselves, and if affected at all by the new law will only be so indirectly through a gradual change in scholastic demands. The purpose of the law indeed is, not to change what has become an integral part of English life and ideals, but to systematize, correlate, and direct new agencies which have been created by or are required to meet modern demands.

By reference to the law (Part II, classes 2 to 4) it will be seen that the local education authorities (county and borough councils) are ordered to take such steps as

may seem to them desirable, subject to the sanction of the board of education, to supply or to aid the supply of education, other than elementary, in their respective areas. To these authorities also is transferred the control of certain public funds (the surplus of the liquor duties) applicable to secondary, or, as the law terms it, "higher" education, and the raising of additional funds for the purpose by means of a local tax. In fact, the local authorities are practically unrestricted in respect to these powers, excepting that their measures must be sanctioned by the Board of Education. An English critic points out that—

The bill contents itself with drawing the line between elementary and non-elementary education, to which it applies the omnibus title of "higher." This includes not only secondary and technical education, but training colleges and evening schools, except those in which the entire teaching is elementary. No terminus ad quem is assigned to the definition, so that a progressive county council will be able, if it please, to subsidize education of a university type.<sup>a</sup>

The word higher is misleading to the American reader, accustomed to its use in respect to colleges and universities, but if secondary be substituted in this relation it must be taken in a very comprehensive sense, covering all education above the most elementary and below the university province. The law is clear as to the purpose of making this extensive department a matter of national concern in the same sense as elementary education. The section of the new law referred to will therefore be best understood in the light of a long series of efforts in respect to secondary education, of which it may be regarded as the consummation.

#### HISTORICAL SURVEY OF THE MEASURES RELATING TO SECONDARY EDUCATION.

The history of efforts looking toward the better organization of secondary education extends back to the early part of the first half of the nineteenth century. These efforts followed for a time two distinct lines, but have been gradually merged into one. On the one side were efforts relating to long-established schools, and on the other efforts to make provision for new demands arising from the industrial revolution that marked the last century. We shall consider these measures in the order of this classification, adding for their better understanding such statistics as are available, and typical programmes showing the scholastic scope of the various classes of schools included in the survey.

##### I. COMMISSIONS OF INQUIRY INTO EDUCATIONAL ENDOWMENTS.

The unorganized state of secondary schools in England was the burden of a report by Matthew Arnold, issued in 1865, which attracted world-wide attention.<sup>b</sup> The author had been deputed by the British Schools Inquiry Commission to investigate and report upon the condition of secondary schools on the Continent, and he did not hesitate to expose the deficiencies of his own country in this respect as compared with rival nations. This report itself was, however, the sign of an interest which had manifested itself in high places as early as 1818. In that year Lord Brougham submitted to Parliament a bill for the appointment of a royal commission to inquire into educational charities in England and Wales. His efforts resulted in the appointment of such a commission to deal with the London charities. Year after year until 1837 the appointment was renewed and the scope of inquiry somewhat extended.

By these limited investigations it was made evident that educational endowments, and especially those intended originally for the benefit of the poorer classes, were too often wasted and misapplied. This perversion of the funds was a matter of

<sup>a</sup> Cloudesley Brereton in *Schoolmaster's Yearbook*, 1903, Part III, pp. 1, 2.

<sup>b</sup> Report on the system of education for the middle and upper classes in France, Italy, Germany, and Switzerland. British Schools Inquiry Commission, Vol. VI.

national concern, as at that time, and indeed until a very recent date, endowed schools offered almost the only provision for poor but promising lads to pursue their education beyond the elements. It is true there were numerous private schools, but these were either expensive or inefficient, and very often both.

The reports of the charities commissions and that of the educational commission of 1858 (chairman, the Duke of Newcastle) appointed to inquire into the state of popular education, combined with political and social developments to create an intense interest in education considered as a public responsibility. On the part of the Government this interest was manifested by the appointment in 1861 of a second educational commission to inquire into the condition of the most independent and exclusive schools in the country. The list included the seven endowed schools—Eton, Winchester, Westminster, Charterhouse, Harrow, Rugby, and Shrewsbury—which, in respect both to their patronage and their influence in forming the characters of the leading men of the Kingdom, are very justly considered as national institutions, and two endowed day schools of a local type—St. Paul's and Merchant Taylors' in London. The commission, generally known as Lord Clarendon's Commission, pursued its investigation for three years, and in 1864 issued a report which led to the passage of the law of 1868 dealing with the seven boarding schools named above. This law provided for the appointment by the schools of new governing bodies which were to make new statutes and regulations for their respective institutions, subject only to the approval by the privy council. Naturally, the overshadowing prestige of the schools precluded specific criticisms of their internal conduct. The law called for the removal of certain narrowing restrictions, but further than this and the final assent of the privy council to their schemes, the new governing bodies were left with a free hand. Nevertheless, through the work of the commission these schools, which at that time had an aggregate annual income of £65,000 (\$325,000) and were attended by nearly 3,000 (exactly 2,956) youths, the élite of the country, were brought within the movement that was making for radical reforms in education.

Lord Clarendon's commission was followed in 1864 by the British Schools Inquiry Commission (under Lord Taunton), which had much more extended scope than the former, and, as the outcome proved, much greater influence upon public opinion and subsequent action. It was to include in its inquiry all the schools that had not been included in the commission of 1861 or in the earlier commission of 1858. Within these limits were comprised 820 endowed schools, established at different times through the long period of seven centuries, and 122 proprietary schools; that is, schools belonging to stock companies, a form of educational activity still quite common in England. The commission did not confine itself to England but deputed experts to report upon the condition of secondary schools in neighboring countries, and hence its voluminous report makes an important addition to the comparative history of education. It was to this report that Matthew Arnold contributed the study of continental schools already mentioned.

Of the 820 endowed schools whose condition was investigated by this commission, 572 were regarded as secondary. They numbered about 40,000 students and had a net aggregate annual income of £183,066 (\$915,333), with exhibitions (a form of scholarship) of the annual value of £13,897 (\$69,485).

In addition to the endowed and proprietary schools there were estimated to be about 10,000 private schools in the country engaged, partly at least, in secondary work. The commission of 1864 made a special endeavor to ascertain particulars respecting the condition of these schools, but, for obvious reasons, this information which was set forth in appendixes of the report could not be brought within the scheme of the general summary.

As a result of the labors of the Clarendon and Taunton commissions, the Government was quite fully informed as to the public provision for secondary education

existing in England. The word public, it should be observed, is here used in a different sense from that current among us. The endowed schools were regarded as public because by the terms of their trust deed or by means of scholarship funds they were, theoretically at least, within reach of capable lads in almost every class of society. Special stress is placed upon this feature of the endowed schools as contrasted with proprietary schools which were restricted generally to a particular class of well-to-do people, and private schools which were apt to be exclusive and expensive or else of little account.

The report of the British Schools Inquiry Commission made it evident that the country was alarmingly deficient in secondary schools for the middle and laboring classes. There were estimated to be a hundred towns with a population of 5,000 or more that had no endowed grammar school. London, whose population was nearly 3,000,000, had only 26 endowed schools with less than 3,000 pupils. More than half the population of the city (1,726,989) were destitute of any endowment for secondary education. Not only was the supply of public schools far below the demand, but those that existed were often badly managed, their resources wasted, and their influence meager. In particular the commissioners note the dearth of day schools.

For the upper classes of the community [they say] there is a sufficient supply of public boarding schools and a very small supply of public day schools; for the upper section of the middle class there is a smaller supply of public boarding schools and a very insufficient supply of public day schools; for the lower section of the middle class and the upper section of the artisans there is almost no supply of public boarding schools, and a very poor supply of public day schools giving an education higher than the national (i. e., elementary) schools.<sup>a</sup>

As to studies, the commissioners note the general absence of instruction in any but classical subjects.

The universities [they observe], by requiring Greek and Latin, make the existence of semiclassical or nonclassical education of the best kind almost impossible. What is found is due mainly to the examination for admission to Woolwich \* \* \* there is seldom made an attempt of any earnestness and importance to give the education of the schools established in Germany under the name of Realschulen \* \* \*

Public schools giving a fair general education, but laying especial stress on such mechanical and physical sciences as shall best assist the scholars who are intended for manufacturing or mechanical pursuits, hardly exist. The Bristol Trades School is the most noticeable instance which has been brought before us.

The report of the Taunton commission, like that of its predecessor, led to the passage of a law (endowed schools act, 1869) which has had important results in respect to the particular schools affected. It embodied, however, only a single one of the recommendations of the commission, namely, that calling for a central authority to draft new schemes for the administration of the endowments. This duty was intrusted at first to three special commissioners; in 1874 it was transferred to the charity commissioners (constituted under law of 1853), and finally, in 1899, to the newly constituted Board of Education.

The practical results of the administrative reform growing out of the labors of the Taunton commission were shown by a return made to the House of Commons in 1892. From this document it appears that in the previous year the amount of income of educational endowments available for secondary education, exclusive of property of an incalculable value in the form of sites and buildings for schools, reached a total of £697,132 (\$3,485,660). Of 1,262 distinct endowments, 668 were then worked under schemes approved by the commission.

A comparison with the earlier conditions shows that new foundations and discoveries had nearly doubled the number of schools and enormously increased the revenues since 1868.<sup>b</sup> But while the endowed schools were thus enlarging their capacity

<sup>a</sup>Report of British Schools Inquiry Commission, Vol. I, pp. 102, 103.

<sup>b</sup>Educational Systems of Great Britain and Ireland, by Graham Balfour, p. 164.

and resources, the demand for secondary schools had greatly increased, and moreover, schools of a new type had become indispensable. The great cities had been active in meeting these requirements, and the Government itself had assisted in the work through the agency of the Science and Art Department. Thus new factors were introduced into the already confused problem of secondary education, and the need of organizing this department on a national basis, as had been advised in 1868 by the Taunton commission, became every day more apparent. Following old precedents, the Government in 1894 appointed a new commission, with James Bryce as chairman, charged to consider "what are the best methods of establishing a well-organized system of secondary education in England, taking into account existing deficiencies, and having regard to such local sources of revenue, from endowment or otherwise, as are available for this purpose, and to make recommendations accordingly."

After an exhaustive investigation of the conditions, this commission, in their report, repeat substantially the recommendations of the Taunton commission. In particular they advise: (1) The creation of a general education department with a permanent secretary and consultative education council charged with directory and advisory functions; and (2) the creation of local authorities empowered to make needed provision for secondary education in their respective districts, to supervise and inspect schools and to administer the public funds applicable to secondary education.<sup>a</sup>

These two requirements of what may be termed a national system of secondary education appear at last to have been assured through the powers conferred upon the central board of education and the obligation with respect to secondary schools imposed upon the local councils by the law of 1902.

The British Schools Inquiry Commission adopted a classification of secondary schools based upon the age up to which pupils normally remain at school. Upon this basis "it is found," they say, "that education as distinct from direct preparation for employment can at present be classified as that which is to stop at about 14, that which is to stop at about 16, and that which is to continue till 18 or 19;" for convenience these were designated as "the third, the second, and the first" grades of education respectively.

The commission of 1894, while following this classification, provisionally note significant changes that have taken place since its first adoption.

The standard of age [they say] is not exactly what it was. For first grade schools it may seem to stand where it did, but the limit of age (19) set for college scholarships appears to favor the higher year as the normal end of the school course. For second and third grade schools the limit of age has distinctly advanced in the one case to 17 or 18, in the other to 15 or 16. On the other hand, there has been a fall in the average age at which the more capable children pass the standards in the elementary schools, and this change has contributed to the rise of the higher grade board schools.

The commissioners note further that the "gradation of social classes in relation to educational demands requires to be modified." This last change, in part at least, was a result of legislation growing out of the work of the earlier commission which had made the highest class of secondary schools accessible to a larger portion of the population.

But a more significant change than either of the two mentioned was attributed by the commission of 1894 to the growth of special and technical studies, which, by a "perfectly natural process," they say, "has become in a quite exceptional degree what we may term a civil concern."<sup>b</sup>

## II.—EXAMINING AGENCIES.

It is noticeable that both the Taunton and Bryce commissions recognized the desirability of some system of inspection and examination for secondary schools as a

<sup>a</sup> Report of the Royal Commission on Secondary Education (1895), Vol. I, pp. 324-328. Compare with Report of British Schools Inquiry Commission, Vol. I, pp. 628, 633-639.

<sup>b</sup> Report of Secondary Education Commission, 1895, pp. 132-136.

means of maintaining their efficiency and promoting unity of aim along common lines. The Government has gradually developed a service of this kind, but other agencies entered much earlier and with much more vigor upon this work. The College of Preceptors, an association of schoolmasters (belonging for the most part to private schools), was formed in 1846 for the organization and improvement of the profession. This association, which received a charter in 1849, anticipated all recommendations in respect to the improvement of secondary schools by organizing at once a system of examinations for individual schools. In December, 1853, the "college" went further by arranging for the examinations of pupils at the headquarters in London, both boys and girls being admitted. The subjects included Latin, French, English history, geography, mathematics, drawing, physical science, and Greek, a very liberal programme for that early date.

In 1857 an experiment was made in the examination of students by a few university men, with such success that the University of Oxford was induced to place the system on a permanent footing, and appointed a body of delegates to take charge of the service. Soon after, Cambridge took similar action, and in 1858 the first examinations were held under the auspices of the universities. These were at first conducted for boys only, but in 1863 the Cambridge syndicate admitted girls, a precedent subsequently followed by Oxford. These examinations, known as the "local examinations," have had enormous growth—the number of candidates examined at the different centers increasing from 1,219 in 1860 to 22,030 in 1897. Those who pass the examinations receive a certificate (junior or senior, according to the standard reached), which is of substantial value to the holder.

As the result of an application from the head masters of public schools, made originally in 1870, and renewed in 1872, the two universities formed in 1873 a joint board for the examination of schools and individuals, and consented to recognize the certificates of the board as exempting undergraduates from their matriculation examinations. Under these advantageous conditions, the examinations of the board were begun in schools for boys in 1874. In 1878 the service was extended to schools for girls, and in 1883 a lower class of certificates was instituted, the standard of the higher being still maintained. Commercial certificates, as in the local examinations, were tried and abandoned. The agents of the board are sent to individual schools for the examination of candidates. For certificate purposes all papers are submitted to examiners assembled in alternate years at Oxford and Cambridge. The word "inspection" entered on the paper denotes that the examiner inspects and reports on sets of papers first marked by masters of the school.

The number of candidates for the examinations of the joint board (Oxford and Cambridge schools examination) rose from 700 in 1880 to 3,073.

These examinations have not only had a salutary effect upon schools and pupils, but they must be counted among the many influences that have led to the legislative effort for placing secondary education on a sound national basis.

### III.—MOVEMENTS FOR PROMOTING SCIENCE AND ART INSTRUCTION.

The development of a new class of studies which had formerly no place in the curricula of secondary schools has been fostered by a series of efforts quite distinct from those which related to schools long established and working on traditional lines.

The efforts in respect to the new studies sprang from the same impulses as those pertaining to elementary education, and they followed the same general course, beginning in private initiative and leading up to Government aid and supervision. Specially noteworthy in the pioneer stage of the movement are the efforts of Dr. Birkbeck, the founder of "mechanics' institutes," which multiplied rapidly both in England and in Scotland during the first quarter of the last century. At the time Dr. Birkbeck was the professor of natural philosophy at Anderson's Institution in

Glasgow, where he began his efforts in behalf of the artisan class by a course of popular lectures for workingmen, but, in spite of the great interest manifested by those whom he drew around him, it soon became apparent that the want of preliminary teaching prevented them from following simple explanations of scientific processes.

The interest in the mechanics' institutes gradually subsided, and if they survived they became either mere clubs or essentially teaching institutions. An example of the latter change is Birkbeck Institution of London, which celebrated its seventy-seventh anniversary in 1900. Its work has become more and more systematized with the passing years, and many of its students have gained distinctions at the London University examinations. The ideas which prompted these early experiments by Dr. Birkbeck found their most powerful advocate in his friend, Lord Brougham, whose "Discourse on the objects, pleasures, and advantages of science," published by the "Society for the Diffusion of Useful Knowledge" (itself an outcome of the new interest) presented a graphic outline of scientific knowledge as then developed, and of its practical bearings.

The awakening sense of the relations of science to industry was accompanied by a growing interest in the subject of industrial art training. This matter was brought to the attention of the House of Commons in 1835 by Mr. William Ewart, member from Liverpool, and upon his motion a select committee was appointed "to inquire into the best means of extending a knowledge of the arts and of the principles of design among the people (especially the manufacturing population) of the country." The committee, which was reappointed in the following session and reported in 1836, recommended the establishment of schools of design, and in accordance with the recommendation, in 1836, a grant of £1,500 (\$7,500) was secured from the public treasury for the establishment of a normal school of design. In 1837 the school was opened in Somerset House (London) under the auspices of a council constituted by the Government. The parliamentary grant for schools of design, which was administered by the board of trade, was increased year by year, and in 1851-52 amounted to £15,055 (\$75,275). Meanwhile 17 branch schools had been opened in the chief centers of industry, Manchester, Birmingham, Glasgow, Leeds, etc., and the central school at London placed in charge of a director who was subject only to the council. An investigation of these schools in 1849 by a committee of the House of Commons led to a change in their general administration. The council was abolished and a department of practical art constituted in 1852.

The movement in behalf of science and art instruction received a new impulse from the Crystal Palace Exposition of 1851, which revealed to England her inferiority in respect to many manufactures in which she had formerly led the world. It was evident that British workmen were falling back in the race from lack of the special training required by the changed conditions of industry. The lesson was not lost. The scope of the art department was at once enlarged, and in 1853 a science division was added, and the name changed to Department of Science and Art. Besides special schools of art and science maintained by the department, it was empowered to draw up examination schemes and conduct examinations for schools and classes complying with specified conditions, and to award grants to the schools on the results of the same. As the subjects included in its schedule presupposed elementary education, the influence of the department was for a time confined to secondary schools. At the outset the importance of correlating its work with that of the elementary schools seems to have been recognized, and in 1856, when a committee of the privy council was constituted to administer the annual grant for elementary education, the control of the department of science and art was transferred from the board of trade to that committee. The union thus affected was, however, merely nominal. Even after the passage of the law of 1870, the administration of the elementary schools was kept entirely distinct from that of the science and art department. As the province of the latter was extended to include the examination of pupils of elementary

schools in art and science with the award of grants for the same, friction and waste ensued. The unity of the elementary schools was impaired, while their upward extension complicated the problem of secondary education. The confusion was further increased by measures which gave educational powers to the county and city councils, namely, the law of 1839, authorizing the local councils to levy a tax (not exceeding a penny in the pound) for technical education, and the law of 1890 placing at their disposal the surplus of the liquor duties with the privilege of applying the funds to the same purpose. These complications resulted in the withdrawal of the science and art grants from the elementary schools in 1897, and the subsequent concentration of all the educational functions of the central government in a single board.

In pursuance of the same policy the administration of the science and art grant for Scotland was transferred in 1898 to the Scotch Education Department, and in 1900 the corresponding grant for Ireland was transferred to the Irish Department of Agriculture and Technical Instruction.

The Board of Education (England) comprises at present, besides the administration of public elementary education, the functions formerly exercised by—

(1) The charity commissioners in regard to educational endowments in England and Wales (these powers include the drafting of schemes for the regulation of educational endowments and “administrative inspection, such as that of inquiring into the financial position of the school, the statutes or other regulations under which it is governed, and the powers and duties of the governing body.”) <sup>a</sup>

(2) The science and art department, including the conditions to be met by schools and classes desiring to share in the science and art grants, the formulation of programmes, the conduct of examinations, and the distribution of the grant, which now amounts to nearly £2,500,000 annually.

(3) The agricultural department, i. e., the administration of special grants intended to foster instruction in agriculture.

The Board of Education is also authorized to inspect all secondary schools that apply for the service, which virtually opens up to its influence the entire province of secondary education without interfering at all with the powers respecting higher education conferred upon the county councils by the law of 1902. The similar powers conferred upon county authorities in Wales by a law of 1899 are henceforth to be exercised under the general oversight of the Board of Education.

From this brief survey of a long series of movements pertaining to education of a higher order than that given in elementary schools, it will be seen that they have been making gradually but surely for increased provision of secondary schools, variation in type, and unified control or supervision. The policies that have been adopted from time to time are due to conditions peculiar to the country, but the general course of development assimilates the movement to what has been going on in other countries.

---

#### STATE OF SECONDARY EDUCATION IN SCOTLAND AND IRELAND.

*Scotland.*—The educational affairs of Scotland are administered by the Scotch Education Department, which has no connection with the English board. This division of the kingdom enjoys peculiar preeminence in respect to the local organization of secondary education. Elementary and secondary schools are alike managed by local elected school boards, and there is no marked line of distinction between the two grades.

In 1888 the department adopted the plan of a leaving certificate for students who on the completion of a course of secondary study should pass an examination for the certificate.

---

<sup>a</sup> Report of the Board of Education, 1899-1900.

The general state of secondary education in Scotland was graphically summed up in an address before the annual meeting of the Scotch Institute, as follows:

On the secular side, from the first, secondary education had been within the province of Scottish school boards, and when the crying need for technical instruction produced the act of 1887 technical instruction came to Scotland two years in advance of England, but it also came naturally and as a matter of course within the ambit and duty of the school boards. There was a confused idea in the public mind that secondary and technical education was managed by county councils, but the contrary was the fact. Such education was managed by the school boards. In Scotland the Cockerton judgment would have been impossible, and no Scottish judge would be set to solve the conundrum as to when a child was not a child. The most powerful causes of the lack of progress in secondary education in their midst were (1) the state of opinion among the working and humbler classes of the community; (2) the state of opinion among the middle and upper classes, and (3) confusion of finance and want of funds.<sup>a</sup>

*Ireland.*—The public elementary schools of Ireland are administered by national commissioners appointed by the Government. In 1878 an Intermediate Education Board was established for the examination of the pupils of intermediate or secondary schools applying for the service, and Government grants are distributed by this board to the schools in respect of the pupils who pass the required standard. The Government has recently appointed temporary inspectors to examine the individual secondary schools and report upon their condition and requirements. It is confidently expected that some measure will be adopted as a result of this investigation which will deal comprehensively with the interest of secondary education in Ireland.

#### STATISTICS OF SECONDARY EDUCATION IN GREAT BRITAIN AND IRELAND.

##### ENGLAND.

No complete summary of the statistics of secondary education has ever been made for England. We present here the latest statistics drawn from the various sources specified.

(1) In 1897 the education department issued an inquiry to schools recognized as distinctively secondary in England (not including Wales and Monmouth County, which are under the Welsh intermediate school law).

Responses to the inquiry were received from 6,209 schools within the limitations indicated. Of these 1,958 were for boys only, 3,173 for girls, and 1,078 mixed. They enrolled 291,554 pupils, of whom 158,502 were boys and 133,042 girls. The pupils ranged in age from 8 to 19 years and over; 40.6 per cent of the boys and 45.7 per cent of the girls were under 12, which shows that a large part of the work of the schools is below secondary grade.<sup>b</sup>

The following tables give in concise form the principal particulars in the return specified:

TABLE A.—*Showing classification of secondary schools according to management.*

Form of control.	Schools for boys.				Schools for girls.				Mixed schools.			
	Number of schools.	Per cent.	Boys in them.	Per cent.	Number of schools.	Per cent.	Girls in them.	Per cent.	Number of schools.	Per cent.	Pupils in them.	Per cent.
Private enterprise.	1,311	66.9	46,617	38.1	2,886	91	80,286	70.3	970	90.1	26,627	65.3

<sup>a</sup> Address by Mr. Thomas Shaw, K. C., M. P.—(Educational News (Edinburgh) January 3, 1903.) The Cockerton judgment referred to is the decision of the courts denying the right of the London school board to apply local taxes to the support of higher grade classes.

<sup>b</sup> An estimate made in 1893 gives 600,000 as the total number of pupils under instruction in the private schools. Mr. J. J. Findlay gives 800,000 as the number of pupils in secondary schools or pursuing secondary studies, including 25,000 instructed at home or on the Continent, and excluding the 90,000 pupils of higher board schools. It should be observed that the elementary departments of secondary schools are included in these totals.

TABLE B.—*Showing the number and proportion of graduates and of nongraduates on the staffs of the various schools, inclusive of the head master or head mistress.*

Schools.	Men teachers.						Women teachers.					
	Regular staff.			Visiting staff.			Regular staff.			Visiting staff.		
	Gradu-ates.	Non-gradu-ates.	Gradu-ates, per cent of whole.	Gradu-ates.	Non-gradu-ates.	Gradu-ates, per cent of whole.	Gradu-ates.	Non-gradu-ates.	Gradu-ates, per cent of whole.	Gradu-ates.	Non-gradu-ates.	Gradu-ates, per cent of whole.
Boys' .....	4,165	3,285	55.9	545	2,410	18.5	117	925	11.3	107	471	18.5

TABLE C.—*Showing the number of schools having on their staff nongraduates exclusively attached to the school, inclusive of the head master or head mistress.*

Schools.	Number of schools in which the regular staff is wholly composed of—			Total schools having only nongraduates on regular staff.	Per-centage of total number.
	Nongraduate men.	Nongraduate women.	Nongraduates of both sexes.		
Boys' .....	351	151	125	626	32
Girls' .....	2	2,269	53	2,324	73.8
Mixed .....	43	705	128	876	81.3
Total .....	396	3,125	306	3,826	61.6

(2) In the official report for 1900–1901, the Board of Education present the following statements relative to the schools and classes participating in the science and art grants, together with other departments of secondary work that have come under inspection by the board. The statistics included in this presentation in some cases duplicate, as regards students, those given above, as many of the schools included in the foregoing tabulation maintain science and art classes.

During the session 1900–1901, the total number of students receiving science and art instruction under the Board of Education was 332,329, and the total number of schools or institutions in which such instruction was given was 2,288. These institutions comprise, (1) schools of science, in which scientific and general instruction is given, (2) science classes, (3) schools of art, and (4) art classes.

The grants paid in respect of the instruction given during the session, or of the examinations held at its close, amounted to £286,251 9s. Of this sum, £139,249 was paid upon attendances; £118,833 as capitation grant in schools of science; £2,687 upon the results of the annual examinations; £18,787 upon work sent up for the national competition in art, and £6,695 on account of pupil teachers and free students in art schools or classes.

The following table shows the number of students under instruction in science and art, and the amounts of grant paid, for the last ten years. It should be observed that the figures for the years previous to 1898 include those for schools in Scotland. In the year named the administration of the science and art grant for Scotland was transferred to the Scotch Education Department.

Year.	Science.		Art.		Total grants.	Equiva-lents in United State cur-rency.
	Under instruc-tion.	Grants.	Under instruc-tion.	Grants.		
		£ s. d.		£ s. d.	£ s. d.	
1892 .....	180,410	123,647 19 1	115,848	48,647 14 9	172,295 13 10	\$861,478
1893 .....	193,431	130,000 0 2	135,807	52,523 6 1	182,522 6 3	912,661
1894 .....	180,686	140,390 15 1	136,324	56,746 3 4	197,136 18 5	985,684
1895 .....	190,896	141,745 2 7	136,768	60,523 15 7	202,268 18 2	1,011,844
1896 .....	177,700	157,916 15 9	146,193	73,722 7 9	231,139 3 6	1,155,695
1897 .....	198,957	172,494 12 4	146,720	79,716 17 5	252,211 9 9	1,261,057
1898 .....	158,370	163,522 19 3	120,771	72,178 13 8	241,701 12 11	1,208,508
1899 .....	174,670	195,491 1 4	130,126	77,794 10 6	273,285 11 10	1,336,427
1900 .....	167,180	204,606 3 0	125,231	74,680 4 0	279,286 7 0	1,396,431
1901 .....	174,692	212,982 6 4	125,597	73,269 2 8	286,251 9 0	1,431,257

Up to December 31, 1901, 78 schools in England and 65 schools in Wales and Monmouthshire applied for recognition under the new regulations, which offer grants to secondary day schools taking an approved scheme of instruction for a three or four years' course in science. Of the schools in England 58 were endowed schools, 6 were county or municipal schools, 9 were established by articles of association, and 5 by religious bodies. All the Welsh schools were working under the Welsh intermediate education act.

As the regulations came into force in August, 1901, none of the schools have yet completed the first year's course. It would therefore be premature to report upon their working.

With regard to the Royal College of Science, which should really be classed with universities, the board of education states:

Considerable progress has been made with the new buildings of the college. The foundations are completed, and the whole building is up to the ground-floor level, and some parts are considerably higher than this. It has been found expedient to defer certain necessary or desirable changes in the curriculum until these buildings are complete. This delay will, however, enable the new curriculum to be drawn up with reference to the arrangement of the new courses of study in the University of London, to which the college is affiliated. The entrance examination to the college will also be revised when the authorities of the university have definitely fixed their standard of matriculation. \* \* \* During the session, 314 students were under instruction in the various divisions of the college, being a decrease of 5 from the previous session. \* \* \* The number of students who attended the several classes was as follows: Chemistry, 134; mathematics, 124; physics, 94; geology, 88; astronomical physics, 75; mechanics, 74; metallurgy, 56; mining, 49; biology, 20. The amount received in fees during the session was £3,244 15s., as against 3,120 4s. in the previous year. Summer courses for teachers were held as usual for about three weeks in July, 1901, on the subjects of astronomical physics, chemistry, mechanics, mining, sound, and zoology, and were attended by 177 teachers.

In the session ending in October, 1901, there were in the college 35 students in training, 20 national scholars, 30 royal exhibitors, 17 local scholars, and 5 local exhibitors. Besides these, there were 103 students admitted on special qualification, making up a total of 210 students, of whom 138 were men and 72 women. The effect of the recently instituted entrance examinations is shown by the large decrease in the number of students, which was 390 in the session of 1899-1900, and 450 in that of 1898-99. Thirty-six of the students paid fees for the whole session, and seven for a portion of the session, the total receipts from fees amounting to £321 8s. as against £1,033 14s. 6d. in the session of 1899-1900, and £1,256 12s. in that of 1898-99. The effect of the more rigorous qualification now required of applicants for entrance to the college has been of considerable value in raising the whole work of the college to a higher level. Short summer courses for art teachers and students were given as usual in July, 1901; the applicants for admission to these courses were 284, and the number admitted 120.

(3) *Inspection of secondary schools.*—The first inspections under the board of education act, 1899, took place in the autumn of 1900, and the first report on the subject was made up to June 30, 1901, by which date 27 schools had been inspected. Between that date and December 31, 1901, the inspection of 24 schools took place. Of these, 13 schools were inspected on the application of the county authorities aiding the schools.

(4) *Administration of the technical instruction acts.*—A return, prepared by order of the House of Commons, dated August 2, 1901, was issued as a parliamentary paper on the 5th of August, 1902, showing the extent to which and the manner in which local authorities in England, Wales, and Ireland have devoted the residue under the local taxation (customs and excise) act, 1890, and funds raised out of the local rates, to educational purposes, during the year ended March 31, 1901.

Of the 49 county councils in England (excepting the county of Monmouth), 40 are applying the whole of the residue and 9 a part of it to technical education. Of the councils of the 62 county boroughs, 56 are applying the whole of the residue and 6 a part to technical education. Further, 2 county councils and the councils of 24 county boroughs, 99 boroughs, and 195 urban districts are making grants out of the rates under the technical instruction acts. In 28 cases, local authorities are also devoting funds to technical education out of the rates under the public libraries and museums acts.

In Wales and Monmouth the councils of the 13 counties and 3 county boroughs are devoting the whole of the residue to intermediate and technical education, chiefly under the Welsh intermediate education act, 1889, and the councils of 12 counties

and county boroughs and 14 boroughs and urban districts are making grants out of the rates under the technical instruction acts.

In England and Wales the total amount expended on technical education during the year was £1,051,422 9d. (\$5,257,110). In addition, the amount raised by loan on the security of the local rate under the technical instruction act, 1889, mainly for the erection of technical and science and art schools, was £152,333 14s. 4d. (\$761,668). In Wales and Monmouth the total amount devoted annually to intermediate and technical education, under the Welsh intermediate education act, 1889, is now approximately £52,000 (\$260,000).

The Board also reports the examination and inspection of 94 county secondary schools and 1 private secondary school in Wales.

The progress in respect to the establishment of technical schools was summed up in the Record of Technical and Secondary Education, October, 1901, as follows:

The erection of central technical schools still occupies the energies of many local authorities and other responsible public bodies. An additional sum of £287,000 (\$1,435,000) was spent or incurred during the past year and a half for capital purposes in connection with 50 technical schools. If the outlay upon all the schools could be definitely assessed, it is estimated that the total amount incurred in England (excluding London, where the capital expenditure upon polytechnics alone would now probably fall not short of three-quarters of a million of money) for these purposes would reach over £3,000,000 (\$15,000,000). There are at least 295 technical schools working under municipal and public bodies, and the number of municipal schools is constantly increasing. In 65 towns in England voluntary science and art and technical schools have been transferred to municipalities, the most important recent transfers being those at Burnley, Dudley, Lincoln, and Liverpool; in London also the Westminster Technical Institute has been so transferred. In 5 other towns the question of the transference of technical schools is under consideration.

In respect to equipment and curricula these technical schools resemble somewhat the manual training and commercial high schools established in our own cities, but greater emphasis is placed upon the technical training in the English than in the American schools of this class. As these technical schools participate in the science and art grant, their students are represented in the statistics given under that head.

#### SECONDARY AND TECHNICAL EDUCATION IN SCOTLAND.

The Scotch Education Department in the report for 1901-2 state that the number of secondary schools under inspection is now 95, 32 being higher class public schools, 25 endowed schools, and 38 schools under voluntary managers who have invited the inspection.

By the passing of the education and local taxation account (Scotland) act in 1892, an annual sum of £60,000 became available for secondary education in Scotland. The cost of the inspection of higher class schools and of the leaving certificate examination is mainly met from this source, and for the year 1901-2 a sum of £4,700 was taken for that purpose. The question of the method of distribution by which the available balance might most effectually contribute to the educational benefit of each locality was referred by the minute of May 1, 1893, to burgh and county committees, who administer the share of the grant falling to their respective districts in accordance with schemes previously submitted to and approved by the department. This arrangement has been continued by subsequent minutes, and the regulations now in force are set forth in the minute of June 10, 1897, as amended by that of April 30, 1900. That minute provides for an extended representation of those local authorities who are willing to intrust to the committee the administration of sums which are at their disposal for purposes of technical education, and the authorities of 12 counties, 10 burghs, and 20 police burghs have taken advantage of this provision and passed special resolutions, in accordance with which a sum of £12,686 12s. 2d. was this year handed over to the secondary education committees for distribution.

In the local examinations in subjects of science and art in Scotland held during the months of April, May, and June, 1901, there were 27,398 presentations, comprising 10,380 in subjects of science and 17,018 in art. Of these, 6,624 candidates in science and 7,384 in art succeeded in satisfying the examiners, and the department awarded to the successful candidates 14,008 certificates. These examinations numbered 1,928 held in the evening and 81 in the day, being 888 in art subjects and 1,121 in science.

*Science and art instruction.*—The expenditure from grants for science and art instruction amounted to £79,617 (\$398,085). The department's grant of £2,000 for agricultural education has since 1900 been augmented by a further sum of £2,000 a year from the local taxation account. The sum available for distribution in the year 1901-2, including a balance of £947 8s. 8d. from the preceding year, was £4,947 8s. 8d., and the following table shows the sums actually distributed to the various institutions for the present, as compared with the preceding year:

Institution, etc.	Sums paid.	
	1900-1901.	1901-2.
Aberdeen University (agricultural department) .....	£ s. d. 500 0 0	£ s. d. 500 0 0
Edinburgh School of Rural Economy .....	1,000 0 0	.....
Edinburgh East of Scotland College of Agriculture .....	.....	1,780 0 0
West of Scotland Agricultural College.....	2,000 0 0	2,350 0 0
Expenses of inspection, etc.....	74 14 2	61 11 2
Total.....	3,574 14 2	4,691 11 2

## IRELAND.

The Intermediate Education Board, Ireland, reports for 1901 the examination of 8,117 students (5,829 boys and 2,288 girls). The grants allowed for passes in the examination amounted to £56,760 (\$283,800), which were disbursed to the managers of 362 schools.

## SCOPE OF SECONDARY EDUCATION AS INDICATED BY TYPICAL SCHOOLS AND PROGRAMMES.

Attention has already been called to the association of the terms secondary and technical in the classification of schools that continue the education of the young beyond the elementary stage. This association has come about through the efforts to provide for scientific and technical studies which had formerly no place in secondary schools. While the value to be attached to the new studies as compared with classics and mathematics is a mooted question, the notion of what constitutes secondary education has been materially modified by the new demands, and schools differing widely in curricula and still more widely in their purposes have been brought into the same category. The current conceptions of what may properly be included in the province which is characterized in the law of 1902 as that of "higher education" would be best understood by a comparison of programmes. The material available for such comparison is at present, however, very incomplete and not reducible to a common form. But even in a partial and unsystematic presentation the programmes and prospectuses which are given below afford, it is believed, a clearer conception of the present state of secondary, or, as the law terms it, "higher" education in England than could be gained by any other means. Elementary programmes have been included to mark the stage at which secondary education begins.

The material comprises:

(1) The courses of instruction authorized by the English board of education (a) for elementary schools, (b) for higher elementary schools.

(2) Typical schools and courses of secondary instruction, Norwich.

(3) Time tables (with comments) of private schools preparatory to the traditional secondary schools.

(4) Typical secondary programme (Rugby).

Further to illustrate the distinction between the schemes of public education fostered respectively by the English Board of Education and the Scotch Education Department are presented:

(5) Courses of instruction authorized by the Scotch Education Department (*a*) for elementary schools, (*b*) for higher grade schools.

(1) PROGRAMME OF STUDIES FOR ENGLISH PUBLIC SCHOOLS.

(*a*) ELEMENTARY SCHOOLS.

The course of instruction in infant schools and classes (ages 3 to 7 years) should, as a rule, include: Suitable instruction in reading, writing, and numbers; simple lessons on common things, appropriate and varied occupations, needlework, drawing, singing, physical exercises.

The course of instruction in schools for older scholars (7 to 15 years of age) is as follows:

(1) English, by which is to be understood reading, recitation, writing, composition, and grammar in so far as it bears upon the correct use of language; arithmetic, drawing (for boys), needlework (for girls), lessons, including object lessons, on geography, history, and common things; singing, which should as a rule be by note; physical training. To be taken, as a rule, in all schools.

N. B.—It is not necessary that all these subjects should be taught in every class.

One or more of them may be omitted in any school which can satisfy the inspector and the board that there is good reason in its case for the omission.

(2) Algebra, Euclid, mensuration, mechanics, chemistry, physics, elementary physics and chemistry, animal physiology, hygiene, botany, principles of agriculture, horticulture, navigation, Latin, French, Welsh (for scholars in schools in Wales), German, bookkeeping, shorthand (according to some system recognized by the board), domestic economy or domestic science, drawing (for girls), needlework (for boys). One or more of these is to be taken when the circumstances of the school, in the opinion of the inspector, make it desirable.

(3) Cookery, laundry work, dairy work, household management. For girls.

Cottage gardening, manual instruction. For boys.

Cookery. For boys in seaport towns.

Where manual instruction is taken it is desirable that suitable occupations leading up to it should be taken in the lower classes.

Any subject other than those mentioned may, if sanctioned by the board, be included in the course of instruction, provided that a graduated scheme for teaching it be submitted to and approved by the inspector.

(*b*) HIGHER ELEMENTARY SCHOOLS.

In accordance with the policy of making early distinction between children whose school life is destined to be very brief and those who may pursue their studies somewhat longer, the Board of Education recognizes as "higher elementary schools" a class of schools—

organized for the purpose of providing a more advanced instruction than can be given in the ordinary elementary schools for children between 10 and 15 years of age who are certified by an inspector of the board as qualified to profit by such instruction. The special object which they have in view is to qualify the children taught in them to enter any of those callings in which scientific methods have to be employed. With this intention the course of instruction, though not exclusively scientific, has been given a science basis, and all the scholars are trained to make accurate measurements and to perform and record simple experiments. One foreign language and elementary mathematics are included in the curriculum, while careful attention is given to drawing.

The course of instruction is spread over four years, and the board has been careful to impress upon managers of higher elementary schools the importance of retaining as many of the scholars as possible throughout the latter half of the course, in order that they may reap the full benefit of the more advanced instruction.

The Board of Education has issued the following rules as to buildings:

1. The code limits the numbers of a higher elementary school to about 300. For such a school ten class rooms will generally be required, since every class should have its own class room. Of the ten class rooms at least four should be suitable for a class of 40 scholars.

2. (a) A class room for 40 scholars should have an area of about 620-square feet; a class room for 30 scholars should have an area of about 480 square feet.

(b) All class rooms must be furnished with single desks; the desks should be 2 feet long, arranged in pairs with intervals of 2 inches and gangways of 2 feet.

3. Every higher elementary school should be provided with suitable laboratories.

(a) The laboratory accommodation must be sufficient to provide at one time for the largest class in the school.

(b) There should generally be one laboratory for chemistry and one for physics.

(c) A laboratory should afford 30 square feet of floor space for each scholar; the minimum size will therefore be 600 square feet, but it is, as a rule, desirable that the laboratory should be somewhat larger. If, however, the laboratory accommodates more than 25 scholars, a second teacher would be required.

(d) Laboratories must be fitted with suitable tables, which must be well lighted; they should be properly supplied with gas and water. For chemical laboratories, sinks, cupboards, and the necessary fume closets must be provided.

(e) A small balance room may be provided if desired.

4. (a) In addition to the class rooms and laboratories it is desirable that a higher elementary school should include at least one lecture room, which should be fitted with (1) demonstration table furnished with a gas and water supply and a sink, and (2) a fume closet. A lecture room should have an area of about 750 square feet.

(b) A small preparation room fitted with bench sink, cupboard and shelves, and proper supply of gas should be provided in a convenient position for the lecture room.

5. A drawing-class room for the more advanced drawing is desirable. It should provide 30 square feet of floor space for each scholar; the best size will be a room with an area of 750 square feet. If suitably lighted the hall would answer for this purpose.

6. Other special rooms for cookery, laundry work, and manual instruction should be provided in accordance with the rules in Schedule VII of the code.

7. A higher elementary school may be planned with a central hall, but no class (other than drawing) can be recognized in such a hall. Good dimensions for such a hall would be 50 feet by 25 feet. As an alternative the hall might be adapted for use as a gymnasium when occasion requires. Such a gymnasium for a school of 300 children should have a floor space of 1,800 square feet. The gymnasium should not be adjacent to the laboratories.

Thirty-one schools of this class have been recognized by the board, enrolling during the year 1902 a total of 7,364 pupils. Of 6,616 pupils present the last day of the year, 4,230 were boys and 2,386 were girls. The programme of these schools includes, besides the general subjects of the elementary programme, one foreign language, science, art, manual instruction; and for girls, cookery, laundry work, domestic economy, and household management.

#### (II) GENERAL ORGANIZATION OF AND COURSES OF INSTRUCTION IN THE SECONDARY SCHOOLS OF NORWICH.

The foregoing programmes and regulations show the present extent of the instruction afforded in free public schools. In the absence of specific programmes the following outline of the provision for secondary education in Norwich "will serve to illustrate the manner in which endowments and public funds are combined to maintain or to increase the provision for secondary education in individual cities and the various courses of instruction which are classed under the head of secondary.

*The Grammar School and the Middle School of Norwich.*—The Grammar School and the Middle School originally were one foundation. In 1325 Bishop Salmon founded a free school, which was annexed to a small collegiate chantry. After the Reformation and the dissolution of the college, the school was refounded in 1547 by Edward VI, and was located in the Blackfriars Priory, and at a later date in the Cathedral Close. The school was under the control of the corporation until 1836, when it was transferred to the charity commissioners, who, in 1862, divided the foundation into two distinct departments, viz, King Edward VI School (commonly known as the Grammar School), which continued in the Close, and King Edward VI Middle School (commonly known as the Middle or Commercial School), which took for its premises the buildings erected on the cloisters of the Blackfriars Priory. The same governors continue to administer both schools, but each school has a separate headmaster and staff. \* \* \*

*The Grammar School.*—The Grammar School is a first-grade school, and the education is of the usual character—Greek, Latin, German, French, English, mathematics, and science being the principal subjects taught. The tuition fees are £16 10s. per annum, with an entrance fee of £2. The income is mainly derived from school fees. Each year boys proceed to Oxford or Cambridge, where they carry off good scholarships, and, in addition, the boys are trained for all ordinary examinations, such as Sandhurst, Woolwich, and London University matriculation. \* \* \*

*The Middle School.*—The Middle School has over 260 boys on the roll at present. Its curriculum is less classical than that of the Grammar School and, while the effort is made to give to all the boys a good general education, not a few have done well at the universities, and in successes at the Cambridge local senior and junior examinations few schools have done better. The tuition fees are £6 6s. and £5 5s. a year, with an entrance fee of 10 shillings. The income of the school is chiefly derived from fees. It is one of the schools recognized by the Norfolk County council at which their scholarships are tenable. \* \* \*

*The Girls' High School.*—The High School for Girls, one of the schools belonging to the Girls' Public Day School Company, was opened in 1875, and is now the largest girls' school in the eastern counties. It is carried on in a very beautiful building erected in 1740 and known as the Norwich Assembly Rooms. The development of the work of the school necessitated an extension of the accommodation at different times. In addition to the ordinary class rooms, there are rooms for science and art work and a science laboratory. There is a large kindergarten section. The staff consists mainly of women with university degrees or their equivalent. The girls are prepared for the Oxford senior and London matriculation examinations and for university scholarships. The physical development of the girls is provided for in having a good playground with a tennis court and a capital hockey field. \* \* \*

*The Higher Grade School.*—The Higher Grade School, conducted by the school board, was opened in 1899. The school is situated in the center of a large population and busy manufactories. It is divided into two departments, the boys' and girls', the average attendance in each of which is close on 300. The school contains, in addition to the ordinary class rooms, separate laboratories and lecture rooms for physics and chemistry. The work includes instruction in Latin, French, English, literature, physics, chemistry, and general subjects. The advanced girls are taught cookery and dressmaking, and the advanced boys attend the technical institute for instruction in manual training in wood and metal by the technical instruction committee's instructors. Each department has attached to it a school of science, and the boys and girls work under the syllabus of the board of education; in addition, some of them are annually prepared for the Cambridge local and London matriculation examinations with considerable success. The staff consists of trained certificated teachers, some of whom have, in addition, university qualifications. \* \* \* The school has football, cricket, and hockey clubs, and also two school magazines (boys' and girls'). The Higher Grade School has undoubtedly been a success in that it has been the means of giving a general education of a secondary character to many boys and girls in Norwich who otherwise would have been debarred from this advantage.

### (III) TIME-TABLES OF PREPARATORY SCHOOLS. <sup>a</sup>

The following time-tables and accompanying comments show the preparations required for boys who seek admission to the classical secondary schools of England.

<sup>a</sup> From special reports on educational subjects, vol. 6, "Preparatory schools for boys—Their place in English secondary Education" (published by Board of Education), pp. 46, 48, 49, 50.

I.—*Time-table of a school that competes for scholarships. Hours per week.*

[Number of boys in school, summer 1899, 53.]

	Class I— Average age, 10 $\frac{1}{2}$ .	Class V— Average age, 12 $\frac{1}{2}$ .
Scripture.....	2	1.45
English <sup>a</sup> .....	2	0
French.....	2	3
Latin.....	6	11
Greek.....	0	b5
German.....	0	b5
History.....	2	1
Geography.....	2	1
Mathematics.....	4	6
Object lessons or elementary science.....	0	0
Writing and dictation.....	3	.45
Drawing.....	1	1
Preparation <sup>c</sup> .....	6	9
Total.....	30	39.30
Optional subjects in addition to those above:		
Singing.....	1	
Instrumental music.....	3	
Carpentering or handicraft.....	1.30	

<sup>a</sup> This includes English language, literature, grammar, and composition.<sup>b</sup> Alternative subjects.<sup>c</sup> It may be assumed that a very large proportion of the preparation time is given to classics and mathematics, or to both.II.—*Average of time given to various subjects as shown by comparison of returns that have come to hand.*

	Class I, or class most nearly averag- ing age of 9 to 10 years.	Top class, age aver- age 13 years.
Scripture.....	2.12	2.3
English <sup>a</sup> .....	2.49	1.10
French.....	2.49	3.8
Latin.....	5.49	7.49
Greek.....	0	4.34
German.....	0	b3.41
History.....	1.57	1.50
Geography.....	1.41	c1.17

Object lessons or elementary science.....	.57	d.53
Writing and dictation.....	2.25	e.53
Drawing.....	1.31	f1.39
Preparation.....	(g)	(g)
Total <sup>h</sup> .....	29.84	35.2

<sup>a</sup> See note to Table I.<sup>b</sup> Usually German is alternative with Greek, with extra French and mathematics; 58.6 per cent of the schools do not teach German at all.<sup>c</sup> 3.7 per cent omit geography entirely; 6.2 per cent do not teach it to their top form.<sup>d</sup> 72.5 per cent omit this subject entirely; 83.7 per cent do not teach it to the top form.<sup>e</sup> One school omits it entirely; 38.7 per cent do not teach it in the top form.<sup>f</sup> In 34.2 per cent of returns it is an optional subject. The above is the average in the remaining 65.8 per cent.<sup>g</sup> No average is possible, practice varies so greatly.<sup>h</sup> The average total given above is not the sum of the various items of the table, but is the average of totals actually returned in each school. No school teaches *all* the subjects enumerated.

## COMMENTS ON THE TABLES.

*Classics.*—The most notable feature in these time-tables is the extraordinary weight given in them to classics and mathematics. It would seem that to these subjects alone is awarded sufficient time for the boys to be thoroughly grounded. Table I

shows sixteen hours per week devoted to classics alone, exclusive of time allotted to that subject in preparation. Exact details of the amount so allotted are wanting, but in this and in all similar cases it may be assumed that the proportion of preparation given to classics and mathematics is a large one. \* \* \*

It appears to be the practice to begin the teaching of Latin to boys as soon as they can read and write English with some facility. They usually reach this stage by the age of 9—the age at which they generally enter a preparatory school. On entry they at first devote somewhat less time than the rest of the school to Latin, but the hours are gradually increased as they go up the school until the point is reached at which Greek is begun, when the restrictions of the time-tables require some reduction to be made in favor of the new subject. \* \* \*

Greek is sometimes not commenced before the age of 12. But this practice, affording as it does opportunity to devote attention to some of the least noticed but highly important subjects of the time-table, is practically impossible for schools that compete for scholarships; for them the standard of Greek required for scholarships is so high as to compel its inclusion in the curriculum generally at the age of 11 years, sometimes still earlier.

*Mathematics.*—Exact statistics of the age at which the teaching of algebra and euclid is begun and of the times devoted to those subjects are not deducible from the returns to hand. \* \* \*

It is the usual practice to entirely reclassify the school for mathematics.

*Scripture.*—Although the weight given in entrance examinations (for secondary schools) to Scripture knowledge often approaches vanishing point, it is noteworthy that in no case is it omitted from the time-table (of preparatory schools), and that more time is assigned to it than to English language, history, geography, drawing, or dictation.

*English language and grammar, geography, history, dictation.*—One can not help feeling that the time allotted to these subjects is altogether inadequate, particularly in the case of schools such as those that are exemplified in Table I. \* \* \*

The headmaster responsible for Table I notes at its foot: "I would gladly see more English<sup>a</sup> in my curriculum, but the standard of Latin, Greek, French, and mathematics is so high in scholarship examinations that English is knocked on the head. We have no time for it. The public schools require none—practically." In so saying this headmaster but voices the general feeling of the profession.

*French and German.*—French is taught in all schools, and there is great uniformity as to the time allotted to it. \* \* \*

The general result of our system is that French is not and can not be taught as a living language. It is to be feared that the large majority of the teachers can not speak it, at least with fluent accuracy. Boys learn to read it and to write it. They learn also a considerable number of grammatical irregularities, and so doing they satisfy all the requirements of the public schools. \* \* \*

German is not taught at all in 58.6 per cent of the schools that have made returns. Experience shows that four languages in addition to his own are much more than can be learned with advantage by any boy at one time. Therefore it is only as an alternative to Greek for boys intended for modern sides of schools or for army classes that German is taught.

*Object lessons and elementary science.*—In 72.5 per cent of the schools these are not attempted and in only 16.3 per cent are they taught to the top forms.

*Drawing.*—This subject appears to form part of the regular curriculum in 65 per cent of the returns, but in many cases it can hardly be seriously attempted. In several cases the time allotted is only half an hour per week; three-fourths of an hour and one hour are also frequent.

*Singing, instrumental music, and carpentry.*—It would be interesting and instructive to be able to tabulate the practice of the various schools in the matter of (1) singing and instrumental music; (2) carpentry and other handicraft. It has, however, unfortunately happened that the questions asked on these points were ambiguous, and it is very plain that all the replies are not framed on the same basis. They suffice, however, to show that in these subjects there is an entire lack of uniformity. Some schools teach all of them as part of the regular curriculum; others teach none of them at all. \* \* \*

No credit whatever is given by the public schools to knowledge of these subjects. It is therefore necessary for them to be treated as supplementary to the regular time-table. The fact that they appear there at all is due solely to the importance attached to them by preparatory school headmasters and by the parents, who in many cases pay an extra fee for their sons' instruction in these matters.

<sup>a</sup>The term English is generally used among us to include language, grammar, geography, history, and dictation.

## (IV) PROGRAMME OF A TYPICAL SECONDARY SCHOOL.

The following programme shows the general scheme of study for the specified term at Rugby, with detailed particulars as to the required courses in classical and modern languages:

*Rugby School—Statistics of Trinity term ending July 31, 1901.*

## CLASSICAL.

Form.	Sixth.		Twenty.	Fifth.	
	Upper bench.	Lower bench.			
Number of boys .....	21	28	29	27	26
Average age.....	18 years 3 months.	17 years 8 months.	16 years 7 months.	16 years 7 months.	16 years 3 months.
Average time in form.	4½ terms .....	2½ terms .....	1½ terms .....	2¾ terms .....	2 terms.
<i>Books read.</i>					
Greek prose, or (modern) French.	Epistles to the Ephesians and Colossians.		Ephesians....	Herodotus, III, 1-110.	Herodotus, III, 1-105.
Greek verse, or (modern) German.	Aristophanes, Knights.....		Soph. Electra.		
Latin prose.....	Cicero's Letters, Tyrell's Selections, I-XX. <sup>a</sup>		Cicero pro Cluentio continued to § 81.	Livy, XXXII, 24 to end.	Livy, XXXIII, 1-20.
Latin verse.....	Plautus, Rudens; Virgil Aeneid, III, IV.		Horace Odes, II.	Horace Odes, II.	Horace Odes, II.
English subject.....	How and Leigh's Roman History, Arnold's History of Rome, Murray's Greek Literature (part).		Macbeth.....	Macbeth.....	Macbeth.
Tutor subject.....	Plato, Republic, III.....		Iliad, VII, VIII, 1-456.	Iliad, VII, VIII, 1-456.	Iliad, VII, VIII, 1-456.

Form.	VI and upper school specialists in mathematics or science.	Lower fifth.		Upper middle I.	
Number of boys .....	16	26	26	29	29
Average age.....	17 years 8 months.	16 years 7 months.	16 years 8 months.	16 years 1 month.	16 years 1 month.
Average time in form.	2½ terms .....	2½ terms .....	2½ terms .....	2 terms .....	2 terms.
<i>Books read.</i>					
Greek prose, or (modern) French.	Xen. Memorabilia, IV.....		Lucian Selections (Inge)		
Greek verse, or (modern) German.	Iliad, XXIII..				
Latin prose.....	Cicero in Verrem Actio Primo.		Sallust, Jugurtha, 46-101.....	Livy, I, 33-52.	
Latin verse.....			Ovid Fasti, V, 1-366.....	Ovid Fasti, I.	
English subject.....	Much Ado About Nothing. Bacon's Essays, I-XIV.		Macbeth .....	Twelfth Night.	
Tutor subject.....			Iliad, VII, VIII, 1-466.....		

<sup>a</sup> With selected sets.

*Rugby School—Statistics of Trinity term ending July 31, 1901—Continued.*

## CLASSICAL—Continued.

Form.	Upper middle II.		Lower middle I.		Lower middle II.	Lower school.
Number of boys.....	29	29	25	26	17	10
Average age .....	15 years 5 months.	15 years 5 months.	15 years 1 month.	15 years 2 months.	14 years 11 months.	14 years 4 months.
Average time in form.	1½ terms ..	1½ terms ..	2 terms ...	2 terms ...	1½ terms .....	1½ terms.
<i>Books read.</i>						
Greek prose, or (modern) French.	Xenophon Anabasis, VII, 1-4.	Xenophon Anabasis, V (part).	Morice's Attic Greek stories.	Rivington's Greek Reader, second term book, I.		
Greek verse, or (modern) German.						
Latin prose .....	Cæsar Bell. Gall., II, 23 to end.	Cæsar Bell. Gall., I (part).	Cæsar Bell. Gall., IV, V.	Rivington's Latin Reader, fourth term book, III.		
Latin verse.....	Taylor's Ovid Selections, XIV-XVI.	Ovid Selections 50-53 and 1-3 (Heatley and Turner).				
English subject .....	Oman's Greece, 33 to end; Twelfth Night.	Gareth and Lynette...	Tennyson's Gareth and Lynette.	Tennyson's Gareth and Lynette.		
Tutor subject .....						

## MODERN.

Form.	VI, XX, V.	Lower fifth.	Army class.	
			Upper division, VI, XX, V.	Lower division, V, V 2; upper middle I.
Number of boys.....	25	26	23	23
Average age .....	17 years.....	16 years 8 months.	16 years 11 months	16 years 3 months.
Average time in form.	2½ terms .....	2½ terms .....	1½ terms .....	2½ terms.
<i>Books read.</i>				
Greek prose, or (modern) French.	1. Ponsard, l'Honneur and l'Argent; About, Le Roi des Montagnes.	L'Abbé Daniel (Theuriet).	1. Pelissier's Unseens; 2. Gasc. Prosateurs Contemporains.	1. Le Roi des Montagnes; 2. Murat and selections.
Greek verse, or (modern) German.	1. Schiller, Braut von Messina; Heine, Die Harzreise; 2. Goethe, Italienische Reise.	Townson's Easy German Stories.	1. Selections; 2. Lechner, passages for translation.	1. Selections; 2. Lechner, passages for translation.
Latin prose .....		Selections from Cicero (Walford).	1. Livy, XXIII, continued; 2. Selections.	1. Livy, XXII, 23-40; 2. Siege of Syracuse continued.
Latin verse .....	Aeneid, V .....		1. Horace, Selections from Epistles and Satires; 2. Selections.	1. Ovid Fasti, VI, 500-end; 2. Ovid Fasti, III.
English subject.....	Hamlet; Burke, Reflections on the French Revolution.	English History, Henry III-Henry VIII.	Skery, Précis.....	Macaulay, Warren Hastings.
Tutor subject .....				

*Rugby School—Statistics of Trinity term ending July 31, 1901—Continued.*

## MODERN—Continued.

Form.	Upper middle I.	Upper middle II and lower middle I.	Lower middle II and lower school.	Total for whole school.
Number of boys.....	28	28	23	579
Average age.....	15 years 9 months.	15 years 3 months.	14 years 10 months	
Average time in form.	1½ terms.....	1½ terms.....	1½ terms.....	
<i>Books read.</i>				
Greek prose, or (modern) French.	Belfond; Histoires Choisies, part II.	Le Chien du Capitaine.	Mateo Falcone...	
Greek verse, or (modern) German.				
Latin prose.....	Cæsar Bell. Gall., VII, 1-43.	Rivington's Reader, fifth term book, III.	Rivington's Reader, fifth term book, I.	
Latin verse.....				
English subject.....	Henry V.....	Geography, Africa and Australia; History, Henry III-Henry VIII, Acts 9-end, Julius Cæsar.	Africa and Australia; Julius Cæsar; Acts of the Apostles; English History, 1216-1485.	
Tutor subject.....				

## (V) SCOTLAND.—PROGRAMMES OF PUBLIC SCHOOLS.

## (a) ELEMENTARY SCHOOLS.

The following is the normal organization of an elementary school as described by the Scotch education department: (a) Infant division, providing instruction suitable for children under 7 years of age; (b) junior division, instruction suitable for children between the ages of 7 and 10; and (c) senior division, instruction suitable for children between the ages of 10 and 12. Liberty of classification irrespective of age is permitted, provided that the inspector is satisfied generally as to the reasons for the retention of children over 7, and of children over 10, in the infant and junior divisions, respectively.

Pupils of the senior division who satisfy the prescribed conditions may be taught in "supplementary courses" or "higher-grade departments," but grants at the higher rates allowed for these departments are only payable on the attendances of children over 12 years of age.

The arrangement of work within each division and the classification of the children may vary according to the circumstances of schools, but must be such as are fitted to secure the required standard of attainment by easy gradations. The classification must be such as to afford due opportunity for promotion, and promotion in one subject, e. g., reading, should not be made dependent on proficiency in another, e. g., arithmetic.

The scheme of work must, in all cases and for all divisions, make provision for—

(a) Adequate physical exercise according to an approved system. In the senior division this exercise may take the form of military drill.

(b) For the instruction of girls in needlework.

(c) For the instruction of the scholars in singing by note, except where the inspector, after due inquiry, shall, in a special report stating the circumstances of the case, recommend that this condition be not insisted upon.

(d) For the instruction of the scholars in drawing (whether with or without manual occupation) according to a scheme prescribed or approved by the department, except where the inspector, after due inquiry, shall, in a special report stating the circumstances of the case, recommend that this condition be not insisted upon.

\* \* \*

(e) For the committing to memory by the scholars of pieces of poetry of literary merit. This shall be a regularly recurring exercise provided for in the time-table, but no set number of lines is prescribed.

5. The scheme of instruction shall further and principally make provision for the instruction of the scholars in the three subjects of reading, writing and arithmetic, according to the degree of advancement suitable to the capacity of each scholar.

6. The scheme of instruction for the junior division shall in addition make provision for the following:

(a) Nature knowledge (object lessons)—the acquisition by the children, by means of observation and inquiry, of a knowledge of common objects, natural phenomena, and the surroundings of the school.

(b) Practice in speaking English, based upon the preceding and upon the lessons of the reading book.

(c) First notions of geography.

7. In the senior division, instruction in the foregoing subjects shall be continued and amplified as follows:

(a) Nature knowledge—direct experimental knowledge of the standards of measure and weight,<sup>a</sup> practice in applying them, in representing them to scale, and in making simple calculations resulting therefrom; some acquaintance with the natural features, the plant life, the industries, and the productions of the district.

(b) English—practice in describing, orally and in writing, actual observations and experiences, and in reproducing the substance of a reading lesson studied beforehand; some knowledge of the structure of English sentences, of the functions of words, and of the related meaning of words from the same root.

(c) Geography—the elements of physical geography. An outline knowledge of the main divisions of the world, with a more detailed knowledge of Europe and a further study of the British Isles and of the colonies.

(d) There shall also be added some knowledge of British history, advancing from an outline knowledge of the main periods to a more detailed study year by year. One of the reading books in use in the senior division must be a manual of history, suitable for use as a reading book in that division of the school.

(b) HIGHER-GRADE SCHOOLS, CODE 1903, ARTICLES 138-140.

Where a special staff of duly qualified teachers is provided for the instruction of pupils at the rate of 1 for every 30 or fewer pupils on the roll, and where a well-defined course of instruction, approved by the department and extending over not less than three years, is given, such school or department may be recognized as a higher-grade school or department.

Such schools or departments may give an education which is either predominantly scientific and technical—higher-grade (science) schools, or predominantly commercial—higher-grade (commercial) schools, or they may give a course which is recognized by the department as specially suited to girls or to special classes of pupils.

In all cases the department must be satisfied that the school possesses the proper provision of class rooms, laboratories, and workshops necessary for the particular type of education to be given therein.

In circumstances approved by the department a higher-grade school may be recognized as giving alternative courses (two or more), provided that there is a supply of qualified teachers for each course; that the organization of the school is not unduly complicated, and that, as a rule, pupils follow out the course with which they begin.

In all higher-grade schools of whatever kind, the curriculum must embrace the subjects of English, history, geography, higher arithmetic, and drawing, and the instruction in these subjects must follow prescribed lines.

Pupils following the higher-grade science course must take in addition the following subjects: Mathematics, experimental science, and as a rule some form of manual work.

Pupils following the higher-grade commercial course must as a rule take, in addition to the subjects named in the first paragraph above, one or more modern languages, bookkeeping, shorthand, and knowledge of commercial products. The study of arithmetic, of history, and of geography in this course should have a commercial application, and the teaching of a modern language should have for its object the attainment of ability to speak as well as to read and write the language.

<sup>a</sup> For this purpose simple balances and examples of the common standard weights and measures should be provided, and should be made available for the use of the children.

Special higher-grade courses for girls may be admitted, giving, in addition to the subjects named in the first paragraph of this article, a practical training in household economy.

The first year of the different courses in the same school may be identical, provided that it includes instruction both in experimental science and in a modern language.

In the second year of the higher-grade science course not less than eight, and in the third year not less than ten, hours a week must as a rule be allotted to science and at least half of this time must be spent by the pupils in individual experimental work. For the purpose of this article three hours of drawing or of manual instruction or of both conjointly will be reckoned as equivalent to two hours of science. In the third and following years manual instruction may be dropped, and the pupil should devote himself to the study of some special branch of science.

In the second year of the higher-grade commercial course at least eight hours, and in the third year ten hours, a week must as a rule be allotted to the study of a modern language or languages.

### HIGHER EDUCATION IN GREAT BRITAIN AND IRELAND.

Higher education is provided in Great Britain and Ireland by universities and university colleges, and professional education by special schools of medicine attached to the principal hospitals and by schools of law and of theology.

The number of students in the universities and university colleges for the successive years of the decade 1889-1900 is shown in the following table:

*Attendance at universities of Great Britain, 1889-1900.<sup>a</sup>*

Universities and university colleges.	Students.					
	1889.	1892.	1893.	1894.	1895.	1896.

a The unusually high attendance this year seems due to excess of evening students.

b Of some 18 colleges formerly comprised under the head of university colleges all but 4 are comprised in the statistics of the following university organizations: London, Victoria, and Birmingham.

c Included in London University.

## UNIVERSITY NOTES.

The extension of the sphere of university influence and activity is one of the most significant facts in the recent educational history of Great Britain. Oxford and Cambridge, as already stated, have come into closer relation with the great body of secondary schools in the country by the system of local and of school examinations.

The work technically known as university extension is maintained by Oxford and Cambridge and by London University and has developed under their auspices many features of peculiar interest.

An important meeting of Congregation of Oxford University was held November 11 (current year) to consider the following resolution, proposed on behalf of the Hebdomadal Council: "That candidates shall not be required to offer both Greek and Latin in the examination in stated subjects in responsions." After prolonged discussion the resolution was rejected by a vote of 189 to 168.

The year was made memorable at this university by the celebration (October 9) of the tercentenary of the Bodleian Library. An extended account of this venerable institution is given in chapter 24 of this Report.

The University of London has been reorganized in accordance with the statutes and regulations drawn up by the royal commission appointed under the "University of London acts," 1898. Under these statutes, which received the royal assent June 29, 1900, the university undertakes teaching functions in addition to the examination work which was formerly its exclusive function.

The schools of the university as named in the statutes are as follows:

(1) University College and King's College (admitting women in all the faculties), (2) the 10 medical schools, (3) the 6 theological colleges, (4) the Royal College of Science and the Southeastern Agricultural College (in agriculture only), (5) the City and Guilds Institute (in engineering), (6) the London College of Economics, (7) the

Royal Holloway College and Bedford College. To this list the senate may add at its discretion any public educational institution within the prescribed limits. All schools will be open to visitation, and are liable to be removed from the list.

At the presentation day of the University of London, on May 14, Lord Roseberry was welcomed as the new chancellor. In his report upon the work of the university during the past year Principal Rücker referred in particular to the following points:

The organization of the university has been completed by the addition of a new department for university extension and the inspection of schools. Regulations have been passed for the admission of post-graduate students from other universities to study for the doctorate in London, and it is satisfactory to be able to record that a considerable number of such students are, or are about to be, placed upon the books of the university. Two chairs of chemistry are to be established at University College—one for general chemistry, which will be filled by Professor Ramsay, the other for organic chemistry. In no subject has the difference between the completeness of English and foreign educational equipment been more marked than in chemistry. Only two or three educational institutions in this country have more than one professor of chemistry, while in Germany even a university of the second class usually has several professors in that department. It is hoped that the chairs now founded in University College will be the beginning of a great chemical department worthy of London. A very large scheme, which will have an important bearing on the future organization of the university, has been set on foot in consequence of the munificent offer of the Drapers' Company to give £30,000 in aid of the incorporation of University College in the university. The authorities, both of the university and of the college, have agreed in principle to the main outlines of a plan for incorporation, provided that an initial sum of £110,000 can be raised. There is every reason to hope that this condition will before long be fulfilled. While the university has been engaged in entering into closer relations with the various schools, and in negotiations for the complete absorption of one of them, it has also been undertaking teaching on its own account. All the leading physiologists in London have banded themselves together to give courses of lectures on that subject for advanced and post-graduate students, and Mr. Walter Palmer has generously given a sum of £2,000 to enable the experiment to be tried as to whether such lectures would attract an adequate number of students; the university has contributed another £400, and has also placed a suite of rooms in the university buildings at the disposal of the teachers as laboratories and lecture rooms. To obtain an idea of the research work being done in London, recognized teachers of the university were asked to supply a short statement as to the publications of themselves, their assistants, and students during the past twelve months. Nearly 600 memoirs, papers, and minor communications to scientific and literary journals have been reported. As might have been expected from the large number of its members, the medical faculty takes the lead in the number of its publications, somewhat less than half the above total being communications to professional medical societies and journals. Teachers of the university, their assistants, and students have made about 220 additions to general scientific literature. They have been the authors, or joint authors, of 11 papers in the *Transactions of the Royal Society*, or of about 80 papers which have appeared in the *Proceedings of the Royal Society*, and in the journals of the Chemical, Linnean, Physiological, and other kindred societies. University College heads the list with a total of about 100 memoirs and papers, while the polytechnics have contributed about a score.

In concluding his report the principal remarked: "It is time that London should realize that it is not the want of men, or a dearth of intellectual effort, which has hindered the University of London from taking its place as a great center of teaching and research. Our needs are organization, which shall make the results of the work of the teachers, their assistants, and students more fruitful and better known, as results of which London may be proud, and funds to supply them with the materials for their work." (*Nature*, May 22, 1902.)

The university colleges recently established in the great centers of industry are rapidly extending their resources and influence. These colleges are characterized by their liberal provision for science instruction and for technical training, and also by the admission of women on the same terms as men. Private and public resources have combined in their support, and the last and most striking phase of their development is their ascent into university organization. Owens College, Manchester (dating from 1851), Yorkshire College, Leeds (1874), and University College, Liver-

pool (1881), are comprised in Victoria University, incorporated in 1880. The three colleges of Wales—Aberystwyth, Bangor, and Cardiff—pertain to the University of Wales, incorporated in 1893, and Mason College, Birmingham, is the nucleus of Birmingham University, incorporated 1900. The development has been stimulated also by a Parliamentary grant which has been appropriated annually since 1889 to be shared by the university colleges of England on the condition that they submit reports to the education department.

The grant, which began at £15,000, was raised to £25,000 in 1897. Upon similar terms the three university colleges of Wales receive each annually £4,000 from the treasury.

Owens College, the oldest of these modern foundations, celebrated its jubilee with imposing ceremonies March 12 and 13 of the current year.

The question of chief moment during the year in respect to the Scotch universities has been that of the reorganization of their curricula to meet modern demands. For this purpose additional resources are greatly needed. To Glasgow University belongs the credit for initiating the first concerted steps toward a new reform. The report of a conference of the Glasgow faculty on extra summer term was forwarded to the arts faculty in Edinburgh. The latter concluded that it would be best to discuss the whole question of the arts curriculum and not merely the single issue—the extension of the academic year. At the request of the senate, Professor Chrystal, dean of the faculty of arts, undertook the task of preparing a public report of the proceedings and of the conclusions arrived at.

The report, which is regarded as a most important document, is thus summarized in the *School World*, October, 1902.

#### DEFECTS OF THE PRESENT CURRICULUM.

(1) One of the main defects is that the work of the students is compressed into too short a period of the year. The student sits day by day in the lecture room, and a series of pictures are thrown on his mind, like lantern views on a screen, each vanishing before it has had time to fix the attention. Lectures to be effective must be broken and assisted by exercises, by recitations, by reading, by reflection, by revisal, all done by the student himself, and also supplemented in varying degrees according to the subject by tutorial instruction.

(2) The great variety of the subjects of the ordinary degree, their want of correlation, and the possibility of taking each of them separately, encourage the student to skim over each as rapidly as possible, and to dismiss each successively from his mind.

(3) The strain of the high-pressure work of the winter session tests to breaking point in many instances the health of both students and professors.

#### PROPOSED ALTERATIONS IN THE ARTS CURRICULUM.

(1) It should be made possible to extend the courses that qualify for the degree of M. A. over a longer portion of the year, say from October 1 to June 30.

(2) In the interest of students who are willing and able to do sustained work on particular subjects, some concentration should be allowed with a corresponding degree of relief from the compulsions of the present curriculum for the ordinary degree of M. A.

(3) A greater variety of honors groups should be recognized, and graduation in honors in more than one group fostered by greater exemption from subjects taken on the ordinary standard.

(4) To economize the energy of the students and give a higher tone to their class work, the example of the American universities and of the new Birmingham University should be followed of allowing class work to count in part for graduation under such limitations as may be thought desirable to prevent possible abuse.

(5) To provide for the greater length of the courses, and to indemnify the university for the loss of fees caused by the abolition of the present summer classes, an increased fee might justifiably be charged.

## THE CARNEGIE TRUST.

The following tables show the apportionment of the grants from the Carnegie trust to the four universities of Scotland, as proposed by the secretary of the Carnegie trustees, July 26, 1902:

	Annual.	Total.
<b>GLASGOW UNIVERSITY.</b>		
[Annual grant of £11,000 for 5 years, making total grant of £55,000.]		
Buildings and permanent equipment.....	£8,000	£40,000
1. (a) Natural philosophy.		
(b) Physiology, materia medica, forensic medicine, etc.		
2. Chemistry, or geology (equipment), if any remainder.		
Teaching.....	2,000	10,000
1. Endowment of chair of geology. (Capital sum of £7,500.)		
2. For some other endowment approved by the committee.		
Library.....	1,000	5,000
Total.....	11,000	55,000
<b>ABERDEEN UNIVERSITY.</b>		
[Annual grant of £9,000 for 5 years, making total grant of £45,000.]		
Buildings and permanent equipment.....	1,000	5,000
Apparatus.....		
Teaching.....	7,000	35,000
A. General.—£4,500 annual.		
(a) For endowment.—£20,000. (£4,000 annual.)		
1. Endowment of chair of history.		
2. For some other endowment approved by the committee.		
(b) For income.—Provisional assistance. (£500 annual.)		
B. Modern languages.—£2,500 annual.		
(a) For endowment.—£10,000. (£2,000 annual.)		
(b) For income.—Provisional assistance. (£500 annual.)		
Library.....	1,000	5,000
Total.....	9,000	45,000
<b>ST. ANDREWS UNIVERSITY.</b>		
[Annual grant of £8,500 for 5 years, making total grant of £42,500.]		
Buildings and permanent equipment.....	3,000	15,000
1. Chemistry (St. Andrews), including endowment for upkeep, etc. (Capital sum of £5,000.)		
2. Physics (St. Andrews). (Capital sum of £2,000.)		
3. Extension, etc. (Dundee). (Capital sum of £8,000.)		
Teaching.....	4,500	22,500
A. General.—£2,000 annual.		
(a) For endowment.—£8,000. (£1,600 annual.)		
For endowments approved by the committee.		
(b) For income.—Provisional assistance. (£400 annual.)		
B. Modern languages.—£2,500 annual.		
(a) For endowment.—£10,000. (£2,000 annual.)		
(b) For income.—Provisional assistance. (£500 annual.)		
Library.....	1,000	5,000
Total.....	8,500	42,500
<b>EDINBURGH UNIVERSITY.</b>		
[Annual grant of £11,500 for 5 years, making total grant of £57,500.]		
Buildings and permanent equipment.....	8,000	40,000
1. Natural philosophy and engineering.		
2. Strong room and alterations in library.		
3. Apparatus.		
4. Pathological bacteriology.		
5. Catalogue of anatomical museum.		
Teaching.....	2,500	12,500
For endowment of modern languages, or some other purpose approved by the committee.		
Library.....	1,000	5,000
Total.....	11,500	57,500

The royal commission on the state of university education in Ireland, appointed in 1901, has just issued its report, which is received too late for extended consideration in this place. The representative character of the commission, the thoroughness of its investigations, and the comprehensive scope and judicial tone of its report excite the hope that its recommendation will lead to a satisfactory settlement of the serious problem which has engaged its attention.

An interesting event in the year's history of Trinity College, Dublin, was the opening ceremony of the memorial building, the gift of old graduates in commemoration of the tercentenary feast of 1892.

The following statements with regard to private bequests for higher education in Great Britain during the period 1871-1890 and the comparative statistics of university students in Great Britain, Germany, and the United States are cited from a recent article in *Nature*:

The question naturally presents itself, What has been done by private effort in this country to assist university education during the same period (1871-1890)? Compared with American munificence, the amounts given and bequeathed here are very small. Take, in the first place, the university colleges, which are largely to be regarded as a growth of the years under consideration. The financial statements contained in the Reports from University Colleges, 1901, published by the board of education, reveal the fact that, including the £400,000 raised for the University of Birmingham, the benefactions to the fifteen university colleges in Great Britain amounted during 1870-1900 to a little more than three millions (\$15,000,000). In the absence of systematic reports during the same period of the financial resources of the older universities of the United Kingdom, it is difficult to estimate the amount of benefactions received by them during the same thirty years. The parliamentary returns which have been published since 1898, showing the revenue of Scottish universities, suggest that their benefactions in the same time, excluding Mr. Carnegie's splendid gift, may be put at something under half a million, so that for the whole of the United Kingdom the total amount of endowment from private sources raised in these years may, without any risk of underestimation, be said to be considerably less than five millions (\$25,000,000). \* \* \*

It is interesting in this connection to compare the number of students taking university courses in this country with those in Germany and the United States. With this object in view the following table has been prepared, but it should be pointed out that the number of students in our university colleges includes all above the age of 16, which is probably much lower than the age of the students included in the totals for other countries. It is well to remember, too, that the number of American university students is probably too high for a fair comparison with those of Germany. Many university students in the United States are really students in the higher branches of technology, and would in Germany study in technical high schools, the students of which are not included in Germany's total in the table. To make the comparisons as simple as possible, the number of university students per ten thousand of population has been calculated.

*Number of university students per 10,000 of population (1900).*

Country.	Population.	Number of students.		Per 10,000.
		Day.	Evening.	
United Kingdom .....	41,164,000	{ a 12,000	-----	} c 4.98
German Empire .....	56,367,000	{ b 8,500	5,000	
United States .....	76,086,000	44,400	97,100	7.87
				12.76

a Universities.

b University colleges.

c Excluding evening students.

Neglecting the income accruing from the State land grants, the legislatures of individual States and the United States Government together supplied about £900,000 for university education during 1899-1900, while the article in *Nature* for March 12, 1903, shows that the total State aid to universities and colleges in the United Kingdom at present amounts only to £155,600.<sup>a</sup>

<sup>a</sup> From article entitled "The university and the modern state," *Nature*, May 14, 1903, p. 27.

## CHAPTER XXVI.

### CORRESPONDENCE SCHOOLS.<sup>a</sup>

---

Instruction by correspondence is, in the very nature of things, as old as written communication, for any person who would give advice and instruction to another in conversation naturally does the same thing by correspondence during absence. Such instruction was the beginning of correspondence schools, just as the teaching of a child at its mother's knee was the beginning of all education; it needed but to be systematized and extended from informal paternal admonition to organized teaching by those whose special function it came to be.

To cite instances in history of noteworthy letters whose sole object was instruction would be an endless task. Some of them, however, may be mentioned as being of special interest and of historical significance. The letters of Cicero to his son Marcus (*De Officiis*), and to his brother Quintus (*Ad Quintum Fratrem*), naturally suggest themselves first. Quintus Cicero was proprætor of Asia Minor, and the letters addressed to him were, in general, newsy letters, mixed with kindly advice and admonition, but they were also full of detailed instruction as to the handling of the public affairs intrusted to Quintus through the influence of the elder Cicero. Written apparently for the perusal of a single individual, they constitute in reality a remarkable dissertation on the duties of those set in high places, and are worthy to serve to such as a guide through all the ages.

The letters to young Marcus were also written on a high moral plane, and comprise in effect an excellent treatise upon ethics. As such they were intended to be not casually read and laid aside, but earnestly studied. At the outset Cicero said:<sup>b</sup>

Having resolved at this time to write to you somewhat, and a great deal in time to come, I have thought proper to set out with that subject which is best adapted to your years and my authority; for while many subjects in philosophy, of great weight and utility, have been accurately and copiously discussed by philosophers, the most extensive seems to be what they have delivered and enjoined concerning the duties of mankind; for there can be no state in life, amidst public or private affairs, abroad or at home, whether you transact anything with yourself or contract anything with another, that is without its obligations. In the due discharge of that consists all the dignity, and in its neglect all the disgrace, of life.

In the closing paragraph of the last letter (or book—there were three books) he says:

But as, if I myself had gone to Athens (which would indeed have been the case had not my country, with loud voice, called me back from the middle of my journey), you would sometimes have listened to me also; so, since my voice has reached you

---

<sup>a</sup> In the Report of the Commissioner of Education for 1901, Vol. I, pp. 232-234, is given a statement regarding the general character of correspondence schools and their methods of securing students, by R. P. Rothwell, president of the United Correspondence Schools of New York. Special information regarding railway correspondence schools, with typical courses of study, by J. Shirley Eaton, statistician of the Lehigh Valley Railroad, is given in the Report of 1898-99, Vol. I, pp. 903-907.

<sup>b</sup> Translation of Cyrus R. Edmonds (Bohn's Classical Library).

in these volumes, you will bestow upon them as much time as you can; and you can bestow as much as you wish. But when I shall understand that you take delight in this department of science, then will I converse with you both when present, which will be in a short time, as I expect, and while you will be far away I will talk with you, though absent.

It is evident, therefore, that in *De Officiis* is a genuine specimen of correspondence instruction of the highest type—so high, in fact, that those letters written by the Roman orator nearly two thousand years ago are still studied for their style and for their contents in the colleges of the world. They were truly “the noblest present ever made by a parent to a child.”

Lord Chesterfield, too, was a correspondence instructor of note. His *Letters to his Son* are not in “pedagogical form,” and as far as any necessary dependence of the substance of one upon that of another is concerned, any one of them might as well be the last of the series.

They are informal, as might be expected of the familiar letters of a parent to a child; beyond occasional advice they deal but little with formal study, and were not designed to be themselves the subject of such study, as were Cicero's letters. They were intended principally to convey directions, or suggestions, as to conduct, using the word in its lighter meaning. A tutor was employed to teach the scholastic branches, but instruction as to the behavior of a gentleman in his association with his fellows could only be given by one of particularly refined manners. It was this which Lord Chesterfield undertook to do for his son, and since the two were together but little, the instruction necessarily took the form of correspondence.

The next important writer of didactic letters who will be noticed here was Karl Philipp Moritz, a German teacher, author, and journalist. He was connected with Basedow's famous “*Philanthropin*,” and was later a friend and protégé of Goethe. He wrote a book upon German prosody, putting it in the form of letters which were supposed to have passed between two imaginary persons, Euphem and Arist. The contents of the book indicate that this form of composition was merely a conceit of the author, and that the substance was never actually transmitted as a series of letters. But this paper would not be complete without mentioning it, because it was one of the works which suggested the idea of correspondence instruction upon an extensive scale to the Germans, who founded the first of the modern correspondence schools.

For the same reason it is necessary to mention William Cobbett, who was famous as an agitator and pamphleteer in this country as well as in England a hundred years ago. It was in 1817, during one of his sojourns in America, that Cobbett wrote to his son, James Paul, a series of letters which together formed a complete grammar of the English language. Just why he happened to select such a subject for these letters is interesting. He had been a plowboy in his youth, and had had little opportunity for early education. Reaching manhood he enlisted in a regiment of infantry with which he came to Halifax. Having been made regimental clerk, he felt sadly the lack of education and eagerly set about to make up the deficiency. One of the first books he secured was *A Short Introduction to English Grammar*, by Bishop Robert Louth, a little duodecimo book of 220 pages. With the enthusiasm of a novice he studied this until he thoroughly mastered every part of it, and even committed the entire book to memory. This gave direction to his subsequent studies and bent to his mind, and it is not surprising that, in writing to his absent son, he should take that topic which he had found so fruitful.

Having written these letters, which were really letters, though forming as a whole a remarkably clear and connected treatise upon the language, he followed his habit and published them in book form. The title-page stated that the book was “intended for the use of schools and of young persons in general, but more especially for the use of soldiers, sailors, apprentices, and plough-boys.” The success of the publication

was unexpectedly great. Ten thousand copies were sold in a month, and it went through many editions. Of the two copies in the library of the Bureau of Education, one is of the original New York edition of 1818; the other also bears a New York imprint and is dated 1832.

In all the instances heretofore cited the letters were written primarily for the benefit of certain individuals, and though it is likely that the authors of some of them, especially Cicero and Cobbett, wrote with a view to publication as well as to the needs of the persons addressed, there was no idea in any case that their work would ever be "letters" to anyone else. It remained for a later time to develop a plan to give instruction in epistolary form to whosoever might demand it. That was a work for professional teachers, while those who had gone before wrote not as teachers, but as fathers. The first instance of such professional instruction was probably that of the Toussaint-Langenscheidt "school," which began its work in 1856. This institution, if such it might be called, was founded by Charles Toussaint, a Frenchman and a teacher of French in Berlin, and Gustav Langenscheidt, a German writer and member of the Society for Modern Languages in Berlin. These men were familiar with the teaching that had been done by correspondence in the ways described in the previous paragraphs, and they were familiar with language teaching in class. They simply combined the one with the other, thus giving rise to the "Toussaint-Langenscheidt method," which has become famous throughout Europe. They modestly refused to claim originality for their undertaking, citing the work of Moritz, Cobbett, and others in giving instruction by letters, and stating that in their actual teaching they but followed the methods of Jacotot, Hamilton, and Robertson, adopting the best ideas of each. Nevertheless, in the details of their teaching there was much that was original in that it had never been practiced before just as they did it.

In the beginning they taught only the French language to German pupils, but English was added soon and other languages afterward. Their plan was to send to each pupil monthly a printed "letter" of about 32 pages, of which half was given to grammar, or the structure of the language taught, while the other half was given to translation and conversational exercises. For translation a portion of a story was given each month, the same story running through the entire course, thus adding an element of interest to the work of translation. For instance, in the English course a part of Dickens's Christmas Carol, "Marley's Ghost," was selected. Under each word of English was a phonetic rendering of the foreign pronunciation, and beneath that was its literal translation into German. Following this was a translation of the passage into good idiomatic German, with discussion of the idioms; and then a detailed treatment of each word in the passage quoted. The conversational exercises were similar in general plan, an imaginary conversation upon everyday topics being given, with full explanation of the use of every word and the meaning of every sentence. Constant practice in pronouncing aloud the words of the unfamiliar language was urged, and other useful suggestions were made which would naturally occur to an experienced teacher.

Having thoroughly studied his lesson, the pupil was expected to forward a written recitation to the instructors, by whom it was corrected and returned with further individual suggestions to the pupil. At the end of the course of about 18 lessons an examination was given covering the entire course, and that was followed by still further criticism and suggestion to the student.<sup>a</sup>

---

<sup>a</sup>The concern which originated the Toussaint-Langenscheidt method still exists as the Langenscheidtsche Verlagsbuchhandlung. As the name indicates, the business is now "merely the publication of a series of educational works for self-instruction." The correspondence feature has been discontinued. The letters are sent periodically to patrons, as before, but each lesson paper after the first contains the solution of all the questions in the previous paper, and the student is expected to correct his own exercises according to printed directions without correspondence with instructors.

The "language letters," as they were called, were prepared with great care, native teachers of two nationalities cooperating to avoid possibility of error, and every effort was made to present the lessons not only with the utmost clearness, but with absolute correctness. The success of the system was remarkable, and it was widely commended and repeatedly imitated. At least once (in 1865) an unauthorized edition of the letters was published in this country, but it met with no success, for even with the text of the letters accurately copied there was still lacking the vital part of the instruction, namely, examination of the pupils' work and suggestions by the living teachers.

In this country correspondence schools have come into being and have grown in such a way as to make it probable that we should have had them even if there had never been a Toussaint-Langenscheidt method. Certainly the early conscious imitations, more or less fraudulent, came to naught, like the edition of the letters in 1865, and never had any influence in leading to the development which we have seen in the last twenty years. Without doubt the men who took up and popularized the correspondence work in the United States were well acquainted with what had been done by the Germans, and they used many of the ideas which had proved fruitful abroad, but they did not set out with the determination to establish a correspondence school. It was practically forced upon them, and its perfection came through natural development and in a remarkable and interesting way.

It was from the Methodist camp meeting that the American correspondence school grew, and it may be profitable to trace the steps which led to the transition.

"Camp meetings" are said to have originated in the sparsely settled regions of Kentucky during the closing years of the eighteenth century. A religious revival conducted by two traveling preachers on the Red River was so successful that the crowds attracted became too great to be accommodated by any building in the settlement, and the meetings were held out of doors. People attended from far and near, and many of those who came from a distance remained for several days, living in tents, no other accommodations being available. After the initial successful meeting, others were held on the same plan, the camping feature being more pronounced. In time, camp meetings became common, and are still a favorite mode of worship in the rural portions of the South and West, and, to a less extent, in the East. Certain localities are specially favored as "camp-meeting grounds," and are utilized for years in succession, until they attain considerable local celebrity. It is not unusual for the attendance upon them to reach several thousand, most of those present living during the week or two of the continuance of the meeting in tents or temporary buildings.

Such a place was Fair Point, N. Y., upon Chautauqua Lake. For several years the Methodists of the Erie Conference had held a camp meeting there, its exercises differing presumably in no essential particular from those of other camp meetings all over the country. To the meeting of 1873 came Rev. J. H. Vincent and Mr. Lewis Miller, the one an enthusiastic Sunday-school worker, full of energy and of ideas, and the other a substantial manufacturer of agricultural machinery, interested in educational and religious work. These men were imbued with an idea, first advanced by Mr. Silas Farmer in 1870, of a Sunday-school institute upon the camp-meeting plan, and Fair Point seemed to them the ideal place for its initiation.

The managers of the Chautauqua Camp Meeting Association readily fell in with their plans, and in due time "The Sunday-School Teachers' Assembly" was instituted, the first meeting being held in 1874. The idea at first was the normal training of Sunday-school teachers only, the intention being "to utilize the general demand for summer rest by uniting daily study with healthful recreation, and thus render the occasion one of pleasure and instruction combined." Though begun under the auspices of the Methodist Episcopal Church the assembly broke away from strict denominational lines soon after its organization, the similarity of the

Sunday-school work of the several Protestant denominations making it possible for them to work together in harmony along the lines attempted at Chautauqua. Then the desirability of a broader culture on the part of Sunday-school teachers, and the difficulty of arranging interesting programmes year after year confined to the narrower subjects of Sunday-school administration led to the introduction of secular subjects as well as religious. Gradually the scope broadened still further, and efforts were made to bring in not only teachers and those directly connected with Sunday-school work, but the general public as well. One new feature after another was added, until a full description of the ramifications of the work of the Chautauqua Assembly would make a volume of itself. In all of them the object is instruction combined with pleasure, but reasonably substantial instruction nevertheless.

Popular lectures, concerts, readings, and semi-intellectual and semi-social entertainments, have always been the central feature of the annual summer sessions at Chautauqua, and are still relied upon to attract attendance to the assembly proper, which usually lasts about six weeks. These things may be called the popular side of Chautauqua; the more substantial side must be sought in other directions.

Perhaps the greatest good and the widest influence among Chautauqua's undertakings have been reached by the "Chautauqua Literary and Scientific Circle," an organization whose members have numbered hundreds of thousands. Its object is to encourage home reading, and substantial courses in literature and science are arranged for each year's work.

The "School of Languages" was organized in 1879, for residence study at Chautauqua, with classes in Greek, Latin, German, French, Anglo-Saxon, and the oriental languages. During the six weeks of the assembly, classes were taught according to the "natural method," and students who concentrated their attention upon a single study during that time were able to make excellent progress. But it was exceedingly unsatisfactory to the students to be obliged to leave a study while still upon its threshold. Many sought to continue their studies without further guidance, but difficulties arose which led to correspondence with the teachers under whose direction they had just been studying. This naturally brought out the suggestion that the instruction might be regularly continued by correspondence after the students had scattered to their homes. The first attempt to do so failed. On the one hand the teachers were too much engaged with other duties to take special interest in work that brought no tangible returns, either professionally or financially; and on the other hand, without the stimulus of the teacher and class, the enthusiasm of most of the students soon waned. The correspondence was irregular and unsatisfactory and gradually ceased.

Another effort was made in 1881 to revive the correspondence work, this time with the appearance of more system and regularity. A definite charge of \$3, in addition to the price of tuition in the summer school, was made for correspondence instruction, that sum entitling the student to one letter a month from the teacher. All the letters from the students and replies of the teachers were to pass through the hands of one person, whose duty it should be to supervise the work and see that the letters were sent regularly. Again the plan failed, for neither the teachers nor the pupils could be held to the mark, probably because the fees paid were too small to be an incentive to either.

But enough had been done to show the elements of success within the idea, and during the next year (1882) important changes were made in details and a new trial was made. The fees were raised from \$3 to \$10, the frequency of communication was increased, and instead of waiting for letters of inquiry from puzzled students, a new lesson was sent out regularly from the teachers, giving the pupil each time something new to attract his attention and to arouse, or re-arouse, his interest.

Under the new arrangements correspondence instruction proved successful. The teachers took renewed interest in the work and set about devising other plans to make it attractive, while the pupils generally found that they could make good advancement and persevered in their tasks with commendable zeal.

The plan of operations, as worked out for the teaching of French, was thus stated in the Chautauqua Assembly Herald of August 8, 1882:

To assist students of the French language to overcome the idiomatic and other difficulties of interpretation, as well as to acquire general facility in French, it is proposed to organize a French Circle, for regular and systematic home study, to be directed through the mail by Professor Lalande.

A free and full use of the French language involves, (1) the art of reading; (2) the art of hearing; (3) the art of speaking; (4) the art of writing. The first and last of these, that may be called sub-arts, are peculiarly suitable for home study. The hearing and the speaking should constitute the main business of the sessions of the school at Chautauqua. At the outset of the study there are difficulties to be overcome that oral instruction only can properly meet, and when the student has gained the ability to read French readily, he must hear the language spoken to cultivate his ear before he can make any profitable advance toward speaking it. Oral instruction is thus valuable at the commencement of the study, and indispensable at a later stage, but there is a large intermediary space in which the proposed circle may be most profitably employed. To this end it is intended to furnish by mail, weekly, to each member, certain exercises comprising a definite amount of reading, translating, and idiomatic and grammatic expounding, to be performed by the member, and mailed to the professor, at Louisville, Ky. These exercises will be corrected by Professor Lalande and returned to the student, with notes and suggestions adapted to his individual needs. The course of exercises will begin October 1 and end May 31. This series of graduated exercises will carry the student over all the important difficulties in the language, the required reading, etc., will insure to the faithful student such attainments in the French language as will fit him to profit fully thereafter by the most advanced instruction in class or under a living teacher. Terms of membership, \$1 per month, to be remitted to Prof. A. Lalande, Louisville, Ky., with the first exercise of each month.

This appears to have been the first complete plan developed and formally announced in this country for correspondence work. It found favor in the eyes of Dr. Vincent, the real head of all of Chautauqua's undertakings, and was apparently the plan followed in teaching the other languages offered at Chautauqua.

It will be seen that, though bearing Chautauqua's name, the correspondence work was really in the hands of the individual instructors, who conducted the correspondence and received all the fees. There was no unity of action or organization and each teacher was a law unto himself, for the officers of the assembly exercised no supervision over the work.

It is one of the characteristics of the Chautauqua management that an idea shown to be good is at once seized upon and its application extended to the utmost limit. When correspondence instruction, therefore, was shown to be practicable in the teaching of languages, arrangements were almost immediately begun to apply the same plan to other studies.

A "School of Theology" had been established in 1881, in which a course of home study had been mapped out, for the completion of which degrees were promised. From time to time special papers on various topics were sent to the young ministers, embracing lectures on law, hygiene, syllabi of important articles in magazines, etc. There was some correspondence, probably between the heads of the departments and students, but it was desultory and purely informal, and the degrees were expected to be awarded on examination only. The successful correspondence work in the School of Languages stimulated the School of Theology to like action, and the advertisements and announcements of the latter soon began to mention correspondence as a feature of its work.

More important still, the long-cherished plan of a Chautauqua University, to be the crowning glory of the Chautauqua system, received strong impetus when a method

of operations was developed by which its work could be done systematically and effectively. Accordingly articles of incorporation were secured from the New York legislature in March, 1883, by which Chautauqua University was established "to promote liberal and practical education, especially among the masses of the people; to teach the sciences, arts, languages, and literature; to prepare its patrons for their several pursuits in life, and to fit them for the duties which devolve upon them as members of society, such instruction to embrace all departments of culture which the board of trustees may deem useful and proper." <sup>a</sup>

The institution was empowered to confer degrees, to hold property, and to have the usual powers and duties of a corporation. Arrangements were soon made for the beginning of its work, and in May, 1884, the following announcement appeared in "The Chautauquan:"

The Chautauqua University is a provision for the higher education of persons who, not being able to leave their homes for college, are willing to give much time and labor to the prosecution of college studies at home by correspondence under the direction of superior professors.

The curriculum is as comprehensive as that of any college in England or America. The memoranda and final written examination are sufficient to test the pupil's work, attainment, and power.

Pupils may take up one or more departments, spending what time they please upon each, passing the examinations whenever they are ready.

As each course is finished to the satisfaction of the professor, a certificate to that effect will be given, and when a required number of certificates is in the possession of the student he will be entitled to a diploma and a degree. \* \* \*

The following departments have already been organized:

Department of Modern Languages—German, Dr. J. H. Worman; French, Prof. A. Lalande; Spanish, Dr. J. H. Worman; English, ———; Anglo-Saxon, Prof. W. D. MacClintock.

Department of Ancient Languages—Greek, Henry Lummis, A. M.; New Testament Greek, A. A. Wright, A. M.; Latin, E. S. Shumway, A. M.; Hebrew, W. R. Harper, Ph. D.

Department of Mathematics, D. H. Moore, A. B.

Thus began a university unique in history, without a dollar of endowment, without buildings, laboratories or libraries, no two of its professors living in the same city, and not a single student in residence! The School of Languages was the nucleus of the new organization, and with one exception all the professors named in the prospectus of the university had been teachers in the older school.

Actual work was begun October 1, 1884, with an enrollment of 6 students, but that number was increased to 295 in a year and a half. Soon after the beginning of operations new departments were added, and the study required for a degree was systematized. The following from "The Chautauquan" for December, 1884, shows the scope of the work proposed:

Among the degrees to be conferred by the Chautauqua University on the satisfactory completion by the candidate of prescribed courses are the following:

A. B.—A full academic course.

A. M.—A postgraduate course in approved liberal studies.

B. S.—An elective course in science, art, and English.

Ph. B.—An elective academic course.

Ph. D.—A postgraduate course in philosophy and one in more liberal studies. \* \* \*

The completion of the following courses of study, and the possession of certificates from the directors of the various departments which these courses represent, will be required before the student will be recommended for the degree of Bachelor of Arts: Two full courses<sup>b</sup> in Greek; three full courses in Latin; four full courses in mathematics; two full courses in French or German; three full courses in English; two full courses in history; one full course each in philosophy, political economy, physics, chemistry, moral philosophy, astronomy, the history and literature of art, and two

<sup>a</sup> Laws of New York, 1883, p. 148.

<sup>b</sup> Each "course" was equivalent to the course that would be covered by a student in a residence college giving two hours a day to study throughout a year.

full courses in biological science. The student will not be required to pursue these courses exactly as prescribed, as wide opportunity will be given to the individual to substitute other branches than those named, or more courses in particular departments than are here specified, as he may elect. But in every case full courses equal in number to those specified will be required. For the other degrees the scheme of study now pursued will form the basis, such omission and substitution being made as are suited to the particular degree; but in no case will a diploma be given for less than 22 courses.

In all the circulars and announcements of the University great stress was laid upon the fact that it presented no easy road to a degree, and that the work required was as much as would be demanded by a residence college for the same recognition. All intention of trespassing upon the field of the regular institutions was repeatedly disclaimed, and students who could do so were urged to attend college in person in the usual way. Justification of the existence of Chautauqua University was found in the numbers of earnest students to whom it was impossible to leave home, and whose studies were necessarily without proper direction.

In 1885, by a new act of the State legislature, Chautauqua University was extended to include all the educational agencies of the Chautauqua Assembly, and the term "College of Liberal Arts" was thereafter applied to what had previously been known as the University. As such it flourished educationally, though not financially, for about fifteen years, bearing on its rolls upward of 300 students a year and numbering among its professors some of the best-known specialists in the country. Its faculty in 1890 was composed as follows: William R. Harper, then of Yale University, principal; James J. Robinson, Ph. D., Latin; William E. Waters, Ph. D., Greek; Herman J. Schmilz, M. A., German; A. de Rougemont, M. A., French; W. D. McClintock, M. A., English; E. H. Moore, Ph. D., mathematics; E. H. Hershey Sneath, Ph. D., mental and moral science; Richard T. Ely, Ph. D., political economy; Herbert B. Adams, Ph. D., history; Le Roy F. Griffin, M. A., physical science; Frederick Starr, Ph. D., geology and physical science. Truly no other college of 300 students in the country could boast a stronger faculty or one containing more distinguished names.

Besides the usual academic work of a college there was in connection with the institution a preparatory department, a school of journalism under Mr. Hamilton W. Mabie, and a school of phonography, at first under the direction of Prof. William D. Bridge.

Then, as parts of Chautauqua University, though apparently independent of the College of Liberal Arts, there were the School of Theology, which I have already mentioned, the School of Business under Mr. Charles R. Wells as director, and the Society of Fine Arts, of which Mr. Frank Fowler and Miss Jeannette L. Gilder were the director and conductor, respectively. In all these correspondence was the medium of instruction employed during the greater part of the year. Classes in all of them were organized at Chautauqua during the period of the assembly, and students were expected to come as much as possible in personal contact with the teachers during that time. Many of the correspondence students undoubtedly did attend the summer classes, but it is not to be supposed that any considerable number of those who lived in distant States did so, for persons who were not able to attend a residence college would scarcely be able to take a long and expensive summer trip for the sake of six weeks' instruction.

The fees paid in the College of Liberal Arts (namely, \$5 matriculation fee and \$10 for each course) were never sufficient to pay the cost of maintenance. Each year a deficit was reported which was paid from the general funds of the assembly, entailing a heavy drain upon the revenues from its more profitable enterprises. Nevertheless the college was maintained unimpaired until 1900, when in the general reorganization of the assembly's affairs all the correspondence work was dropped, thus ending an exceedingly interesting and important chapter in America's educational history.

In taking this step the managers of Chautauqua felt that no loss would follow to the educational world, since similar work had been taken up extensively by endowed colleges and other institutions. After all, the greatest work of the correspondence college of Chautauqua had been to mark the way for others. To recite the names of those who have followed in Chautauqua's footsteps would be a long story. Suffice it to say, however, that the commercial possibilities of correspondence work were quickly recognized. Several "business schools" were early in adding a correspondence feature to their regular residence work, and even yet commercial branches like bookkeeping, stenography, etc., are the most extensively advertised of the correspondence courses. Perhaps a reason for this is that business schools find that correspondence students frequently continue their studies in a residence institution, and that correspondence instruction is not only profitable in itself, but is also an excellent "feeder" for the residence department. Another motive which has prompted the establishment of several schools has been the desire of certain publishing houses to find a new means of selling their books. Some of the largest of the schools began in this way. In one or two instances the original business has been wholly swallowed up in the magnitude of the newer enterprise, and the publications have of late been restricted to the needs of the schools. Scores of others have been attracted to the business by the very great extent and apparent financial success of some of the older schools. Many of these purely commercial ventures bear evidence of a close approach to being fraudulent.

So far not many of the established colleges have gone into correspondence work. The University of Chicago was the first and most noteworthy of them. President Harper had been identified with the correspondence instruction of Chautauqua almost from its beginning, and it was but natural that when he went to his new and broader field he would take with him the methods with which he had long been familiar and of which he is the most conspicuous advocate in this country. Pennsylvania State College has several courses in agriculture which are given gratuitously by correspondence, and Baylor University, Waco, Tex., has gone into correspondence work to a limited extent.

Wesleyan University, Bloomington, Ill., has been giving degrees since 1876 for work done in absentia, after the plan of London University. But this involves no instruction whatever on the part of the institution, and scarcely falls within the scope of this paper. Taylor University, Upland, Ind., pursued the same plan for several years, but has recently discontinued it. The University of Wisconsin, the University of West Virginia, the Agricultural and Mechanical College of Rhode Island, and perhaps a few other colleges have experimented with correspondence departments, but have found them too unprofitable and unsatisfactory, as there conducted, to be continued.

This suggests the question why some of the commercial ventures, stock companies with an eye single to financial gain, have found profit in correspondence instruction, while Chautauqua and the colleges referred to as a rule, have not. In reply several things may be said: First, the fees charged by the stock-company schools are much higher than those of the colleges. A "course," equivalent to a year's work in a single study at a residence college, cost but \$10 at Chautauqua, while fees of \$100 and upward are common in the commercial type of schools. In them there are very few courses as cheap as \$20, and those are short and inconsequential. A French course in the Chautauqua College of Liberal Arts, for example, was \$10; in a typical stock-company school it is \$72, of which \$20 is for a phonograph outfit, making the net price of the instruction \$52. The higher price is by no means unreasonable; the \$10 charge was abnormally low, especially for instruction given by college professors of high standing and wide repute. The actual time per pupil demanded of the teacher by correspondence instruction is greater than in class-room

work, and the work done by the Chautauqua professors must be classed as pure philanthropy, and may be likened to gratuitous practice of famous physicians in the hospitals.

Not only do the stock-company schools charge more for their courses, but they have also arranged systematic methods by which the great bulk of the examination and correction of students' work is done by clerks and subordinates, to whom small salaries are paid. These people work under the direction of experienced men, and the text-books studied and questions to be answered by students are prepared by competent experts. Naturally the instruction given by clerks, even under supervision, is not altogether such as it would be under college professors, but the system is "businesslike" and in the best of these schools it is fairly efficient and satisfactory to patrons.

But the most marked difference between the colleges and the stock-company schools lies in the energetic "hustling for students" by the latter class, to use the words of the manager of one of them. Certain questions of scholarly dignity and professional ethics which might influence and restrain a college professor are not regarded by the "business men" at the head of the schools. Extensive advertising of the most alluring and optimistic sort is supplemented by organized systems of branch offices in the principal cities, and by an army of solicitors who cover the country very much in the same way that book agents and insurance solicitors do.

The operations of one of the largest and apparently most flourishing of its class may be cited as illustrating the methods which seem to be common to all of them. The advertising matter of this institution appears extensively in all the principal magazines and periodicals, and it has over twenty branch offices and employs regularly a force of 2,500 persons in all its departments. Over 350,000 students were enrolled in the first ten years of its existence, but for actual instruction only 26 "principals," with a total of 358 "experts, instructors, and assistants" were required in 1902. Thus it will be seen that the greater part of the receipts from tuition go for securing and retaining students, rather than for instructing them. The reverse is true of the colleges, for in them practically all the fees for the correspondence work go to the professors; very little is paid for advertising, and nothing at all to canvassers.

As to the actual extent of correspondence instruction it is difficult to make a satisfactory statement. The conditions of enrollment in the stock-company schools are such that it is impossible to state at any one time how many students are actually studying and how many have finally dropped their work. A pupil may usually take as long as he wishes to complete his course, though some schools limit the time in certain lines to five years. A name once enrolled is therefore continued on the lists indefinitely. Some students drop their studies for long intervals and resume them after months and even years of inaction. Others may send in a paper only about once in six months, but they are still rated as students as long as any lessons paid for have not been taken. Of course the great majority of those who lose interest in their work for a few months, or even weeks, will not be heard from again, but that can not be assumed for any particular case. The managers of the schools themselves therefore do not know definitely how many active students they have, and when asked for estimates usually refuse to make them or else give the whole number enrolled from the beginning of the school. In the University of Chicago a course lapses if not completed in a year, and, as ample records are kept, it is easy to determine the number actively at work at any given time. This, however, is not generally the case.

The numbers which are reported in connection with these schools are undoubtedly impressive. With one of the schools claiming over 350,000 students, the claims of the rest must be set in proportion, and the institution which can not refer to at least 10,000 is small indeed. But as representing present conditions these figures are wholly misleading for the reasons described. If the numbers usually given to the public be

divided by 6 the result would probably exceed the number of bona fide active students at any one time. This ratio, 6 to 1, is that shown between the total enrollments (4,224) and the number active at the end of the year 1901-2 (708) in the correspondence department of the University of Chicago. The commercial schools would not show nearly so high a proportion of those who complete the courses for which they are entered,<sup>a</sup> and consequently the ratio of those remaining at any particular time, as compared to the total enrollments, would be less in them than in the university. The ratio is, however, affected by the age of the school considered, for of course the older the school the smaller the proportion of the pupils who now remain.

Nearly half of the replies to an inquiry recently made indicated that the writers could not be classed as correspondence instructors of a legitimate type. Some merely seek to sell books or instruments, and, notwithstanding the wording of their advertisements, it is apparent that they have no facilities for instruction and do not mean to give any except through the books sold. Others pretend to give instruction in "sciences" with names and objects not known to the National Academy. Still others are so transparently dishonest as to openly request applicants to insert deceptive advertisements in local papers, while they themselves advertise free tuition, guarantee positions to students, and otherwise make promises impossible of fulfillment.

Certain advertisers pretend to teach professions by correspondence in a few weeks which in the very nature of things can be learned only by years of practice and observation of practical work, in addition to the study of books. Nursing and medicine, in general, or in some of its specialties, are the favorite fields for this class of advertisers. An instance is mentioned in a medical journal of a school which offers to train a man to be a competent oculist for \$7.50. Law is better adapted to correspondence work than any other profession, and several reputable schools are giving good instruction in that subject, but that field too has been invaded by the charlatan.

Correspondence instruction is sometimes undertaken by those who are not competent to teach what they claim to teach and are not even well enough acquainted with their subjects to know their own incompetence. A letter recently came to this Bureau from a young man in a small Western village asking his rights in advertising correspondence instruction. The letter in itself showed that the writer had but an insufficient education, though he stated that he had taught school for two years and held a third-grade certificate, yet he proposed to advertise instruction in forty subjects, including journalism, short-story writing, theory and practice of teaching, music, the commercial branches, and a long list of academic subjects, and the tenor of the letter showed that the writer honestly thought he could do what he expected to attempt. This man is but a representative of a class which is far too numerous in correspondence work, for in that line it has its best opportunity. Often these persons can not be charged with deliberate dishonesty, but nevertheless the student who pays them his money with the expectation of receiving satisfactory instruction is defrauded just as much as if he had patronized a swindler.

There is still another class of persons who may or may not be honest in intention, but who undoubtedly give very little in return for the tuition fees paid them. The instruction given by some of the so-called schools of caricature, designing, and illustration is exceedingly meager. One "complete course" consists of thirty sheets, each showing one or more pictures to be copied, specimens of lettering, examples of "tints," and a few paragraphs of instruction which are utterly inadequate to do the subject justice. The charge for the course is \$25 cash, and more if paid in installments, and great claims are made in the advertising matter of the "school" for its

<sup>a</sup> First, the fees for each course must be paid in advance in the university while the schools allow payments in installments; second, 90 per cent of the students of the university are teachers, and as a class are far superior to those in the schools and more likely to remain to the end. Of the 4,224 enrollments in the University of Chicago, 1,968 courses were completed.

efficiency. But it is difficult to understand how such a course can be of material benefit, to say nothing of its ability to develop first-class illustrators, as the statements to prospective students seem to imply.

There are several correspondence schools of music which are advertised more or less extensively, and which claim to have many students. Undoubtedly there is much in the science of music that can be taught by mail as easily as any other subject can be taught by that method, and there are teachers of high reputation engaged in such instruction; but to teach the art, as distinguished from the science, in that way is quite another matter. It would certainly be difficult to accomplish it satisfactorily.

These instances represent the darker side of the picture, and they arise from the condition of affairs that exists in this country which makes it possible for a man to undertake any business he wishes so long as he does not actually violate the ordinary criminal laws. There is no supervision whatever on the part of any public officer over the work of correspondence schools. In most States they may with apparent ease even secure charters enabling them to grant degrees without restriction. It must be said that in very few instances does there seem to be a conscious disposition to abuse this power, yet the mere fact that degrees are given by many schools for work done wholly in absentia, and upon examinations at the pupils' homes under supervision that is plainly insufficient to insure honesty, is in itself suspicious.

Yet the fact remains that a very great work has been done and is being done by correspondence schools. Even inferior ones, with all their shortcomings, have been the means of good. True, they have discouraged many, but they have prompted others to seek instruction who have subsequently pursued their studies under more favorable auspices. The very fact that the watchword of all of them is "improve yourself," and that they constantly stimulate their patrons to study, is not to be overlooked. Then, when we consider the thousands to whom the better class of these schools have carried the means of improvement, and reflect that without the aggressive tactics of these enterprising "hustlers" the great majority of their students would have remained without any instruction at all, we can understand their value as a force in popular education. The stock-company schools have done for education a work in some degree similar to that of John Wesley and William Booth in the cause of religion. Their methods are startling to the conservative, but the sum total of their efforts have made for the good of mankind.

In regard to the achievements of institutions still higher in the category, namely, the Chautauqua College of Liberal Arts, the University of Chicago, Pennsylvania State College, and the like, nothing but good may be said. They have carried the higher education to thousands to whom college walls were but a dream. The figures of the correspondence work of those institutions speak for themselves.

---

### TYPICAL SCHOOLS AND COURSES OF STUDY.

#### THE UNIVERSITY OF CHICAGO, CORRESPONDENCE-STUDY DEPARTMENT.

[From a letter of Mr. Hervey F. Mallory, secretary, November 4, 1902.]

Our correspondence work differs radically from that conducted by schools offering instruction in a certain group of studies and calling that group a course. We do nothing of this kind, but simply offer a list of perhaps 250 different "courses," as we call them—that is, units of study—and allow anyone, anywhere, who feels qualified to do the work in any particular course or unit to take it on payment of the fees and compliance with general university admission requirements. This course or unit we denominate a major. It represents the amount of ground which a student in residence would be taken over in twelve weeks, averaging five hours of recitation per

week. One-half a course or unit we denominate a minor. Thirty-six of these units are required for our bachelor degree, and of the 36 a student may do 12 by correspondence. The balance must represent residence work, either here (and at least 9 must be done here) or at some other institution of recognized standing. You will see, therefore, that it was originally intended that correspondence work and residence work should supplement the one the other. No degree is granted for work done wholly in absentia.

The organization of the correspondence-study department was coincidental with that of the university as a whole. Both the residence and the correspondence work began on the same day—October 1, 1892. The beginnings were tentative, but success has marked the work from the outset, and it has grown in scope from a few courses or units offered in history and Latin to nearly 250 courses in 23 of the 31 departments in which instruction in the colleges of arts, literature, and science is now being given, and in 5 of the 6 departments of instruction in the divinity school.

Printed instruction sheets, each containing a definite assignment of reading in standard text-books, references for collateral reading and questions based upon this reading, constitute the basis of instruction. Ordinarily a major course contains 40 such lessons and a minor course 20. Each lesson which the student submits receives the personal attention of the instructor who is announced to give the course, be he head professor or reader. After the student has completed the written work in the course he is granted a certificate testifying to this fact, signed by the president of the university and the secretary of the correspondence-study department, and stamped with the university seal. If he wishes university credit for his work he passes a final examination on the course, either here or in his own city, under supervision which has been approved by the university.

To all intents and purposes the correspondence courses are the same as the residence courses, except for the manner of communication. The instructors who give the correspondence courses are the same, in almost every case, as those who give the residence courses, which insures the highest grade of teaching, both as to matter and method.

Between October, 1892, and June 30, 1902, about 3,000 different students, coming from every State and Territory in this country, and many foreign countries, have availed themselves of the opportunities thus offered. More than 100 different vocations are represented in the student body, though perhaps 90 per cent of the number are teachers. Considering the fact that the scope of our work is limited to purely academic subjects, the general interest thus manifested is significant. Of the total number who have enrolled, approximately two-thirds have completed their courses.

[From "Announcements," Correspondence-Study Department, July, 1902.]

*The general plan for university extension teaching.*—All nonresident work of the University of Chicago is conducted through the university extension division. The university extends its teachings beyond its class rooms in two ways: (1) By lecture-study courses; (2) by correspondence-study courses. The scope of the correspondence-study department is explained in the following paragraphs:

1. *The correspondence work in general.*—Experience has shown that in many lines of study correspondence instruction secures results highly satisfactory both to the student and to the instructor. Direction and correction may be given oftentimes as effectively by written as by spoken word.

2. *Purpose and constituency.*—This department of the university extension division does not provide a curriculum leading to a degree, but furnishes a list of courses from which the student may choose such as will afford helpful and stimulating study. It aims to offer anyone anywhere the opportunity of securing instruction from specialists.

The work appeals, therefore, to the following classes: (1) Students preparing for college; (2) college students who are unable to pursue continuous resident study; (3) grammar and high-school teachers who have not had and can not avail themselves of resident college instruction; (4) teachers and others who have had a partial college course and wish to work along some special line; (5) instructors in higher institutions who desire assistance in the advanced study of some special subject; (6) professional and business men who wish technical advice; (7) ministers and Bible students who would fit themselves better to use the sacred Scriptures; (8) all who desire a broader knowledge or a more thorough scholarship.

3. *Method of instruction.*—Each correspondence course is arranged to cover the same ground as the resident course on the same subject, and consists, therefore, of a definite amount of work. The terms major (Mj.) and minor (M.) indicate that if the correspondence course were given as a resident course, it would run through twelve weeks or six weeks, respectively. Courses are of two kinds, formal and informal.

(1) Formal courses are conducted on the basis of printed instruction sheets which furnish suggestions and assistance and assign the tasks to be performed. The student thus works under guidance, as in the recitation room. At regular intervals the student mails to the instructor a recitation paper on which he has written out the tasks assigned in the instruction sheet, the answers to such questions as are set therein, and any questions or difficulties which may have arisen in his study. This recitation paper is promptly returned with the errors in it corrected, and with such suggestions as it may be thought best to offer. In this manner each lesson submitted by the student is carefully criticised by the instructor and returned.

(2) Informal courses are designed for a special class of students who are pursuing studies of an advanced nature. The course is usually arranged between instructor and student to meet the particular needs of the latter. The formal lesson sheet is dispensed with, but the course is carefully outlined by the instructor and the student is required to present satisfactory evidence that the work is being properly done. This evidence may consist of a number of short papers on special themes, a thesis covering the whole work, or it may partake rather of the nature of ordinary correspondence.

4. *Admission.*—(1) No preliminary examination or proof of previous work is required of applicants for correspondence courses. Before matriculating or registering a student, however, the university does require certain information called for on the formal application blank, and reserves the right to accept or reject applicants on the basis of the data thus furnished.

(2) All correspondence students are classified as regular or special students, according as they have or have not satisfied the requirements for entrance to one of the colleges or schools of the university.

5. *Recognition for work.*—(1) A certificate is granted for each correspondence course successfully completed.

(2) The university accepts correspondence work as qualifying in part for the degree, on the following conditions: (a) The applicant shall present a certificate for the work performed. (b) He shall pass an examination on the course at such time as is most convenient to himself and his instructor, either at the university or, if elsewhere, under supervision which has been approved by his dean. (c) Only those who receive a grade of A, B, or C will be regarded as having passed. (d) If the correspondence student has not been a resident student, the record of his work and examination remains in the correspondence-study department until after this condition is realized. It is then transferred to his record of resident work and applied toward the degree.

6. *Regulations.*—(1) The University of Chicago grants no degree for work done wholly in absence. A candidate for any degree must spend at least one year (three quarters) in resident study at the University of Chicago, and secure credit for nine majors of resident work.

(2) A student may not do more than twelve of the thirty-six majors of college work required for the bachelor's degree, nor more than one of the three years of graduate work required for the doctor's degree by correspondence. Correspondence courses can not count directly toward the master's degree, inasmuch as only one year and nine majors of resident study (the minimum residence-study requirement for any degree) is required for this degree.

(3) The student will not be allowed to register for more than two correspondence courses at a time, except by consent of the director of the university extension division.

(4) A student may begin a correspondence course at any time in the year.

(5) A resident undergraduate student must secure the consent of his dean before registering for a correspondence course.

(6) A student will be expected to complete any course within one year from the end (i. e., March 23, June 23, September 23, December 23) of that quarter in which he registers.

(7) A student who for any reason does not report either by lesson or by letter within a period of ninety days, thereby forfeits his right to further instruction in return for the fee paid.

(8) Extension of time will be granted: (1) For a period equal to the length of time which a correspondence student spends in resident study at the University of Chicago, providing due notice is given the secretary and the instructor both at the beginning and the end of such resident study. (2) For one full year from the date of expiration of the course, if, on account of sickness or other serious disability, the student has been unable to complete the course within the prescribed time, providing (a) he secures the consent of the secretary and his instructor and (b) pays a fee equal

to one-fourth of the original tuition fee for the course. Private arrangement for extension of time between the student and his instructor can not be recognized by the department.

(9) During an instructor's vacation a substitute will, if possible, be provided.

(10) All correspondence students who have not matriculated in the university are required to do so. This matriculation is general for the whole university and is paid but once.

\* \* \* \* \*

(15) Ordinarily, a major consists of 40, and a minor of 20 written lessons; but there may be variations from this number in order to accommodate the work to the requirements of a particular course. Each course represents a definite amount of work, the number of lessons into which it is divided being incidental.

(17) Each major or minor taken by correspondence will be the equivalent of a major or minor on the same subject taken in residence and will secure corresponding university credit.

(18) Except when otherwise indicated, all informal courses will be given as majors.

7. *Expenses.*—(1) All fees are payable in advance.

(2) The matriculation fee is \$5; the tuition fee for each minor (M.) is \$8, and for each major (Mj.) is \$16. The tuition fee includes payment for the instruction sheets received. Text-books must be purchased by the student.

(3) The student is required to inclose postage for the return of the lesson papers.

[From pamphlet on correspondence instruction, Chicago University, 1900.]

## SOME OPINIONS OF INSTRUCTORS, UNIVERSITY OF CHICAGO.

President William Rainey Harper: I have myself been personally interested in the correspondence work for twenty years, and have seen the system work for that period of time. The correspondence method of study is not intended for all men and women; it is intended for those who have the ability—the backbone—to work without the constant prodding of a teacher. Half the students in a university need the constant attention of the teacher day by day. It is the best class of students who do work by correspondence. It is without doubt true that in linguistics (I draw my illustrations from the department with which I am personally connected—Hebrew and the cognate languages) the work done by correspondence is even better than that done in the class room. Students who come to us after a year of such work are

better prepared than those who have taken it with us in the class room, and we do not mean to say that we are not doing our very best for our students in the class room.

Assistant Prof. Edwin Erle Sparks (history): Correspondence work represents the very essence of self-help. The earnest student in this work feels the exhilaration and inspiration which come from the consciousness of growing, self-developed power.

Dr. Charles Alexander McMurray (pedagogy): During the past year I had the opportunity of comparing the work done by students who were taking the "history of education" course in the class room and by correspondence. I do not hesitate a moment in saying that those who did the work by correspondence did three times as effective work and gained three times as much satisfaction for themselves as those who took the work in the class room. The correspondence student must carefully and thoughtfully sift out definite material for himself and give his opinion on it. This calls for an amount of self-reliant effort that is among the best results of study.

Dr. Charles Joseph Chamberlain (botany): A major's work by correspondence demands more time, both from the student and from the instructor, than a major's work in residence; but my experience has convinced me that three or four majors by correspondence is highly desirable, especially for those who wish to do advanced work in botany, for it develops self-reliance and independence. Twelve students who have taken their elementary work in botany by correspondence have since taken resident work in the subject. Other members of the department with whom these students have done resident work agree that it is fully up to the highest standard of those who have taken all their work in residence.

Prof. Starr Willard Cutting (German): Within certain ranges, defined by the previous preparation and the library facilities within reach of my pupils, I have conducted courses in German by correspondence with a success at least equal to that attainable in the class room. This I attribute chiefly to these facts: (1) The necessity of committing one's questions to writing leads to careful reflection and independent effort in solving difficulties as a preface to calling upon the instructor for help. At the same time the absence of the formal lecture stimulates the pupil to ask questions that gauge an amount of personal interest and activity not always aroused in the class room. More sane questions are asked by the student in a correspondence course than by the same student in a resident course. (2) Work by correspondence is strictly individual work. The instructor is adjusting himself all the time, not to that statistical abstraction, "the average student," but to one of his fellow-men, whose definite needs are reflected by the questions he asks.

Assistant Prof. Frank Justus Miller (Latin): Of the scores of students who have taken correspondence courses in Latin with me, the only failures to do creditable work have been on the part of those whose unfitness to undertake the course could not be predetermined adequately, but was manifest at once when the course was well under way. On the other hand, and, as a rule, work of the most careful and painstaking kind and of the highest and most satisfactory character has been done not by few but by many of my students in Latin. There has been a gratifying change in the type of my nonresident student. A better class is being attracted to this work. Undoubtedly, the loss of the personal teacher is a great lack; but this finds at least a partial compensation in the much larger amount of individual work that the student is called upon to perform. Besides, while there is indeed no teacher present in person in this work, there may be much of the teacher's personality infused into it. That much of the student's personality is reflected I can abundantly testify.

[From the University Record, August, 1902, p. 139.]

#### ENGLISH COMPOSITION BY CORRESPONDENCE.

[EDITH FOSTER FLINT, The University of Chicago.]

Correspondence study is popularly regarded as a makeshift—a poor substitute for the greatly-to-be-preferred work in residence. Is a person too busy, too poor, too old, to go to college? Let him do correspondence work; it won't hurt him and it may do him good. To the world at large correspondence study is the homeopathic medicine of the educational pharmacopœia—harmless, pleasant to take, and incapable of causing shock to the feeblest constitution.

Even the arguments made for the system by the prejudiced students and teachers working under it are nearly all based on the idea of expediency. Yet it is unquestionable that strong claims may be made for it on the basis of pedagogy. And English composition, besides profiting by the convenience of the method, is fitted by nature to make the most of its pedagogic advantages and reduce to a minimum the results of its pedagogic defects.

The work in composition is divided into four courses, two of them, English I and English III, designed to be exact equivalents of the similarly named courses in residence and commanding full university credit; the others, English IV and English V, corresponding only roughly to the higher electives in residence work. English I calls for lesson papers based on a given text and for various set papers or "themes." It aims to teach the principles underlying all composition and to deal with the elements of composition—the word, the sentence, the paragraph, and the whole composition. It affords a foundation for all subsequent work in the subject. English III aims to provide drill in structure, in the organization of the larger units of thought, and to do this by giving the student practice in the various forms of composition. It assumes that mastery of mere correctness lies behind the student. English IV and English V are much more flexible courses. They do not correspond to required work in the university, do not command university credit, and hence may be adapted very generously to the needs of the individual student. In both courses the student who is interested in one particular field, as story writing, book reviewing, editorial writing, etc., may concentrate most of his attention on that sort of work. At present, among those taking English IV and V are: a member of a city school board, writing educational articles for the press; a writer of short stories for the magazines; two recent graduates of Vassar, writing college and other tales; two women who have traveled much in the Tropics and in the Orient, desirous of putting their experiences into form for publication; a sub-editor of a certain series of classics for school use, getting criticisms on her material; a writer for certain Western papers, getting a series of already published travel sketches into shape for publication in book form; an editorial writer on an Eastern paper writing a series of editorials.

The average number of quarto pages written by an English III student is about 150. When one bears in mind the large amount of exposition and argument these pages contain, and reflects that in these two fields the student gets the greater part of his indispensable drill in structure one sees that the necessity for doing all his explaining in writing is a blessing in disguise. The machinery of the course may be said to be self-feeding, and there are no waste products. For the object of the course being to teach one to express himself in writing, not only on themes, but in lesson papers, and even in letters of inquiry, etc., furthers the end of the work. All is grist that comes to the instructor's mill.

It must be understood, moreover, that most of this written work, even on the lessons, as distinguished from the themes, calls for original thought. That is, the student is required, not to paraphrase a text, but to give his personal reaction on the reading he has done, his personal criticism of literary theories and literary achievement. Work in verbal expression is essentially personal work. The effort is to help a student to express himself. It is not a restatement of Wordsworth's nature feeling that is asked of him, but a bit of nature viewed from his own angle of vision. This point can not be too strongly emphasized, in view of the indissoluble connection between thought and expression—when one realizes how one's mental horizon recedes as one travels.

"The world is so full of a number of things  
I'm sure we should all be as happy as kings"

wrote that indefatigable worker and player, Stevenson. And just how full it is and how infinite in wonder all the "things" are, one never realizes until he consciously strives to express, through the medium of some art, what he has observed.

One who has taught long by the correspondence method finds that the system works out very definite results. One finds that it brings in a mature and an earnest class of students of a rather wide range of experience and interests—a class stimulating to the instructor, who is thereby saved from the pit yawning for his profession—routine work. One finds that students outgrow their faults with unusual rapidity and completeness, because all the machinery of the course, all the attention of the instructor, can be concentrated on their individual needs. What they have is practically private tutoring, minus this disintegrating sense of private property in another's mind which the tutoring too often gives the student. One finds the work of the students to be of unusual excellence. This is doubtless due to several facts: the maturity of the students, their earnestness, their having had to think much out for themselves, and their freedom from self-consciousness. On these last two points a special word falls to be said.

The opportunity which correspondence work offers for the growth of self-reliance is one of its most valuable features. Real university work is almost research work. The scholarly atmosphere, the necessary appliances are provided, the wise counsel is there for the seeking, but the impulse and the energy to carry it out the student must bring. He is not taken by the hand and gently led along flowery paths, but must

hew out a way for himself, often through the solid rock. But in undergraduate work, especially when the student is young and inexperienced, and where the instructor is so conveniently at hand, counsel is too easily sought, and often too readily and too liberally given. Moreover, there is the class, a convenient body to repose upon, and be carried along as upon a wave. In correspondence work, on the other hand, an explicit letter must be written, if counsel is to be sought, and the consequence is that unless the matter be one of much difficulty even the flabbiest of minds—to reduce the situation to its lowest terms—will think it out for itself rather than write the letter. This may be the path of least resistance, but it is a path that leads to knowledge and character.

As for the blight of self-consciousness, every teacher of composition has found in this feeling on the part of his students a hindrance to good results. A student who will fail with ease and grace before a whole class in the demonstration of a mathematical problem, or who, unblushing, publicly tampers with the facts of history, will be all sensitiveness and prickly pride when his composition work is criticised. Especially if the subject be a personal one, or the work have the character of fiction, is this true. Toward these brain children the student is very tender, and a word spoken of them not in the spirit of praise is felt to be in the spirit of harshness. And, feeling thus personally, the student can not divest himself of the idea that the instructor is criticising not his work but him. This fact gives rise to many unfortunate conditions. The writer fails to get the benefit of the criticisms; he fails to write freely and frankly, to express himself; he seeks refuge in the colorless and the conventional. "Write my autobiography for that man?" exclaimed a woman student in residence. "Never! He's too young." But in ninety-nine cases out of a hundred the correspondence instructor is to his students a mere bodiless name, and they may send work to him with the same feeling of security with which they drop a letter into the mail box.

Of course the situation has its drawbacks. The student misses the inspiration to be derived from a face-to-face acquaintance with his teacher. He misses the invaluable personal consultation which can never be given so freely as orally. But though much is taken much abides, and a method which attracts so competent a set of students, which draws from them work of so much excellence, and which, in the process, fosters in them ability to think for themselves, must always have strong friends at the court of reason.

#### LABORATORY WORK BY CORRESPONDENCE.

[CHARLES J. CHAMBERLAIN, The University of Chicago.]

While it is becoming quite generally known that many university subjects can be conducted successfully by correspondence, it is only recently that laboratory work has been attempted. So far as the writer knows, his own courses in general morphology represent the first attempt to conduct laboratory work in botany by this method.

Seven years ago a student wrote to the extension division requesting a laboratory course in botany by correspondence. A vivid recollection of time spent in unguided and often misguided effort to increase my own knowledge of botany and at the same time perform the numerous duties of a high-school principal, led me to plan such a course as would systematize the work of those who can spare only irregular hours in the midst of other duties. The progress of the single student was so reassuring that in the following year three courses in general morphology were announced, covering the work of the three courses which form the necessary foundation for all advanced work in botany, whether the special work be morphology, physiology, taxonomy, or ecology. The first course deals with algae and fungi, the second with bryophytes and pteridophytes, and the third with gymnosperms and angiosperms, each course being the equivalent of the course of the same name as conducted at the university. Material and the more difficult preparations are sent to the pupil, together with definite directions for study. Each exercise of a course is forwarded to the instructor for criticism and suggestion, and is then returned to the student. The material is carefully selected and, in some types, is sent in sufficient quantity to supply a small class. The preparations are stained so as to show the details of structure with the utmost clearness.

The course in algae and fungi as conducted at the university requires three laboratory exercises of two hours each and two lectures a week for twelve weeks. By correspondence there are twelve exercises, each covering the ground of a week's work in residence, assigned readings and a larger number of types compensating for the lack of formal lectures. About fifty types are studied, representing all the principal groups of the algae and fungi. Aside from an examination of the structure,

development, and relationships of the groups, which forms the most important part of all three courses, particular attention is given to the development of the plant body and the evolution of sex, problems which could hardly be understood if the student were to begin with more complicated forms. The ease with which these simple forms may be prepared for microscopic examination makes them favorable for those who have not yet learned to use a microscope effectively, while their simple structure makes them suitable objects for the great number of students who have not learned to "draw."

In the course in bryophytes and pteridophytes, which presupposes a knowledge of algæ and fungi, special attention is given to the great problem of alternation of generations, the evolution of the sporophyte, and reduction of the gametophyte. The structures involved in these fundamental problems are clearly shown in critically prepared slides. Heterospory is studied in several forms.

In the gymnosperms and angiosperms some attention is paid to the histological structure of the root, stem, and leaf with a comparison of gymnosperm, monocotyl, and dicotyl characters. Other subjects are the development of the flower, the development of the ovule, the development of pollen and the embryo sac, fertilization and formation of the embryo. The principles of the Engler and Prantl classification are also presented. One exercise is devoted to karyokinesis and cell formation. A comparison of critical structures with homologous structures in the pteridophytes is an important feature of this course.

Two years ago a course, Methods in Plant Histology, preeminently a technical course devoted to fixing, imbedding, sectioning, staining, etc., was offered, and results have shown that even so technical a course as this can be pursued successfully by correspondence.

The subject of botany has made extremely rapid progress in the last decade, so that view points have changed, and even the subject-matter presented in the best secondary schools is changing. By the aid of the correspondence work teachers are able to put themselves in touch with more modern views and methods, benefiting themselves and their pupils at the same time. Many graduate students desire to perfect themselves in some chosen line and thus secure a higher degree. Those who have done their botanical work several years ago usually find that they are not able to undertake advanced work in this subject, so that it is no uncommon thing at the University of Chicago to find an undergraduate class composed largely of graduate students. Some who have had good training in college and have tried to keep up with modern methods have done so much of the fundamental work that they would find much repetition if they should enter the general classes, and since time is precious they hesitate to undertake such work; yet, for the lack of the one-half or one-third of the work which is still unfamiliar, such students, almost without exception, have made conspicuous failures when attempting advanced work. The foundation necessary for advanced courses could have been completed very rapidly by correspondence.

In looking over the large list of those who have taken botany by correspondence it is interesting to note that many have come to the university for more advanced work. Three who have taken the doctor's degree in botany and three of the present candidates for that honor having completed two or more majors by correspondence. But besides those who are teaching botany, the list includes lawyers, artisans, and business men, who, in the midst of their daily occupations, find time to improve their knowledge of a favorite subject.

The courses are so arranged that the necessary books in any single course cost less than \$5. The only necessary apparatus is a compound microscope giving a magnification of about 400 diameters.

Besides the courses with which the writer is personally familiar, successful work has been done in the newer field of ecology, and a carefully planned course in plant physiology is now offered. Courses in zoology and bacteriology are being conducted with encouraging results, and a course in physics will be offered after July, 1903.

#### CAN HISTORY BE SUCCESSFULLY TAUGHT BY CORRESPONDENCE?

[FRANCES KNOX, the University of Chicago.]

The history department of the University of Chicago does not pretend to do research work by correspondence. It offers no graduate courses by this method, not because the method itself is not adapted to such courses, but because of the fact that only in rare cases is the correspondence student able to command the materials requisite for exhaustive work. In the college and preparatory courses, however, the case is different. In these days, when the teacher of any important period of history

is able to select from a considerable number of fairly satisfactory text-books, and when other helps for obtaining a general knowledge of the subject are available at moderate cost, it is possible to place in the hands of the correspondence student enough material to enable him to pursue to excellent advantage such undergraduate courses as are usually offered in the best American colleges.

Again, the method of well-selected questions and carefully criticised written answers is, as every successful teacher of history knows, the best possible way of gauging the students' progress and correcting faulty habits of work. It stands to reason, therefore, that a method which permits every lesson to be treated in this manner must be well adapted to the teaching of history. It is hardly possible for the teacher of large history classes to test each student's reading habits often enough to be sure that he is pursuing the best method; but in correspondence teaching, if the questions are properly framed, every lesson is a satisfactory test, for hurry and carelessness and bad judgment are sure to leave their marks. Hence the correspondence student, who usually takes time to read thoroughly, if for no other reason than because he knows that every page will at once be tested by an examination, is more likely to form careful and thoughtful reading habits than the student in the college class; and the habit of reading carefully is undeniably the first essential of a good history student. Moreover, the earnest and conscientious character of the great majority of correspondence students, and the serious purpose that leads them to undertake the work, makes them anxious to perform it in the very best way, so that it is possible to hold them up to a higher standard of excellence and to exert a stronger influence on their ideals of scholarship and character than is usual in the class-room, where the influence of the earnest student is often neutralized by the inattention of the idle and careless.

Experience proves that correspondence courses in history furnish excellent opportunity for the correction of bad English. They present a series of daily or weekly themes for which the student never has to rack his brains to find material, and in which all his weaknesses of spelling or composition are sure, sooner or later, to make themselves known. It is true that the correction of bad English often doubles the history teacher's work, but he has his reward in the rapid improvement that nearly always follows, and that makes each succeeding paper easier to read.

In regard to the failure to complete courses, which has always been regarded as the chief drawback to correspondence work, the writer's experience has proved that such failures can be reduced to as small a ratio in correspondence work in history as in that of the regular class room. Illness, pressure of other duties, and want of persistence will, in both cases, cause a certain proportion of students to succumb before the completion of their work; but if given the same care that teachers of classes exercise in keeping track of their students, there is no doubt that the correspondence student (in history, at any rate) can be held just as steadily to his task. If a member of a class does not appear at a class-room recitation within a reasonable time after he is due there, the teacher at once makes an effort to find out the cause of the delinquency, and when a recitation paper fails to put in an appearance within a reasonable time after it is due, the correspondence teacher has only to adopt the same method to secure equally good results. It is because the correspondence instructor does not, in many cases, have time to do this, that so many incomplete records are found in the correspondence archives.

But the important question after all is not whether history is capable of being successfully taught by this method, but whether it actually is so taught; and fortunately on this head there are many proofs of the very sort that the historian delights to honor, namely, hard, cold facts:

1. The fact that so large a proportion of the history faculty are engaged in correspondence work and are constantly adding new courses, proves that they have no serious doubts regarding its success. The recitation papers in history are apt to be longer than in most other subjects, and often require for their correction an amount of time and labor out of all proportion to the slight fee received by the instructors in return; hence it is safe to infer that it is no mercenary motive but only a conviction of the utility and efficiency of the work that induces them to spend so much time and energy in this direction.
2. The correspondence method in history is indorsed by practically every student who tries it, and by many of them in the most emphatic terms.
3. The uniformly high character of the class-room work in history done by correspondence students in that subject who subsequently come into residence, affords the clearest evidence of the merits of the system.
4. Teachers of history whose training in that subject has been derived exclusively from the correspondence courses of the University have, on the strength of such training, obtained and successfully held excellent positions.
5. The fact that the history department offers no graduate courses by correspondence is a negative proof that in the opinion of the faculty the courses that are offered can be successfully done.

The correspondence method of study is still in its infancy, and even those who have known it longest and most favorably still run the risk of being considered fool-

ish enthusiasts when they venture to tell what they know to be the simple truth concerning its success; but whatever uncertainty may yet remain in regard to other studies, experience proves beyond a shadow of a doubt that the correspondence method has been applied with excellent results to the teaching of undergraduate courses in history; and when it is remembered that these results have been accomplished by instructors who have been able to give to their correspondence teaching only the scraps and remnants of time that could be spared from other duties, what may we not reasonably look for when teachers, fitted by inclination and experience for this special work, can give to it the time and attention that its importance demands?

---

## THE PENNSYLVANIA STATE COLLEGE, STATE COLLEGE, PA., CORRESPONDENCE COURSES.

[From Circular, 1902.]

### THE OBJECTS OF THE COURSES.

These courses are designed to afford an easy means for the student to pursue a systematic course of study at his own home. Experience has clearly shown that there are many people who desire an agricultural education, and who can not, for various reasons, attend college. These courses are designed to meet the wants of such persons, and are especially arranged for the farmer, the gardener, the nurseryman, the florist, the teacher, and, in fact, any person who desires to pursue a course of study pertaining to the propagation, care, and management of the various plants that are grown for utility, and of the various classes of domestic animals. As science is continually making more or less rapid strides in the various lines of agricultural work, in many instances it is almost impossible for the busy man to keep well informed upon the latest investigations and the best thought of those whom we recognize as authorities on agricultural affairs. It is the purpose, therefore, of these courses to give, in a somewhat condensed form, yet comprehensive enough to be readily understood, a summary of the best knowledge concerning the subjects of which they treat.

### INSTRUCTION GIVEN BY LESSONS, BY BOOKS, AND BY CORRESPONDENCE.

Printed lessons have been prepared by the college, and are sent out free of cost to the students enrolled in these courses. These lessons treat somewhat in detail of the topics under consideration, and, as regards subject-matter, they resemble the lectures that are given to college classes. Some subjects treated in the various courses are fully discussed by books and other publications. As far as practicable books are recommended for students' use, and means have been provided whereby they may be purchased at greatly reduced prices. Many subjects treated in the various courses, however, are not satisfactorily discussed in available publications. Such subjects are treated wholly by the lessons, which are found to be quite as satisfactory to the students as a combination of books and lessons. Whenever the lessons are used with the books it is with the aim of bringing the subject-matter of the books up to date and thoroughly explaining the difficult parts. The lessons also present suggestions for study, and frequently describe simple experiments that may be made by the students to illustrate points in question.

### COURSES OF STUDY.

Lessons have been prepared in thirty courses of study. Each course consists of from five to eleven lessons, and is expected to occupy the time of the student for a few weeks, particularly if it is found impossible for him to devote all of his time to study. Some courses are necessarily more complete than others. It is the aim of the college, however, to make each course as complete as possible under the circumstances, and to give, as far as the college is able, the latest and best thoughts on the various subjects.

The lessons are printed by means of a mimeograph in small editions, in order that changes may be made in the subject-matter of the lessons on short notice if occasion demands.

As some courses are more complete or more difficult of study than others, a numerical value is given to each course. These values represent the relative amount of work required of average students to pursue successfully the various courses.

## ENROLLMENT.

Students may be enrolled at any time, by applying either personally or by letter, and filling out the blank form furnished by the college. It is necessary that the student make formal application in order to receive the advantages offered through these courses.

At the time of enrollment each student is given a certificate of membership, which enables him to secure one or more books used in the various courses at the reduced prices.

## EXPENSES.

The college makes no charge for enrollment nor for any instruction that may be given. The lessons are sent without cost to the students as they are prepared to study them.

Each student is required to bear his share of the expense of correspondence. For courses where books are not required, no other expense need be incurred.

## EXAMINATIONS.

Each lesson sent out by the college is accompanied by a question sheet, or examination paper, containing a list of questions or topics. These are to be answered or discussed by the student before a second lesson will be sent. This does not prevent students from pursuing two or more courses at the same time, providing they can devote sufficient time to the work to make satisfactory progress in each. They are recommended to pursue the study of two or more courses at the same time whenever practicable, in order that they may have a lesson of one course for study while the examination paper of another course is being graded. Students are requested to write answers in ink on specially prepared paper furnished by the Orange Judd Company.

## CERTIFICATES.

Any student who has satisfactorily completed the study of courses, whose aggregate number of credits equals 60, is entitled to a college certificate. This certificate, signed by the proper college authorities, will be forwarded upon payment of 50 cents.

The following are the subjects of the courses offered:

*General agriculture.*—Plant Life (10 credits), Tile Drainage (6), Farm Bookkeeping (10), The Silo and Ensilage Crops (6), Grain Crops (8), Clovers and Grasses (8), Tubers and Roots (7), Commercial Fertilizers (9), Farm Manures (8).

*Animal industry.*—Principles of Breeding (10 credits), Swine Husbandry (8), The Breeds of Horses (8), Sheep Husbandry (8), Stock Feeding (10), Beef Production (8), Poultry Keeping (10).

*Horticulture.*—Propagation of Plants (9 credits), Principles of Fruit Growing (8), Insects and Insecticides (8), Vegetable Gardening (10).

*Dairying.*—Milk and its Products (10 credits), Dairy Bacteriology (9), Butter Making (9), Cheese Making (9), The Dairy Breeds of Cattle (9), The Dual Purpose Breeds (7).

*Miscellaneous.*—Principles of Cooking (10 credits), House Furnishing (7), The Art of Canning and Preserving (8), Heating and Ventilating (9).

[From a letter of Mr. George C. Watson, professor of agriculture, and superintendent of correspondence courses, October 13, 1902.]

The following is a description of the Chautauqua courses of home study in agriculture which were formerly given by the Pennsylvania State College, from which the correspondence courses have developed. The Chautauqua courses of home study in agriculture interested many farmers in the study of agriculture, and without doubt paved the way for the more thorough and systematic work of the correspondence courses. One difficulty which the instructors met in conducting the home reading course was that they did not have a firm hold upon the students. The students read the books as they pleased, and comparatively few of them took examinations in order to receive certificates. Many of the books which were recommended were not satisfactory, and consequently the course of home study did not accomplish all that it was designed to accomplish, and thus was more or less unsatisfactory. In order to bring the books up to date, and to keep in closer touch with the students, lessons

were prepared to supplement the books. These lessons were sent to the students one at a time. The lessons were accompanied with an examination paper; when the students answered the questions of the examination paper, the next lesson was sent them. In this manner thorough systematic work has been secured, which is much more satisfactory to both students and instructors.

#### THE "CHAUTAUQUA COURSE" OF HOME STUDY.

The Director of the Experiment Station, in his report to the President for 1891, clearly set forth the need of some means of disseminating agricultural information among the farmers of the Commonwealth, the object in disseminating this information being to prepare the farmer for a more just appreciation of new truths brought to him through Experiment Station publications as the result of recent investigation. The Experiment Station publications necessarily being somewhat disconnected and fragmentary, demand for the practical application of the facts contained in them a better knowledge of the fundamental principles of agriculture than that possessed by the agricultural classes. The director, therefore, recommended university-extension work or methods similar to what is now known as the Chautauqua plan.

Consequently, during the following year, the college offered a carefully prepared course of home reading in agriculture, under the name of "Home Reading in Agriculture," consisting briefly of—

1. A carefully prepared course of reading, designed to cover the most important branches of agricultural science and practice.
2. A reduction of price upon the books needed, all of which were standard works.
3. Personal advice and assistance through correspondence.
4. Examinations upon subjects read with certificates and diplomas for those attaining certain grades of excellence.

This course attracted considerable attention at home and abroad and received numerous applications for admission from students, a number of whom did excellent work, completed their prescribed course, and received diplomas.

During the following years the number of students was largely increased and a demand was made by them for more extended work and more individual aid from the college. To meet this demand the list of books has been largely increased, now constituting five divisions of five books each upon the subjects of crop production, animal production, horticulture, dairying, and domestic economy. In addition to these 25 books, a supplementary list of 15 books is added from which students may select books to form additional courses if they desire.

The course consists of thorough study of 10 books and a satisfactory examination upon the same.

To meet the demand made by the students for greater aid from the college, lessons have been provided on various books in the course. These are sent to students free of cost. These lessons aim to give new matter, or, in other words, to bring the book up to date; to make suggestions for study, observation, and experiment, and to give page references to the book. Each lesson is accompanied by an examination paper covering the subject of the lesson. Students are required to satisfactorily answer these examination questions or discuss the topics there mentioned before they can receive a second lesson. From the limited number of lessons thus far sent out very encouraging reports have been received. The correspondence concerning this work clearly shows a desire on the part of many practical agriculturists to obtain a better knowledge of the fundamental principles which underlie their calling.

As these people are busily employed and for various reasons can not attend courses given at the agricultural colleges, the Pennsylvania State College aims to go out to them in their own homes and give them the desired information.

---

#### BAYLOR UNIVERSITY, WACO, TEX.

[From a letter of Mr. S. P. Brooks, president of the university.]

1. Correspondence work was adopted in 1897.
2. Our method of instruction: If a student makes application for work, it is passed upon by the committee of the faculty, and then the assignment is made by the head of the department whose work is chosen.
3. There are no limitations as to the courses, each being passed upon by the above committee. I am unable to give you the number of students who have thus studied. Last year there were 17.

4. Most of them are teachers or preachers who are not able to attend this institution or any other; some of them expecting to use it toward graduation.

5. Except in special instances, there is no supplementary special instruction; it is all by correspondence.

6. There are no degrees given for correspondence work alone, and it is possible for a student to do one-fourth of his work by correspondence.

7. As to examinations, they are conducted here in class, or by some friend of the institution near the residence of the student.

[From the catalogue of Baylor University for 1902-3, p. 84.]

#### DEPARTMENT OF INSTRUCTION BY CORRESPONDENCE.

To extend the scope of the usefulness of the university, to accommodate the large number of students who desire to advance their education but can not go to college, and to popularize higher education, the board of trustees, acting upon a recommendation from the faculty, adopted, on October 21, 1897, resolutions founding "a department of correspondence instruction," prescribing in detail regulations concerning it.

Two methods are pursued: (1) Certain courses are given by formal correspondence. In these courses full printed directions are furnished on each lesson and specific questions propounded for written answers. The written work and recitations on each lesson are mailed to the instructor, who corrects it and returns it to the student with criticisms and suggestions. (2) Other courses are given informally, in which the instructor has only a general supervision of the student's work, and gives help from time to time as the latter may need it. The element of instruction here is decidedly less, and for this reason the amount of the work assigned is approximately 50 per cent less than for the same credits in formal correspondence or class-room work.

All persons enrolled in this department are officially regarded as students of the university and receive credit toward a degree for the work done by correspondence. Nonresident candidates for a master's degree pursue their studies in this department.

The tuition fees are as follows:

	Double study.	Full study.	Two-thirds study.	Half study.
Bible school:				
Formal instruction .....		\$10.00	\$8.00	\$6.00
Informal instruction.....	\$5.00	3.00	2.50	2.00
Other departments:				
Formal instruction .....		12.50	10.00	8.00
Informal instruction.....	5.00	3.00	2.00	2.00

No fees are refunded. Students may begin at any time of the year. There is no vacation, and each student works independently of any class.

#### CORRESPONDENCE COURSES OF THE STATE NORMAL TRAINING SCHOOL AT WILLIMANTIC, CONN.

[From the Report of the Connecticut Board of Education, 1902, pp. 106-108.]

In connection with the Normal Training School at Willimantic the State board of education offers to the teachers of this State several courses of instruction by correspondence.

Students who enter upon any of these courses will be enrolled as nonresident students of the school and their names will appear in the annual catalogue.

*Instructors.*—The correspondence courses will be under the direction of the faculty of the Willimantic Normal School.

*What will be offered.*—The following courses will be open to nonresident students: American history, botany, civil government, drawing, English, general history, geography, literature, mathematical geography, mineralogy, penmanship, physics.

*Purpose.*—This nonresidential connection with the normal school is intended for—

1. Teachers who desire to study a particular subject under direction.
2. Teachers who wish to prepare themselves to enter the normal school as resident students and complete the course in a shorter time than is regularly required.
3. Teachers who are preparing for the examination for the State certificate.

*Plan of work.*—Lesson papers containing assignments of work, references, directions, suggestions, and questions will be sent to the student. By means of these the student prepares the lesson, making use of all available helps. After preparation the recitation paper is written, without help, and mailed to the school.

The recitation paper will be read, corrected, and returned to the student with criticisms and suggestions as soon as possible after the paper is received. Another lesson paper will then be sent. Whenever several teachers in the same locality are pursuing the same subject, conferences will be arranged between instructors and students.

Any course undertaken must be completed within one year from the time it is begun.

Not more than two courses should be attempted at one time.

*Resident practice.*—The practice teaching, for which all other work is preparatory, requires residence at the school and is given only under supervision in the public schools connected with the normal school.

The study of method, consisting of observation of teaching and discussion of principles, can not be undertaken by nonresident students.

*Completion of course.*—Nonresident students will receive credit for courses satisfactorily completed. After completing a number of nonresident courses equivalent to one year of resident work, students will be admitted to the senior class of the Willimantic Normal School.

The normal school diploma will be granted to all who satisfy the requirements of the training department.

*State certificate.*—All students who have satisfactorily met the requirements of any correspondence course will be exempt from further examination in that subject in the examination for the State certificate.

*Admission.*—Any person over 18 years of age engaged in teaching in any public school in this State may, upon presentation of the credentials required in the normal school catalogue, be admitted to the correspondence courses. \* \* \*

*Expense.*—It will be necessary for students to purchase a few books, but prescribed books will be loaned upon request.

So far as possible, books for collateral reading will be loaned from the library.

Apparatus for the science courses will be loaned and carriage paid by the State. •

## CHAPTER XXVII.

### CHILD STUDY IN CHICAGO.

*Contents.*—Record card.—The establishment of norms.—Growth in height and weight.—Development of strength, vital capacity, and endurance.—Annual increase in growth and development.—The physical concomitants of dullness and precocity.—Righthandedness.—Growth abnormalities and motor defects.—Tests of sight and hearing.—School desks.—The child-study laboratory.—The John Worthy School (reformatory).—Percentiles.—School standing of the different percentile groups.—Memory investigation.

[In the spring of 1899 Dr. W. S. Christopher, a member of the Chicago board of education, conducted a child-study investigation in certain of the public schools of that city, the results of which he reported to the school board. The success of this inquiry led to the establishment of a permanent department of child-study and pedagogic investigation, under the directorship of Mr. Fred W. Smedley. Mr. Smedley had been a teacher of child study in the University of Chicago and actively engaged there several years in laboratory work in physiological psychology.

During his term as director of the department of child study he made two reports describing his methods and giving in considerable detail the data he had collected and the conclusions he had arrived at. The information contained in this chapter has been selected from those reports.]

[From report of Director Fred W. Smedley for 1899-1900.]

The work of the department of child-study and pedagogic investigation for the past year has consisted mainly of a continuation of the tests inaugurated by Dr. W. S. Christopher in March, 1899. It seems but natural that the starting point for a systematic pedagogical study of Chicago school children should be an attempt to determine the laws of their growth and the relationship which may exist between physical growth and mental development

The results of the test on each individual pupil were recorded on a card, the following copy of which will serve to show the scope of the data collected.

Name, \_\_\_\_\_ No. \_\_\_\_\_.  
Grade, \_\_\_\_\_. Number of weeks in this grade, \_\_\_\_\_.

The use of cards with one color for the boys and another for the girls allows the quick compilation of the data in any manner desired by changing the grouping of the cards.

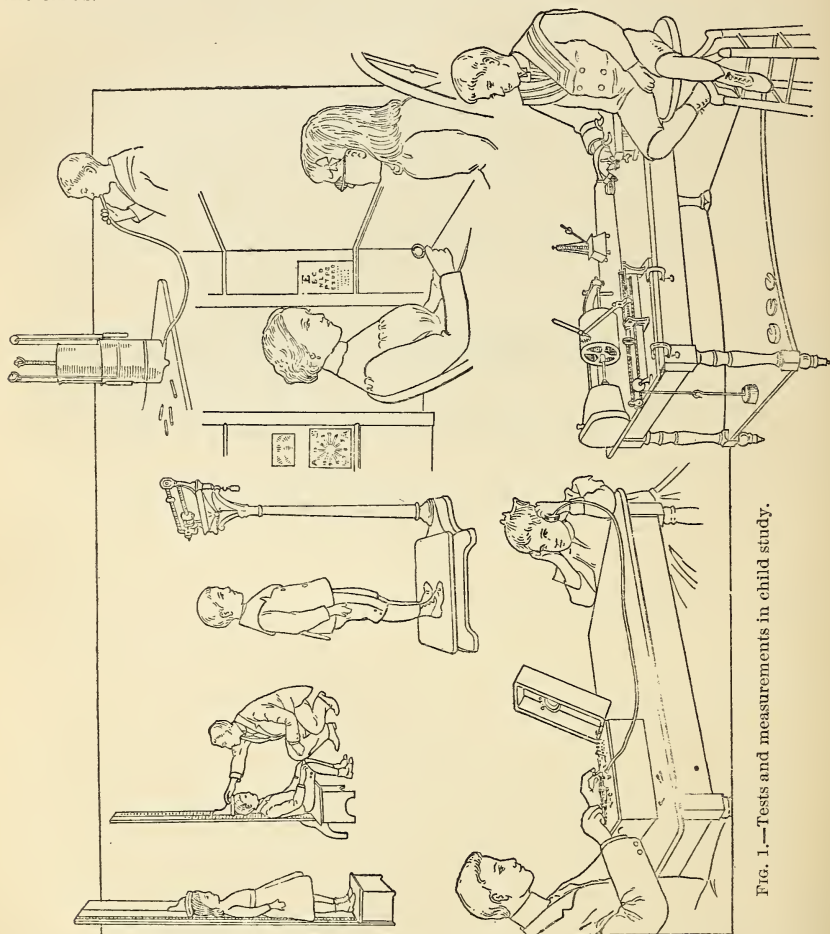

Fig. 1.—Tests and measurements in child study.

#### THE ESTABLISHMENT OF NORMS.

Up to date, tests have been made on the pupils of the Alcott, Kozminski, Andersen, and Tennyson elementary schools, the eighth grade and the kindergarten in the Hoyne School, the kindergartens of the Burr, Kinzie, and Sheldon schools, and also the pupils of the Englewood and Lake View High schools; in all, 6,259 pupils, 2,788 boys and 3,471 girls. The pupils of these schools are largely of American parentage and are the children of parents in comfortable circumstances, so that they are uni-

formly well fed and clothed. Therefore, it is believed that they may be taken to represent normal Chicago children, living under good conditions. From these tests and measurements, tables of norms have been compiled. As we were obliged to compile the data several times, we have been able to watch the changes which added numbers have produced. These changes of the norms from the addition of the last set of cards representing the measurements of about 50 pupils of each year of age, between the ages of 6 and 16, have been so slight that it is believed that these norms are fairly representative of the class of pupils tested for these years. And probably large additions to these figures, if the data were taken from the same class of pupils, would but slightly change the averages thus established. The norms for the upper years, 16 to 21, and also for the kindergarten ages, 4 to 6, on account of the paucity of numbers can hardly be considered so completely established. In these compilations averages have been used rather than medians, although the difference between averages and medians proved insignificant. The mathematical computations were made by means of a comptograph; so "machine accuracy" in the results has been obtained. That these results may be quickly and clearly understood, charts have been made of the growth and development along the lines in which tests and measurements have been made. It is not assumed that a single child grows at exactly the same regular movement upward as is shown by the tables and charts, yet it is believed that ordinarily children do not differ widely from this rate, and the average of a small number of the same class of boys and girls taken from year to year would give us figures almost identical with the results of these compilations. So these tables fairly show laws of growth and physical development.

There is a prevalent belief, growing out of the evolutionary doctrine of the survival of the fittest, that the average represents the ideal type. As these measurements must include many imperfect specimens, children who through disease, malnutrition, and other insalutary conditions have failed to attain the growth and development that they otherwise would have reached, in all probability the evolutionary ideal type will be found somewhat above the average in each measurement. These averages are representative of the class of children measured, and are highly important as a basis of comparison. It may be added that comparison of these measurements with those taken in other cities shows the superiority of this class of Chicago school children in both size and physical development.

TABLE I — *Norms—By averages.*

*Birthday norms.*—In compiling these norms the age at the last birthday was used. It was assumed that the actual average age for any year would be that year and about six months. When the average ages were made out, it was found, as will appear on the table, that in some years the ages averaged above the half year and in some below. In order to ascertain the norms for the exact years and half years the daily and monthly increments were calculated. The increment between any two average ages divided by the exact number of days between those ages gives the average daily increment, and this multiplied by  $30\frac{1}{2}$  gives the average monthly increment. On this basis a table of norms computed to integral years and half years for the ages from 6 to  $18\frac{1}{2}$  has been calculated and is given, together with a table of the monthly increments. In these tables where the averages of the girls are greater than the averages of the boys for corresponding ages, the measurements have been printed in heavy-faced type.

These norms, computed to the integral years, are, for the sake of convenience, termed "birthday norms."

TABLE II.—*Birthday norms.*

## GROWTH IN HEIGHT AND HEIGHT SITTING.

Height was measured by means of an adaptation of the Bertillon stadiometer. The heels of the shoes were calipered, and the height of the shoe heels taken from the gross height gave the net height. This upon trial proved almost identical

with the height when taken without shoes. The results of the compilation of height standing and height sitting will be found in Table I. It will be noted that the average girl is shorter than the average boy when they enter the kindergarten, but just before reaching 11 years of age, owing to a slackening of the boy's rate of growth and an acceleration of the girl's, the average girl becomes taller than the average boy and remains taller till they reach the age of 15 years. At this period the girls seem to be exhausted in the race, and the boys surpass the girls in height and continue to increase the difference in stature for a number of years.

As in height standing so in height sitting. When the pupils enter the kindergarten the average boy is slightly taller when seated than the average girl, but just before attaining the age of 11 years the average girl surpasses the average boy in height sitting. This again seems due as much to a retardation in the boy's rate of growth as to an acceleration in the girl's rate of growth. The average girl continues taller when seated than the average boy till nearly 16 years, or almost a year longer than her height standing exceeds the height standing of the average boy. This shows that the more rapid growth of the boy at this age is chiefly in the lower extremities rather than in the trunk.

#### GROWTH IN WEIGHT.

As we found in stature so we find in weight that the average boy exceeds the average girl during the early years of school life. During the three years from 12 to 15 the average girl is heavier than the average boy. Soon after 15 is reached the boy surpasses the girl in weight and he continues to increase in weight more rapidly than she does for a number of years. It will be noted that the average girl surpasses the average boy in weight at about a year later than her stature exceeds his. The tables of weight and height show that the girls continue to increase in weight for a longer period than they increase in height.

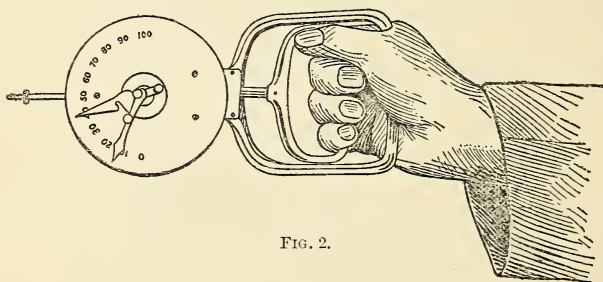

FIG. 2.

#### THE DEVELOPMENT OF STRENGTH.

Strength of grip was tested at first by an ordinary 2-spring dynamometer, but an attempt to test the young children with this instrument proved that it was entirely unsuited to the size of their hands. Those with the smallest hands were forced to use a different set of phalanges from those which the adult would use on the same instrument. Again, it was found that the adult could make his best record only when the instrument was suited to the size of this hand. For this reason we were forced to devise a new dynamometer which could be adjusted to the size of the hand. This new adjustable grip dynamometer is represented in fig. 2. It is set by changing the distance between the bars of the inner and outer stirrups. This is accomplished by whirling the inner stirrup, a screw thread passing through a nut below the dial, causing the protrusion or withdrawal of the stem of the stirrup. A distance between the bars corresponding to about one-half of the distance from the

place where the thumb joins the hand, to the end of the fingers, was found best suited to most hands.

Each pupil was given several trials of strength and the best result obtainable was recorded. It will be seen from Table I that the boys surpass the girls in strength at all ages; even in the kindergarten the average boy is stronger in his left hand than the average girl is in her right hand, and during the early years of adolescence this differentiation of the sexes becomes very striking. These facts were shown in Dr. Christopher's report and have been fully confirmed by the compilation from the larger numbers.

#### DEVELOPMENT OF VITAL CAPACITY.

The term vital capacity is used here to signify the amount of air that a person can expire after a forced inspiration.

Vital capacity was tested by means of a wet spirometer. In this test, as in the test of strength, the child was allowed repeated trials until he fell short of his previous efforts and the best mark attained was recorded. The boys show greater breathing capacity from the first, the difference becoming marked during adolescence. The great breathing capacities of the boys who were in training for football and the girls who played basket ball were in strong contrast with those who took little physical exercise, which suggests that vital capacity increases and decreases with the amount of one's activity, and so, in connection with size, is an index of the rate of metabolism.

#### THE DEVELOPMENT OF ENDURANCE.

A modification of Mosso's ergograph made possible the study of endurance and fatigue. This instrument gives a graphic record and a measure of the work done under certain fixed conditions by a single group of muscles. The apparatus consists of two parts, a fixing board and a carriage with tracing apparatus mounted on a suitable frame. The arm is fastened firmly to the fixing board, allowing free movement to only the middle finger of the right hand. To this finger a cord is fastened which, passing to the carriage and over a pulley at the end of the stand, is attached to a weight. In each case in these tests this weight was 7 per cent of the weight of the individual. In flexing the finger the weight is lifted and on extending the finger the weight returns to its original place. A pen attached to the carriage and resting upon a kymograph traces the movement thus made upon paper fastened to the revolving cylinder of the kymograph, and a moving tapeline measures the distance which the weight has been lifted. This distance, multiplied by the weight, gives the amount of work done. By keeping time with the beating of a metronome these flexions and extensions of the finger are made at regular intervals, so that in ninety seconds, the time employed in each test, the weight would be lifted 45 times. In operating the ergograph loaded thus with 7 per cent of the gross weight of the individual it was found that at some period between ninety and one hundred and fifty seconds such fatigue was usually produced as to render it impossible to move the weight at all. By limiting the work to ninety seconds a point was reached at which the strongest pupils would begin to show fatigue, and only the weakest and very obese pupils became entirely exhausted. Table I shows the development of endurance, as shown by the power to do work on the ergograph. It appears that boys have greater endurance than girls at all ages, and during adolescence the differentiation of the sexes becomes very striking. The comparison of the records of an individual makes in endurance and vital capacity seems to show that they usually develop together.

#### THE RATE OF ANNUAL INCREASE IN GROWTH AND DEVELOPMENT.

Table IV shows separately for each sex and for each of the physical measurements taken the following points: First, the special measurement under consideration at the

beginning of each year, as shown in the table of exact birthday norms. Second, the increase in that measurement found at the beginning of the next year or the increment during that year. Third, the per cent that this increment is of the measurement at the beginning of the year during which it has occurred.

The per cents of gain in height, weight, strength, endurance, and vital capacity are represented in Charts I and II. The study of these charts and tables leads to some interesting and important considerations. Noting first the chart relating to the

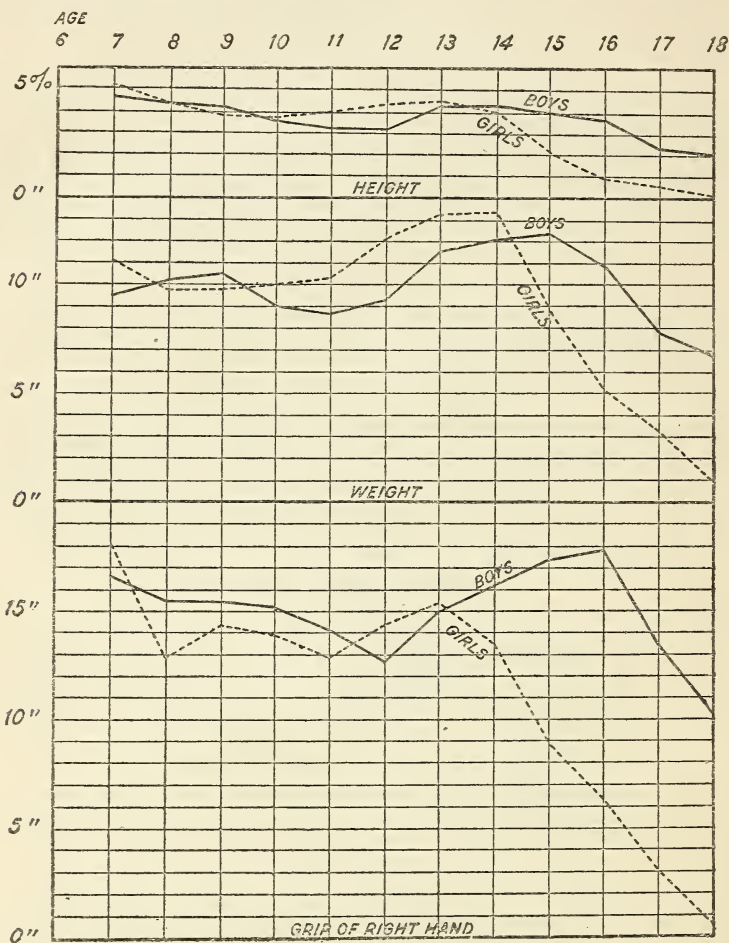

CHART I.—Rate of annual increase in stature, weight, and strength of grip.  
Based on data in Table IV.

annual rate of gain in height, it is seen that the general trend of this rate of increase is downward. This general trend is broken in both sexes by a rise, which in girls commences at 10 and ends at 16, and in boys commences at 12 and ends at 17. The summits of these rises are from 12 to 14 in girls and from 13 to 16 in boys. The curve showing the rate of gain in weight shows a similar rise in both sexes with maxima at the same ages as in the case of height. The superiority of girls over boys in gain in height and weight at this period of life is also shown. When the curves of the increments of the strength of grip of the right hand, vital capacity, and endurance

are observed, it is seen that there is a similar increase at the same ages. The period of the superiority of girls over boys in rate of increase in these latter measurements, all of which involve the factor of physical power, which is less at all ages in girls than in boys, is not so great nor so long maintained as in the case of height and weight. However, the finer differences in rate of growth and development between the sexes are not of special import to us at present. The great feature for considera-

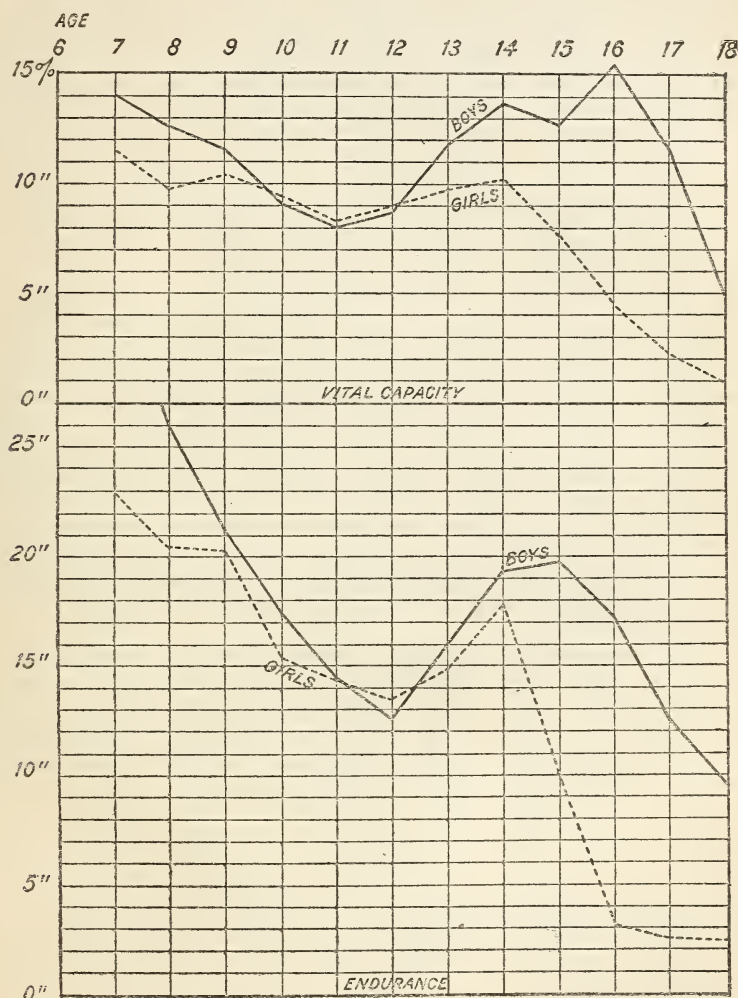

CHART II.—Rate of annual increase in vital capacity and endurance.  
Based on data in Table IV.

tion is this: There is an exaltation of life processes at the pubescent period which finds its expression not only in an increased rate of growth but also in the development of physical power.

Education has as its basis the bringing about of bodily changes, especially the modification of the central nervous system. The period of growth of any organ is the period of its plasticity. Although this is not the period of most rapid increase in weight of the nervous system, the rapid development of physical power would in

itself indicate that it is a period of nervous change. The question may now be asked, Is this pubescent exaltation, shown so markedly in the physical elements of child life, characteristic also of the other features of that life? In other words, is there a corresponding exaltation of the intellectual and emotional features of the child life? It is unquestionably true that at this period the emotions are in a relatively high state of exaltation, and that many neuroses appear, according to the observations of well-trained alienists and neurologists.

It is undoubtedly a period of great plasticity, physical, mental, and moral, a period when great changes occur rapidly. The already well-established relationship existing between physical and intellectual life justifies us in believing that at this period the intellectual turmoil is as great as the physical and emotional. It therefore seems to be the period in school life when the child organism is not only most in need of, but most susceptible to, educational influences. It may not follow that it is a time when the greatest amount of intellectual work should be put upon the child, but it certainly is the great period for character formation. At no time in the whole school life of the child is judicious, intelligent, and sympathetic educational guidance so necessary and so useful.

There is also another feature of the pubescent period of life no less important than the general law of exaltation of physical, mental, and moral processes. This feature is the matter of the exceptions to this law. In the report of last year there was shown to exist a wide range in all the physical measurements of pupils in the upper grammar grades. In the present report an examination of the tables of percentiles will reveal a similar tendency to extreme range of measurements in the outer percentiles in the pubescent years. The significance of these facts seems to be that in the pubescent period a larger per cent of individuals than usual pass beyond the normal limits set by the mass. Furthermore, this passing is in both directions, upward and downward. In other words, while pubescence is a period of great exaltation of the mass of children, it is also a period of high individualization, a period when the weak fail and the able forge to the front. Such a fact is of fundamental importance in education and demands rational and extensive elasticity in the school work at this period of life.

At this period a large number of pupils drop out of school. Is this the fault of the curriculum? The high physical averages found in the following years seems to indicate that the weaker ones are those who leave school at this time. This is a question of great pedagogic and social import and should receive further attention.

The charts seem to show also that a similar, but less well marked, period of activity is present from the beginning of school life to the age of 9.

## THE PHYSICAL CONCOMITANTS OF DULLNESS AND PRECOCITY.

The tests mentioned so far are physical, but mental tests made by the teachers have been going on daily for years, and the pupils have been graded on an intellectual basis; and the psychological value of the tests is brought out when we compare the intellectual standing of the pupil with the result of the physical tests. For example, the 12-year-old pupils are scattered throughout the grades of the elementary schools. Some are found in the second grade, some in the third, some in the fourth, some in the fifth, some in the sixth, some in the seventh, and some in the eighth. On compiling the results of the physical tests it is found that the 12-year-old pupils of the higher grades are decidedly superior in stature, weight, strength, endurance, and vital capacity to those found in the lower grades, as shown by Table V. In Dr. Christopher's preliminary report similar tables were given in demonstration of this problem, originally set forth in reference to height and weight by W. Townsend Porter. They were based upon the examination of only 138 pupils of the age of 12 and 126 of the age of 11. The table here given is based upon the examination of 497 pupils of the age of 12. To show how decidedly this parallelism between physical superiority and mental capacity exists throughout school life the pupils have been divided into two groups—those at or above the normal grade for that age representing the brighter pupils, and those below the normal grade for that age representing the backward pupils. The normal grade for a given age was found by subtracting 6 from the age; thus, a pupil of 12 years would normally be found in the sixth grade; if in the fifth or lower grade he would be classed as below grade; if in the sixth, seventh, or eighth he would be classed as at or above grade. The results of this compilation will be seen in Table VI.

That those below grade approach so closely to those at or above grade will be readily understood when we consider that the great majority of all the pupils are but little above or below grade—that is, but little removed from their normal grade.

This demonstration of the physical superiority of the more intelligent pupils does not necessarily imply that small or weak men are always less efficient mentally than are large men, but it does seem to show that one is likely to attain to his highest mental development only as he reaches the physical growth and development which nature has marked out for him. It suggests that those in charge of children should see that the normal conditions of growth and development are not interfered with. To the parent it suggests that he should keep wide open the path of growth for the child by securing the best conditions of food, shelter, and immunity from disease. Teachers are liable to interfere with the conditions of growth and development by

subjecting the pupils to overstimulation, bad air, improper temperatures, and too limited an amount of physical exercise. Everywhere it should be borne in mind that childhood should be sacred to growth and development.

## RIGHT-HANDEDNESS.

Educators have long been divided on the question of the desirability of attempting to develop ambidexterity in their pupils. One class maintains that "all want of perfect bilateral symmetry looks away from perfect sanity," that ambidexterity is the ideal condition, both in regard to the perfection of development and utility. The other class maintains that a high development can be given to one hand only, that the left hand plays the most useful part when it aids and supplements the action of the right. Most physical exercises prescribed for pupils from the kindergarten through the high school have aimed at overcoming the tendency to right-handedness, while penmanship and manual training have yielded to this tendency. This question, like most educational questions, can be rightly settled only upon the basis of child-study investigation.

In the absence of any term corresponding to ambidexterity, and meaning unequal ability in the use of the hands without indication of which hand is the superior, the term unidexterity is suggested.

Reference to Table I shows that the children on the average are unidextrous, with the right hand superior at the time they enter school, and that the unidexterity increases during the early years of adolescence. It has long been known by those who have made a study of the localization of cerebral function that there is a connection between unidexterity and speech. J. Mark Baldwin, from a study of his children has discovered a parallelism between the beginning of unidexterity and the beginning of speech in the development of the child. Does not the pubescent increase in unidexterity parallel the change of voice? In his report of last year, Dr. Christopher intimated that the marked differentiation in the strength of the hands is a pubescent change, but the small number of pupils involved in the examination, and the consequent irregularities in the curves, forbade a definite assertion to that effect. The larger numbers involved in the present discussion justify the definite conclusion that the phenomenon is a true law of child life.

A glance at Table V will show that the more advanced of the 12-year-old pupils are more decidedly unidextrous than are the backward pupils of that age. That this association between decided unidexterity and intellectual power holds good throughout school life will be seen by a reference to Table VII. The apparent exception of the 16-year-old pupils disappears if the records of the left-handed pupils be excluded. Among the left-handed pupils at or above grade, the average strength of grip of the right hand is 91.8 per cent of the strength of the left. Of the left-handed pupils below grade, the strength of the right hand is 94 per cent of that of the left. On the whole, the brightest are more decidedly unidextrous than are the average pupils, the average pupils are more unidextrous than are the dull pupils.

## GROWTH ABNORMALITIES AND MOTOR DEFECTS.

On the back of each card was printed a list of abnormalities of growth and defective movements, as follows:

## Growth:

Macrocephalic.  
 Microcephalic.  
 Dolichocephalic.  
 Brachycephalic.  
 Cranial asymmetry.  
 Face asymmetrical as to—  
     Forehead.  
     Nose.  
     Eyes.  
     Ears.  
     Mouth.  
 Forehead retreating.  
     Narrow.  
 Palpebral fissures small.  
 Epicanthis.  
 Nasal bones sunken.  
 Superior maxillary small.  
 Inferior maxillary small.  
 Hare lip.  
 Palate cleft.  
     Narrow.  
     High.  
     Asymmetrical.  
 Ears diminutive.  
     Imperfectly formed.  
 Obesity.  
 Bilateral asymmetry.  
 Spinal curvature.  
 Deformed limbs.  
 Crippled.

## Movement:

Quick.  
 Sluggish.  
 Restless.  
 Incoordinated.  
 General balance relaxed.  
 Asymmetrical posture.  
 Head balance asymmetrical.  
 Lordosis.  
 Over action of frontals.  
 Corrugation.  
 Blinking.  
 Incoordination of eyes.  
 Immobility of eyes.  
 Relaxed orbicularis oculi.  
 Hand balance asymmetrical.  
     Tense.  
     Relaxed.  
 Finger twitches.  
 Blushing.  
 Pallor.  
 Mouth breathing.  
 Defective speech.

When the child came in the room to take the tests an observer carefully inspected him and noted the growth and movement abnormalities. A slight abnormality was marked with one X, a more decided by two, a marked abnormality by three, and extreme by four. The results of this inspection are shown in Tables VIII and IX.

It is found that the dull pupils have more of these cranial and facial asymmetries and other growth peculiarities than the bright children. From the study of movements of children it is found that the dull children show more cases of imperfectly controlled movement than are found among the brighter children.

The John Worthy [reformatory school] boys far exceed even the dull pupils of the other schools both in the average number of growth abnormalities and in the number of motor defects.

All this forces us to the conclusion that, with children, a high, symmetrical intellectual development is likely to be attained only when there is an approach to physical perfection.

TABLE IX.—*Motor defects.*

	Age.										
	8 years.	9 years.	10 years.	11 years.	12 years.	13 years.	14 years.	15 years.	16 years.	17 years.	18 years.

## TESTS OF SIGHT.

The sight of the pupils was tested in the Kozminski, Andersen, and Tennyson elementary schools and the Englewood and Lake View high schools. This test of visual acuity was made by means of the ordinary Snellen's type, the test cards being selected by Dr. Frank Allport, consulting oculist and aurist to the department of child study. Well-lighted rooms were used for these tests. In testing sight the child was seated in a chair placed 20 feet away from the test chart, and, with the left eye covered, he was asked to begin at the top of the card and read aloud down the card as far as he could. After this was done the right eye was covered and the left eye tested. The last line of which the pupil was able to read the majority of the letters showed his visual acuity for the eye used. Visual acuity was recorded by placing the number representing the normal reading distance of the last line which the pupil was able to read as the denominator and the distance from which it was read (20 feet) as the numerator of a fraction. Thus, if a child seated 20 feet from the chart could read the majority of the letters of the line normally read at 30 feet, but could not read a majority of the letters of the line normally read at 20 feet, he would be  $\frac{20}{30}$  in visual acuity for the eye tested.

These tests were made without spectacles where the pupils wore glasses, as the aim was to find the number with subnormal visual acuity for each year.

Four thousand seven hundred and sixty-five pupils were tested—2,030 boys, 2,735 girls. Thirty-five per cent of all the pupils tested were found defective—37 per cent of the girls and 32 per cent of the boys. Thus 5 per cent more of the girls were found to be defective than the boys. Table X shows something of the results of these tests. Thirty-two per cent of the 6-year-old pupils were found subnormal in vision. For the first three years of school life the per cent of those defective rapidly increases, suggesting that the school work of that period is hard on the eyes of the pupils. After the age of 9 years is passed the per cent of pupils having eye defects decreases; at first slowly, then more rapidly until the age of 13 is passed. This decrease in the per cent of eye defects parallels so closely the period of rapid growth and development that the improvement may be considered a manifestation of the improved health of this period of florid growth. The slight rise at 14 is probably due to the larger proportion of girls found in the high schools at that and the following years. It will be remembered that girls have a larger per cent of eye defects than boys.

TABLE X.—*School life and sight.*

Age.	Number tested.	$\frac{3}{8}$ and below.	$\frac{2}{3}$ and below.	$\frac{1}{2}$ and below.	$\frac{1}{4}$ and below.	$\frac{1}{8}$ and below.

18	173	32	16	13	10	8

*Defective vision and school standing.*—The influence of defective vision on school standing is shown in Table XI. It appears that on the average a smaller per cent of the pupils at and above grade have defective sight than those below grade. The fact that the reverse is true during the first two years led to an investigation which gave quite conclusive evidence that the increase in eye defects during the first years of school life is due, in part at least, to school conditions. It will be seen that 8 and 9 year old pupils who have made the best advancement have the greater per cent of eye defects. On investigation it was found that the more advanced pupils in this case had on the whole started to school younger, and this longer time at school is believed to account for both the advanced standing and the increased number of those who are subnormal in visual acuity.

TABLE XI.—*School standing and sight.*

## TESTS OF HEARING.

Hearing was tested by means of the audiometer invented by Prof. C. E. Seashore, of the Iowa State University, and described fully by him in *Studies in Psychology*, Volume II, issued from that university. This is a piece of electric apparatus so constructed that the operator can vary the current at will, producing clicks of different degrees of loudness in the telephone receiver held at the subject's ear. The intensities of the current, and hence intensities of the sound vibrations, are graded arbitrarily along the scale from 1 to 40. The threshold of hearing is determined by producing a click loud enough to be heard clearly by the subject and then passing gradually down the scale until the click becomes so slight that the subject can not

hear it. The figures on the scale at the point producing the slightest sound that can be heard is taken to represent the subject's acuteness of hearing. Because the click is made in direct contact with the ear of the subject, external noises are less confusing than is the case with most tests of hearing; nevertheless, these sounds do interfere somewhat, and on this account the quietest room in the building was always selected for these tests.

Table XIII is based on tests on 5,706 pupils.

There seems to be no decided sex difference in the matter of hearing. The girls, on the whole, are found to have about 1 per cent less of defective ears than the boys. Table XIII, on hearing defects and school life, bears a striking resemblance to the corresponding one on sight, in that the number of defects increases during the first few years of school life and then the number gradually decreases. This correspondence suggests that, in part at least, the changes may be due to a common cause.

Table XIV, in reference to hearing and school standing, shows the decided disadvantage at which the child with poor hearing is placed.

The following table shows the per cent of pupils who are defective in hearing by the number of points indicated:

TABLE XII.

	3 or more points below normal.	4 or more points below normal.	5 or more points below normal.
With one ear .....	<i>Per cent.</i> 25.3	<i>Per cent.</i> 16.8	<i>Per cent.</i> 12.2
With both ears .....	12.3	6.8	3.2

From this table it appears that there are a large number of pupils whose two ears differ in hearing power. These will be at a decided disadvantage if seated on the wrong side of the room.

## CONCLUSIONS.

Many of the tests and measurements which this department has made are preliminary to other investigations, which, it is suggested, should be carried on in reference to different lines of mental development, methods of instruction, and school adjustments. It is believed that the utility of much of the work so far done will best appear as it forms a basis for these future investigations and compilations, yet there are certain truths important for educational theory and practice which have been so clearly foreshadowed as to warrant their being set forth here.

From the investigations of last year Dr. Christopher formulated the following deductions:

1. In general there is a distinct relationship in children between physical condition and intellectual capacity, the latter varying directly as the former.
2. The endurance (ergographic work) of boys is greater than that of girls at all ages, and the difference seems to increase after the age of nine.
3. There are certain anthropometric indications which warrant a careful and thorough investigation into the subject of coeducation in the upper grammar grades.
4. Physical condition should be made a factor in the grading of children for school work, and especially for the entrance into the first grade.
5. The great extremes in physical condition of pupils in the upper grammar grades make it desirable to introduce great elasticity into the work of these grades.
6. The classes in physical culture should be graded on a physical instead of an intellectual basis.

The work this year, so far as it relates to them, confirmed these deductions, except as to the age when great differentiation of the sexes in endurance begins. To these certain other conclusions are added, not as settled beyond any possibility of modification, but yet as being fairly indicated by these tests.

1. The pubescent period is characterized by great and rapid changes in height, weight, strength of grip, vital capacity, and endurance. There seems to accompany this physical activity a corresponding intellectual and emotional activity. It therefore is a period when broad educational influences are most needed. From the pedagogic standpoint it is preeminently a time for character building.

2. The pubescent period is characterized by extensive range of all physical features of the individuals in it. Hence, although a period fit for great activity of the mass

of children, it is also one of numerous individual exceptions to this general law. During this period a greater per cent of individuals than usual pass beyond the range of normal limits set by the mass. It is a time, therefore, when the weak fail and the able forge to the front, and hence calls for a higher degree than usual of individualization of educational work and influence.

3. Unidexterity is a normal condition. Rapid and marked accentuation of unidexterity is a pubescent change. On the whole there is a direct relationship between the degree of unidexterity and the intellectual progress of the pupil. At any given age of school life bright or advanced pupils tend toward accentuated unidexterity and dull or backward pupils tend toward ambidexterity. The pupils of the John Worthy (Bridewell) School are more nearly ambidextrous than even the backward pupils of the ordinary schools. Training in ambidexterity is training contrary to a law of child life.

4. Boys of school age at the Bridewell are inferior in all physical measurements to boys in the ordinary schools, and this inferiority seems to increase with age.

5. Defects of sight and hearing are more numerous among the dull and backward pupils. These defects should be taken into consideration in the seating of pupils. Only by removing the defects can the best advancement of the pupils be secured.

6. The number of eye and ear defects increases during the first years of school life. The causes of this increase should be investigated and as far as possible removed.

7. There are certain parts of the school day when pupils, on the average, have a higher storage of energy than at other periods. These periods should be utilized for the highest forms of educational work.

8. The stature of boys is greater than that of girls up to the age of 11, when the girls surpass the boys and remain greater in stature up to the age of 14. After 14 girls increase in stature very slowly and very slightly, while boys continue to increase rapidly until 18.

9. The weight of the girl surpasses that of the boy about a year later than her stature surpasses his, and she maintains her superiority in weight to a later period of time than she maintains her superiority in height.

10. In height sitting girls surpass boys at the same age as in stature, viz, 11 years, but they maintain their superiority in this measurement for one year longer than they do in stature, which indicates that the more rapid growth of the boy at this age is in the lower extremities rather than in the trunk.

11. Commencing at the age of 13, strength of grip in boys shows a marked accentuation in its rate of increase, and this increase continues as far as our observations extend, viz, to the age of 20. In girls no such great acceleration in muscular strength at puberty occurs, and after 16 there is little increase in strength of grip. The well-known muscular differentiation of the sexes practically begins at 13.

12. As with strength of grip, so with endurance as measured by the ergograph, boys surpass girls at all ages, and this differentiation becomes very marked after the age of 14, after which age girls increase in strength and endurance but very slightly, while after 14 boys acquire almost exactly half of the total power in these two features which they acquire in the first twenty years of life.

13. The development of vital capacity bears a striking resemblance to that of endurance, the curves representing the two being almost identical.

---

[From report of Director Fred W. Smedley for 1900-1901.]

#### SCHOOL DESKS.

At the beginning of the school year we were directed by the committee on child study and pedagogical investigation of the board of education to determine what sizes of desks are best suited to the pupils of each of the different grades and what

proportion of the desks should be adjustable. It is well known that an ill-fitting desk impedes circulation, causes unhealthful postures, muscular strain, fatigue, and in time even spinal curvature. The discomfort engendered distracts the attention and interferes with the best conditions of school work. Some cities have met this problem by having all of the desks adjustable; but as adjustable desks are more expensive, and as it had been found troublesome to adjust a large number of desks, the Chicago board of education adopted the policy of having only a portion of the desks adjustable. These measurements were undertaken to guide in the future purchase of desks. The measurements which we had previously taken of nearly 7,000 pupils were supplemented by special measurements, taken chiefly at the Alcott School. This gave us data for determining the matter upon a broad basis. The result of this investigation appears in the following report presented by Dr. W. S. Christopher, chairman of the committee, to the board of education and adopted by them on September 19, 1900:

The committee on child-study and pedagogical investigation beg to report that at the opening of schools this fall it had observations made to determine the varying sizes of children which the several sizes of desks used can accommodate. Different children were placed in each desk until there was determined with reference to each desk the stature of the shortest pupil and the stature of the tallest pupil who could be properly accommodated by that desk.

The results were as follows:

TABLE I.

Desk number.	Height of seat.	Maximum stature accommodated.	Minimum stature accommodated.
	<i>Inches.</i>	<i>Mm.</i>	<i>Mm.</i>
1.....	17	1,865	1,555
2.....	16	1,740	1,470
3.....	15	1,620	1,370
4.....	14	1,500	1,275
5.....	13	1,382	1,190
6.....	12	1,270	1,130

The adjustable desks supplied under the existing contracts are known as—

A1, with seat adjustable from  $15\frac{1}{2}$  to  $17\frac{1}{2}$  inches.

B1, with seat adjustable from  $13\frac{1}{2}$  to  $15\frac{1}{2}$  inches.

C1, with seat adjustable from 12 to 14 inches.

The measurements which have been made by this department since its inauguration supplied the material necessary to determine what percentage of pupils in each grade could be provided with a fixed desk, what size desk could accommodate the largest percentage of those pupils, and which adjustable desk and how many should be supplied.

This information is given in the following table:

TABLE II.

Grade.	Desk number.	Per cent of pupils of this grade of stature below minimum for this desk.	Per cent of pupils of this grade of stature within limits accommodated by this desk.	Per cent of pupils of this grade of stature above maximum for this desk.
High school.....	1	15.87	83.78	0.35
Eighth.....	2	10.75	86.56	2.69
Seventh.....	3	4.18	78.07	17.75
Sixth.....	3	11.06	83.58	5.41
Fifth.....	4	3.07	81.55	15.36
Fourth.....	4	8.75	87.04	4.21
Third.....	5	3.50	82.91	13.59
Second.....	5	19.97	77.50	2.53
First.....	6	25.77	72.42	1.80

From information obtained from the business manager we find that at present the grades are supplied with desks as follows: High schools, No. 1; eighth grade, No. 2; seventh grade, No. 2; sixth grade, No. 3; fifth grade, No. 3; fourth grade, No. 3; third grade, No. 4; second grade, No. 4; first grade, No. 5; first grade, No. 6.

From which it would appear that grades 7, 5, 4, 3, 2, and part of the first are supplied with sizes too large to accommodate properly the largest percentage of pupils.

It furthermore appears that in the first grade the smallest size desk now supplied, which is the same whether stationary or adjustable desks be considered, is too large for more than 25 per cent of the pupils.

In view of the foregoing, your committee respectfully recommends:

1. That the several grades be supplied with stationary and adjustable desks in dimensions and percentages as follows:

TABLE III.

Grade.	Per cent of stationary desks.	Dimensions.	Per cent of adjustable desks.	Dimensions.
High school .....	85	1	15	A1
Eighth .....	85	2	15	A1
Seventh .....	75	3	25	B1
Sixth .....	80	3	20	B1
Fifth .....	80	4	20	B1
Fourth .....	85	4	15	E1
Third .....	80	5	20	C1
Second .....	75	5	25	C1

The committee further recommended that in view of the fact that 26 per cent of the pupils in the first grade are too small to be accommodated by any desk now purchased by the board, the committee on buildings and grounds be requested to secure bids for an adjustable desk whose seat shall be adjustable from 10 to 12 inches, and that when such desks are obtained the first-grade rooms be supplied with 30 per cent of such adjustable desks and 70 per cent of desks No. 6.

#### THE CHILD-STUDY LABORATORY.

On most of the Saturdays during the school year the members of the child-study department have had their time occupied in the examination of children brought to the laboratory by teachers and parents. Almost every wide-awake teacher meets with problems in the management of children in which more certain and definite knowledge of the child's condition will be of great assistance. At the child-study laboratory trained observers of children, using instruments of precision, can often quickly point out wherein a given child differs from the ordinary child. When such a variation is injurious, some régime may be suggested which will tend to correct the defect. Many children are misunderstood. Parents often have a very wrong estimation of how their child compares with others. Many of the children were brought to the laboratory as a result of a difference of opinion between parents and teachers in regard to the child's ability.

While all principals have not made equal use of the laboratory, yet pupils from over 60 schools have sought its assistance. The 300 children brought to the child-study laboratory during the past year presented a large variety of problems. Many parents and teachers have brought children here to learn the nature and extent of their sensory defects. Very bright children have been brought to the laboratory to determine whether the phenomenal progress which they have been making is at the expense of their physical well-being. Principals have brought their own children to know how they compare with the average children of the same age, in order that these children, whom they know best of all, may form a basis for their estimation of other children. Children who had failed to make progress in certain studies were presented to determine what the physical or mental cause of their special deficiencies might be. Peculiar children were brought to determine whether the work of the kindergarten or of the primary school would best answer their needs. Children

with very defective sight were examined and decision made as to whether the ordinary school or the department of the blind was best suited for them. Similar work was done with those with defective hearing. High school pupils, in order that they might choose their course of study wisely, have sought our opinion as to whether certain deformities would prevent their passing the physical examination for entering the normal school. Teachers have brought pupils with speech defects to the laboratory in order to learn more about the nature and causes of the defects and how they best could be removed. Many dull, nervous, and frail children have been brought in. Sometimes the child's needs demanded medical or surgical treatment, and he was referred to the family physician or a dispensary. Usually a hygienic and educational régime was most demanded.

## THE JOHN WORTHY SCHOOL.

In order to secure a broader basis for conclusions concerning the class of boys represented by the John Worthy School, the school in connection with the house of correction, tests and measurements were again taken on the inmates, 317 in all. Seventy of these pupils had been measured last year, and the data from testing them were allowed to count again in the compilation here presented, which includes the work of both years. As seen from Table IV, the addition of these data from the examination of 247 new subjects tends to confirm the conclusions of last year. The John Worthy boys are inferior in all the principal measurements taken, and this inferiority increases with age.

TABLE IV.—*Comparison of the John Worthy averages with the norms.*

11.....	51	1,669	1,799	92.77
12.....	99	1,763	1,956	90.13
13.....	114	2,000	2,246	89.04
14.....	144	2,239	2,527	88.60
15.....	111	2,413	2,858	84.42
16.....	37	2,488	3,363	73.97
17.....	14	2,660	3,570	74.50

## PERCENTILES.

The large addition to the numbers that have been measured and tested has permitted our classification of the results into percentile groups in reference to height, weight, strength of grip, and vital capacity. Tables have thus been produced which will be of especial service in the child-study laboratory and of value to all who make a study of individual children. By means of these tables one can determine closely how a given child compares with others of his age. These percentiles have been obtained in the following manner: The individual cards on which the measurements were recorded when the child was tested were arranged according to the size of the pupils in each measurement, grouped separately for each age in years. The minimum measurement in each such group gave the zero percentile for that group. To determine the 10 percentile for that group 10 per cent of the number of cards was removed, beginning at the minimal end, and the highest measurement on the cards so removed was recorded as the desired 10 percentile. Similarly the other percentiles were determined, the maximum measurement being recorded as the 100 percentile.

TABLE V.—*Percentiles.*

## FOUR-YEAR-OLD BOYS.

[Number of cases, 58.]

Per cent.	Height, standing.	Height, sitting.	Weight.	Grip of right hand.	Grip of left hand.	Vital capacity.
	<i>Mm.</i>	<i>Mm.</i>	<i>Kilos.</i>	<i>Kilos.</i>	<i>Kilos.</i>	<i>C. c.</i>
100.....	1,165	624	21.600	11.0	10.5	1,050
90.....	1,096	614	20.375	9.0	8.5	875
80.....	1,063	610	18.775	8.0	7.5	800
70.....	1,038	598	17.850	7.25	7.0	800

*School standing of the different percentile groups.*—The child is a very complex being. Many factors contribute to the development of his school efficiency. Often only by considering a factor in reference to a large number of children can it be determined whether it is favorable or unfavorable to a child's school advancement. In the report of last year we were enabled to say that the evolutionary ideal child stood somewhere above the average in each measurement, and later to demonstrate that the more advanced pupils stood higher in the physical measurements than the backward ones. By taking the average number of school grades made by the several percentile groups of a given age we are enabled to compare the school efficiency of these groups. In order to present this matter on a broad basis, and to reduce it to a form sufficiently condensed to show at once the relation of school standing to physical condition abstractly, and dissociated from age and sex, we have proceeded as follows:

1. The cards representing the individual pupils from 8 to 16 inclusive (irrespective of sex) were first classified into the several ages by years.

2. The cards were then arranged separately for each year of age, with reference to stature, and each year's group divided into its ten percentile groups. Then the average grades of all the pupils in each of these percentile groups were determined. Then the average grades of all the pupils in each of the same percentiles of each age were added together, and this sum divided by 9, the number of ages considered, to determine the average number of grades made by each of the several percentile stature groups. The results thus obtained are given in the first column of Table VI.

3. The same process was repeated for each of the several measurements taken, and the results so obtained are given in the several columns of Table VI under their appropriate headings. In this way it is thought that the relationship of physical condition to mental capacity, as shown by school standing, has been shown completely divested of the influence of age and sex. The total number of pupils involved in this compilation is 5,768.

It will be seen from Table VI that the 90-100 per cent group has made on the average one more school grade, or a year's work, than has the 0-10 per cent group. If we take the average number of grades made by the very tallest pupils, the 100 percentiles, and compare this with the average made by the very shortest pupils, -0 percentiles, for each age, we will find that the tallest have made on the average 6.44 grades while the shortest have made 4.50 grades.

Table VI shows that this greater school efficiency of those physically superior holds good also for height sitting, weight, strength, endurance, and vital capacity, although not to the same degree in each. Part of this gain might possibly be explained on the supposition that those physically superior may have had better health and so have lost less time from school on account of illness than have the smaller and weaker ones, and so in part this higher standing of the larger pupils might be due purely to their physical superiority and not to their superior mental ability. On such a basis it might be easy to explain why certain smaller pupils are below grade, but such an explanation would hardly be so plausible in accounting for the fact that so many of the best physical specimens are above grade. Actual tests of the memory power show that the larger and stronger pupils are superior in native force of memory to the smaller and weaker. The true explanation will probably be found in the fact that those conditions which bring about large growth are favorable to the perfect formation and ideal balance of the brain and vital organs.

TABLE VI.—*School standing of the different percentile groups, showing the average number of grades made by the pupils coming under the various percentile groups for the different measurements.*

#### MEMORY INVESTIGATION.

An investigation of some of the phenomena of memory was undertaken with two special objects: First, to establish norms for use in the examination of special cases;

second, to gain light on the teaching of spelling. This second practical pedagogical problem was undertaken at the request of Superintendent Cooley. It is hoped that later on added data will enable us to make this report more complete. The scope of the work can best be seen from the following copy of the card on which the data were recorded:

The data to be recorded upon the upper part of the card were furnished in part by the pupil himself and in part by his teacher. Careful check tests were made on sight, hearing, and motor ability. Later, measurements were taken of height, height sitting, weight, strength of grip of the right and the left hand, and vital capacity.

*Method.*—For the purpose of investigating the native power of immediate sense memory of the children of different ages, memory-span tests were made in the following manner: Figures were arranged in series of different lengths of from four to eight digits each, only the nine significant digits being used. These series were printed in very large type on cards. A set constituting a test consisted of ten series, two series of four digits, two of five each, two of six, two of seven, and two of eight. The following is a specimen set of the series used in a test:

5 1 6 2	2 9 6 8 5
6 8 4 7 3 5	8 6 3 7 1 9
7 4 2 8 3 5 8 1	4 7 9 2 1 8 3
6 3 9 2 7	9 3 2 4
3 9 1 5 8 4 6	2 9 5 8 4 7 6 3

In order that the matter might be as homogeneous a mass of material as possible, an attempt was made to avoid all previously established associations. To this end

care was taken that in no case should two digits come in their natural order, as 3, 4, nor were they in any case arranged in their reverse order, as 8, 7. Series representing familiar dates were avoided. A sufficient number of series were thus produced, so that no set was presented twice to the same pupils.

The tests were made on all the pupils of a room at once by having the pupils reproduce the series on specially prepared blanks. These papers were collected and carefully graded. The errors were checked, and the percentage correctly recorded constituted the grade for that test. Seven tests were taken during the day, an hour intervening between the tests. The average made by each pupil in these seven tests constituted his final grade. The compilations include 25,000 individual tests of ten series each.

The series of four digits proved to be easy enough for those with the poorest memory, and the series of eight digits was difficult enough for all except the brightest pupils of the highest grades. In the higher grades were some pupils who probably could have remembered a longer span than eight had such a series been given them in the test; so the final percentages made in the upper grades do not show the full memory power as compared with those in the lower grades. On the other hand, the amount of attention required for writing the figures was greater with the younger pupils, and on this account the percentages made by them probably fall short of showing their full memory power.

It will be seen that in this investigation the attempt has been made to test the native memory power of the child rather than his previous acquirements and school training, as is done in the ordinary examinations, which test knowledge primarily and power only incidentally.

*Method in auditory memory.*—In order to test the auditory memory a series of digits, as 6, 8, 5, 3, was read to the pupils at a uniform rate of speed and a degree of loudness that was clearly perceptible by all. In the reading care was taken to avoid all rhythm. After a lapse of about five seconds the child was allowed to write this series. The reading was regulated by a metronome beating ninety times a minute. The ten series constituting a set were so arranged that the child could not anticipate the number of digits constituting the series about to be read; nevertheless, a series was given first which would be within the memory span of nearly all the pupils, because it was believed that by using one of the shorter series at first the children would be encouraged, whereas if a span beyond their power to reproduce was given first, some might lose heart and so not put forth their most intense power of attention.

*Method in visual memory.*—In testing visual memory, the card on which the series was printed, after the usual warning, was held before the pupils the same length of time that would have been consumed in reading the series in the auditory tests, namely, two-thirds of a second for each digit composing the series. The type used in printing the card was of such a size that it could be read by the normal eye at a far greater distance than that actually required of any pupil, but at the same time opportunity was given to anyone who experienced difficulty in seeing the figures to change his seat. The figures of a series were not exposed one at a time, and undoubtedly many of the children ran their eyes several times over the line of figures exposed, and so secured the advantage of repetition, which the child did not have in the auditory test. While it would have been easy to have arranged a shutter so as to expose one figure at a time, it was not considered best to do so, as this opportunity for repetition is a natural advantage which one usually has in learning through the eye. While a more rapid rate might be used as far as auditory and visual memory are concerned, and still allow time for clear and distinct enunciation, yet the longer period was selected in order to allow sufficient time for the audio-visual-articulatory and the audio-visual-hand-motor tests. It is believed that the slow rate was slightly to the advantage of the visual memory in comparison with the auditory memory.

*Method in audio-visual memory.*—In the audio-visual test a card containing the series was exposed to view just as in the visual test, and at the same time the digits were repeated aloud by the experimenter at the rate used in the auditory test. Thus a simultaneous appeal was made to the sight and hearing of the pupils.

*Method in audio-visual-articulatory memory.*—In the test of the audio-visual-articulatory memory the impression was produced by making a simultaneous appeal to hearing, sight, and the muscle sense by having the series read aloud by the pupils when the card containing the digits was presented, the concert reading being timed by the metronome.

*Method in audio-visual-hand-motor memory.*—While the series was dictated at the established rate, the pupils wrote the digits on scrap paper and at the close of the series the paper was turned face downward and the pupils reproduced the series from memory upon the test paper, thus testing the result of a simultaneous appeal to hearing, sight, and the sensations from the muscles used in writing.

*No complete separation of the different sense memories.*—While the attempt was made to test the immediate sense memory from the exercise of sight, hearing, and the combined action of these senses, with each other and with the muscle sense awakened by activity in the hand and vocal organs, yet these elements could not be tested as isolated memories. It must be remembered that the muscle sense enters into our activities of both sight and hearing in the reception of the impression, because both the eye and ear require the action of muscles for their adjustment. In testing visual memory, it was noted that many children, in spite of all admonitions to the contrary, moved their lips and throats, thus indicating that articulatory impressions were awakened. Even in the auditory tests slight lip movements were noted in some pupils. In the recording of the figures of any series the impressions, of course, had to be translated into visual and motor terms, so that probably the sight, hearing, and motor tracts and centers were active during all the tests; yet nevertheless it is believed that the predominating elements are the ones named in each test.

*Fatigue.*—It is well known that extreme fatigue lowers the memory power. The tests were made at the different periods of the day with the thought of ascertaining whether any trace of the course of power during the day, as established by the ergograph, would appear from these memory tests, but it seems that the children on the whole gained more through practice than they lost through fatigue. There is but a slight falling away just previous to the noon hour and again in the afternoon just before the close of school.

*The development of auditory and visual memory power.*—Table IX shows the development of the auditory and visual memory. While there are a number of irregularities which are due simply to the paucity of numbers, yet certain facts seem to be thoroughly established. The auditory memory develops rapidly up to about 14 years of age, and but slowly after this period. The visual memory seems to develop rapidly up to 15 or 16 years of age. This period of rapid development of visual memory lasts a year or two longer than the period of rapid development of auditory memory. It will be noted that in the early life of the child the auditory memory is stronger than the visual memory; after about nine years of age the visual memory of most of the children becomes stronger than the auditory, and continues to develop more rapidly than the auditory memory throughout school life. Yet even in the high school there still remains a small proportion of the pupils whose hearing memory is the stronger. This small percentage of persistently ear-minded individuals, like the small per cent of left-handed people, seems to be a special provision of nature to show to teachers that children are not alike mentally or physically and are not all to be subjected to the same treatment; that children are not so plastic as educators seem to think them to be, and that school training, important as it is in the development of human power, is often overestimated when compared with the great factors—heredity and nutrition.

The investigation shows, too, that there is no "memory period;" no period in early school life when the memory is stronger than it is at any later portion of the child's life, a period especially adapted to memorizing.

TABLE IX.—*The development of memory.*

Average age.	Number tested.	Auditory.	Visual.
		<i>Per cent.</i>	<i>Per cent.</i>
7 years, 8 months, 9 days .....	19	36.4	35.2
8 years, 5 months, 24 days .....	58	44.6	42.8
9 years, 6 months, 6 days .....	100	45.0	47.4
10 years, 5 months, 3 days .....	89	49.4	54.6
11 years, 5 months, 17 days .....	91	55.4	64.7
12 years, 6 months, 3 days .....	93	55.7	72.3
13 years, 6 months, 21 days .....	109	57.9	76.8
14 years, 5 months, 28 days .....	114	66.2	80.5
15 years, 6 months, 1 day .....	94	65.6	78.2
16 years, 6 months, 4 days .....	77	66.9	81.3
17 years, 5 months, 20 days .....	56	65.5	84.1
18 years, 5 months, 3 days .....	25	67.2	77.5
19 years, 5 months, 11 days .....	12	70.0	85.3

*Bearing of sensory defects.*—It might readily be suspected that the sight and hearing defects of the pupils, in spite of all care, might seriously influence the results in the tests of auditory and visual memory; thus, in the visual test, if the child failed to see the figures clearly he could not be expected to reproduce them correctly; and in a few cases papers had to be discarded because the errors proved to be clearly due to defective vision. To ascertain the probable effect the sensory defects had upon the results of the memory tests, certain compilations in regard to the sensory defects of the pupils tested were made. Of the pupils who stood above the average for their age in auditory memory, 32 per cent were slightly subnormal in visual acuity and 10 per cent were slightly defective in hearing. Of the pupils below the average for their age in auditory memory, 41 per cent were slightly subnormal in vision and 14 per cent were somewhat defective in hearing. Of the pupils who stood above the average in visual memory, 32 per cent were slightly defective in vision and 10 per cent defective in hearing. Of the pupils below the average of their age in visual memory, 45 per cent had defective sight and 15 per cent defective hearing. It will be seen that in both auditory and visual memory those above the average have a smaller per cent of defects than those below the average, but the fact that those below the average in auditory memory have no larger per cent of hearing defects than those below the average in visual memory would seem to indicate that the hearing defects played but a small part, if any, in these tests; and so in visual memory, the fact that the percentage of those below the average with defective eyesight does not much exceed the per cent of those below the average in auditory memory with defective eyesight would seem to indicate that eye defects played but a minor part in the tests in visual memory.

*Audio-visual memory.*—It has been pointed out that during early school life the auditory memory is the stronger; later, the visual memory is the stronger. It will be seen in Table IX that during the whole of school life the audio-visual memory is stronger than either the auditory or the visual; that is, a simultaneous appeal to both sight and hearing produces a deeper impression than is brought about by an appeal to either sense alone. This fact is very far-reaching in its application to teaching.

*Audio-visual-articulatory and audio-visual-hand-motor memories.*—It will also be seen from Table X that the audio-visual-articulatory memory, in which the impression is produced by an appeal to hearing, sight, and the muscle sense, is even stronger than the audio-visual. It would seem that, as a general rule, the more senses we can appeal to the richer and more usable, and probably the more lasting, will be the impression, yet the audio-visual-hand-motor memory, while stronger than the audi-

tory or the visual, is not quite so strong as the audio-visual or the audio-visual-articulatory. It would seem that the divided attention required in writing the digits when dictated interferes slightly with their firm grasp in memory.

TABLE X.—*Combined sense memories.*

Age at last birthday.	Number tested.	Audio-visual.	Audio-visual-articulatory.	Audio-visual-hand-motor.
		<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
7 years .....	19	43.8	47.4	.....

11 years .....	91	70.9	74.6	68.8
12 years .....	92	74.8	76.9	71.7
13 years .....	97	82.9	84.8	79.3
14 years .....	80	82.6	86.0	81.1
15 years .....	45	80.7	81.4	78.9
16 years .....	18	86.9	83.4	82.4

*Memory span.*—In order to have a simple standard for determining whether an individual is equal to, above, or below others of his age in memory power, the memory span for each age from 8 to 19 years, inclusive, has been determined in the following manner: If a child could remember a series of a given length so as to write it perfectly at least one-half the time, it was considered within his memory span. In determining the average memory span, the first four trials of each pupil on a series of a given length were taken as a basis for computation. If a majority of the pupils of a given age could reproduce correctly series of a given length in at least one-half of the trials, it was considered within the memory span for that age. For example, of the 12-year-old pupils, 47 out of 93 reproduced correctly two or more of the first four visual tests given them on a series of 7 digits, so 7 is within the visual-memory span for the 12-year-olds. In this manner the following table of memory span has been established:

TABLE XI.—*Memory span.*

Age.	Auditory memory.	Visual memory.	Age.	Auditory memory.	Visual memory.
	<i>Digits.</i>	<i>Digits.</i>		<i>Digits.</i>	<i>Digits.</i>
7 years.....	5	5	14 years.....	6	7
8 years.....	5	5	15 years.....	6	7
9 years.....	5	6	16 years.....	6	7
10 years.....	6	6	17 years.....	7	8
11 years.....	6	6	18 years.....	6	7
12 years.....	6	7	19 years.....	7	8
13 years.....	6	7			

*Repetition.*—To test the effect of repetition a schoolroom was selected containing 38 pupils, averaging 10 years and 27 days old. The first test given was the usual auditory test. On this the pupils made an average of 47 per cent. In the second test each series was read to the pupils and then immediately reread at the same rate. On this test an average of 55 per cent was made. In the next test each series was read three times, the pupils making an average of 59 per cent.

*Memory power and school standing.*—The 93 12-year-old pupils found in the Ogden School were scattered throughout the grades, from the third to the eighth, inclusive. From Table XII it will appear that those 12-year-old pupils found in the higher grades have stronger memory power than those of the same age in the lower grades. Not only is this true, but we find that the 12-year-old pupils of the eighth grade, who are the youngest pupils of this grade, are decidedly superior in memory power to the average eighth-grade pupils, thus indicating that their superior native memory

power has been a potent factor in putting them two years ahead of their normal grade.

To show how decidedly this parallelism between superior school standing and memory power holds good throughout school life, the pupils have been divided into two groups, one representing those at or above the normal grade for that age, the other those below the normal grade for that year representing the backward pupils. The normal grade for that age was found by subtracting six from that age; thus, a pupil of twelve years would be found normally in the sixth grade; if in the fifth or lower grade he would be classed as below grade; if in the sixth, seventh, or eighth grade he would be classed as above grade. The result of this compilation appears in Table XIII.

TABLE XII.—*Memory power of 12-year-old pupils, by grades.*

	Grades.					
	Third.	Fourth.	Fifth.	Sixth.	Seventh.	Eighth.
Number tested.....	7	11	30	25	15	5
Auditory.....per cent..	43.3	50.8	54.7	61.9	60.3	71.8
Visual.....per cent..	56.7	63.8	71.8	73	76.9	92.8

TABLE XIII.—*Memory and school standing.*

Age.	Number tested.	Auditory.		Visual.	
		Average standing of pupils at and above grade.	Average standing of pupils below grade.	Average standing of pupils at and above grade.	Average standing of pupils below grade.
		<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
9 years .....	99	47.8	39.7	50.3	41.9
10 years .....	88	54.4	42.7	61.6	46.2
11 years .....	91	59.0	48.6	69.4	53.3
12 years .....	92	62.6	52.2	76.7	66.0
13 years .....	110	70.4	64.3	80.7	72.3
14 years .....	116	68.9	62.6	87.6	74.9
15 years .....	94	68.9	62.4	80.9	75.0
16 years .....	75	70.1	65.8	83.3	78.8
17 years .....	56	67.5	62.7	87.8	81.2

*Balance of sense memory.*—Table IX shows that on the average the visual memory develops more rapidly than the auditory memory. It appears from Table XII that the more advanced 12-year-old pupils have visual memory stronger in proportion to the auditory memory than do the backward pupils of this age. If we take the pupils from 9 to 17 years of age we find that only 16 per cent of those at or above grade have the auditory memory stronger than the visual, while 21 per cent of those below grade have the auditory memory stronger.

*Comparison of memory power and physical condition.*—Table XIV gives a comparison of all those above the average with those below the average for their age in memory power in reference to the physical tests. It will be seen from this table that those who are higher in memory power are larger and better developed physically than those below the average in memory. This physical superiority is slight, yet the difference in memory power between those above the average and those below the average is but small, for most of the pupils are only slightly removed from the average in memory power. That those with superior memory power are larger and in a better physical condition, as shown by the physical tests, suggests that the immediate sense memory is dependent upon good brain formation and nutrition.

TABLE XIV.—*Comparison of memory power and physical condition.*

Physical measurements.	Auditory memory.		Visual memory.

*Boys of the John Worthy School.*—Tests in auditory and visual memory were made on the pupils of the John Worthy School [reformatory]. Nearly one-fourth of these pupils could not be tested after the manner in which the tests were made in the public schools, because the pupils were not far enough advanced in scholarship to write the figures which were read to them. Although on this account the averages are probably much higher than they otherwise would be, yet it will be noted from Table XV that the boys of the John Worthy School are lower in memory power than are the pupils of the other schools, and that this disparity increases with age.

TABLE XV.—*Memory power of the John Worthy boys.*

Age.	Auditory.				Visual.			
	Number tested.	Average.	Normal for this age.	Per cent John Worthy is of normal.	Number tested.	Average.	Normal for this age.	Per cent John Worthy is of normal.

*Spelling test.*—In order to determine how the power of auditory memory compares with visual memory when actually employed in learning to spell, tests were given in the following manner: Two lists of 70 words each were prepared, and each list divided into 7 sets of 10 words each. These words were believed by the principal and teachers to be in the speaking vocabulary of all the pupils. Seven tests of 10 words each were given during the day at intervals of one hour. Instead of allowing the pupils to write the word immediately after its presentation, as in the work with figures, the 10 words were presented one at a time and then were pronounced, to be written as in the ordinary spelling exercise.

The first day the 7 sets of the first list were given as auditory tests, and the next day the sets of the second list were used as visual tests. Of course it was impossible to make lists of words of exactly equal difficulty. To obviate this the tests were repeated one week later. The exercises were given as before, except that the words used as auditory were given as visual tests in the second trial, and vice versa. So each word was used twice—once in an auditory test and once in a visual test. On compiling the results we find an average standing of 64 per cent in the auditory tests and 73 per cent in the visual. The striking similarity in the comparative strength of auditory and visual memory, as shown in this spelling test and in the test of the

same pupils with figures, serves to strengthen the belief that many of the conclusions drawn from the memory tests are applicable to the learning of spelling.

*Comparison of good and bad spelling.*—Each teacher in the Ogden School furnished the names of the five poorest and the five best spellers of her room. This gave an opportunity to study the characteristics of good and bad spellers. While on the whole the good spellers have decidedly better memory power than the bad spellers, yet there are individuals among the poor spellers who are superior in memory power, and individuals among the best spellers whose memory power is scarcely up to the average of their age. While this native power of sense memory plays an important rôle, it is by no means the only factor in learning to spell.

It should be added, also, that while the number of sight and hearing defects is greater among the poor spellers, yet there are among the very best spellers pupils with marked sensory defects.

*Some conclusions and suggestions.*—1. In these tests of memory an attempt has been made to divest the matter to be memorized of as many associations as possible, and so to measure the native strength of the memory. The power thus measured is passive; it is blind; it attempts to take and give back without change, to return an echo of the sensations. It shows what the child can apprehend, not what he can comprehend. Good teaching attempts to make the mind active and alert, causing it to compare, associate, and classify. It is the province of the school to discipline this native power of memory; to bring forth skill where originally there is only strength. The teacher should aim to develop from the native sense memory an organized rational memory. It is said that English spelling is illogical, but this is true in part only, and the teacher should use every available opportunity to see that the child uses his rational memory instead of depending too largely on the native force of his sense memory.

2. Those with superior memory power being in superior physical condition, as shown by the anthropometric tests, clearly indicates that the immediate sense memory is dependent upon good brain formation and nutrition. The skillful and rational use of this memory power is dependent upon habitual use; hence on education and experience. All these factors are significant in learning to spell.

3. Where the matter memorized has been divested of associations, repetition is necessary for the securing of deep and lasting impressions. Wherever logical association is possible there can be a more efficacious method of study. In studying, the child should be habituated to depend upon comparing and classifying, rather than upon mere repetition. Children are so prone to depend upon blind repetition that they sometimes put forth as much effort in studying the words that they have long thoroughly known as they do upon unfamiliar words, and use as much energy in studying the parts of a word that present no difficulty as they do upon the unknown portions. A wise direction of the child's energies would greatly shorten the time necessary for the mastery of English orthography.

4. While usually the better spellers are possessed of better memory power than are the poor spellers, yet there are bad spellers with a high development of memory. Superior memory may make the acquisition of spelling easy, yet it by no means removes the necessity for some intelligent application on the part of the pupil. While most good spellers tend toward the visual type, still there are both good and bad spellers of each type.

5. The fact that children have the ear memory stronger during the early years suggests at once that the teaching of spelling to the young will be effective if the ear is appealed to; that there is probably a place for oral spelling; that there should be some pronunciation of syllables with the spelling; that the words presented to the child at first should be, as far as possible, phonetic in their spelling, leaving the "more cruel and unusual" forms of English orthography to be learned in later years, when the eye memory has become stronger.

6. The investigation shows that there is no "memory period," no period in early school life when the memory is stronger than it is at any later portion of the child's life, a period especially adapted for learning to spell. While there are no memory stages, there are undoubtedly periods of interest that are especially favorable for the child's learning to spell; times when, through the influence of companions or teachers, the child is aroused from indifference or from a feeling that spelling is a small part of life to a recognition that it is important.

7. It has been pointed out that during early school life the auditory memory is the stronger, and later that the visual memory is stronger. During the whole of school life the audio-visual memory is stronger than either the auditory or visual; that is, a simultaneous appeal to both sight and hearing produces a richer and more usable image than is brought about by an appeal to either sense alone. This fact is very far-reaching in its application to teaching. The audio-visual-articulatory memory, in which the impression is produced by an appeal to the hearing, sight, and the muscle sense, is even stronger than the audio-visual. It would seem from this that the more senses we can appeal to the deeper will be the impression. This fact should be made use of in spelling drills.

8. The aim in teaching spelling should be to render words of the most frequent use automatic, to have them so well known that in writing they will flow from the point of the pen, requiring but little thought as to their formation. Then there is a large class of words of less frequent occurrence which should be recalled on slight reflection. For the more unusual words the individual should have the dictionary habit so firmly fixed that he will conscientiously look up every word he needs to write if in doubt about its correct spelling. The spelling of words is rendered automatic through practice in writing them. Though the first grasp of the word may well be made through other combinations of sense memories, yet the final retention of the spelling of most words should be through the audio-visual-hand-motor memory.

9. The per cent of pupils having sight and hearing defects is greater among the poor spellers than among the good spellers; yet there are pupils with decided sensory defects among the very best spellers. While these sensory defects are handicaps in learning to spell, still they may be overcome through careful application by those pupils who have good memory power.

10. Much that has been said here concerning the teaching of spelling will apply with but slightly diminished force to instruction in the other branches of the curriculum.

## CHAPTER XXVIII.

### EDUCATION IN RUSSIA.

By E. KOVALEVSKY.

*Member of the Scientific Committee, Ministry of Public Instruction in Russia.*

---

Most of the educational institutions in Russia are under the direction of the ministry of public instruction, but there are many special schools which depend upon the other administrative departments, including a series of technical and commercial schools and a complete system of agricultural schools.

#### SUPERIOR TECHNICAL INSTITUTIONS.

The want of men with higher technical education is very sensibly felt in Russia, and as a consequence the influx of secondary students wishing to enter the special higher schools is increasing with every year, even in greater numbers than these schools can receive. In the year 1898 7,000 applications were presented in the different institutes, while only 2,000 students could be admitted. The Government shows its disposition to help the progress of technical instruction. Since the year 1895 five large, new, higher establishments (three polytechnical schools in St. Petersburg, Warsaw, and Kief, a technological institute in Tomsk, and an engineering school in Moscow) have been founded. Taking in consideration the importance that chemistry has lately acquired in Russian industry the State has constructed new laboratories in the existing schools (St. Petersburg Technological Institute and Riga Polytechnical School) in the hope of increasing the number of the students of the chemistry departments, who till now formed only 26 per cent of all students of technology.

The expenditures of the ministry of public instruction alone for the support of higher technical education amount to a million and a half of rubles. The ministry of finance assigned seven millions for the construction of the last polytechnical school.

There are at present (1902) 13 superior technical institutions in Russia, with 8,000 students, viz: Four technological institutes, 4 polytechnical schools, 2 engineering schools, 1 school of civil engineering, 1 of mining, and 1 of electrotechnics.

The aim of all these establishments is to train engineers for the service of the State, competent to act as foremen in factories, in industrial enterprises, and on public works.

The students are accepted graduates of secondary schools, selected by competitive examination. They attend the institutes for five years, the last year including a practical course. Besides their theoretical studies, they are sent every summer to practical work in factories and on railroads.

The list of the 13 higher schools is as follows:

1. The Technological School in St. Petersburg, one of the oldest technical schools, opened in 1828. There are two divisions, the mechanical and the chemical, attended by 1,109 students. The State assigns for it yearly 275,628 rubles.

2. The Technological Institute in Kharkof, dating from 1885. It has 685 students and receives yearly 341,544 rubles from the State.

3. The Moscow Imperial Technical High School, with 865 students, organized like the two preceding. The yearly income of 269,500 rubles includes 208,000 given by the State.

4. The Technological Institute in Tomsk (Siberia), founded in 1900. This school has accommodations for 220 students.

5. The Polytechnical School in St. Petersburg, ready to be opened next autumn (1903), and designed for 1,800 students, with the 4 following departments: Economy, shipbuilding, metallurgy, and electrotechnics.

6. The Polytechnical Institute in Riga, having 6 divisions, viz: Chemistry, mechanics, agronomy, commercial sciences, architecture, and engineering, and attended by 1,446 students. This school is chiefly supported by the city of Riga.

7. The Polytechnical Institute in Kief, consisting of 4 divisions, viz: Mechanics, engineering, agronomy, and chemistry. It has 710 students.

8. The Polytechnical Institute in Warsaw, with only 3 divisions, while a fourth division of mining is to be founded next year. It has 644 students, and was chiefly constructed from the means provided by the city and the local Polish societies, which presented during the visit of the Emperor to Warsaw a million for this purpose in memory of his visit.

9. The Institute of Railway Engineers in St. Petersburg, containing 886 students.

10. The Engineering School in Moscow, attended by 300 students.

11. The Institute of Civil Engineers is supported by the sum of 82,000 rubles, yearly appropriated by the State. The number of the students is 350.

12. The Institute of Mining in St. Petersburg, which is very ancient. It was founded about a century ago, in 1795, in the reign of Catherine II; 480 students are studying there; 156,205 rubles are appropriated yearly for this school. The institute is celebrated for its splendid mineral collections.

13. The Electro-Technical Institute, the aim of which is to prepare engineers for the State's telegraphs and telephones. The maximum number of students is 300.

It will be of interest to compare Russia with other European countries as regards higher technical education. According to the statistical tables for the year 1898-99 exhibited in the Paris exhibition, the number of higher technical students in Germany was 15,000, in Russia 8,000, in Austria 3,500, in France 1,500, in Italy and Switzerland 1,200, while in Spain and Denmark the number did not exceed 500.

#### OTHER TECHNICAL AND SPECIAL SCHOOLS.

Intermediate and elementary technical and industrial education in Russia is supervised by a special division of the ministry of public instruction, formed in the year 1883. To this division was given the work of drawing up the general educational programme which received the imperial sanction in 1888.

All the boys' schools of middle and lower grades directed by the division of industrial schools are divided, according to the object they have in view, into five groups.

1. The technical schools with the course of the middle grade educational establishments. Their aim is to provide their pupils with a general education, and also with that amount of technical education that is necessary to qualify them for positions as assistant engineers or for acting as foremen in smaller industrial enterprises.

These schools consist either (1) of 4 special classes where students are received after a five-years' course in a secondary "Realschule;" or (2) a five-years' general course is attached to the last 4 technical classes; or (3) the 7 classes of the middle technical school contain both the general and the special subjects.

The number of such schools is 20; the most noteworthy among them are the school of Krasnoofinsk (furnishing teachers for the mine works), the Komnessorof School

in Moscow, and the industrial school in Lodz, preparing textile and weaving specialists.

2. The lower technical schools, in which such subjects of general education are taught as are found in the programmes of the higher elementary schools; their aim is to prepare master workmen for the factories, specialists in the ruder kind of mechanical work, machinists, and draftsmen. Their number is also 20.

3. The so-called artisan schools, 22 of higher and 55 of lower grade, with a programme of general subjects resembling that of the elementary schools. They prepare master workmen in the domestic industries, and give instruction in carpentering, carving, blacksmithing, tailoring, shoemaking, bookbinding, etc.

The most noteworthy for their specialties are (1) the artisan schools of leather fabrication in Bogorodsk and Bazarmy Karkoulac (the objects exhibited by the latter were sent after the Paris exhibition to England in exchange for a collection from a bootmaking school); (2) the school of toy making in Totma, and (3) the school of bonnet making in Samara.

4. The 67 industrial schools with different specialties in their programmes, to which may be added the schools for adults, such as the schools of printing, the evening classes of the Imperial Technical Society, etc.

5. The newly created 18 schools for apprentices, the aim of which is to replace the hard years of apprenticeship in a workshop under the direction of an ignorant master by a course giving some general education and the theoretical knowledge necessary for a workman besides his practice. Boys of 11 to 13 years attend these schools before entering a factory workshop under the oversight of an experienced master. Most of these schools are founded near large factories for their workmen.

The number of pupils attending these 209 schools was, in 1900, nearly 13,000. The expenditures of the year amount to nearly 2,000,000 rubles, of which the State supplies 34.9 per cent, the local institutions 21 per cent, the income of funds 16.3 per cent, fees for teaching 12.3 per cent, the selling of the objects made in the workshops by the pupils 4.5 per cent, while the remaining 11.2 per cent proceeds from different sources.

During the years 1888 to 1898, while the division of industrial schools proceeded with its work, the yearly income of the middle and lower grade technical schools increased from 400,000 rubles to nearly 2,000,000, thanks to the constant gifts presented for this purpose by private individuals, townships, and associations. Among these benefactions may be noted that of the celebrated railway contractor Chigof, who left a fund of 5,000,000 rubles for the construction of 5 industrial schools in the province of Kostrome, where he was born. Mr. N. Kareznikof left 3,000,000 rubles for a technical boarding school in Irkutsk. The councilor of commerce, Mr. Komarof, left 3,500,000 rubles for an artisan school in Rybinsk; the merchant Pastouhof, 380,000 rubles. The municipality of Moscow gave 850,000, the magistrate of Lodz 200,000, the city of Odessa 1,000,000, and a series of other municipalities more than 100,000 rubles each, for the construction of technical schools.

The intention of the ministry of public instruction is to open every year two or three middle grade technical schools, five or six artisan schools, and ten or eleven schools of the lowest grade. The expense will amount to the sum of 1,500,000 rubles yearly; but only by this course can a satisfactory result be obtained, owing to the evident need in Russia of men with special education.

In the year 1902 a series of artisan schools are to be constructed in the localities where some domestic (or "kush") industry is particularly developed. In the Crimea a coopers' school will be necessary for the vine dressers, in Kimry (a village where leather is fabricated) a shoemaking school, in the agricultural provinces schools of agricultural machinery, etc.

The professional schools for girls are less numerous; their programmes as well as their incomes are various. There were in 1899-1900 48 professional girls' schools, 30 professional classes and workshops, 15 cookery schools, 105 needlework classes

added to schools for general education, and courses preparing teachers of needlework in St. Petersburg. Most of these institutions are supported by private gifts, the State furnishing them only 10,000 rubles yearly.

A private "society for encouraging the professional education of women" formerly played the leading part in matters concerning the programmes and regulations of such schools. But in the year 1900 the ministry of public instruction formed in the scientific committee a division of professional education for women, the office of which is to elaborate and publish new programmes and rules, and to discuss all special questions concerning girls' professional schools.

To the group of technical schools belong the intermediate and lower institutions controlled by the ministry of railroads. They train the personnel serving on the rail and river roads, and are of three classes: (1) One middle-graded, the so-called school of railway conductors, preparing assistant engineers; (2) 34 lower technical railway schools; (3) three so-called river schools. The two last groups train employees for subordinate service on the railway and river central systems.

The 6 mining schools also belong to the group of technical schools, as well as the 20 rural workshops under the direction of the ministry of finance; the aim of these latter is to prepare workmen to take care of agricultural machines and to make the simplest instruments.

#### COMMERCIAL SCHOOLS.

The ministry of finance, however, manifests a far greater interest in the supervision and construction of the commercial educational establishments, the development of which is quite recent. In 1894 there were only 9 commercial schools, with 2,500 students; their present number is 105, attended by 18,400 students.

The commercial schools are divided into three classes:

1. The intermediate commercial institutions, 42 in number, with a general course of seven years, a secondary school, or only a special course of three years. Their aim is to prepare agents for large commercial or industrial enterprises.

2. The so-called trade schools, with a course of one or of three years, preparing employees of lower grade for the same enterprises. There are 30 trade schools founded by private persons or by the State.

3. The 33 commercial courses and classes, the object of which is to impart knowledge in commercial sciences to persons of all ages, from 12 years upward, already employed in industrial or commercial institutions, or having the intention to enter such.

The income of commercial schools has been almost exclusively derived from private or local sources, such as local institutions, associations, and private gifts. (The State gives only 25,000 rubles yearly.) The yearly expenditures are 2,382,000 rubles, a middle-grade school, attended on an average by 380 pupils, costing nearly 35,000 rubles, while the minimum cost of a class in the commercial sciences, with 15 to 20 students, is 300 rubles a year. Nearly 32 "real" secondary schools, commercial sections, with a course of three years, have been founded.

Departments of higher commercial education exist in the Riga and St. Petersburg polytechnical schools and in the Oriental Institute in Vladivostok. The commercial education of women is still in private hands. We can only mention two girls' public commercial schools, in St. Petersburg (asylum of Demidoff) and in Odessa, but commercial courses and classes are, as a general rule, often for both sexes.

#### ART SCHOOLS.

A special type of professional schools, under the jurisdiction of the ministry of finance, is yet to be mentioned, viz, the schools of art and of art industry. Besides the Academy of Arts in St. Petersburg, a higher school of sculpture exists in Moscow. Four large schools of art industry form a second category: (1) The Central School of Drawing of Streglitz; (2) the School of Technical Drawing of Strogonoff in Moscow;

(3) a school conducted by the Imperial Society of Art Instruction; (4) one of the same of the Poet Gogol in Mirgorod. A degree lower are drawing schools in all large cities, and a series of evening drawing classes for artisans and workmen. In 1901 a school of industrial art is to be opened in Ekaterinburg in the Ural, with divisions for gold, silver, and stone industries.

#### AGRICULTURAL EDUCATION.

Agricultural education is of great importance in Russia, where the greater proportion of the population derives its living from agriculture. Nevertheless it was introduced only twenty years ago. Since then the number of schools has increased every year, and the ministry of agriculture, which has the direction of this branch of education, could present to the last Paris exhibition the most remarkable statistics, that speak for themselves:

Year.	Agricultural schools.	Students.	Expenditure.
			<i>Rubles.</i>
1879.....	14	1,292	435,980
1889.....	46	2,715	673,015
1899.....	133	5,992	2,076,499

All agricultural and forestry educational institutions, like the other technical ones, are of three grades. To the higher grade belong four of them, namely: (1) The New Alexandria higher agronomical and forestry institute (province of Lublin, Poland); (2) the agronomic institute in Moscow; (3) the forestry institute in St. Petersburg; (4) the higher courses of oenology near the Imperial Garden Nikitsky in the Crimea. Besides these, the two polytechnical institutes in Riga and Kief have agronomic departments. All high-grade agricultural schools are designed to give their students good, superior instruction in forestry and agronomy.

The middle-grade schools, which prepare young men theoretically and practically to be overseers of properties with regular rural economy, are 13 in number, with 1,599 students in them. All these schools have a general secondary course of six years, besides the agricultural sciences. Some prepare vinedressers, others sheep breeders, others again land surveyors. In Gorki, province of Mogilef, has been founded almost the best and the most noteworthy of the middle-grade schools, where, in an artisan section, boys are taught to take care of agricultural machines and to make the simplest parts of them. In order to prepare teachers for the middle-grade schools normal agricultural courses are added to the same school and to another middle-grade establishment (in Kharkof).

The schools of the lower grade may be subdivided into eight groups, according to the branches taught in them, as follows: (1) Eighty-two general agricultural lower schools; (2) 83 horticultural schools; (3) 15 dairy schools; (4) 1 school of sheep breeding; (5) 1 agricultural-artisan school; (6) 4 women's schools of rural economy and dairying; (7) 13 practical schools for gardeners; (8) 28 schools for foresters.

The general aim of all these schools, attended by nearly 4,000 students, is to spread among the rural population elementary knowledge of the agricultural sciences and to teach the peasants different trades and handicrafts useful in their life.

To complete the picture of the actual state of agricultural education in Russia, the measuring and land-surveying schools must be mentioned, viz, the Constantin Measuring Institute in Moscow, and the five intermediate land-surveying schools.

#### ELEMENTARY INSTRUCTION.

Before entering any of the preceding schools most of the boys, as a preparatory grade, pass through the village or city elementary school. This side of education, which exercises so much influence on the general welfare of a nation, is in Russia in

part under the direction and supervision of the ministry of public instruction, a certain number of schools being attached to the other departments.

Under elementary instruction are included (1) elementary schools of one class, with a course of four years; (2) higher elementary schools, to which belong the district schools, the town schools of five classes, and the ministerial two-class model schools, with a course of five years. The same grade occupies the second graded school of the department of the holy synod.

The elementary school occupies itself with the immediate surroundings of the pupils, the first religious instruction, the mother tongue, reading printed and written matter, arithmetic, and church singing.

The higher grade elementary programme includes geography, Russian history, geometry, drawing, drafting, and singing. If possible a trade or school gardening is added for the boys and needlework for the girls.

In the course arranged by the holy synod great stress is laid on religious instruction.

Children of both sexes may attend elementary schools; the education of this grade is gratuitous.

The elementary schools of the ministry of public instruction are generally founded by cities, zemstvos, communes, or private individuals. The local direction belongs to the district and provincial school councils, composed of representatives of the ministries, the clergy, and the local authorities, which provide means for supporting the schools; the presidency belongs to the local president of the nobility. The immediate supervision depends upon inspectors of public schools in the districts and directors of public schools in the provinces.

The so-called reading schools where pupils are simply taught to read, write, and cipher, and parochial schools of the same grade as the elementary ones above mentioned, are supervised by special school councils depending upon local bishops and directed by the school council connected with the holy synod.

To the elementary schools must be added the evening and Sunday schools for adults, founded for the most part by private persons. These complete the list of elementary schools, attendance at which is far from being obligatory, except in the provinces of the Baltic Sea, Finland, and the domain of the Cossacks, where compulsory school laws are in force. Schools are not yet everywhere accessible to all children of school age, owing to the great distances. The actual aim of the ministry of public instruction and of the local institutions is to provide the country with a sufficient number of rural schools.

The best results are attained by the province of Moscow, where elementary schools are within reach of all children of suitable age, and the result shows that under these circumstances no compulsory measures are needed to force the children to go to school.

The latest statistics published by the department of public instruction show that in 1898 the total number of elementary schools was 78,724, with 3,801,133 pupils of both sexes (the 30,000 professed Hebrew and Mussulman schools are not included in this list); 32,708 of them, with 2,339,934 pupils, were attached to the ministry of public instruction (counting in 1,114 Sunday schools). The holy synod directed 34,836 schools with 1,116,492 pupils. The expenditure for elementary instruction is now nearly 80,000,000 rubles a year—58,000,000 furnished by the State, the remainder by local authorities and private persons.

This total of elementary schools can not be sufficient for a population of 120,000,000, but it should be remembered that the development of popular education in Russia has taken place under very unfavorable conditions. Progress began with the abolition of serfdom in 1861 and the introduction of local self-government in 1865. A comparison between the actual statistics and the figures of the year preceding the reforms of the Emperor Alexander II testifies to the result of the efforts made by Russia in this direction. In 1856 in the whole country there were only 8,227 elementary schools, with 45,000 pupils in them.

## SECONDARY EDUCATION.

Secondary education is open to both boys and girls of all social classes. The girls' gymnasia and progymnasiums which have a complete secondary course—376 in number, according to the latest statistics—are often public secondary schools, with almost the same course as the masculine one except the ancient tongues. The course of study is seven years. To some of the gymnasia an eighth normal class is added to prepare those wishing to embrace the teacher's career. For graduates of a gymnasium without an eighth class a pedagogical course is formed for the same end. Besides these schools, 346 of which are attached to the ministry of public instruction and 30 are directed by the Society of the Empress Maria, this society founded and is now supporting 32 secondary boarding schools for girls. To complete the number of secondary schools for girls we must add to the establishments mentioned above 69 secondary parochial schools, the general object of which is the education of the daughters of the orthodox clergy. These 477 secondary establishments were attended in 1899 by 129,000 girls.

The secondary schools for the general instruction of boys are on the point of being radically reformed in their programmes and methods. Till the year 1900 they were divided into (1) classical gymnasia and progymnasiums and (2) "real schools." The former (191 gymnasia and 53 progymnasiums) had a course of eight years preparing for the university, and based their educational system on the study of the classical tongues. The second type of schools (115 in number) consisted of 7 classes and prepared for all higher technical schools.

The expected reform of secondary education (recognized defective and unsatisfactory in Russia) was first made by the last minister of public instruction, Mr. Bogolepof, who assembled in 1899 a special commission to discuss the matter. But the final execution of the change will devolve upon the present minister, the general adjutant, Mr. Vannovsky, called to this responsible post by the memorable imperial decree of March 25, 1901, as follows:

The experience of recent years has shown such important defects in our educational system that I believe it is time to begin without delay its radical examination and correction.

Fully appreciating your experience as a statesman and your highly cultivated mind, I choose you as my companion in the work of renewing and reconstructing the Russian school.

## INSTITUTIONS OF HIGHER EDUCATION.

It seems evident that not only the secondary system was meant by these last words, but that they also have in view the immediate reform of the organization of educational institutions of higher grade, namely, the universities.

There are 10 universities in Russia, in the towns of St. Petersburg, Moscow, Kief, Kharkof, Odessa, Warsaw, Kazan, Yurjef, Tomsk, and Helsingfors.

Each university is composed of four faculties, viz, history and philology, law, medicine, science and mathematics. The university of St. Petersburg forms an exception to this general rule, where, instead of the medical faculty, is the department of oriental tongues; also the university of Yurjef, where to the four usual faculties is added a theological one (preparing Protestant clergymen), and the university of Tomsk, which has only two faculties, those of law and medicine.

The admission of graduates of secondary classical schools takes place every autumn without special examination. The course of study is four years, after which a state examination is held for university graduates wishing to enter the Government service.

The interior organization is expected to be so thoroughly changed before the next semester that it is not considered desirable to give a description of it now.

Besides the 13 technical institutes, the 4 agricultural schools, and the 10 universities, there are 18 higher grade educational establishments in Russia, namely: two

special medical schools, the Imperial Military Medical Academy, in St. Petersburg, and the Clinical Institute of the Grand Duchess Elena Pavlovna; 3 historic-philological institutes, in St. Petersburg and Niegine; 2 higher schools of oriental tongues, in Moscow; the so-called Institute Lezaref; in St. Petersburg, 3 lyceums and 1 higher school of law; the Alexander Lyceum and the school of law, in St. Petersburg; the Lyceum Demidof, in Yaroslaf; the Nicolas Lyceum, in Moscow; 4 higher veterinary institutes, in Kharkof, Warsaw, Kazan, and Yurjef; 1 academy of arts, in St. Petersburg, and 3 higher establishments for women.

These last deserve especial attention, having been founded and being supported exclusively by private societies. The oldest of them, the Superior Courses for Women, in St. Petersburg, has, like the universities, a course of four years and two faculties, the historic-philological and the mathematical. Quite lately there was a question of adding an agronomical section to these two. The number of women attending the courses is nearly 1,000, and the expenditure of the society supporting them is 144,000 rubles yearly.

The second institution, founded five years ago under similar conditions, is the Women's Medical Institute in St. Petersburg, with a five-years' course of study, attended also by nearly 1,000 women students. The third school is the Higher Course in Moscow, to which next year a medical institute will be added.

The total number of superior educational institutions in Russia, including the higher military, naval, and ecclesiastical schools, is 55, with more than 30,000 students attending them, which number is three times larger than in the year 1878, when there were only 10,000 students of this grade.

#### MILITARY, NAVAL, AND THEOLOGICAL SCHOOLS.

The system of military schools includes 4 schools of higher grade, or academies, viz, the Nicholas Military Academy, the Military Jurisdiction Academy, the Military Engineering Academy, and the Artillery Academy.

A grade lower are the 8 officers' schools. The secondary educational institutions are all boarding schools, designed for the children of officers; the higher classes, which the cadets must pass before being qualified as officers, are called the "junkers' schools."

For the superior instruction of naval officers an academy and a naval engineering school in Kronstadt have been founded. Intermediate education is given in the naval corps in St. Petersburg, including a three years' general course and three years of special sciences. The lower naval education is given in the 44 sailors' classes.

The ecclesiastical schools, of 3 grades, prepare the orthodox clergy. There are 3 orthodox academies, 1 for Roman Catholics, and 1 faculty (in the university of Yurjef) for Protestants. The system of secondary schools consists of 65 seminaries; the lower grade includes 55 ecclesiastical schools, both serving for the education of the children of the orthodox clergy. All these schools are attached to the Holy Synod.

Russia is generally looked upon as a country which remains far behind in regard to public instruction; but it must be taken into consideration that the commencement of public instruction is very recent and that the Russian State and society have been working at it only for the last thirty-five years. The efforts made during the last twenty years have been most remarkable, as was testified to by the experts and visitors of the educational section of the last Paris Exhibition, where more than 60 documents dealing with all aspects of public instruction were published and distributed by the Russian division. This division was next to the French one in the number of schools exhibited and in printed matter. Besides organizing it the Russian Government provided 50,000 rubles for the transportation of 600 Russian educators to Paris during the summer of 1900, to enable them to study the different methods and systems of instruction.

## CHAPTER XXIX.

### LIST OF EDUCATIONAL PERIODICALS IN THE UNITED STATES IN 1902.

#### (1) ARRANGED BY STATES.

##### *Alabama.*

Birmingham, Educational Exchange, M., 1902, vol. 17.  
Huntsville, The Educator, M., 1902, vol. 4.  
Normal, Normal Index, W., 1902, vol. 16.

##### *Arkansas.*

Little Rock, Arkansas School Journal, M., 1902, vol. 7.

##### *California.*

Berkeley, University Chronicle, Bi-m., 1902, vol. 5.  
San Francisco, Western Journal of Education, M., 1902, vol. 17.

##### *Colorado.*

Denver, Chautauquan Journal, M., 1902, vol. 4.  
Denver, Colorado School Journal, M., 1902, vol. 17.

##### *Connecticut.*

Meriden, Connecticut School Journal, W., 1902, vol. 8.  
New Haven, Yale Review, M., 1902, vol. 11.

##### *District of Columbia.*

Washington, American Annals of the Deaf, Qu., 1902, vol. 48.  
Washington, Catholic University Bulletin, Qu., 1902, vol. 8.

##### *Florida.*

Jacksonville, Florida School Exponent, M., 1902, vol. 9.  
Tallahassee, Southern School and Home, M., 1902, vol. 1.

##### *Georgia.*

Atlanta, Southern Educational Journal, M., 1902, vol. 15.

##### *Illinois.*

Bloomington, School and Home Education, M., 1902, vol. 21.  
Chicago, Biblical World, M., 1902, vol. 16.  
Chicago, Child Garden, M., 1902, vol. 10.  
Chicago, Dial (The), M., 1902, vol. 80.

Chicago, Elementary Teacher and Course of Study, M., 1902, vol. 3.

Chicago, Journal of Childhood and Adolescence, M., 1902, vol. 2.

Chicago, Kindergarten Magazine, M., 1902, vol. 15.

Chicago, Manual Training Magazine, Qu., 1902, vol. 4.

Chicago, Music, M., 1902, vol. 20.

Chicago, Progress, M., 1902, vol. 7.

Chicago, Review of Education, M., 1902, vol. 8.

Chicago, School Review, M., 1902, vol. 10.

Chicago, School Science, M., 1902, vol. 2.

Chicago, University Record, W., 1902, vol. 7.

Oak Park, Intelligence, Semi-m., 1902, vol. 22.

Oak Park, School Weekly, W., 1902, vol. 8.

Taylorsville, School News and Practical Educator, M., 1902, vol. 16.

##### *Indiana.*

Indianapolis, Educator-Journal, M., 1902, vol. 3.

##### *Iowa.*

Cedar Rapids, The Western Penman, M., 1902, vol. 19.

Charles City, Iowa Teacher, M., 1902, vol. 17.

Des Moines, Midland Schools, M., 1902, vol. 17.

Dubuque, Iowa Normal Monthly, M., 1902, vol. 25.

Fort Dodge, Webster County Teacher, M., 1902, vol. 12.

Keokuk, School Music Monthly, M., 1902, vol. 3.

##### *Kansas.*

Emporia, State Normal Bulletin, M., 1902, vol. 4.

Lawrence, Kansas University Quarterly, Qu., 1902, vol. 11.

Manhattan, Industrialist (The), M., 1902, vol. 29.

New Albany, Country School Champion, M., 1902, vol. 5.

Topeka, Western School Journal, M., 1902, vol. 19.

##### *Louisiana.*

New Orleans, Teachers' Outlook, M., 1902, vol. 3.

##### *Maryland.*

Baltimore, Johns Hopkins University Circular, M., 1902, vol. 22.

*Massachusetts.*

- Boston, American Kitchen Magazine, M., 1902, vol. 15.  
 Boston, American Primary Teacher, M., 1902, vol. 20.  
 Boston, Bostonia, Qu., 1902, vol. 3.  
 Boston, Boston Cooking School Magazine, Bi-m., 1902, vol. 7.  
 Boston, Education, M., 1902, vol. 23.  
 Boston, Journal of Education, W., 1902, vol. 54.  
 Boston, Literary World, Semi-m., 1902, vol. 33.  
 Boston, Popular Educator, M., 1902, vol. 19.  
 Boston, Posse Gymnasium Journal, M., 1902, vol. 10.  
 Boston, Practical Psychology, M., 1902, vol. 2.  
 Boston, Primary Education, M., 1902, vol. 10.  
 Boston, School Physiology Journal, M., 1902, vol. 12.  
 Boston, Technological Quarterly, Qu., 1902, vol. 15.  
 Cambridge, The People, M., 1902, vol. 4.  
 Springfield, Kindergarten Review, M., 1902, vol. 13.  
 Worcester, Seminary (The), Qu., 1902, vol. 9.  
 Worcester, American Journal of Psychology, Qu., 1902, vol. 14.

*Michigan.*

- Lansing, Journal of Pedagogy, Qu., 1902, vol. 18.  
 Lansing, Michigan School Moderator, Semi-m., 1902, vol. 23.

*Minnesota.*

- Minneapolis, School Education, M., 1902, vol. 21.  
 Minneapolis, Minnesota School Journal, M., 1902, vol. 2.

*Missouri.*

- Fulton, School Independent, M., 1902, vol. 1.  
 Jefferson City, Missouri School Journal, M., 1902, vol. 19.  
 St. Louis, Evangelish-Lutherisches Schulblatt, M., 1902, vol. 37.

*Nebraska.*

- Lincoln, Nebraska Teacher, M., 1902, vol. 5.  
 Lincoln, School Index, M., 1902, vol. 2.  
 Omaha, Nebraska Mute Journal, M., 1902, vol. 30.  
 Santee Agency, Word Carrier, M., 1902, vol. 31.

*New Hampshire.*

- Manchester, Notes and Queries, M., 1902, vol. 21.

*New Jersey.*

- Ringoes, Journal of Orthoepe and Orthografi, M., 1902, vol. 19.  
 Trenton, Silent Worker (The), M., 1902, vol. 15.

*New York.*

- Albany, American Education from Kindergarten to College, M., 1902, vol. 6.  
 Brooklyn, American Physical Education Review, Qu., 1902, vol. 3.  
 Brooklyn, Latin Leaflet, W., 1902, vol. 2.  
 Brooklyn, Teacher (The), M., 1902, vol. 7.  
 Cornwall, Schoolmaster (The), M., 1902, vol. 5.

- Dansville, Normal Instructor and Teachers' World, M., 1902, vol. 11.  
 Malone, Mentor (The), M., 1902, vol. 8.  
 Newark Valley, Educational Review, M., 1902, vol. 3.  
 New York, American School Board Journal, M., 1902, vol. 22.  
 New York, American University Magazine, Bi-m., 1902, vol. 9.  
 New York, Art Amateur (The), M., 1902, vol. 44.  
 New York, Art Study, M., 1902, vol. 1.  
 New York, Columbia University Quarterly, Qu., 1902, vol. 5.

<sup>a</sup>Corrected to June, 1903, in so far as changes have been reported to the Bureau.

## II.—LIST OF CITY SUPERINTENDENTS.

## ALABAMA

Anniston, D. R. Murphy.  
 Bessemer, Joseph M. Dill.  
 Birmingham, J. H. Phillips.  
 Eufaula, F. L. McCoy.  
 Florence, Henry Clay Gilbert.  
 Huntsville, S. R. Butler.  
 Mobile, S. S. Murphy.  
 Montgomery, Charles L. Floyd.  
 New Decatur, R. R. Harris.  
 Opelika, George W. Brock.  
 Phoenix, W. F. Monk.  
 Selma, R. E. Hardaway.  
 Tuscaloosa, James H. Foster.

## ARIZONA.

Phoenix, R. L. McDonnold.  
 Tucson, William Angus.

## ARKANSAS.

Fayetteville, J. C. Mitchell.  
 Fort Smith, B. W. Torreyson.  
 Helena, S. H. Spragins.  
 Hot Springs, George B. Cook.  
 Jonesboro, D. T. Rogers.  
 Little Rock, John H. Hinemon.  
 Pine Bluff, ———.  
 Texarkana, W. C. McAllister.

## CALIFORNIA.

Alameda, Charles C. Hughes.  
 Bakersfield, David W. Nelson.  
 Berkeley, S. D. Waterman.  
 Eureka, A. C. Barker.  
 Fresno, C. L. McLane.  
 Los Angeles, James A. Foshay.  
 Napa City, J. L. Shearer.<sup>a</sup>  
 Oakland, John W. McClymonds.  
 Pasadena, James D. Graham.  
 Pomona, Frank H. Hyatt.<sup>b</sup>  
 Redlands:  
     School district, A. Harvey Collins.<sup>b</sup>  
     Luconia district, D. C. Reed.<sup>b</sup>  
 Riverside, Howard L. Lunt.<sup>b</sup>  
 Sacramento, O. W. Erlewine.  
 San Bernardino, Miss Lula Claire Bahr.  
 San Diego, F. P. Davidson.  
 San Francisco, W. H. Langdon.  
 San Jose, D. T. Bateman.  
 Santa Ana, Joseph C. Templeton.  
 Santa Barbara, William A. Wilson.  
 Santa Cruz, David C. Clark.  
 Santa Rosa, E. M. Cox.<sup>b</sup>  
 Stockton, James A. Barr.  
 Vallejo, J. J. Rippetoe.

## COLORADO.

Aspen, F. J. Brownscombe.  
 Boulder, William V. Casey.

<sup>a</sup> Principal grammar school.

<sup>b</sup> Supervising principal.

<sup>c</sup> Secretary board of school visitors.

<sup>d</sup> Acting visitor.

<sup>e</sup> Principal.

Colorado Springs, John Dietrich.  
 Cripple Creek, Wilson M. Shafer.  
 Denver:

District No. 1, Aaron Gove.

District No. 2, L. C. Greenlee.

District No. 7, M. F. Miller.

District No. 17, Charles E. Chadsey.

Leadville, Edward C. Elliott.

Pueblo:

District No. 1, James S. McClung.

District No. 20, John F. Keating.

Trinidad, Charles V. Parker.

## CONNECTICUT.

Ansonia, Arthur D. Call.  
 Bridgeport, Charles W. Deane.  
 Bristol, Charles L. Wooding.  
 Danbury, A. C. Hubbard.<sup>c</sup>  
 Derby, J. W. Peck.  
 East Hartford, Joseph O. Goodwin,<sup>c</sup> Charles D. Hine.<sup>d</sup>  
 Enfield, George T. Finch.<sup>d</sup>  
 Greenwich, Newton B. Hobart,<sup>e</sup> Thomas F. Howley.<sup>c</sup>  
 Hartford, Thomas S. Weaver.  
 Huntington, Horace Wheeler.<sup>c</sup>  
 Killingly, James M. Paine.  
 Manchester:  
     Town schools, Herbert O. Bowers.<sup>c</sup>  
     Ninth district (south), Charles S. Cheney.  
 Meriden, Albert B. Mather.  
 Middletown, Walter B. Ferguson.  
 Naugatuck, Frank W. Eaton.  
 New Britain, Giles A. Stuart.  
 New Haven, Frank Herbert Beede.  
 New London, Charles B. Jennings.  
 New Milford, Charles N. Hall.  
 Norwalk, A. Blanchard.<sup>c</sup>  
 Norwich:

Nathan Lee Bishop (superintendent Central district).

John B. Stanton (superintendent West Chelsea district).

Putnam, W. R. Barber,<sup>c</sup> E. H. Johnson.<sup>f</sup>

Southington, Mrs. Anna D. Pollard.

Stamford, Everett C. Willard.

Torrington, Edwin H. Forbes.

Vernon, W. B. Foster.

Wallingford, W. P. Thomson, Malcolm Booth (?).

Waterbury, B. W. Tinker.

West Haven, Edgar C. Stiles.

Westport, L. T. Day.<sup>g</sup>

Winchester, H. Hungerford Drake.<sup>h</sup>

Windham, George E. Hinman.<sup>i</sup>

## DELAWARE.

Wilmington, George W. Twitmyer.

## DISTRICT OF COLUMBIA.

Washington, A. T. Stuart.

<sup>f</sup> Acting school visitor.

<sup>g</sup> Secretary of the board of school visitors.

<sup>h</sup> School visitor and secretary of the board, post-office, Winsted.

<sup>i</sup> Secretary school committee; post-office, Willimantic.

## FLORIDA.

 Key West, J. V. Harris.<sup>a</sup>  
 Lake City, T. H. Owens.<sup>a</sup>  
 Pensacola, N. B. Cook.<sup>a</sup>  
 St. Augustine, E. H. Reynolds.  
 Tampa, B. C. Gragam.<sup>a</sup>

## GEORGIA.

Albany, S. R. De Jarnette,<sup>a</sup> L. E. Welsh.<sup>b</sup>  
 Americus, J. E. Mathis.  
 Athens, G. G. Bond.  
 Atlanta, W. F. Slaton.  
 Augusta, Lawton B. Evans.  
 Brunswick, N. H. Ballard.  
 Columbus, Carleton B. Gibson.  
 Dalton, B. M. Thomas.  
 Griffin, J. Henry Walker.  
 Macon, Jere M. Pound.  
 Marietta, Steadman V. Sanford.  
 Rome, James C. Harris.  
 Savannah, Otis Ashmore.  
 Thomasville, C. Jackson.  
 Waycross, E. A. Pound.

## IDAHO.

Boise, John W. Daniels.  
 Pocatello, Walter R. Siders.

## ILLINOIS.

Alton, Robert A. Haight.  
 Aurora:

District No. 4 (west side), A. V. Greenman.

District No. 5 (east side), C. M. Bardwell.

Beardstown, H. J. Jokisch.  
 Belleville, J. K. Light.  
 Belvidere, Arthur J. Snyder.  
 Bloomington, J. K. Stableton.  
 Blue Island, J. E. Lemon.  
 Cairo, Taylor C. Clendenen.  
 Canton, Charles S. Aldrich.  
 Centralia, S. H. Bohn.  
 Champaign, Joseph Carter.  
 Charleston, J. L. Hughes.  
 Chicago, Edwin G. Cooley.  
 Clinton, E. B. Bentley.  
 Collinsville, Charles H. Dorris.  
 Danville, L. H. Griffith.  
 Decatur, Enoch A. Gastman.  
 Dekalb, Newell D. Gilbert.  
 Dixon, Charles W. Groves.  
 Duquoin, Charles W. Houk.  
 East St. Louis, John Richeson.  
 Edwardsville, Charles W. Parkinson.  
 Elgin, M. A. Whitney.  
 Evanston:

District No. 1, Homer H. Kingsley.

District No. 74, North Evanston, Nellie E. Trembor.<sup>b</sup>

District No. 76, South Evanston, Fred W. Nichols.

Freeport, R. S. Page.  
 Galena, P. H. Clark.  
 Galesburg, William L. Steele.  
 Harlem, Frank Curtis.

<sup>a</sup> County superintendent.

Harvey, F. L. Miller.  
 Jacksonville, E. E. Webster.  
 Joliet, John J. Allison.  
 Kankakee, F. N. Tracy.  
 Kewanee, A. C. Butler.  
 La Salle, J. B. McManus.  
 Lincoln, B. E. Nelson.  
 Litchfield, C. E. Richmond.  
 Macomb, W. W. Earnest.  
 Maywood, J. Porter Adams.  
 Mattoon, G. P. Randall.  
 Metropolis City, Edward Longbons.  
 Moline, William J. M. Cox.  
 Monmouth, B. F. Armitage.  
 Morris, Preston King Cross.  
 Mount Carmel, W. S. Booth.  
 Mount Vernon, H. J. Alvis.  
 Murphysboro, Edward J. Klemme.  
 Ottawa, W. A. Furr.  
 Pana, H. C. McCarrel.  
 Paris, H. W. Monical.  
 Pekin, O. A. Shotts.  
 Peoria, Newton Charles Dougherty.  
 Peru, Ira M. Ong.  
 Pontiac, Isaac Mitchell.  
 Princeton, ———.  
 Quincy, F. G. Ertel.  
 Rockford, P. R. Walker.  
 Rock Island, Herbert B. Hayden.  
 Springfield, J. H. Collins.  
 Spring Valley, C. H. Andrews.  
 Sterling:

District No. 3 (the Sterling schools), H. L. Chaplin.

District No. 8 (the Wallace schools), H. A. Hollister.

Streator, John Andrew Long.  
 Taylorville, John A. Cheney.  
 Urbana, J. W. Hays.  
 Waukegan, Miriam Besley.

## INDIANA.

Alexandria, Lawrence McTurnan.  
 Anderson, John W. Carr.  
 Bedford, W. E. Alexander.  
 Bloomington, James K. Beck.  
 Bluffton, W. A. Wirt.  
 Brazil, L. B. O'Dell.  
 Columbus, T. F. Fitzgibbon.  
 Connersville, W. S. Rowe.  
 Crawfordsville, William A. Millis.  
 Elkhart, D. W. Thomas.  
 Evansville, Frank W. Cooley.  
 Fort Wayne, Justin N. Study.  
 Frankfort, George L. Roberts.  
 Franklin, H. B. Wilson.  
 Goshen, Victor W. B. Hedgepeth.  
 Greencfield, A. E. Martin.  
 Greensburg, D. M. Geeting.  
 Hammond, W. H. Hershsman.  
 Hartford City, C. H. Drybread.  
 Huntington, Robert I. Hamilton.  
 Indianapolis, Calvin N. Kendall.  
 Jeffersonville, A. C. Goodwin.  
 Kokomo, Robert A. Ogg.  
 Lafayette, Russell K. Bedgood.

<sup>b</sup> Principal.

Laporte, John A. Wood.  
 Lawrenceburg, T. H. Meek.  
 Lebanon, Charles A. Peterson.  
 Logansport, Albert H. Douglass.  
 Madison, C. M. McDaniel.  
 Marion, Benjamin F. Moore.  
 Martinsville, J. E. Robinson.  
 Michigan City, Paul A. Cowgill.  
 Mishawaka, Byron J. Bogue.  
 Mount Vernon, Edwin S. Monroe.  
 Muncie, W. R. Snyder.  
 New Albany, C. A. Prosser.  
 Noblesville, John F. Haines.  
 Peru, Ira M. Ong.  
 Portland, Hale Bradt.  
 Princeton, ———.  
 Richmond, Thomas A. Mott.  
 Rushville, A. G. McGregor.  
 Seymour, H. C. Montgomery.

 South Bend, Calvin Moon.  
 Terre Haute, William H. Wiley.  
 Valparaiso, Arthur A. Hughart.  
 Vincennes, Albert E. Humke.  
 Wabash, Miles W. Harrison.  
 Washington, William F. Axtell.

## IOWA.

Atlantic, Carlos M. Cole.  
 Boone, J. C. King.  
 Burlington, Francis M. Fultz.  
 Cedar Falls, D. M. Kelly.  
 Cedar Rapids, J. J. McConnell.  
 Centerville, F. E. King.  
 Chariton, J. B. Morris.  
 Charles City, George S. Dick.  
 Clinton, O. P. Bostwick.  
 Council Bluffs, W. N. Clifford.  
 Creston, O. E. French.  
 Davenport, J. B. Young.  
 Des Moines:  
     East Side, Amos Hiatt.  
     West Side, Samuel H. Sheakley.  
     Capital Park, R. J. Hartung.  
 Dubuque, F. T. Oldt.  
 Fairfield, J. E. Williamson.  
 Fort Dodge, George H. Mullin.  
 Fort Madison, C. W. Cruikshank.  
 Grinnell, D. A. Thornburg.  
 Iowa City, S. K. Stevenson.  
 Keokuk, O. W. Weyer.  
 Lemars, Anson H. Bigelow.  
 Marion, G. E. Finch.  
 Marshalltown, William I. Crane.  
 Mason City, Leander D. Ellis.  
 Missouri Valley, ———.  
 Mount Pleasant, Frank Whittier Else.  
 Muscatine, W. F. Chevalier.  
 Oelwein, L. B. Moffett.  
 Oskaloosa, S. J. Finley.  
 Ottumwa, A. W. Stuart.  
 Redoak, G. W. Bryan.  
 Sioux City, W. M. Stevens.  
 Washington, W. A. Pratt.

## Waterloo:

East Side, F. H. Bloodgood.  
 West Side, A. T. Hukill.  
 Webster City, L. H. Ford.

## KANSAS.

Argentine, H. P. Butcher.  
 Arkansas City, W. M. Fisher.  
 Atchison, Nathan T. Veatch.  
 Coffeyville, W. E. Ringle.  
 Emporia, L. A. Lowther.  
 Fort Scott, David M. Bowen.  
 Galena, J. A. Higdon.  
 Hutchison, R. R. Price.  
 Iola, Miss Clifford A. Mitchell.  
 Junction City, William S. Heusner.  
 Kansas City, M. E. Pearson.  
 Lawrence, Frank P. Smith.  
 Leavenworth, ———.  
 Newton, David F. Shirk.  
 Ottawa, J. H. Adams.  
 Parsons, N. McDonald.  
 Pittsburg, R. S. Russ.  
 Salina, George R. Crissman.  
 Topeka, W. M. Davidson.  
 Wellington, H. F. M. Bear.  
 Wichita, R. F. Knight.  
 Winfield, J. W. Spindler.

## KENTUCKY.

Ashland, John Grant Crabbe.  
 Bellevue, F. S. Alley.  
 Bowling Green, Edward Taylor.  
 Covington, John Morris.  
 Danville, W. C. Grinstead.  
 Dayton, E. P. West.  
 Frankfort, S. L. Frogge.  
 Henderson, Livingstone McCartney.  
 Hopkinsville, J. B. Taylor.  
 Lexington, William Rogers Clay.  
 Louisville, Edgar H. Mark.  
 Maysville, E. Regenstien.<sup>a</sup>  
 Middlesboro, ———.  
 Newport, John Burke.  
 Owensboro, McHenry Rhoads.  
 Paducah, C. B. Hatfield.  
 Paris, A. O. Reubelt.  
 Richmond, J. D. Clark.

 Wilmerding, Samuel Hamilton. <sup>c</sup>  
 York, Atreus Wanner.

## RHODE ISLAND.

Bristol, John Post Reynolds.  
 Burrillville, Allen P. Keith.<sup>d</sup>  
 Central Falls, Wendell A. Mawry.  
 Coventry, William R. Potter.  
 Cranston, Valentine Almy.<sup>e</sup>  
 Cumberland, Wilbur A. Scott.  
 East Providence, George N. Bliss.  
 Johnston, William H. Starr.<sup>f</sup>  
 Lincoln, Frederick E. Bragdon.  
 Newport, Herbert Warren Lull.  
 North Kingstown, F. B. Cole.<sup>g</sup>

<sup>a</sup> Supervising principal.

<sup>b</sup> Principal.

<sup>c</sup> County superintendent.

<sup>d</sup> Post-office, Pascoag.

Pawtucket, Henry D. Hervey.  
 Providence, Walter H. Small.  
 South Kingstown, B. E. Helme.<sup>h</sup>  
 Warren, G. L. Church.  
 Warwick, C. Edward Glover.  
 Westerly, Charles H. Babcock.  
 Woonsocket, Frank E. McFee.

## SOUTH CAROLINA.

Anderson, Thomas C. Walton.  
 Beaufort, Frank T. Harder.  
 Charleston, Henry P. Archer.  
 Chester, W. H. Hand.  
 Columbia, E. S. Dreher.  
 Florence, C. Edward Johnson.  
 Georgetown, Ellison Capers, jr.  
 Greenville, E. L. Hughes.  
 Greenwood, Edward C. Coker.  
 Laurens, B. L. Jones.  
 Orangeburg, A. J. Thackston.  
 Spartanburg, Frank Evans.  
 Sumter, S. H. Edmunds.

## SOUTH DAKOTA.

Aberdeen, W. L. Cochrane.  
 Lead, E. C. Grubbs.  
 Mitchell, E. J. Quigley.  
 Sioux Falls, Frank C. McClelland.  
 Yankton, C. W. Martindale.

## TENNESSEE.

Bristol, Richard Henry Watkins.  
 Chattanooga, A. T. Barrett.  
 Clarksville, Alfred Livingston.  
 Columbia, W. E. Bostick <sup>b</sup> and J. H. Kelly.<sup>b</sup>  
 Jackson, Seymour A. Mynders.  
 Johnson City, J. E. Crouch.  
 Knoxville, Albert Ruth.  
 Memphis, George W. Gordon.  
 Nashville, Z. H. Brown.

## TEXAS.

Austin, T. G. Harris.  
 Bonham, I. W. Evans.  
 Brenham, Edward W. Tarrant.  
 Brownsville, Thomas P. Barbour.<sup>b</sup>  
 Brownwood, W. S. Fleming.  
 Cleburne, V. M. Fulton.  
 Corpus Christi, Charles W. Croosley.  
 Corsicana, J. W. Cantwell.  
 Dallas, J. L. Long.  
 Denison, J. E. Blair.  
 Denton, J. S. Carlisle.  
 El Paso, G. P. Putnam.  
 Ennis, H. F. Triplett.  
 Fort Worth, Alex. Hogg.  
 Gainesville, E. F. Comegys.  
 Galveston, John W. Hopkins.  
 Gonzales, T. L. Toland.  
 Greenville, J. H. Van Amburgh.  
 Hillsboro, W. D. Butler.  
 Houston, W. W. Barnett.

<sup>e</sup> Post-office, Auburn.

<sup>f</sup> Post-office, Centerdale.

<sup>g</sup> Post-office, Wickford.

<sup>h</sup> Post-office, Kingston.

Laredo, L. J. Christen.  
 McKinney, T. W. Lanham  
 Marshall, W. H. Attebery.  
 Palestine, Wilbur F. Wilson.  
 Paris, J. G. Wooten.  
 San Antonio, L. E. Wolfe.  
 Sherman, P. W. Horn.  
 Taylor, W. M. Williams.  
 Temple, James E. Binkley.  
 Terrell, S. M. N. Marrs.  
 Texarkana, W. Owens.  
 Tyler, J. L. Henderson.  
 Victoria, Felix E. Smith.  
 Waco, J. C. Lattimore.  
 Waxahachie, Walter Acker.  
 Weatherford, H. G. Reed.

## UTAH.

Logan, Albert M. Merrill.  
 Ogden, ———.  
 Provo, William S. Rawlings.  
 Salt Lake City, D. H. Christensen.

## VERMONT.

Barre, O. D. Mathewson.  
 Bellows Falls, B. E. Marriam.  
 Bennington, Charles L. Simmons.  
 Brattleboro, H. K. Whitaker.  
 Burlington, Henry O. Wheeler.  
 Montpelier, E. G. Ham.  
 Rutland, Willard A. Frazier.  
 St. Albans, Francis A. Bagnall.  
 St. Johnsbury, Clarence H. Dempsey.

## VIRGINIA.

Alexandria, Kosciusko Kemper.  
 Bristol, E. H. Russell.  
 Charlottesville, John S. Patton.  
 Danville, Abner Anderson.  
 Fredericksburg, Benjamin P. Willis.  
 Lynchburg, E. C. Glass.  
 Manchester, David L. Pulliam.  
 Newport News, John Sheldon Jones.  
 Norfolk, Richard A. Dobie.  
 Petersburg, D. M. Brown.  
 Portsmouth, John C. Ashton.  
 Richmond, William F. Fox.  
 Roanoke, Bushrod Rust.  
 Staunton, Francis H. Smith, jr.  
 Winchester, Maurice M. Lynch.

## WASHINGTON.

Ballard, J. C. Dickson.  
 Everett, George E. St. John.  
 Fairhaven, W. J. Hughes.  
 Olympia, C. W. Durette.  
 Seattle, Frank B. Cooper.  
 Spokane, J. F. Saylor.  
 Tacoma, A. B. Warner.  
 Vancouver, ———.  
 Walla Walla, F. M. Burke.  
 Whatcom, E. E. White.

## WEST VIRGINIA.

Benwood, Charles E. Carrigan.<sup>a</sup>  
 Bluefield, C. A. Fulwider.  
 Charleston, George S. Laidley.  
 Clarksburg, F. L. Burdette.  
 Grafton, Hayward Fleming.  
 Huntington, W. H. Cole.  
 Martinsburg, C. H. Cole.  
 Moundsville, D. T. Williams.  
 Parkersburg, U. S. Fleming.  
 Wheeling, David E. Cloyd.

## WISCONSIN.

Antigo, F. F. Showers.  
 Appleton, Carrie E. Morgan.  
 Ashland, J. T. Hooper.  
 Baraboo, H. A. Whipple.  
 Beaverdam, John C. Healy.  
 Beloit, Franklin E. Converse.  
 Berlin, J. E. Murphy.  
 Chippewa Falls, Silas B. Tobey.  
 Depere:

East Side, Andrew C. Mailer.

West Side, J. D. Conley.

Eau Claire, Otis C. Gross.  
 Fond du Lac, Wm. Wilson.  
 Grand Rapids, H. S. Yonker.  
 Greenbay, A. W. Burton.  
 Janesville, H. C. Buell.  
 Kaukauna, A. M. Olson.  
 Kenosha, Norman L. Baker.  
 La Crosse, John P. Bird.  
 Madison, R. B. Dudgeon.  
 Manitowoc, Paul G. W. Keller.  
 Marinette, John T. Edwards.  
 Marshfield, J. B. Borden.  
 Menasha, John Rosch.  
 Menominee, Judson E. Hoyt.  
 Merrill, W. H. Schulz.  
 Milwaukee, H. O. R. Siefert.  
 Monroe, G. W. Swartz.  
 Neenah, Jennie S. Cooke.  
 Oconto, C. A. H. Fortier.  
 Oshkosh, H. A. Simonds.  
 Portage, A. C. Kellogg.  
 Racine, George F. Bell.  
 Rhineland, F. A. Lowell.  
 Sheboygan, H. F. Leverenz.  
 Stevens Point, Edmund J. Vert.  
 Superior, B. B. Jackson.  
 Washburn, D. E. Cameron.  
 Watertown, Charles F. Viebahn.  
 Waukesha, H. L. Terry.<sup>a</sup>  
 Wausau, Karl Mathie.

## WYOMING.

Cheyenne, James O. Churchill.  
 Laramie, Frank W. Lee.  
 Rock Springs, B. A. Dunbar.

<sup>a</sup> Principal.

## III.—COLLEGE PRESIDENTS.

## I.—Colleges for men and coeducational colleges of liberal arts.

Name of president.	University or college.	Address.
A. P. Montague, Ph. D., LL. D.	Howard College	Eastlake, Ala.
Rev. S. M. Hosmer, D. D.	Southern University	Greensboro, Ala.
J. P. Neff, M. S.	Lafayette College	Lafayette, Ala.
Rev. Benedict Menges, O. S. B.	St. Bernard College	St. Bernard, Ala.
Rev. William Tyrrell, S. J.	Spring Hill College	Springhill, Ala.
John W. Abercrombie, LL. D.	University of Alabama	University, Ala.
Frank Y. Adams, A. M.	University of Arizona	Tucson, Ariz.
G. C. Jones, LL. D.	Arkadelphia Methodist College	Arkadelphia, Ark.
John W. Conger, LL. D.	Ouachita College	Do.
Eugene R. Long, Ph. D.	Arkansas College	Batesville, Ark.
Rev. E. H. Liles	Arkansas Cumberland College	Clarksville, Ark.
Rev. S. Anderson, A. B.	Hendrix College	Conway, Ark.
Henry S. Hartzog, LL. D.	University of Arkansas	Fayetteville, Ark.
Rev. J. M. Cox, D. D.	Philander Smith College	Little Rock, Ark.
B. I. Wheeler, Ph. D., LL. D.	University of California	Berkeley, Cal.
Rev. George A. Gates, D. D., LL. D.	Pomona College	Claremont, Cal.
Rev. G. W. Wadsworth, D. D.	Occidental College	Los Angeles, Cal.
Rev. J. S. Glass, C. M., D. D.	St. Vincent's College	Do.
William T. Randall, A. M., dean.	University of Southern California	Do.
Rev. T. G. Brownson, D. D.	California College	Oakland, Cal.
Walter A. Edwards, LL. D.	Throop Polytechnic Institute	Pasadena, Cal.
Rev. John P. Frieden, S. J.	St. Ignatius College	San Francisco, Cal.
Rev. Eli McClish, D. D.	University of the Pacific	San Jose, Cal.
Rev. Robert E. Kenna, S. J.	Santa Clara College	Santa Clara, Cal.
G. H. Wilkinson, Ph. B.	Pacific Methodist College	Santa Rosa, Cal.
D. S. Jordan, Ph. D., LL. D.	Leland Stanford Junior University	Stanford University, Cal.
James H. Baker, LL. D.	University of Colorado	Boulder, Colo.
Rev. W. F. Sloum, LL. D.	Colorado College	Colorado Springs, Colo.
Rev. J. J. Brown, S. J.	College of the Sacred Heart	Denver, Colo.
Rev. Henry A. Buchtel, D. D., LL. D., chancellor.	University of Denver	University Park, Colo.
Rev. G. W. Smith, D. D., LL. D.	Trinity College	Hartford, Conn.
Rev. B. P. Raymond, D. D., LL. D.	Wesleyan University	Middletown, Conn.
Arthur T. Hadley, LL. D.	Yale University	New Haven, Conn.
Rev. W. C. Jason, A. M., B. D.	State College for Colored Students	Dover, Del.
Geo. A. Harter, Ph. D.	Delaware College	Newark, Del.
Rev. Dennis J. O'Connell, S. T. D., rector.	Catholic University of America	Washington, D. C.
Charles W. Needham, LL. D.	Columbian University	Do.
E. M. Gallaudet, Ph. D., LL. D.	Gallaudet College	Do.
Rev. Jerome Daugherty, S. J.	Georgetown University	Do.
Rev. Edward X. Fink, S. J.	Gonzaga College	Do.
Rev. John Gordon, D. D.	Howard University	Do.
Rev. Brother Abbas, F. S. C.	St. John's College	Do.
John F. Forbes, Ph. D.	John B. Stetson University	Deland, Fla.
Thos. H. Taliaferro, Ph. D.	University of Florida	Lake City, Fla.
Rev. Charles H. More, Ph. D.	St. Leo College	St. Leo, Fla.
A. A. Murphree, A. M.	Florida State College	Tallahassee, Fla.
Rev. Wm. F. Blackman, Ph. D.	Rollins College	Winterpark, Fla.
Walter B. Hill, LL. D., chancellor.	University of Georgia	Athens, Ga.
Rev. George Sale, A. M.	Atlanta Baptist College	Atlanta, Ga.
Rev. Horace Bumstead, D. D.	Atlanta University	Do.
Rev. J. M. Henderson, D. D.	Morris Brown College	Do.
W. Claude Williams, A. B.	Bowdon College	Bowdon, Ga.
Joseph S. Stewart, A. M.	North Georgia Agricultural College	Dahlonega, Ga.
P. D. Pollock, LL. D.	Mercer University	Macon, Ga.
Rev. J. E. Dickey	Emory College	Oxford, Ga.
William F. Quillian, jr.	Clark University	South Atlanta, Ga.
Rev. Joseph A. Sharp, A. B.	Nannie Lou Warthen Institute	Wrightsville, Ga.
James A. MacLean, Ph. D.	Young Harris College	Young Harris, Ga.
Rev. Harry B. Gough	University of Idaho	Moscow, Idaho.
Rev. E. M. Smith, D. D.	Hedding College	Abingdon, Ill.
Rev. M. J. Marsile, C. S. V.	Illinois Wesleyan University	Bloomington, Ill.
W. H. Bradley, Ph. D., dean	St. Viator's College	Bourbonnais, Ill.
Rev. Fred L. Sigmund, D. D.	Blackburn College	Carlinville, Ill.
Rev. Henry J. Dumbach, S. J.	Carthage College	Carthage, Ill.
Rev. John Kruszyński, C. R.	St. Ignatius College	Chicago, Ill.
Rev. Wm. R. Harper, Ph. D., D. D., LL. D.	St. Stanislaus College	Do.
A. R. Taylor, Ph. D.	University of Chicago	Do.
W. E. Lugenbeel, Ph. D.	James Millikin University	Decatur, Ill.
Rev. Daniel Irion	Austin College	Elingham, Ill.
Robert E. Hieronymus, A. M.	Evangelical Proseminary	Elmhurst, Ill.
Edmund J. James, Ph. D., LL. D.	Eureka College	Eureka, Ill.
Rev. J. A. Leavitt, D. D.	Northwestern University	Evanston, Ill.
J. E. Bittinger, A. M.	Ewing College	Ewing, Ill.
Rev. Thomas McClelland, D. D.	Northern Illinois College	Fulton, Ill.
Rev. Charles E. Nash, S. T. D.	Knox College	Galesburg, Ill.
Wilson T. Hogue, Ph. B.	Lombard College	Do.
	Greenville College	Greenville, Ill.

## I.—Colleges for men and coeducational colleges of liberal arts—Continued.

Name of president.	University or college.	Address.
Rev. Clifford W. Barnes, A. M.	Illinois College	Jacksonville, Ill.
Rev. Richard D. Harlan, D. D.	Lake Forest College	Lake Forest, Ill.
M. H. Chamberlin, LL. D.	McKendree College	Lebanon, Ill.
Rev. J. L. Goodknight, D. D.	Lincoln College	Lincoln, Ill.
Rev. Thos. H. McMichael, D. D.	Monmouth College	Monmouth, Ill.
Rev. H. J. Kiekhoefer, Ph. D.	Northwestern College	Naperville, Ill.
Rev. John Miller, O. S. B., rector.	St. Bede College	Peru, Ill.
Rev. Anselm Mueller, O. S. F.	St. Francis Solanus College	Quincy, Ill.
Gustav A. Andreen, Ph. D.	Augustana College	Rock Island, Ill.
Rev. Samuel Macke, O. S. F., rector.	St. Joseph's College	Teutopolis, Ill.
Rev. Stanley A. McKay, D. D.	Shurtleff College	Upper Alton, Ill.
Andrew S. Draper, LL. D.	University of Illinois	Urbana, Ill.
Rev. J. A. Hawkins, A. M.	Westfield College	Westfield, Ill.
Rev. C. A. Blanchard, D. D.	Wheaton College	Wheaton, Ill.
William L. Bryan, Ph. D.	Indiana University	Bloomington, Ind.
Rev. Wm. P. Kane, D. D.	Wabash College	Crawfordsville, Ind.
Rev. Martin Luecke	Concordia College	Fort Wayne, Ind.
Rev. William T. Stott, D. D., LL. D.	Franklin College	Franklin, Ind.
Rev. E. H. Hughes	De Pauw University	Greencastle, Ind.
Scott Butler, LL. D.	Hanover College	Hanover, Ind.
Rev. L. J. Aldrich, D. D.	Butler College	Irrington, Ind.
Rev. C. W. Lewis, D. D.	Union Christian College	Merom, Ind.
Rev. A. Morrissey, C. S. C.	Moore's Hill College	Moore's Hill, Ind.
Robert L. Kelly, Ph. M.	University of Notre Dame	Notre Dame, Ind.
Rev. A. Schmitt, O. S. B.	Earlham College	Richmond, Ind.
Rev. John H. Shilling, Ph. D., S. T. D., acting.	St. Meinrad College	St. Meinrad, Ind.
J. H. Scott, A. B.	Taylor University	Upland, Ind.
Rev. A. Grant Evans	Indian University	Bacone, Ind. T.
Rev. S. B. McCormick, D. D.	Henry Kendall College	Muscogee, Ind. T.
J. Frederick Hirsch, A. M.	Coe College	Cedar Rapids, Iowa.
O. Kraushaar	Charles City College	Charles City, Iowa.
D. P. Smith	Wartburg College	Clinton, Iowa.
Rev. C. K. Preus	Amity College	College Springs, Iowa.
Rev. George D. Adams, D. D.	Luther College	Decorah, Iowa.
Hill M. Bell, A. M.	Des Moines College	Des Moines, Iowa.
Rev. John P. Carroll, D. D.	Drake University	Do.
Rev. F. W. Hinit, Ph. D., D. D.	St. Joseph's College	Dubuque, Iowa.
Rev. T. J. Bassett, D. D.	Parsons College	Fairfield, Iowa.
Rev. Dan F. Bradley, D. D.	Upper Iowa University	Fayette, Iowa.
Rev. F. W. Grossman, A. B.	Iowa College	Grinnell, Iowa.
Charles E. Shelton, LL. D.	Lenox College	Hopkinton, Iowa.
Geo. E. MacLean, Ph. D., LL. D.	Simpson College	Indianola, Iowa.
Herbert S. Salisbury, B. S.	State University of Iowa	Iowa City, Iowa.
Carlyle Summerbell, A. M.	Graceland College	Lamoni, Iowa.
Rev. E. S. Havighorst, D. D.	Palmer College	Legend, Iowa.
Rev. John W. Hancher, S. T. D.	German College	Mount Pleasant, Iowa.
Rev. Wm. F. King, D. D., LL. D.	Iowa Wesleyan University	Do.
A. Rosenberger, A. B., LL. B.	Cornell College	Mount Vernon, Iowa.
L. A. Garrison, A. B., vice-pres.	Penn College	Oskaloosa, Iowa.
Rev. W. S. Lewis, D. D.	Central University of Iowa	Pella, Iowa.
Rev. E. E. Reed, D. D.	Morningside College	Sioux City, Iowa.
Rev. L. Bookwalter, D. D.	Buena Vista College	Storm Lake, Iowa.
Rev. Jacob A. Clutz, D. D.	Western College	Toledo, Iowa.
Rev. I. Wolf, O. S. B., D. D.	Midland College	Atchison, Kans.
Rev. L. H. Murlin, D. D.	St. Benedict's College	Do.
Rev. J. C. Miller, D. D.	Baker University	Baldwin, Kans.
Amos A. Davis, A. M.	College of Emporia	Emporia, Kans.
P. O. Bonebrake, A. M.	Highland University	Highland, Kans.
Rev. D. S. Stephens, D. D., chancellor.	Campbell College	Holton, Kans.
Frank Strong, Ph. D.	Kansas City University	Kansas City, Kans.
T. W. Bellingham, Ph. D.	University of Kansas	Lawrence, Kans.
Rev. C. A. Swenson, Ph. D., D. D.	Kansas Christian College	Lincoln, Kans.
